Preface to the new edition ..... **xxvii**
Preface to the first edition ..... **xxviii**
Authors ..... **xxxi**
Some notations and remarks ..... **xxxiii**

Part I. Exact Solutions of Nonlinear Partial Differential Equations **1**

1. First-Order Quasilinear Equations **3**
1.1. Equations with Two Independent Variables Containing Arbitrary Parameters .. 3
1.1.1. Coefficients of Equations Contain Power-Law Functions 3
1.1.2. Coefficients of Equations Contain Exponential Functions 11
1.1.3. Coefficients of Equations Contain Hyperbolic Functions 14
1.1.4. Coefficients of Equations Contain Logarithmic Functions 16
1.1.5. Coefficients of Equations Contain Trigonometric Functions 17
1.2. Equations with Two Independent Variables Containing Arbitrary Functions ... 19
1.2.1. Equations Contain Arbitrary Functions of One Variable 19
1.2.2. Equations Contain Arbitrary Functions of Two Variables 30
1.3. Other Quasilinear Equations 35
1.3.1. Equations with Three Independent Variables 35
1.3.2. Equations with Arbitrary Number of Independent Variables 39

2. First-Order Equations with Two Independent Variables Quadratic in Derivatives **43**
2.1. Equations Containing Arbitrary Parameters 43
2.1.1. Equations of the Form $\frac{\partial w}{\partial x}\frac{\partial w}{\partial y} = f(x, y, w)$ 43
2.1.2. Equations of the Form $f(x, y, w)\frac{\partial w}{\partial x}\frac{\partial w}{\partial y} + g(x, y, w)\frac{\partial w}{\partial x} = h(x, y, w)$ 45
2.1.3. Equations of the Form $f(x, y, w)\frac{\partial w}{\partial x}\frac{\partial w}{\partial y} + g(x, y, w)\frac{\partial w}{\partial x} + h(x, y, w)\frac{\partial w}{\partial y} = s(x, y, w)$ 47
2.1.4. Equations of the Form $\frac{\partial w}{\partial x} + f(x, y, w)\big(\frac{\partial w}{\partial y}\big)^2 = g(x, y, w)$ 51
2.1.5. Equations of the Form $\frac{\partial w}{\partial x} + f(x, y, w)\big(\frac{\partial w}{\partial x}\big)^2 + g(x, y, w)\frac{\partial w}{\partial y} = h(x, y, w)$ 59
2.1.6. Equations of the Form $f(x, y, w)\big(\frac{\partial w}{\partial x}\big)^2 + g(x, y, w)\big(\frac{\partial w}{\partial y}\big)^2 = h(x, y, w)$. 63
2.1.7. Equations of the Form $f(x, y)\big(\frac{\partial w}{\partial x}\big)^2 + g(x, y)\frac{\partial w}{\partial x}\frac{\partial w}{\partial y} = h(x, y, w)$ 69
2.1.8. Other Equations 73
2.2. Equations Containing Arbitrary Functions 77
2.2.1. Equations of the Form $\frac{\partial w}{\partial x}\frac{\partial w}{\partial y} = f(x, y, w)$ 77
2.2.2. Equations of the Form $f(x, y)\frac{\partial w}{\partial x} + g(x, y, w)\big(\frac{\partial w}{\partial y}\big)^2 = h(x, y, w)$ 79
2.2.3. Equations of the Form $\frac{\partial w}{\partial x} + f(x, y, w)\big(\frac{\partial w}{\partial x}\big)^2 + g(x, y, w)\frac{\partial w}{\partial y} = h(x, y, w)$ 86
2.2.4. Equations of the Form $f(x, y, w)\big(\frac{\partial w}{\partial x}\big)^2 + g(x, y, w)\big(\frac{\partial w}{\partial y}\big)^2 = h(x, y, w)$. 89
2.2.5. Equations of the Form $\big(\frac{\partial w}{\partial x}\big)^2 + f(x, y, w)\frac{\partial w}{\partial x}\frac{\partial w}{\partial y} = g(x, y, w)$ 92
2.2.6. Other Equations 95

3. First-Order Nonlinear Equations with Two Independent Variables of General Form 99

3.1. Nonlinear Equations Containing Arbitrary Parameters 99
3.1.1. Equations Contain the Fourth Powers of Derivatives 99
3.1.2. Equations Contain Derivatives in Radicands 101
3.1.3. Equations Contain Arbitrary Powers of Derivatives 102
3.1.4. More Complicated Equations 105

3.2. Equations Containing Arbitrary Functions of Independent Variables 107
3.2.1. Equations Contain One Arbitrary Power of Derivative 107
3.2.2. Equations Contain Two or Three Arbitrary Powers of Derivatives 111

3.3. Equations Containing Arbitrary Functions of Derivatives 113
3.3.1. Equations Contain Arbitrary Functions of One Variable 113
3.3.2. Equations Contain Arbitrary Functions of Two Variables 116
3.3.3. Equations Contain Arbitrary Functions of Three Variables 120
3.3.4. Equations Contain Arbitrary Functions of Four Variables 123

4. First-Order Nonlinear Equations with Three or More Independent Variables 125

4.1. Nonlinear Equations with Three Variables Quadratic in Derivatives 125
4.1.1. Equations Contain Squares of One or Two Derivatives 125
4.1.2. Equations Contain Squares of Three Derivatives 130
4.1.3. Equations Contain Products of Derivatives with Respect to Different Variables 131
4.1.4. Equations Contain Squares and Products of Derivatives 133

4.2. Other Nonlinear Equations with Three Variables Containing Parameters 134
4.2.1. Equations Cubic in Derivatives 134
4.2.2. Equations Contain Roots and Moduli of Derivatives 136
4.2.3. Equations Contain Arbitrary Powers of Derivatives 136

4.3. Nonlinear Equations with Three Variables Containing Arbitrary Functions 139
4.3.1. Equations Quadratic in Derivatives 139
4.3.2. Equations with Power Nonlinearity in Derivatives 146
4.3.3. Equations with Arbitrary Dependence on Derivatives 148
4.3.4. Nonlinear Equations of General Form 150

4.4. Nonlinear Equations with Four Independent Variables 154
4.4.1. Equations Quadratic in Derivatives 154
4.4.2. Equations Contain Power-Law Functions of Derivatives 156

4.5. Nonlinear Equations with Arbitrary Number of Variables Containing Arbitrary Parameters 158
4.5.1. Equations Quadratic in Derivatives 158
4.5.2. Equations with Power-Law Nonlinearity in Derivatives 161

4.6. Nonlinear Equations with Arbitrary Number of Variables Containing Arbitrary Functions 162
4.6.1. Equations Quadratic in Derivatives 162
4.6.2. Equations with Power-Law Nonlinearity in Derivatives 167
4.6.3. Equations Contain Arbitrary Functions of Two Variables 168
4.6.4. Nonlinear Equations of General Form 169

5. Second-Order Parabolic Equations with One Space Variable **175**
5.1. Equations with Power-Law Nonlinearities 175
5.1.1. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + bw + cw^2$ 175
5.1.2. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + b_0 + b_1 w + b_2 w^2 + b_3 w^3$ 176
5.1.3. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + bw^k + cw^m + sw^n$ 182
5.1.4. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + f(x,t,w)$ 185
5.1.5. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + bw^k\frac{\partial w}{\partial x} + f(w)$ 186
5.1.6. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + f(x,t,w)\frac{\partial w}{\partial x} + g(x,t,w)$ 190
5.1.7. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + b\big(\frac{\partial w}{\partial x}\big)^2 + f(x,t,w)$ 193
5.1.8. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + f\big(x,t,w,\frac{\partial w}{\partial x}\big)$ 195
5.1.9. Equations of the Form $\frac{\partial w}{\partial t} = aw^k\frac{\partial^2 w}{\partial x^2} + f\big(x,t,w,\frac{\partial w}{\partial x}\big)$ 197
5.1.10. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial}{\partial x}\big(w^m\frac{\partial w}{\partial x}\big)$ 210
5.1.11. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial}{\partial x}\big(w^m\frac{\partial w}{\partial x}\big) + bw^k$ 219
5.1.12. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial}{\partial x}\big(w^m\frac{\partial w}{\partial x}\big) + bw + c_1 w^{k_1} + c_2 w^{k_2} + c_3 w^{k_3}$ 228
5.1.13. Equations of the Form $\frac{\partial w}{\partial t} = \frac{\partial}{\partial x}\big[f(w)\frac{\partial w}{\partial x}\big] + g(w)$ 233
5.1.14. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial}{\partial x}\big(w^m\frac{\partial w}{\partial x}\big) + f(x,t,w)$ 236
5.1.15. Equations of the Form $\frac{\partial w}{\partial t} = \frac{\partial}{\partial x}\big[f(w)\frac{\partial w}{\partial x}\big] + g(w)\frac{\partial w}{\partial x}$ 237
5.1.16. Equations of the Form $\frac{\partial w}{\partial t} = \frac{\partial}{\partial x}\big[f(w)\frac{\partial w}{\partial x}\big] + g\big(x,t,w,\frac{\partial w}{\partial x}\big)$ 242
5.1.17. Other Equations 245
5.2. Equations with Exponential Nonlinearities 254
5.2.1. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + b_0 + b_1 e^{\lambda w} + b_2 e^{2\lambda w}$ 254
5.2.2. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial}{\partial x}\big(e^{\lambda w}\frac{\partial w}{\partial x}\big) + f(w)$ 256
5.2.3. Equations of the Form $\frac{\partial w}{\partial t} = \frac{\partial}{\partial x}\big[f(w)\frac{\partial w}{\partial x}\big] + g(w)$ 259
5.2.4. Other Equations Explicitly Independent of x and t 262
5.2.5. Equations Explicitly Dependent on x and/or t 266
5.3. Equations with Hyperbolic Nonlinearities 268
5.3.1. Equations Involving Hyperbolic Cosine 268
5.3.2. Equations Involving Hyperbolic Sine 269
5.3.3. Equations Involving Hyperbolic Tangent 270
5.3.4. Equations Involving Hyperbolic Cotangent 270
5.4. Equations with Logarithmic Nonlinearities 271
5.4.1. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + f(x,t,w)$ 271
5.4.2. Other Equations 273
5.5. Equations with Trigonometric Nonlinearities 276
5.5.1. Equations Involving Cosine 276
5.5.2. Equations Involving Sine 277
5.5.3. Equations Involving Tangent 278
5.5.4. Equations Involving Cotangent 278
5.5.5. Equations Involving Inverse Trigonometric Functions 279
5.6. Equations Involving Arbitrary Functions 279
5.6.1. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + f(x,t,w)$ 279
5.6.2. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + f(x,t)\frac{\partial w}{\partial x} + g(x,t,w)$ 284

5.6.3. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + f(x,t,w)\frac{\partial w}{\partial x} + g(x,t,w)$ 286
5.6.4. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + b\left(\frac{\partial w}{\partial x}\right)^2 + f(x,t,w)$ 290
5.6.5. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + b\left(\frac{\partial w}{\partial x}\right)^2 + f(x,t,w)\frac{\partial w}{\partial x} + g(x,t,w)$ 293
5.6.6. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + f(x,t,w)\left(\frac{\partial w}{\partial x}\right)^2 + g(x,t,w)\frac{\partial w}{\partial x} + h(x,t,w)$ 294
5.6.7. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + f\left(x,t,w,\frac{\partial w}{\partial x}\right)$ 298
5.6.8. Equations of the Form $\frac{\partial w}{\partial t} = f(x,t)\frac{\partial^2 w}{\partial x^2} + g\left(x,t,w,\frac{\partial w}{\partial x}\right)$ 299
5.6.9. Equations of the Form $\frac{\partial w}{\partial t} = aw\frac{\partial^2 w}{\partial x^2} + f(x,t,w)\frac{\partial w}{\partial x} + g(x,t,w)$ 303
5.6.10. Equations of the Form $\frac{\partial w}{\partial t} = (aw+b)\frac{\partial^2 w}{\partial x^2} + f(x,t,w)\left(\frac{\partial w}{\partial x}\right)^2 + g(x,t,w)\frac{\partial w}{\partial x} + h(x,t,w)$ 306
5.6.11. Equations of the Form $\frac{\partial w}{\partial t} = aw^m\frac{\partial^2 w}{\partial x^2} + f(x,t)\frac{\partial w}{\partial x} + g(x,t,w)$ 308
5.6.12. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial}{\partial x}\left(w\frac{\partial w}{\partial x}\right) + f(x,t)\frac{\partial w}{\partial x} + g(x,t,w)$ 311
5.6.13. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial}{\partial x}\left(w^m\frac{\partial w}{\partial x}\right) + f(x,t)\frac{\partial w}{\partial x} + g(x,t,w)$ 312
5.6.14. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial}{\partial x}\left(e^{\lambda w}\frac{\partial w}{\partial x}\right) + f(x,t,w)$ 316
5.6.15. Equations of the Form $\frac{\partial w}{\partial t} = \frac{\partial}{\partial x}\left[f(w)\frac{\partial w}{\partial x}\right] + g\left(x,t,w,\frac{\partial w}{\partial x}\right)$ 318
5.6.16. Equations of the Form $\frac{\partial w}{\partial t} = f(x,w)\frac{\partial^2 w}{\partial x^2}$ 327
5.6.17. Equations of the Form $\frac{\partial w}{\partial t} = f(x,t,w)\frac{\partial^2 w}{\partial x^2} + g\left(x,t,w,\frac{\partial w}{\partial x}\right)$ 329
5.6.18. Equations of the Form $\frac{\partial w}{\partial t} = f\left(x,w,\frac{\partial w}{\partial x}\right)\frac{\partial^2 w}{\partial x^2} + g\left(x,t,w,\frac{\partial w}{\partial x}\right)$ 339
5.6.19. Evolution Equations Nonlinear in the Second Derivative 346
5.6.20. Nonlinear Equations of the Thermal (Diffusion) Boundary Layer 346
5.7. Nonlinear Schrödinger Equations and Related Equations 348
5.7.1. Equations of the Form $i\frac{\partial w}{\partial t} + \frac{\partial^2 w}{\partial x^2} + f(|w|)w = 0$ Involving Arbitrary Parameters 348
5.7.2. Equations of the Form $i\frac{\partial w}{\partial t} + \frac{1}{x^n}\frac{\partial}{\partial x}\left(x^n\frac{\partial w}{\partial x}\right) + f(|w|)w = 0$ Involving Arbitrary Parameters 352
5.7.3. Other Equations Involving Arbitrary Parameters 354
5.7.4. Equations with Cubic Nonlinearities Involving Arbitrary Functions 355
5.7.5. Equations of General Form Involving Arbitrary Functions of a Single Argument 358
5.7.6. Equations of General Form Involving Arbitrary Functions of Two Arguments 362

6. Second-Order Parabolic Equations with Two or More Space Variables 367

6.1. Equations with Two Space Variables Involving Power-Law Nonlinearities 367
6.1.1. Equations of the Form $\frac{\partial w}{\partial t} = \frac{\partial}{\partial x}\left[f(x)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(y)\frac{\partial w}{\partial y}\right] + aw^p$ 367
6.1.2. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial}{\partial x}\left(w^n\frac{\partial w}{\partial x}\right) + b\frac{\partial}{\partial y}\left(w^k\frac{\partial w}{\partial y}\right)$ 368
6.1.3. Equations of the Form $\frac{\partial w}{\partial t} = \frac{\partial}{\partial x}\left[f(w)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(w)\frac{\partial w}{\partial y}\right] + h(w)$ 374
6.1.4. Other Equations 377
6.2. Equations with Two Space Variables Involving Exponential Nonlinearities 384
6.2.1. Equations of the Form $\frac{\partial w}{\partial t} = \frac{\partial}{\partial x}\left[f(x)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(y)\frac{\partial w}{\partial y}\right] + ae^{\lambda w}$ 384
6.2.2. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial}{\partial x}\left(e^{\beta w}\frac{\partial w}{\partial x}\right) + b\frac{\partial}{\partial y}\left(e^{\lambda w}\frac{\partial w}{\partial y}\right) + f(w)$ 385

6.3. Other Equations with Two Space Variables Involving Arbitrary Parameters 388
6.3.1. Equations with Logarithmic Nonlinearities 388
6.3.2. Equations with Trigonometrical Nonlinearities 389
6.4. Equations Involving Arbitrary Functions 390
6.4.1. Heat and Mass Transfer Equations in Quiescent or Moving Media with Chemical Reactions 390
6.4.2. Equations of the Form $\frac{\partial w}{\partial t} = \frac{\partial}{\partial x}\left[f(x)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(y)\frac{\partial w}{\partial y}\right] + h(w)$ 392
6.4.3. Equations of the Form $\frac{\partial w}{\partial t} = \frac{\partial}{\partial x}\left[f(w)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(w)\frac{\partial w}{\partial y}\right] + h(t, w)$ 394
6.4.4. Other Equations Linear in the Highest Derivatives 398
6.4.5. Nonlinear Diffusion Boundary Layer Equations 402
6.4.6. Equations Nonlinear in the Highest Derivatives 404
6.5. Equations with Three or More Space Variables 406
6.5.1. Equations of Mass Transfer in Quiescent or Moving Media with Chemical Reactions 406
6.5.2. Heat Equations with Power-Law or Exponential Temperature-Dependent Thermal Diffusivity 409
6.5.3. Equations of Heat and Mass Transfer in Anisotropic Media 412
6.5.4. Other Equations with Three Space Variables 414
6.5.5. Equations with n Space Variables 417
6.6. Nonlinear Schrödinger Equations 425
6.6.1. Two-Dimensional Equations 425
6.6.2. Three and n-Dimensional Equations 428

7. Second-Order Hyperbolic Equations with One Space Variable 433

7.1. Equations with Power-Law Nonlinearities 433
7.1.1. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = \frac{\partial^2 w}{\partial x^2} + aw + bw^n + cw^{2n-1}$ 433
7.1.2. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = a\frac{\partial^2 w}{\partial x^2} + f(x, t, w)$ 436
7.1.3. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = a\frac{\partial^2 w}{\partial x^2} + f\left(x, t, w, \frac{\partial w}{\partial x}\right)$ 439
7.1.4. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = f(x)\frac{\partial^2 w}{\partial x^2} + g\left(x, t, w, \frac{\partial w}{\partial x}\right)$ 442
7.1.5. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = aw^n\frac{\partial^2 w}{\partial x^2} + f(x, w)$ 447
7.1.6. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = a\frac{\partial}{\partial x}\left(w^n\frac{\partial w}{\partial x}\right)$ 450
7.1.7. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = a\frac{\partial}{\partial x}\left(w^n\frac{\partial w}{\partial x}\right) + bw^k$ 454
7.1.8. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = a\frac{\partial}{\partial x}\left(w^n\frac{\partial w}{\partial x}\right) + b_1w^{k_1} + b_2w^{k_2} + b_3w^{k_3}$ ... 458
7.1.9. Other Equations 460
7.2. Equations with Exponential Nonlinearities 469
7.2.1. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = a\frac{\partial^2 w}{\partial x^2} + be^{\beta w} + ce^{\gamma w}$ 469
7.2.2. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = a\frac{\partial^2 w}{\partial x^2} + f(x, t, w)$ 472
7.2.3. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = f(x)\frac{\partial^2 w}{\partial x^2} + g\left(x, t, w, \frac{\partial w}{\partial x}\right)$ 475
7.2.4. Other Equations 480
7.3. Other Equations Involving Arbitrary Parameters 485
7.3.1. Equations with Hyperbolic Nonlinearities 485
7.3.2. Equations with Logarithmic Nonlinearities 486
7.3.3. Sine-Gordon Equation and Other Equations with Trigonometric Nonlinearities 490
7.3.4. Equations of the Form $\frac{\partial^2 w}{\partial t^2} + a\frac{\partial w}{\partial t} = \frac{\partial}{\partial x}\left[f(w)\frac{\partial w}{\partial x}\right]$ 494
7.3.5. Equations of the Form $\frac{\partial^2 w}{\partial t^2} + f(w)\frac{\partial w}{\partial t} = \frac{\partial}{\partial x}\left[g(w)\frac{\partial w}{\partial x}\right]$ 496

7.4. Equations Involving Arbitrary Functions 499
7.4.1. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = a\frac{\partial^2 w}{\partial x^2} + f(x,t,w)$ 499
7.4.2. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = a\frac{\partial^2 w}{\partial x^2} + f\left(x,t,w,\frac{\partial w}{\partial x}\right)$ 505
7.4.3. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = f(x)\frac{\partial^2 w}{\partial x^2} + g\left(x,t,w,\frac{\partial w}{\partial x}\right)$ 511
7.4.4. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = f(w)\frac{\partial^2 w}{\partial x^2} + g\left(x,t,w,\frac{\partial w}{\partial x}\right)$ 517
7.4.5. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = f(x,w)\frac{\partial^2 w}{\partial x^2} + g\left(x,t,w,\frac{\partial w}{\partial x}\right)$ 526
7.4.6. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = f(t,w)\frac{\partial^2 w}{\partial x^2} + g\left(x,t,w,\frac{\partial w}{\partial x}\right)$ 529
7.4.7. Other Equations Linear in the Highest Derivatives 530
7.5. Equations of the Form $\frac{\partial^2 w}{\partial x \partial y} = F\left(x,y,w,\frac{\partial w}{\partial x},\frac{\partial w}{\partial y}\right)$ 540
7.5.1. Equations Involving Arbitrary Parameters of the Form $\frac{\partial^2 w}{\partial x \partial y} = f(w)$ 540
7.5.2. Other Equations Involving Arbitrary Parameters 544
7.5.3. Equations Involving Arbitrary Functions 546

8. Second-Order Hyperbolic Equations with Two or More Space Variables . . . 553
8.1. Equations with Two Space Variables Involving Power-Law Nonlinearities 553
8.1.1. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = \frac{\partial}{\partial x}\left[f(x)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(y)\frac{\partial w}{\partial y}\right] + aw^p$ 553
8.1.2. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = a\frac{\partial}{\partial x}\left(w^n\frac{\partial w}{\partial x}\right) + b\frac{\partial}{\partial y}\left(w^k\frac{\partial w}{\partial y}\right)$ 555
8.1.3. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = \frac{\partial}{\partial x}\left[f(w)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(w)\frac{\partial w}{\partial y}\right]$ 565
8.1.4. Other Equations 570
8.2. Equations with Two Space Variables Involving Exponential Nonlinearities 574
8.2.1. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = \frac{\partial}{\partial x}\left[f(x)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(y)\frac{\partial w}{\partial y}\right] + ae^{\lambda w}$ 574
8.2.2. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = a\frac{\partial}{\partial x}\left(e^{\beta w}\frac{\partial w}{\partial x}\right) + b\frac{\partial}{\partial y}\left(e^{\lambda w}\frac{\partial w}{\partial y}\right)$ 577
8.2.3. Other Equations 582
8.3. Nonlinear Telegraph Equations with Two Space Variables 583
8.3.1. Equations Involving Power-Law Nonlinearities 583
8.3.2. Equations Involving Exponential Nonlinearities 587
8.4. Equations with Two Space Variables Involving Arbitrary Functions 589
8.4.1. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = \frac{\partial}{\partial x}\left[f(x)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(y)\frac{\partial w}{\partial y}\right] + h(w)$ 589
8.4.2. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = \frac{\partial}{\partial x}\left[f(w)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(w)\frac{\partial w}{\partial y}\right] + h(w)$ 593
8.4.3. Other Equations 599
8.5. Equations with Three Space Variables Involving Arbitrary Parameters 604
8.5.1. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = \frac{\partial}{\partial x}\left[f(x)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(y)\frac{\partial w}{\partial y}\right] + \frac{\partial}{\partial z}\left[h(z)\frac{\partial w}{\partial z}\right] + aw^p$ 604
8.5.2. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = \frac{\partial}{\partial x}\left[f(x)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(y)\frac{\partial w}{\partial y}\right] + \frac{\partial}{\partial z}\left[h(z)\frac{\partial w}{\partial z}\right] + ae^{\lambda w}$ 606
8.5.3. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = a\frac{\partial}{\partial x}\left(w^n\frac{\partial w}{\partial x}\right) + b\frac{\partial}{\partial y}\left(w^m\frac{\partial w}{\partial y}\right) + c\frac{\partial}{\partial z}\left(w^k\frac{\partial w}{\partial z}\right) + sw^p$ 608
8.5.4. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = a\frac{\partial}{\partial x}\left(e^{\lambda_1 w}\frac{\partial w}{\partial x}\right) + b\frac{\partial}{\partial y}\left(e^{\lambda_2 w}\frac{\partial w}{\partial y}\right) + c\frac{\partial}{\partial z}\left(e^{\lambda_3 w}\frac{\partial w}{\partial z}\right) + se^{\beta w}$ 615
8.6. Equations with Three or More Space Variables Involving Arbitrary Functions . 624
8.6.1. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = \frac{\partial}{\partial x}\left[f_1(x)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[f_2(y)\frac{\partial w}{\partial y}\right] + \frac{\partial}{\partial z}\left[f_3(z)\frac{\partial w}{\partial z}\right] + g(w)$ 624

8.6.2. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = \frac{\partial}{\partial x}\left[f_1(w)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[f_2(w)\frac{\partial w}{\partial y}\right] + \frac{\partial}{\partial z}\left[f_3(w)\frac{\partial w}{\partial z}\right] + g(w)$ 629
8.6.3. Other Equations 637

9. Second-Order Elliptic Equations with Two Space Variables 641

9.1. Equations with Power-Law Nonlinearities 641
9.1.1. Equations of the Form $\frac{\partial^2 w}{\partial x^2} + \frac{\partial^2 w}{\partial y^2} = aw + bw^n + cw^{2n-1}$ 641
9.1.2. Equations of the Form $\frac{\partial^2 w}{\partial x^2} + \frac{\partial^2 w}{\partial y^2} = f(x, y, w)$ 644
9.1.3. Equations of the Form $\frac{\partial^2 w}{\partial x^2} + a\frac{\partial^2 w}{\partial y^2} = F\left(x, y, w, \frac{\partial w}{\partial x}, \frac{\partial w}{\partial y}\right)$ 645
9.1.4. Equations of the Form $\frac{\partial}{\partial x}\left[f_1(x, y)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[f_2(x, y)\frac{\partial w}{\partial y}\right] = g(w)$ 646
9.1.5. Equations of the Form $\frac{\partial}{\partial x}\left[f_1(w)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[f_2(w)\frac{\partial w}{\partial y}\right] = g(w)$ 648
9.1.6. Other Equations Involving Arbitrary Parameters 654

9.2. Equations with Exponential Nonlinearities 662
9.2.1. Equations of the Form $\frac{\partial^2 w}{\partial x^2} + \frac{\partial^2 w}{\partial y^2} = a + be^{\beta w} + ce^{\gamma w}$ 662
9.2.2. Equations of the Form $\frac{\partial^2 w}{\partial x^2} + \frac{\partial^2 w}{\partial y^2} = f(x, y, w)$ 664
9.2.3. Equations of the Form $\frac{\partial}{\partial x}\left[f_1(x, y)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[f_2(x, y)\frac{\partial w}{\partial y}\right] = g(w)$ 665
9.2.4. Equations of the Form $\frac{\partial}{\partial x}\left[f_1(w)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[f_2(w)\frac{\partial w}{\partial y}\right] = g(w)$ 668
9.2.5. Other Equations Involving Arbitrary Parameters 671

9.3. Equations Involving Other Nonlinearities 675
9.3.1. Equations with Hyperbolic Nonlinearities 675
9.3.2. Equations with Logarithmic Nonlinearities 677
9.3.3. Equations with Trigonometric Nonlinearities 680

9.4. Equations Involving Arbitrary Functions 682
9.4.1. Equations of the Form $\frac{\partial^2 w}{\partial x^2} + \frac{\partial^2 w}{\partial y^2} = F(x, y, w)$ 682
9.4.2. Equations of the Form $a\frac{\partial^2 w}{\partial x^2} + b\frac{\partial^2 w}{\partial y^2} = F\left(x, y, w, \frac{\partial w}{\partial x}, \frac{\partial w}{\partial y}\right)$ 690
9.4.3. Heat and Mass Transfer Equations of the Form $\frac{\partial}{\partial x}\left[f(x)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(y)\frac{\partial w}{\partial y}\right] = h(w)$ 697
9.4.4. Equations of the Form $\frac{\partial}{\partial x}\left[f(x, y, w)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(x, y, w)\frac{\partial w}{\partial y}\right] = h(x, y, w)$ 699
9.4.5. Other Equations 707

10. Second-Order Elliptic Equations with Three or More Space Variables 713

10.1. Equations with Three Space Variables Involving Power-Law Nonlinearities . . 713
10.1.1. Equations of the Form $\frac{\partial}{\partial x}\left[f(x)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(y)\frac{\partial w}{\partial y}\right] + \frac{\partial}{\partial z}\left[h(z)\frac{\partial w}{\partial z}\right] = aw^p$ 713
10.1.2. Equations of the Form $\frac{\partial}{\partial x}\left[f(w)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(w)\frac{\partial w}{\partial y}\right] + \frac{\partial}{\partial z}\left[g(w)\frac{\partial w}{\partial z}\right] = 0$ 716

10.2. Equations with Three Space Variables Involving Exponential Nonlinearities . . 722
10.2.1. Equations of the Form $\frac{\partial}{\partial x}\left[f(x)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(y)\frac{\partial w}{\partial y}\right] + \frac{\partial}{\partial z}\left[h(z)\frac{\partial w}{\partial z}\right] = ae^{\lambda w}$ 722
10.2.2. Equations of the Form $a_1\frac{\partial}{\partial x}\left(e^{\lambda_1 w}\frac{\partial w}{\partial x}\right) + a_2\frac{\partial}{\partial y}\left(e^{\lambda_2 w}\frac{\partial w}{\partial y}\right) + a_3\frac{\partial}{\partial y}\left(e^{\lambda_2 w}\frac{\partial w}{\partial y}\right) = be^{\beta w}$ 725

10.3. Three-Dimensional Equations Involving Arbitrary Functions 730
10.3.1. Heat and Mass Transfer Equations of the Form $\frac{\partial}{\partial x}\left[f_1(x)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[f_2(y)\frac{\partial w}{\partial y}\right] + \frac{\partial}{\partial z}\left[f_3(z)\frac{\partial w}{\partial z}\right] = g(w)$ 730
10.3.2. Heat and Mass Transfer Equations with Complicating Factors 734

10.3.3. Other Equations 737
10.4. Equations with n Independent Variables 739
10.4.1. Equations of the Form $\frac{\partial}{\partial x_1}\big[f_1(x_1)\frac{\partial w}{\partial x_1}\big] + \cdots + \frac{\partial}{\partial x_n}\big[f_n(x_n)\frac{\partial w}{\partial x_n}\big] = g(x_1, \ldots, x_n, w)$ 739
10.4.2. Other Equations 742

11. Second-Order Equations Involving Mixed Derivatives and Some Other Equations 745

11.1. Equations Linear in the Mixed Derivative 745
11.1.1. Calogero Equation and Related Equations 745
11.1.2. Khokhlov–Zabolotskaya and Related Equations 749
11.1.3. Equation of Unsteady Transonic Gas Flows 756
11.1.4. Equations of the Form $\frac{\partial w}{\partial y}\frac{\partial^2 w}{\partial x \partial y} - \frac{\partial w}{\partial x}\frac{\partial^2 w}{\partial y^2} = F\big(x, y, \frac{\partial w}{\partial x}, \frac{\partial w}{\partial y}\big)$ 760
11.1.5. Other Equations with Two Independent Variables 762
11.1.6. Other Equations with Three and More Independent Variables 770
11.2. Equations Quadratic in the Highest Derivatives 772
11.2.1. Equations of the Form $\frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2} = F(x, y)$ 772
11.2.2. Monge–Ampère Equation $\big(\frac{\partial^2 w}{\partial x \partial y}\big)^2 - \frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2} = F(x, y)$ 774
11.2.3. Equations of the Form $\big(\frac{\partial^2 w}{\partial x \partial y}\big)^2 - \frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2} = F\big(x, y, w, \frac{\partial w}{\partial x}, \frac{\partial w}{\partial y}\big)$ 787
11.2.4. Equations of the Form $\big(\frac{\partial^2 w}{\partial x \partial y}\big)^2 = f(x, y)\frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2} + g(x, y)$ 794
11.2.5. Other Equations with Two Independent Variables 798
11.2.6. Plebański Heavenly Equations 802
11.3. Bellman Type Equations and Related Equations 805
11.3.1. Equations with Quadratic Nonlinearities 805
11.3.2. Equations with Power-Law Nonlinearities 808

12. Second-Order Equations of General Form 811

12.1. Equations Involving the First Derivative in t 811
12.1.1. Equations of the Form $\frac{\partial w}{\partial t} = F\big(w, \frac{\partial w}{\partial x}, \frac{\partial^2 w}{\partial x^2}\big)$ 811
12.1.2. Equations of the Form $\frac{\partial w}{\partial t} = F\big(t, w, \frac{\partial w}{\partial x}, \frac{\partial^2 w}{\partial x^2}\big)$ 820
12.1.3. Equations of the Form $\frac{\partial w}{\partial t} = F\big(x, w, \frac{\partial w}{\partial x}, \frac{\partial^2 w}{\partial x^2}\big)$ 825
12.1.4. Equations of the Form $\frac{\partial w}{\partial t} = F\big(x, t, w, \frac{\partial w}{\partial x}, \frac{\partial^2 w}{\partial x^2}\big)$ 830
12.1.5. Equations of the Form $F\big(x, t, w, \frac{\partial w}{\partial t}, \frac{\partial w}{\partial x}, \frac{\partial^2 w}{\partial x^2}\big) = 0$ 836
12.1.6. Equations with Three Independent Variables 838
12.2. Equations Involving Two or More Second Derivatives 839
12.2.1. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = F\big(w, \frac{\partial w}{\partial x}, \frac{\partial^2 w}{\partial x^2}\big)$ 839
12.2.2. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = F\big(x, t, w, \frac{\partial w}{\partial x}, \frac{\partial w}{\partial t}, \frac{\partial^2 w}{\partial x^2}\big)$ 843
12.2.3. Equations Linear in the Mixed Derivative 847
12.2.4. Equations with Two Independent Variables, Nonlinear in Two or More Highest Derivatives 849
12.2.5. Equations with n Independent Variables 853

13. Third-Order Equations **857**
13.1. Equations Involving the First Derivative in t 857
13.1.1. Korteweg–de Vries Equation $\frac{\partial w}{\partial t} + a\frac{\partial^3 w}{\partial x^3} + bw\frac{\partial w}{\partial x} = 0$ 857
13.1.2. Cylindrical, Spherical, and Modified Korteweg–de Vries Equations .. 866
13.1.3. Generalized Korteweg–de Vries Equation $\frac{\partial w}{\partial t} + a\frac{\partial^3 w}{\partial x^3} + f(w)\frac{\partial w}{\partial x} = 0$. 871
13.1.4. Equations Reducible to the Korteweg–de Vries Equation 875
13.1.5. Equations of the Form $\frac{\partial w}{\partial t} + a\frac{\partial^3 w}{\partial x^3} + F\big(w, \frac{\partial w}{\partial x}\big) = 0$ 879
13.1.6. Equations of the Form $\frac{\partial w}{\partial t} + a\frac{\partial^3 w}{\partial x^3} + F\big(x, t, w, \frac{\partial w}{\partial x}\big) = 0$ 882
13.1.7. Equations of the Form $\frac{\partial w}{\partial t} = F\big(x, w, \frac{\partial w}{\partial x}, \frac{\partial^2 w}{\partial x^2}, \frac{\partial^3 w}{\partial x^3}\big)$ 884
13.2. Equations Involving the Second Derivative in t 896
13.2.1. Equations with Quadratic Nonlinearities 896
13.2.2. Other Equations 900
13.3. Hydrodynamic Boundary Layer Equations 903
13.3.1. Steady Hydrodynamic Boundary Layer Equations for a Newtonian Fluid 903
13.3.2. Steady Boundary Layer Equations for Non-Newtonian Fluids 911
13.3.3. Unsteady Boundary Layer Equations for a Newtonian Fluid 917
13.3.4. Unsteady Boundary Layer Equations for Non-Newtonian Fluids 930
13.3.5. Related Equations 935
13.4. Equations of Motion of Ideal Fluid (Euler Equations) 938
13.4.1. Stationary Equations 938
13.4.2. Nonstationary Equations 942
13.5. Other Third-Order Nonlinear Equations 949
13.5.1. Equations Involving Second-Order Mixed Derivatives 949
13.5.2. Equations Involving Third-Order Mixed Derivatives 958
13.5.3. Other Equations 973

14. Fourth-Order Equations **977**
14.1. Equations Involving the First Derivative in t 977
14.1.1. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^4 w}{\partial x^4} + F\big(x, t, w, \frac{\partial w}{\partial x}\big)$ 977
14.1.2. Other Equations 982
14.2. Equations Involving the Second Derivative in t 987
14.2.1. Boussinesq Equation and Its Modifications 987
14.2.2. Other Equations with Quadratic Nonlinearities 993
14.2.3. Other Equations 998
14.3. Equations Involving Mixed Derivatives 1000
14.3.1. Kadomtsev–Petviashvili Equation and Related Equations 1000
14.3.2. Stationary Hydrodynamic Equations (Navier–Stokes Equations) 1003
14.3.3. Nonstationary Hydrodynamic Equations (Navier–Stokes Equations) . 1013
14.3.4. Other Equations 1028

15. Equations of Higher Orders **1031**
15.1. Equations Involving the First Derivative in t and Linear in the Highest Derivative 1031
15.1.1. Fifth-Order Equations 1031
15.1.2. Some Equations with Sixth- to Ninth-Order 1039
15.1.3. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^n w}{\partial x^n} + f(x, t, w)$ 1043
15.1.4. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^n w}{\partial x^n} + f(w)\frac{\partial w}{\partial x}$ 1044

15.1.5. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^n w}{\partial x^n} + f(x,t,w)\frac{\partial w}{\partial x} + g(x,t,w)$ 1047
15.1.6. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^n w}{\partial x^n} + F\left(x,t,w,\frac{\partial w}{\partial x}\right)$ 1051
15.1.7. Equations of the Form $\frac{\partial w}{\partial t} = a\frac{\partial^n w}{\partial x^n} + F\left(x,t,w,\frac{\partial w}{\partial x},\ldots,\frac{\partial^{n-1} w}{\partial x^{n-1}}\right)$ 1057
15.1.8. Equations of the Form $\frac{\partial w}{\partial t} = aw\frac{\partial^n w}{\partial x^n} + f(x,t,w)\frac{\partial w}{\partial x} + g(x,t,w)$ 1059
15.1.9. Other Equations Involving Arbitrary Parameters and/or Arbitrary Functions 1062
15.1.10. Nonlinear Equations Involving Arbitrary Linear Differential Operators 1065
15.1.11. Equations of the Burgers and the Korteweg–de Vries Hierarchies and Related Equations 1067
15.2. General Form Equations Involving the First Derivative in t 1070
15.2.1. Equations of the Form $\frac{\partial w}{\partial t} = F\left(w,\frac{\partial w}{\partial x},\ldots,\frac{\partial^n w}{\partial x^n}\right)$ 1070
15.2.2. Equations of the Form $\frac{\partial w}{\partial t} = F\left(t,w,\frac{\partial w}{\partial x},\ldots,\frac{\partial^n w}{\partial x^n}\right)$ 1077
15.2.3. Equations of the Form $\frac{\partial w}{\partial t} = F\left(x,w,\frac{\partial w}{\partial x},\ldots,\frac{\partial^n w}{\partial x^n}\right)$ 1079
15.2.4. Equations of the Form $\frac{\partial w}{\partial t} = F\left(x,t,w,\frac{\partial w}{\partial x},\ldots,\frac{\partial^n w}{\partial x^n}\right)$ 1084
15.3. Equations Involving the Second Derivative in t 1088
15.3.1. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = a\frac{\partial^n w}{\partial x^n} + f(x,t,w)$ 1088
15.3.2. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = a\frac{\partial^n w}{\partial x^n} + F\left(x,t,w,\frac{\partial w}{\partial x}\right)$ 1089
15.3.3. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = a\frac{\partial^n w}{\partial x^n} + F\left(x,t,w,\frac{\partial w}{\partial x},\ldots,\frac{\partial^{n-1} w}{\partial x^{n-1}}\right)$ 1094
15.3.4. Equations of the Form $\frac{\partial^2 w}{\partial t^2} = aw\frac{\partial^n w}{\partial x^n} + f(x,t,w)\frac{\partial w}{\partial x} + g(x,t,w)$ 1098
15.3.5. Other Equations Involving Arbitrary Functions 1099
15.3.6. Equations Involving Arbitrary Differential Operators 1101
15.4. Other Equations 1103
15.4.1. Equations Involving Mixed Derivatives 1103
15.4.2. Equations Involving $\frac{\partial^n w}{\partial x^n}$ and $\frac{\partial^m w}{\partial y^m}$ 1110

16. Systems of Two First-Order Partial Differential Equations 1115

16.1. Systems of the Form $\frac{\partial u}{\partial x} = F(u,w)$, $\frac{\partial w}{\partial t} = G(u,w)$ 1115
16.1.1. Systems Involving Arbitrary Parameters 1115
16.1.2. Systems Involving Arbitrary Functions 1117
16.2. Other Systems of Two Equations 1122
16.2.1. Gas Dynamic Type Systems Linearizable with the Hodograph Transformation 1122
16.2.2. Other Systems of Equations 1130

17. Systems of Two Parabolic Equations 1133

17.1. Systems of the Form $\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial x^2} + F(u,w)$, $\frac{\partial w}{\partial t} = b\frac{\partial^2 w}{\partial x^2} + G(u,w)$ 1133
17.1.1. Arbitrary Functions Depend on a Linear Combination of the Unknowns 1133
17.1.2. Arbitrary Functions Depend on the Ratio of the Unknowns 1137
17.1.3. Arbitrary Functions Depend on the Product of Powers of the Unknowns 1145
17.1.4. Arbitrary Functions Depend on Sum or Difference of Squares of the Unknowns 1146
17.1.5. Arbitrary Functions Depend on the Unknowns in a Complex Way ... 1148
17.1.6. Some Systems Depending on Arbitrary Parameters 1150

17.2. Systems of the Form $\frac{\partial u}{\partial t} = \frac{a}{x^n}\frac{\partial}{\partial x}\left(x^n\frac{\partial u}{\partial x}\right) + F(u,w)$, $\frac{\partial w}{\partial t} = \frac{b}{x^n}\frac{\partial}{\partial x}\left(x^n\frac{\partial w}{\partial x}\right) + G(u,w)$ 1156
17.2.1. Arbitrary Functions Depend on a Linear Combination of the Unknowns 1157
17.2.2. Arbitrary Functions Depend on the Ratio of the Unknowns 1159
17.2.3. Arbitrary Functions Depend on the Product of Powers of the Unknowns 1162
17.2.4. Arbitrary Functions Depend on Sum or Difference of Squares of the Unknowns 1163
17.2.5. Arbitrary Functions Have Different Arguments 1164

17.3. Other Systems of Two Parabolic Equations 1165
17.3.1. Second-Order Equations Involving Real Functions of Real Variables . 1165
17.3.2. Second-Order Nonlinear Equations of Laser Systems 1170
17.3.3. Systems Involving Third-Order Evolution Equations 1172

18. Systems of Two Second-Order Klein–Gordon Type Hyperbolic Equations . 1173

18.1. Systems of the Form $\frac{\partial^2 u}{\partial t^2} = a\frac{\partial^2 u}{\partial x^2} + F(u,w)$, $\frac{\partial^2 w}{\partial t^2} = b\frac{\partial^2 w}{\partial x^2} + G(u,w)$ 1173
18.1.1. Arbitrary Functions Depend on a Linear Combination of the Unknowns 1173
18.1.2. Arbitrary Functions Depend on the Ratio of the Unknowns 1175
18.1.3. Other Systems 1177

18.2. Systems of the Form $\frac{\partial^2 u}{\partial t^2} = \frac{a}{x^n}\frac{\partial}{\partial x}\left(x^n\frac{\partial u}{\partial x}\right) + F(u,w)$, $\frac{\partial^2 w}{\partial t^2} = \frac{b}{x^n}\frac{\partial}{\partial x}\left(x^n\frac{\partial w}{\partial x}\right) + G(u,w)$ 1178
18.2.1. Arbitrary Functions Depend on a Linear Combination of the Unknowns 1178
18.2.2. Arbitrary Functions Depend on the Ratio of the Unknowns 1181
18.2.3. Other Systems 1183

19. Systems of Two Elliptic Equations 1185

19.1. Systems of the Form $\Delta u = F(u,w)$, $\Delta w = G(u,w)$ 1185
19.1.1. Arbitrary Functions Depend on a Linear Combination of the Unknowns 1185
19.1.2. Arbitrary Functions Depend on the Ratio of the Unknowns 1187
19.1.3. Other Systems 1189

19.2. Other Systems of Two Second-Order Elliptic Equations 1191

19.3. Von Kármán Equations (Fourth-Order Elliptic Equations) 1192

20. First-Order Hydrodynamic and Other Systems Involving Three or More Equations 1197

20.1. Equations of Motion of Ideal Fluid (Euler Equations) 1197
20.1.1. Euler Equations in Various Coordinate Systems 1197
20.1.2. Two-Dimensional Euler Equations for Incompressible Ideal Fluid (Plane Flows) 1198
20.1.3. Other Solutions with Two Nonzero Components of the Fluid Velocity 1199
20.1.4. Rotationally Symmetric Motions of Fluid 1200
20.1.5. Euler Equations for Barotropic Gas Flow 1201

20.2. Adiabatic Gas Flow 1204
20.2.1. Preliminary Remarks 1204
20.2.2. One-Dimensional Case 1205
20.2.3. Two-Dimensional Case 1215
20.2.4. Three-Dimensional Case 1219

20.3. Systems Describing Fluid Flows in the Atmosphere, Seas, and Oceans 1223
20.3.1. Equations of Breezes and Monsoons 1223
20.3.2. Equations of Atmospheric Circulation in the Equatorial Region 1225
20.3.3. Equations of Dynamic Convection in the Sea 1227
20.3.4. Equations of Flows in the Baroclinic Layer of the Ocean 1229
20.4. Chromatography Equations 1231
20.4.1. Langmuir Isotherm 1231
20.4.2. Generalized Langmuir Isotherm 1233
20.4.3. Power Isotherm 1234
20.4.4. Exponential Isotherm 1235
20.5. Other Hydrodynamic-Type Systems 1236
20.5.1. Hydrodynamic-Type Systems of Diagonal Form 1236
20.5.2. Hydrodynamic-Type Systems of Nondiagonal Form 1236
20.6. Ideal Plasticity with the von Mises Yield Criterion 1238
20.6.1. Two-Dimensional Equations. Plane Case 1238
20.6.2. Axisymmetric Case 1239
20.6.3. Three-Dimensional Equations. Steady-State Case 1240
20.6.4. Dynamic Case. Two-Dimensional Equations 1244

21. Navier–Stokes and Related Equations 1247

21.1. Navier–Stokes Equations 1247
21.1.1. Navier–Stokes Equations in Various Coordinate Systems 1247
21.1.2. General Properties of the Navier–Stokes Equations 1249
21.2. Solutions with One Nonzero Component of the Fluid Velocity 1251
21.2.1. Unidirectional Plane Flows 1251
21.2.2. Unidirectional Flows in Tubes of Various Cross-Sections. External Flow Around a Cylinder 1253
21.2.3. One-Dimensional Rotation Fluid Flows 1257
21.2.4. Purely Radial Fluid Motions 1260
21.3. Solutions with Two Nonzero Components of the Fluid Velocity 1263
21.3.1. Two-Dimensional Solutions in the Rectangular Cartesian Coordinates (Plane Flows) 1263
21.3.2. Two-Dimensional Solutions in the Cylindrical Coordinates (Plane Flows) 1270
21.3.3. Axisymmetric Fluid Flows 1274
21.3.4. Other Fluid Flows with Two-Nonzero Velocity Components 1282
21.4. Solutions with Three Nonzero Fluid Velocity Components Dependent on Two Space Variables 1285
21.4.1. Quasi-plane Flows (with the Fluid Velocity Components Independent of z) 1285
21.4.2. Cylindrical and Conical Vortex Flows. Von Kármán-Type Rotationally Symmetric Motions 1290
21.4.3. Rotationally Symmetric Motions of General Form 1297
21.5. Solutions with Three Nonzero Fluid Velocity Components Dependent on Three Space Variables 1302
21.5.1. Three-Dimensional Stagnation-Point Type Flows 1302
21.5.2. Solutions with Linear Dependence of the Velocity Components on Two Space Variables. Axial Flows 1303
21.5.3. Solutions with Linear Dependence of the Velocity Components on Two Space Variables. General Analysis 1317

21.5.4. Solutions with the Linear Dependence of the Velocity Components on One Space Variable . . . 1323
21.5.5. Other Three-Dimensional Solutions . . . 1327

21.6. Convective Fluid Motions . . . 1329
21.6.1. Equations for Convective Fluid Motions . . . 1329
21.6.2. Steady-State Solutions . . . 1329
21.6.3. Unsteady Solutions . . . 1331

21.7. Boundary Layer Equations (Prandtl Equations) . . . 1333
21.7.1. Equations and Boundary Conditions. Stream Function . . . 1333
21.7.2. Self-Similar Solutions of Some Boundary Layer Problems . . . 1333
21.7.3. Other Solutions of the Boundary Layer Equations . . . 1336

22. Systems of General Form . . . 1337

22.1. Nonlinear Systems of Two Equations Involving the First Derivatives with Respect to t . . . 1337

22.2. Nonlinear Systems of Two Equations Involving the Second Derivatives with Respect to t . . . 1344

22.3. Other Nonlinear Systems of Two Equations . . . 1347

22.4. Nonlinear Systems of Many Equations Involving the First Derivatives with Respect to t . . . 1348

Part II. Exact Methods for Nonlinear Partial Differential Equations 1353

23. Methods for Solving First-Order Quasilinear Equations . . . 1355

23.1. Characteristic System. General Solution . . . 1355
23.1.1. Equations with Two Independent Variables. General Solution . . . 1355
23.1.2. Quasilinear Equations with n Independent Variables . . . 1356

23.2. Cauchy Problem. Existence and Uniqueness Theorem . . . 1357
23.2.1. Cauchy Problem . . . 1357
23.2.2. Procedure of Solving the Cauchy Problem . . . 1358
23.2.3. Existence and Uniqueness Theorem . . . 1359

23.3. Qualitative Features and Discontinuous Solutions of Quasilinear Equations . . 1360
23.3.1. Model Equation of Gas Dynamics . . . 1360
23.3.2. Solution of the Cauchy Problem. Rarefaction Wave. Wave "Overturn" 1360
23.3.3. Shock Waves. Jump Conditions . . . 1362
23.3.4. Utilization of Integral Relations for Determining Generalized Solutions . . . 1364
23.3.5. Conservation Laws. Viscosity Solutions . . . 1365
23.3.6. Hopf's Formula for the Generalized Solution . . . 1366
23.3.7. Problem of Propagation of a Signal . . . 1367

23.4. Quasilinear Equations of General Form . . . 1368
23.4.1. Quasilinear Equations in Conservative Form . . . 1368
23.4.2. Generalized Solution. Jump Condition and Stability Condition . . . 1369
23.4.3. Method for Constructing Stable Generalized Solutions . . . 1370

24. Methods for Solving First-Order Nonlinear Equations 1373

24.1. Solution Methods 1373
24.1.1. Complete, General, and Singular Integrals 1373
24.1.2. Method of Separation of Variables. Equations of Special Form 1374
24.1.3. Lagrange–Charpit Method 1376
24.1.4. Construction of a Complete Integral with the Aid of Two First Integrals 1377
24.1.5. Case where the Equation Does Not Depend on w Explicitly 1378
24.1.6. Hamilton–Jacobi Equation 1379

24.2. Cauchy Problem. Existence and Uniqueness Theorem 1379
24.2.1. Statement of the Problem. Solution Procedure 1379
24.2.2. Existence and Uniqueness Theorem 1380
24.2.3. Cauchy Problem for the Hamilton–Jacobi Equation 1380
24.2.4. Examples of Solving the Cauchy Problem 1381

24.3. Generalized Viscosity Solutions and Their Applications 1382
24.3.1. Preliminary Remarks 1382
24.3.2. Viscosity Solutions Based on the Use of a Parabolic Equation 1382
24.3.3. Viscosity Solutions Based on Test Functions and Differential Inequalities 1383
24.3.4. Local Structure of Generalized Viscosity Solutions 1383
24.3.5. Generalized Classical Method of Characteristics 1385
24.3.6. Examples of Viscosity (Nonsmooth) Solutions 1386

25. Classification of Second-Order Nonlinear Equations 1389

25.1. Semilinear Equations in Two Independent Variables 1389
25.1.1. Types of Equations. Characteristic Equation 1389
25.1.2. Canonical Form of Parabolic Equations (Case $b^2 - ac = 0$) 1390
25.1.3. Canonical Form of Hyperbolic Equations (Case $b^2 - ac > 0$) 1390
25.1.4. Canonical Form of Elliptic Equations (Case $b^2 - ac < 0$) 1392

25.2. Nonlinear Equations in Two Independent Variables 1392
25.2.1. Nonlinear Equations of General Form 1392
25.2.2. Quasilinear Equations 1393

26. Transformations of Equations of Mathematical Physics 1395

26.1. Point Transformations: Overview and Examples 1395
26.1.1. General Form of Point Transformations 1395
26.1.2. Linear Transformations 1396
26.1.3. Simple Nonlinear Point Transformations 1396

26.2. Hodograph Transformations (Special Point Transformations) 1397
26.2.1. One PDE: One of the Independent Variables Is Taken to Be the Dependent One 1397
26.2.2. One PDE: Method of Conversion to an Equivalent System of Equations 1398
26.2.3. System of Two PDEs: One of the Independent Variables Is Taken to Be the Dependent One 1402
26.2.4. System of Two PDEs: Both of the Independent Variables Are Taken to Be the Dependent Ones 1402

26.3. Contact Transformations. Legendre and Euler Transformations 1403
26.3.1. Preliminary Remarks. Contact Transformations for Ordinary Differential Equations 1403
26.3.2. General Form of Contact Transformations for Partial Differential Equations 1405

26.3.3. Legendre Transformation 1406
26.3.4. Euler Transformation 1407
26.3.5. Legendre Transformation with Many Variables 1408

26.4. Differential Substitutions. Von Mises Transformation 1409
26.4.1. Differential Substitutions 1409
26.4.2. Von Mises Transformation 1410

26.5. Bäcklund Transformations. RF Pairs 1413
26.5.1. Bäcklund Transformations for Second-Order Equations 1413
26.5.2. RF Pairs and Their Use for Constructing Bäcklund Transformations . . 1415

26.6. Some Other Transformations 1422
26.6.1. Crocco Transformation. Order Reduction of Hydrodynamic Type Equations 1422
26.6.2. Transformations Based on Conservation Laws 1425

27. Traveling-Wave Solutions and Self-Similar Solutions 1429

27.1. Preliminary Remarks 1429

27.2. Traveling-Wave Solutions. Invariance of Equations under Translations 1429
27.2.1. General Form of Traveling-Wave Solutions 1429
27.2.2. Invariance of Solutions and Equations under Translation Transformations 1430
27.2.3. Functional Equation Describing Traveling-Wave Solutions 1431

27.3. Self-Similar Solutions. Invariance of Equations Under Scaling Transformations 1431
27.3.1. General Form of Self-Similar Solutions. Similarity Method 1431
27.3.2. Examples of Self-Similar Solutions to Mathematical Physics Equations 1432
27.3.3. More General Approach Based on Solving a Functional Equation. Some Remarks 1434
27.3.4. Generalized Self-Similar Solutions 1436

28. Elementary Theory of Using Invariants for Solving Equations 1439

28.1. Introduction. Symmetries. General Scheme of Using Invariants for Solving Mathematical Equations 1439
28.1.1. Symmetries. Transformations Preserving the Form of Equations. Invariants 1439
28.1.2. General Scheme of Using Invariants for Solving Mathematical Equations 1440

28.2. Algebraic Equations and Systems of Equations 1441
28.2.1. Algebraic Equations with Even Powers 1441
28.2.2. Reciprocal Equations 1442
28.2.3. Systems of Algebraic Equations Symmetric with Respect to Permutation of Arguments 1444

28.3. Ordinary Differential Equations 1445
28.3.1. Transformations Preserving the Form of Equations. Invariants 1445
28.3.2. Order Reduction Procedure for Equations with $n \geq 2$ (Reduction to Solvable Form with $n = 1$) 1446
28.3.3. Simple Transformations. Invariant Determination Procedure 1446
28.3.4. Analysis of Some Ordinary Differential Equations. Useful Remarks . 1447

28.4. Partial Differential Equations 1450
28.4.1. Transformations Preserving the Form of Equations. Invariants 1450
28.4.2. Procedure for Constructing Exact Solutions 1450
28.4.3. Examples of Constructing Invariant Solutions to Nonlinear Partial Differential Equations 1451
28.4.4. Simple Inverse Problems (Determination of the Form of Equations from Their Properties) 1455
28.5. General Conclusions and Remarks 1457

29. Method of Generalized Separation of Variables 1459

29.1. Exact Solutions with Simple Separation of Variables 1459
29.1.1. Multiplicative and Additive Separable Solutions 1459
29.1.2. Simple Separation of Variables in Nonlinear Partial Differential Equations 1459
29.1.3. Complex Separation of Variables in Nonlinear Partial Differential Equations 1462
29.2. Structure of Generalized Separable Solutions 1464
29.2.1. General Form of Solutions. Classes of Nonlinear Equations Considered 1464
29.2.2. General Form of Functional Differential Equations 1464
29.3. Simplified Scheme for Constructing Generalized Separable Solutions 1465
29.3.1. Description of the Simplified Scheme for Constructing Solutions Based on Presetting One System of Coordinate Functions 1465
29.3.2. Examples of Finding Exact Solutions of Second- and Third-Order Equations 1465
29.4. Solution of Functional Differential Equations by Differentiation 1467
29.4.1. Description of the Method 1467
29.4.2. Examples of Constructing Exact Generalized Separable Solutions . . . 1467
29.5. Solution of Functional-Differential Equations by Splitting 1471
29.5.1. Preliminary Remarks. Description of the Method 1471
29.5.2. Solutions of Simple Functional Equations and Their Application 1472
29.6. Titov–Galaktionov Method 1477
29.6.1. Method Description. Linear Subspaces Invariant under a Nonlinear Operator 1477
29.6.2. Some Generalizations 1479
29.6.3. Finding Linear Subspaces Invariant Under a Given Nonlinear Operator 1480
29.6.4. Generalizations to Pseudo-Differential Equations 1483

30. Method of Functional Separation of Variables 1487

30.1. Structure of Functional Separable Solutions. Solution by Reduction to Equations with Quadratic Nonlinearities 1487
30.1.1. Structure of Functional Separable Solutions 1487
30.1.2. Solution by Reduction to Equations with Quadratic (or Power) Nonlinearities 1487
30.2. Special Functional Separable Solutions. Generalized Traveling-Wave Solutions 1487
30.2.1. Special Functional Separable and Generalized Traveling-Wave Solutions 1487
30.2.2. General Scheme for Constructing Generalized Traveling-Wave Solutions 1489

30.3. Differentiation Method 1492
30.3.1. Basic Ideas of the Method. Reduction to a Standard Equation 1492
30.3.2. Examples of Constructing Functional Separable Solutions 1492
30.4. Splitting Method. Solutions of Some Nonlinear Functional Equations and Their Applications 1496
30.4.1. Splitting Method. Reduction to a Standard Functional Equation 1496
30.4.2. Three-Argument Functional Equations of Special Form 1497
30.4.3. Functional Equation $f(t) + g(x) = Q(z)$, with $z = \varphi(x) + \psi(t)$ 1498
30.4.4. Functional Equation $f(t) + g(x) + h(x)Q(z) + R(z) = 0$, with $z = \varphi(x) + \psi(t)$ 1498
30.4.5. Functional Equation $f(t)+g(x)Q(z)+h(x)R(z)=0$, with $z=\varphi(x)+\psi(t)$ 1500
30.4.6. Equation $f_1(x) + f_2(y) + g_1(x)P(z) + g_2(y)Q(z) + R(z) = 0$, $z = \varphi(x) + \psi(y)$ 1501

31. Direct Method of Symmetry Reductions of Nonlinear Equations 1503

31.1. Clarkson–Kruskal Direct Method 1503
31.1.1. Simplified Scheme. Examples of Constructing Exact Solutions 1503
31.1.2. Description of the Method: A Special Form for Symmetry Reduction 1505
31.1.3. Description of the Method: the General Form for Symmetry Reduction 1506
31.2. Some Modifications and Generalizations 1507
31.2.1. Symmetry Reductions Based on the Generalized Separation of Variables 1507
31.2.2. Similarity Reductions in Equations with Three or More Independent Variables 1510

32. Classical Method of Symmetry Reductions 1513

32.1. One-Parameter Transformations and Their Local Properties 1513
32.1.1. One-Parameter Transformations. Infinitesimal Operator 1513
32.1.2. Invariant of an Infinitesimal Operator. Transformations in the Plane . . 1514
32.1.3. Formulas for Derivatives. Coordinates of the First and Second Prolongations 1515
32.2. Symmetries of Nonlinear Second-Order Equations. Invariance Condition 1516
32.2.1. Invariance Condition. Splitting in Derivatives 1516
32.2.2. Examples of Finding Symmetries of Nonlinear Equations 1516
32.3. Using Symmetries of Equations for Finding Exact Solutions. Invariant Solutions 1520
32.3.1. Using Symmetries of Equations for Constructing One-Parameter Solutions 1520
32.3.2. Procedure for Constructing Invariant Solutions 1520
32.3.3. Examples of Constructing Invariant Solutions to Nonlinear Equations 1522
32.3.4. Solutions Induced by Linear Combinations of Admissible Operators . 1524
32.4. Some Generalizations. Higher-Order Equations 1526
32.4.1. One-Parameter Lie Groups of Point Transformations. Group Generator 1526
32.4.2. Group Invariants. Local Transformations of Derivatives 1526
32.4.3. Invariant Condition. Splitting Procedure. Invariant Solutions 1527
32.5. Symmetries of Systems of Equations of Mathematical Physics 1527
32.5.1. Basic Relations Used in Symmetry Analysis of Systems of Equations 1527
32.5.2. Symmetries of Equations of Steady Hydrodynamic Boundary Layer . 1528

33. Nonclassical Method of Symmetry Reductions **1533**
33.1. General Description of the Method 1533
33.1.1. Description of the Method. Invariant Surface Condition 1533
33.1.2. Scheme for Constructing Exact Solutions by the Nonclassical Method 1533
33.2. Examples of Constructing Exact Solutions 1534
33.2.1. Newell–Whitehead Equation 1534
33.2.2. Nonlinear Wave Equation 1536

34. Method of Differential Constraints **1539**
34.1. Preliminary Remarks. Method of Differential Constraints for Ordinary Differential Equations 1539
34.1.1. Description of the Method. First-Order Differential Constraints 1539
34.1.2. Differential Constraints of Arbitrary Order. General Consistency Method for Two Equations 1542
34.1.3. Some Generalizations. The Case of Several Differential Constraints . 1543
34.2. Description of the Method for Partial Differential Equations 1545
34.2.1. Preliminary Remarks. A Simple Example 1545
34.2.2. General Description of the Method of Differential Constraints 1546
34.3. First-Order Differential Constraints for PDEs 1547
34.3.1. Second-Order Evolution Equations 1547
34.3.2. Second-Order Hyperbolic Equations 1551
34.3.3. Second-Order Equations of General Form 1553
34.4. Second-Order Differential Constraints for PDEs. Some Generalized 1553
34.4.1. Second-Order Differential Constraints 1553
34.4.2. Higher-Order Differential Constraints. Determining Equations 1555
34.4.3. Usage of Several Differential Constraints. Systems of Nonlinear Equations 1557
34.5. Connection Between the Method of Differential Constraints and Other Methods 1561
34.5.1. Generalized/Functional Separation of Variables vs. Differential Constraints 1561
34.5.2. Direct Method of Symmetry Reductions and Differential Constraints . 1562
34.5.3. Nonclassical Method of Symmetry Reductions and Differential Constraints 1562

35. Painlevé Test for Nonlinear Equations of Mathematical Physics **1565**
35.1. Movable Singularities of Solutions of Ordinary Differential Equations 1565
35.1.1. Examples of Solutions Having Movable Singularities 1565
35.1.2. Classification Results for Nonlinear First- and Second-Order Equations 1565
35.1.3. Painlevé Equations 1566
35.1.4. Painlevé Test for Ordinary Differential Equations 1566
35.1.5. Remarks on the Painlevé Test. Fuchs Indices. Examples 1567
35.1.6. The Painlevé Test for Systems of Ordinary Differential Equations 1569
35.2. Solutions of Partial Differential Equations with a Movable Pole. Method Description 1569
35.2.1. Simple Scheme for Studying Nonlinear Partial Differential Equations 1570
35.2.2. General Scheme for Analysis of Nonlinear Partial Differential Equations 1570
35.2.3. Basic Steps of the Painlevé Test for Nonlinear Equations 1570
35.2.4. Some Remarks. Truncated Expansions 1571

35.3. Performing the Painlevé Test and Truncated Expansions for Studying Some Nonlinear Equations ... 1572
35.3.1. Equations Passing the Painlevé Test ... 1572
35.3.2. Checking Whether Nonlinear Systems of Equations of Mathematical Physics Pass the Painlevé Test ... 1576
35.3.3. Construction of Solutions of Nonlinear Equations That Fail the Painlevé Test, Using Truncated Expansions ... 1577

36. Methods of the Inverse Scattering Problem (Soliton Theory) ... 1579

36.1. Method Based on Using Lax Pairs ... 1579
36.1.1. Method Description. Consistency Condition. Lax Pairs ... 1579
36.1.2. Examples of Lax Pairs for Nonlinear Equations of Mathematical Physics ... 1580
36.2. Method Based on a Compatibility Condition for Systems of Linear Equations 1581
36.2.1. General Scheme. Compatibility Condition. Systems of Two Equations 1581
36.2.2. Solution of the Determining Equations in the Form of Polynomials in λ 1582
36.3. Method Based on Linear Integral Equations ... 1584
36.3.1. Description of the Method ... 1584
36.3.2. Specific Examples ... 1585
36.4. Solution of the Cauchy Problem by the Inverse Scattering Problem Method .. 1587
36.4.1. Preliminary Remarks. Direct and Inverse Scattering Problems ... 1587
36.4.2. Solution of the Cauchy Problem for Nonlinear Equations by the Inverse Scattering Problem Method ... 1589
36.4.3. N-Soliton Solution of the Korteweg–de Vries Equation ... 1591

37. Conservation Laws ... 1593

37.1. Basic Definitions and Examples ... 1593
37.1.1. General Form of Conservation Laws. Integrals of Motion ... 1593
37.1.2. Conservation Laws for Some Nonlinear Equations of Mathematical Physics ... 1593
37.2. Equations Admitting Variational Form. Noetherian Symmetries ... 1595
37.2.1. Lagrangian. Euler–Lagrange Equation. Noetherian Symmetries ... 1595
37.2.2. Examples of Constructing Conservation Laws Using Noetherian Symmetries ... 1596

38. Nonlinear Systems of Partial Differential Equations ... 1599

38.1. Overdetermined Systems of Two Equations ... 1599
38.1.1. Overdetermined Systems of First-Order Equations in One Unknown . 1599
38.1.2. Other Overdetermined Systems of Equations in One Unknown ... 1600
38.2. Pfaffian Equations and Their Solutions. Connection with Overdetermined Systems ... 1600
38.2.1. Pfaffian Equations ... 1600
38.2.2. Condition for Integrability of the Pfaffian Equation by a Single Relation ... 1601
38.2.3. Pfaffian Equations Not Satisfying the Integrability Condition ... 1602
38.3. Systems of First-Order Equations Describing Convective Mass Transfer with Volume Reaction ... 1602
38.3.1. Traveling-Wave Solutions and Some Other Invariant Solutions ... 1602
38.3.2. Systems Reducible to an Ordinary Differential Equation ... 1603
38.3.3. Some Nonlinear Problems of Suspension Transport in Porous Media . 1604
38.3.4. Some Generalizations ... 1606

38.4. First-Order Hyperbolic Systems of Quasilinear Equations. Systems of Conservation Laws of Gas Dynamic Type 1607
38.4.1. Systems of Two Quasilinear Equations. Systems in the Form of Conservation Laws 1607
38.4.2. Self-Similar Continuous Solutions. Hyperbolic Systems 1607

PREFACE TO THE NEW EDITION

The **Handbook of Nonlinear Partial Differential Equations**, a unique reference for scientists and engineers, contains over 3,000 nonlinear partial differential equations with solutions, as well as exact, symbolic, and numerical methods for solving nonlinear equations. First-, second-, third-, fourth-, and higher-order nonlinear equations and systems of equations are considered. Equations of parabolic, hyperbolic, elliptic, mixed, and general types are discussed. A large number of new exact solutions to nonlinear equations are described. In total, the handbook contains several times more nonlinear PDEs and exact solutions than any other book currently available.

In selecting the material, the authors gave the highest priority to the following five major types of equations:

- Equations that arise in various applications (heat and mass transfer theory, wave theory, nonlinear mechanics, hydrodynamics, gas dynamics, plasticity theory, nonlinear acoustics, combustion theory, nonlinear optics, theoretical physics, differential geometry, control theory, chemical engineering sciences, biology, and others).
- Equations of general form that depend on arbitrary functions; exact solutions of such equations are of principal value for testing numerical and approximate methods.
- Equations for which the general solution or solutions of quite general form, with arbitrary functions, could be obtained.
- Equations that involve many free parameters.
- Equations whose solutions are reduced to solving linear partial differential equations or linear integral equations.

The second edition has been substantially updated, revised, and expanded. More than 1,500 new equations with exact solutions, as well some methods and many examples, have been added. The new edition has been increased by a total of over 1,000 pages.

New to the second edition:

- First-order nonlinear partial differential equations with solutions.
- Some second-, third-, fourth-, and higher-order nonlinear equations with solutions.
- Parabolic, hyperbolic, elliptic, and other systems of equations with solutions.
- Some exact methods and transformations.
- Symbolic and numerical methods for solving nonlinear PDEs with Maple, Mathematica, and MATLAB.
- Many new examples and tables included for illustrative purposes.
- A large list of references consisting of over 1,300 sources.
- Extensive table of contents and detailed index.

Note that the first part of the book can be used as a database of test problems for numerical and approximate methods for solving nonlinear partial differential equations.

We would like to express our deep gratitude to Alexei Zhurov and Alexander Aksenov for fruitful discussions and valuable remarks. We are very thankful to Inna Shingareva and Carlos Lizárraga-Celaya who wrote three chapters (39–41) of the book at our request.

The authors hope that the handbook will prove helpful for a wide audience of researchers, university and college teachers, engineers, and students in various fields of applied mathematics, mechanics, physics, chemistry, biology, economics, and engineering sciences.

PREFACE TO THE FIRST EDITION

Nonlinear partial differential equations are encountered in various fields of mathematics, physics, chemistry, and biology, and numerous applications.

Exact (closed-form) solutions of differential equations play an important role in the proper understanding of qualitative features of many phenomena and processes in various areas of natural science. Exact solutions of nonlinear equations graphically demonstrate and allow unraveling the mechanisms of many complex nonlinear phenomena such as spatial localization of transfer processes, multiplicity or absence of steady states under various conditions, existence of peaking regimes, and many others. Furthermore, simple solutions are often used in teaching many courses as specific examples illustrating basic tenets of a theory that admit mathematical formulation.

Even those special exact solutions that do not have a clear physical meaning can be used as "test problems" to verify the consistency and estimate errors of various numerical, asymptotic, and approximate analytical methods. Exact solutions can serve as a basis for perfecting and testing computer algebra software packages for solving differential equations. It is significant that many equations of physics, chemistry, and biology contain empirical parameters or empirical functions. Exact solutions allow researchers to design and run experiments, by creating appropriate natural conditions, to determine these parameters or functions.

This book contains more than 1,600 nonlinear mathematical physics equations and nonlinear partial differential equations and their solutions. A large number of new exact solutions to nonlinear equations are described. Equations of parabolic, hyperbolic, elliptic, mixed, and general types are discussed. Second-, third-, fourth-, and higher-order nonlinear equations are considered. The book presents exact solutions to equations of heat and mass transfer, wave theory, nonlinear mechanics, hydrodynamics, gas dynamics, plasticity theory, nonlinear acoustics, combustion theory, nonlinear optics, theoretical physics, differential geometry, control theory, chemical engineering sciences, biology, and other fields.

Special attention is paid to general-form equations that depend on arbitrary functions; exact solutions of such equations are of principal value for testing numerical and approximate methods. Almost all other equations contain one or more arbitrary parameters (in fact, this book deals with whole families of partial differential equations), which can be fixed by the reader at will. *In total, the handbook contains significantly more nonlinear PDEs and exact solutions than any other book currently available.*

The supplement of the book presents exact analytical methods for solving nonlinear mathematical physics equations. When selecting the material, the authors have given a pronounced preference to practical aspects of the matter; that is, to methods that allow effectively "constructing" exact solutions. Apart from the classical methods, the book also describes wide-range methods that have been greatly developed over the last decade (the nonclassical and direct methods for symmetry reductions, the differential constraints

method, the method of generalized separation of variables, and others). For the reader's better understanding of the methods, numerous examples of solving specific differential equations and systems of differential equations are given throughout the book.

For the convenience of a wide audience with different mathematical backgrounds, the authors tried to do their best, wherever possible, to avoid special terminology. Therefore, some of the methods are outlined in a schematic and somewhat simplified manner, with necessary references made to books where these methods are considered in more detail. Many sections were written so that they could be read independently from each other. This allows the reader to quickly get to the heart of the matter.

The handbook consists of chapters, sections, and subsections. Equations and formulas are numbered separately in each subsection. The equations within subsections are arranged in increasing order of complexity. The extensive table of contents provides rapid access to the desired equations.

Separate parts of the book may be used by lecturers of universities and colleges for practical courses and lectures on nonlinear mathematical physics equations for graduate and postgraduate students. Furthermore, the books may be used as a database of test problems for numerical and approximate methods for solving nonlinear partial differential equations.

We would like to express our deep gratitude to Alexei Zhurov for fruitful discussions and valuable remarks.

The authors hope that this book will be helpful for a wide range of scientists, university teachers, engineers, and students engaged in the fields of mathematics, physics, mechanics, control, chemistry, and engineering sciences.

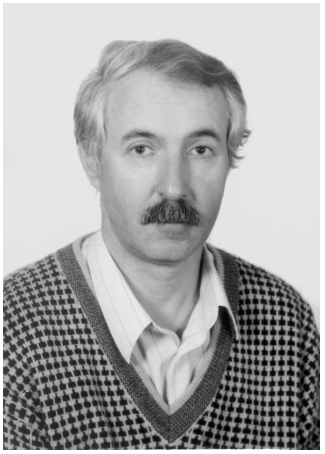
AUTHORS



Andrei D. Polyanin, D.Sc., Ph.D., is a well-known scientist of broad interests and is active in various areas of mathematics, mechanics, and chemical engineering sciences. He is one of the most prominent authors in the field of reference literature on mathematics.

Professor Polyanin graduated with honors from the Department of Mechanics and Mathematics at Moscow State University in 1974. He received his Ph.D. in 1981 and D.Sc. in 1986 at the Institute for Problems in Mechanics of the Russian (former USSR) Academy of Sciences. Since 1975, Professor Polyanin has been working at the Institute for Problems in Mechanics of the Russian Academy of Sciences; he is also professor of mathematics at Bauman Moscow State Technical University. He is a member of the Russian National Committee on Theoretical and Applied Mechanics and the Mathematics and Mechanics Expert Council of the Higher Certification Committee of the Russian Federation.

Professor Polyanin has made important contributions to the theory of differential and integral equations, mathematical physics, engineering mathematics, theory of heat and mass transfer, and chemical hydrodynamics. He has obtained exact solutions for several thousand ordinary differential, partial differential, and integral equations.

Professor Polyanin is the author of more than 30 books in English, Russian, German, and Bulgarian as well as over 150 research papers and three patents. He has written a number of fundamental handbooks, including: A. D. Polyanin and V. F. Zaitsev's *Handbook of Exact Solutions for Ordinary Differential Equations* (CRC Press, 1995 and 2003); A. D. Polyanin and A. V. Manzhirov's *Handbook of Integral Equations* (CRC Press, 1998 and 2008); A. D. Polyanin's *Handbook of Linear Partial Differential Equations for Engineers and Scientists* (Chapman & Hall/CRC Press, 2002); A. D. Polyanin, V. F. Zaitsev, and A. Moussiaux's *Handbook of First Order Partial Differential Equations* (Taylor & Francis, 2002); A. D. Polyanin and V. F. Zaitsev's *Handbook of Nonlinear Partial Differential Equations* (Chapman & Hall/CRC Press, 2004); A. D. Polyanin and A. V. Manzhirov's *Handbook of Mathematics for Engineers and Scientists* (Chapman & Hall/CRC Press, 2007), and A. D. Polyanin and A. I. Chernoutsan's (Eds.) *A Concise Handbook of Mathematics, Physics, and Engineering Sciences* (Chapman & Hall/CRC Press, 2010).

Professor Polyanin is editor-in-chief of the international scientific educational website *EqWorld — The World of Mathematical Equations* (http://eqworld.ipmnet.ru), which is visited by several thousand users a day worldwide. He is also editor of the book series *Differential and Integral Equations and Their Applications* (Chapman & Hall/CRC Press, London/Boca Raton). Professor Polyanin is a member of the editorial board of the journal *Theoretical Foundations of Chemical Engineering.*

In 1991, Professor Polyanin was awarded a Chaplygin Prize of the Russian Academy of Sciences for his research in mechanics. In 2001, he received an award from the Ministry of Education of the Russian Federation.

Home page: http://eqworld.ipmnet.ru/polyanin-ew.htm

Valentin F. Zaitsev, Ph.D., D.Sc., is a noted scientist in the fields of ordinary differential equations, mathematical physics, and nonlinear mechanics.

Dr. Zaitsev graduated from the Radio Electronics Faculty of the Leningrad Polytechnical Institute (now St. Petersburg Technical University) in 1969 and received his Ph.D. degree in 1983 at the Leningrad State University. His Ph.D. thesis was devoted to the group approach of the study of some classes of ordinary differential equations. In 1992, Professor Zaitsev received his D.Sc. and his thesis was dedicated to the discrete group analysis of ordinary differential equations.

From 1971–1996, Dr. Zaitsev worked in the Research Institute for Computational Mathematics and Control Processes of the St. Petersburg State University. Since 1996, Professor Zaitsev has been a member of the staff of the Russian State Pedagogical University (St. Petersburg).

Professor Zaitsev has made important contributions to new methods in the theory of ordinary and partial differential equations. He is the author of more than 150 scientific publications, including 23 books, and 1 patent.

Address: Russian State Pedagogical University, 48 Naberezhnaya reki Moiki, 191186 Saint-Petersburg, Russia

SOME NOTATIONS AND REMARKS

Latin Characters

$C_1, C_2, \ldots$ are arbitrary constants;

$\operatorname{curl}\mathbf{u}$ curl of a vector $\mathbf{u}$, sometimes also denoted $\operatorname{rot}\mathbf{u}$;

$\operatorname{div}\mathbf{u}$ divergence of a vector $\mathbf{u}$; $\operatorname{div}\mathbf{u} = \frac{\partial u_1}{\partial x} + \frac{\partial u_2}{\partial y}$ in two-dimensional case $\mathbf{u} = (u_1, u_2)$;

$\operatorname{grad} a$ gradient of a scalar a, also denoted by ∇a, with ∇ being the nabla vector differential operator;

$r,\ \varphi,\ z$ cylindrical coordinates, $r = \sqrt{x^2 + y^2}$ and $x = r\cos\varphi$, $y = r\sin\varphi$;

$r,\ \theta,\ \varphi$ spherical coordinates, $r = \sqrt{x^2 + y^2 + z^2}$ and $x = r\sin\theta\cos\varphi$, $y = \sin\theta\sin\varphi$, $z = r\cos\theta$;

t time ($t \geq 0$);

w unknown function (dependent variable);

x, y, z space (Cartesian) coordinates;

$x_1, \ldots, x_n$ Cartesian coordinates in n-dimensional space.

Greek Characters

Δ Laplace operator:

$\Delta = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}$, in two-dimensional case;

$\Delta = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} + \frac{\partial^2}{\partial z^2}$, in three-dimensional case;

$\Delta = \sum_{k=1}^{n} \frac{\partial^2}{\partial x_k^2}$, in n-dimensional case;

$\Delta\Delta$ biharmonic operator; in two-dimensional case, $\Delta\Delta = \frac{\partial^4}{\partial x^4} + 2\frac{\partial^4}{\partial x^2 \partial y^2} + \frac{\partial^4}{\partial y^4}$.

Brief Notation for Derivatives

Partial derivatives:

$$w_x = \frac{\partial w}{\partial x}, \quad w_t = \frac{\partial w}{\partial t}, \quad w_{xx} = \frac{\partial^2 w}{\partial x^2}, \quad w_{xt} = \frac{\partial^2 w}{\partial x \partial t}, \quad w_{tt} = \frac{\partial^2 w}{\partial t^2}, \quad w_{xxx} = \frac{\partial^3 w}{\partial x^3}, \quad \ldots$$

Ordinary derivatives for $f = f(x)$:

$$f'_x = \frac{df}{dx}, \quad f''_{xx} = \frac{d^2 f}{dx^2}, \quad f'''_{xxx} = \frac{d^3 f}{dx^3}, \quad f''''_{xxxx} = \frac{d^4 f}{dx^4}, \quad f_x^{(n)} = \frac{d^n f}{dx^n} \quad \text{with} \quad n \geq 5.$$

Brief Notation for Differential Operators

$$\partial_x = \frac{\partial}{\partial x}, \quad \partial_y = \frac{\partial}{\partial y}, \quad \partial_t = \frac{\partial}{\partial t}, \quad \partial_w = \frac{\partial}{\partial w} \quad \text{(differential operators in } x, y, t, \text{ and } w\text{)};$$

$$\mathrm{D}_x = \frac{\partial}{\partial x} + w_x \frac{\partial}{\partial w} + w_{xx} \frac{\partial}{\partial w_x} + w_{xt} \frac{\partial}{\partial w_t} + \cdots \quad \text{(total differential operator in } x\text{)};$$

$$\mathrm{D}_t = \frac{\partial}{\partial t} + w_t \frac{\partial}{\partial w} + w_{xt} \frac{\partial}{\partial w_x} + w_{tt} \frac{\partial}{\partial w_t} + \cdots \quad \text{(total differential operator in } t\text{)}.$$

In the last two relations, w is assumed to be dependent on x and t, $w = w(x, t)$.

Remarks

1. The book presents solutions of the following types:

(a) expressible in terms of elementary functions explicitly, implicitly, or parametrically;
(b) expressible in terms of elementary functions and integrals of elementary functions;
(c) expressible in terms of elementary functions, functions involved in the equation (if the equation contains arbitrary functions), and integrals of the equation functions and/or other elementary functions;
(d) expressible in terms of ordinary differential equations or finite systems of ordinary differential equations;
(e) expressible in terms of solutions to linear partial differential equations or linear integral equations.

2. The book also deals with solutions described by equations with fewer new variables than those in the original equations. An expression that solves an equations in three independent variables and is determined by an equation in two independent variables will be called a *two-dimensional solution*.

3. As a rule, the book does not present simple solutions that depend on only one of the variables involved in the original equation.

4. Equations are numbered separately within each subsection. In Part I, when referencing a particular equation, we use a notation like 3.2.1.5, which implies equation 5 from Subsection 3.2.1. In Parts II and III, equation numbers are enclosed in parentheses; for example, (27.2.1.4) means equation 4 from Subsection 27.2.1.

5. If a formula or a solution contains an expression like $\dfrac{f(x)}{a-2}$, it is often not stated that the assumption $a \neq 2$ is implied.

6. If a formula or a solution contains derivatives of some functions, then the functions are assumed to be differentiable.

7. If a formula or a solution contains definite integrals, then the integrals are supposed to be convergent.

8. Though incomplete, very simple and graphical classification of solutions by their appearance is used in the book. For equations in two independent variables, x and t, and one unknown, w, the solution name and structure are as follows (x and t in the solutions below can be swapped):

No.	*Solution name*	*Solution structure*
1	Traveling-wave solution*	$w = F(z), \quad z = \alpha x + \beta t, \quad \alpha\beta \neq 0$
2	Additive separable solution	$w = \varphi(x) + \psi(t)$
3	Multiplicative separable solution	$w = \varphi(x)\psi(t)$
4	Self-similar solution**	$w = t^{\alpha} F(z), \quad z = xt^{\beta}$
5	Generalized self-similar solution	$w = \varphi(t)F(z), \quad z = x\psi(t)$
6	Generalized traveling-wave solution	$w = F(z), \quad z = \varphi(t)x + \psi(t)$
7	Generalized separable solution	$w = \varphi_1(x)\psi_1(t) + \cdots + \varphi_n(x)\psi_n(t)$
8	Functional separable solution	$w = F(z), \quad z = \varphi_1(x)\psi_1(t) + \cdots + \varphi_n(x)\psi_n(t)$

*For uniformity of presentation, we also use this term in the cases where the variable t plays the role of a spatial coordinate.

**Sometimes, a solution of the form $w = \bar{t}^{\alpha} F(z)$ with $z = \bar{x}\bar{t}^{\beta}$, where $\bar{x} = x + C_1$ and $\bar{t} = t + C_2$, will also be called a self-similar solution.

9. In this book, the term *integrable equation* applies to nonlinear partial differential equations that admit solution in terms of integrals or can be *linearized*, which means that their solutions can be expressed in terms of solutions to linear differential equations or linear integral equations.

10. The previous handbooks by Zaitsev and Polyanin (1996, 2003), Polyanin and Zaitsev (2002, 2004), and Polyanin, Zaitsev, and Moussiaux (2002) were extensively used in compiling this book; references to these sources are often omitted.

11. The ODE and PDE are conventional abbreviations for ordinary differential equation and partial differential equation, respectively.

⊙ This symbol indicates references to literature sources whenever:

(*a*) at least one of the solutions was obtained in the cited source (even though the solution contained "correctable" misprints in signs or coefficients);
(*b*) the cited source provides further information on the equation in question and their solutions.

Part I

Exact Solutions of Nonlinear Partial Differential Equations

This page intentionally left blank

Chapter 1
First-Order Quasilinear Equations

Preliminary remarks. The equations in each subsection are arranged in order of complexity of their form. The functions $\Phi(u_1, \ldots, u_n)$ appearing below in general solutions are arbitrary functions of their arguments u_k, and the u_k are some functions the independent and dependent variables.

1.1. Equations with Two Independent Variables Containing Arbitrary Parameters

1.1.1. Coefficients of Equations Contain Power-Law Functions

► **Equations of the form $F(x,y)\frac{\partial w}{\partial x} + G(x,y)\frac{\partial w}{\partial y} = H(x,y,w)$.**

1. $\boldsymbol{a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = cw^n + sw^m.}$

General solution: $a\displaystyle\int \frac{dw}{cw^n + sw^m} = x + \Phi(bx - ay).$

2. $\boldsymbol{\dfrac{\partial w}{\partial x} + k\dfrac{\partial w}{\partial y} = (ax + by + cw)^n + s.}$

The substitution $v(x,y) = ax + by + cw(x,y)$ leads to an equation of the form 1.1.1.1 with $m = 0$:

$$\frac{\partial v}{\partial x} + k\frac{\partial v}{\partial y} = cv^n + a + bk + cs.$$

3. $\boldsymbol{\dfrac{\partial w}{\partial x} + a\dfrac{\partial w}{\partial y} = bx^n w + cx^m w^k.}$

General solution:

$$w = \left[F(x)\Phi(y - ax) + c(1-k)F(x)\int \frac{x^m\,dx}{F(x)}\right]^{\frac{1}{1-k}}, \qquad F(x) = \exp\left[\frac{b(1-k)}{n+1}x^{n+1}\right].$$

4. $\boldsymbol{a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = cw + (\beta x^n + \lambda y^m)w^k.}$

This is a special case of equation 11.2.1.3 with $f(x) = \beta x^n$ and $g(y) = \lambda y^m$.

5. $\boldsymbol{\dfrac{\partial w}{\partial x} + a\dfrac{\partial w}{\partial y} = bx^n y^m w^k.}$

This is a special case of equation 1.2.1.8 with $f(x) = bx^n$, $g(y) = y^m$, and $h(w) = w^k$.

6. $\boldsymbol{ax\dfrac{\partial w}{\partial x}+bx\dfrac{\partial w}{\partial y}=cw^k}$.

General solution:

$$\frac{c}{a}\ln|x|+\Phi(bx-ay)=\begin{cases}\frac{1}{1-k}w^{1-k} & \text{if } k\neq 1,\\ \ln|w| & \text{if } k=1.\end{cases}$$

7. $\boldsymbol{ax\dfrac{\partial w}{\partial x}+by\dfrac{\partial w}{\partial y}=cw^k}$.

General solution:

$$\frac{c}{a}\ln|x|+\Phi\big(|x|^b|y|^{-a}\big)=\begin{cases}\frac{1}{1-k}w^{1-k} & \text{if } k\neq 1,\\ \ln|w| & \text{if } k=1.\end{cases}$$

8. $\boldsymbol{ay\dfrac{\partial w}{\partial x}+bx\dfrac{\partial w}{\partial y}=cw^k}$.

General solution for $ab>0$:

$$\frac{c}{\sqrt{ab}}\ln\big|\sqrt{ab}\,x+ay\big|+\Phi\big(ay^2-bx^2\big)=\begin{cases}\frac{1}{1-k}w^{1-k} & \text{if } k\neq 1,\\ \ln|w| & \text{if } k=1.\end{cases}$$

9. $\boldsymbol{x\dfrac{\partial w}{\partial x}+y\dfrac{\partial w}{\partial y}=w-a\sqrt{w^2-x^2-y^2}}$.

General solution: $w+\sqrt{w^2-x^2-y^2}=\dfrac{1}{x^{a-1}}\Phi\Big(\dfrac{y}{x}\Big)$.

10. $\boldsymbol{ax^2\dfrac{\partial w}{\partial x}+by^2\dfrac{\partial w}{\partial y}=cw^2}$.

General solution: $w=\dfrac{1}{c}\left[\dfrac{1}{ax}+\Phi\left(\dfrac{1}{by}-\dfrac{1}{ax}\right)\right]^{-1}$.

11. $\boldsymbol{ax^2\dfrac{\partial w}{\partial x}-bx^2\dfrac{\partial w}{\partial y}=(w-bx-ay)^2}$.

General solution: $w=\dfrac{[(a+b)x+ay]\Phi(bx+ay)-ax(bx+ay)}{\Phi(bx+ay)-ax}$.

12. $\boldsymbol{(x^2\pm a^2)\dfrac{\partial w}{\partial x}+(y^2\pm a^2)\dfrac{\partial w}{\partial y}=bx^ny^m\left[\dfrac{n(x^2\pm a^2)}{x}+\dfrac{m(y^2\pm a^2)}{y}\right]w^2}$.

General solution:

$$w=\frac{1}{\Phi(v)-bx^ny^m},\quad \text{where}\quad v=\begin{cases}\dfrac{a(x-y)}{a^2+xy} & \text{for the upper sign,}\\ \dfrac{(x-a)(y+a)}{(x+a)(y-a)} & \text{for the lower sign.}\end{cases}$$

13. $(xy + a^2)\left(x\dfrac{\partial w}{\partial x} - y\dfrac{\partial w}{\partial y}\right) = a(x^2 + y^2)w^2.$

General solution: $w = \left[\dfrac{a(y^2 - x^2)}{2(xy + a^2)} + \Phi(xy)\right]^{-1}$.

14. $ax^n\dfrac{\partial w}{\partial x} + by^k\dfrac{\partial w}{\partial y} = cw^m + s.$

This is a special case of equation 1.2.1.11 with $f(w) = cw^m + s$.

15. $ay^n\dfrac{\partial w}{\partial x} + bx^k\dfrac{\partial w}{\partial y} = cw^m + s.$

This is a special case of equation 1.2.1.12 with $f(w) = cw^m + s$.

16. $y^{2a}\left(ax\dfrac{\partial w}{\partial x} + by\dfrac{\partial w}{\partial y}\right) = c(y^a w - x^b)^2.$

General solution: $\Phi\left(\dfrac{x^b}{y^a},\ y^{c/b}\exp\left(\dfrac{y^a}{y^a w - x^b}\right)\right) = 0.$

17. $b_1x^{n_1}\dfrac{\partial w}{\partial x} + b_2y^{n_2}\dfrac{\partial w}{\partial y} = aw + (c_1x^{m_1} + c_2y^{m_2})w^k.$

This is a special case of equation 1.2.1.17 with $f_1(x) = b_1x^{n_1}$, $f_2(y) = b_2y^{n_2}$, $g_1(x) = c_1x^{m_1}$, and $g_2(y) = c_2y^{m_2}$.

► **Equations of the form** $F(x, y, w)\frac{\partial w}{\partial x} + G(x, y, w)\frac{\partial w}{\partial y} = H(x, y, w).$

18. $\dfrac{\partial w}{\partial x} + aw\dfrac{\partial w}{\partial y} = 0.$

Hopf's equation. It is used as a model equation of the nonlinear wave theory and gas dynamics, where the independent variables x and y play the role of time and the spatial coordinate, respectively.

1°. General solution:

$$\Phi(axw - y, w) = 0 \qquad \text{or} \qquad y = axw + \overline{\Phi}(w),$$

where Φ and $\overline{\Phi}$ are arbitrary functions.

2°. The solution of the Cauchy problem with the initial condition

$$w = \varphi(y) \quad \text{at} \quad x = 0$$

can be represented in parametric form as

$$y = \xi + a\varphi(\xi)x, \qquad w = \varphi(\xi).$$

For $a > 0$ and $\varphi'(\xi) > 0$, these relations describe the classical single-valued solution.

3°. Consider the Cauchy problem with the discontinuous initial condition

$$w(0,y)=\begin{cases} w_1 & \text{for } y<0,\\ w_2 & \text{for } y>0.\end{cases}$$

It is assumed that $a>0$, $w_1>0$, and $w_2>0$.

For $w_1<w_2$, the generalized solution has the form

$$w(x,y)=\begin{cases} w_1 & \text{for } y/x<V_1,\\ y/(ax) & \text{for } V_1\le y/x\le V_2,\\ w_2 & \text{for } y/x>V_2,\end{cases}\qquad \text{where}\quad V_1=aw_1,\ \ V_2=aw_2.$$

This solution is continuous in the half-plane $x>0$ and describes a "rarefaction wave."

For $w_1>w_2$, the generalized solution has the form

$$w(x,y)=\begin{cases} w_1 & \text{for } y/x<V,\\ w_2 & \text{for } y/x>V,\end{cases}\qquad \text{where}\quad V=\tfrac{1}{2}a(w_1+w_2).$$

This solution experiences a discontinuity along the line $y=Vx$ and describes a "shock wave."

4°. In Subsection 23.3, examples are given which illustrate qualitative features of solutions to Hopf's equations, including the wave breaking effect and shock waves. These subsections also present general formulas that permit one to construct discontinuous solutions for arbitrary initial conditions. The references listed below contain a lot of solutions to Cauchy problems which describe the merging and decay of discontinuities, periodic waves, and other nonlinear physical effects.

19. $\dfrac{\partial w}{\partial x}+aw\dfrac{\partial w}{\partial y}=b.$

General solution: $\Phi\big(w-bx,\ aw^2-2by\big)=0.$

20. $\dfrac{\partial w}{\partial x}+aw\dfrac{\partial w}{\partial y}=bx.$

General solution: $y=axw-\frac{1}{3}abx^3+\Phi\big(w-\frac{1}{2}bx^2\big).$

21. $\dfrac{\partial w}{\partial x}+aw\dfrac{\partial w}{\partial y}=by.$

General solution: $x=\displaystyle\int_{y_0}^{y}\frac{dt}{\sqrt{ab(t^2-y^2)+a^2w^2}}+\Phi\big(aw^2-by^2\big)$, where y_0 may be taken arbitrary.

22. $\dfrac{\partial w}{\partial x}+aw\dfrac{\partial w}{\partial y}+bw=0.$

This is a *model equation of nonlinear waves with damping* ($a,\ b>0$).

1°. General solution: $\Phi\big(aw + by,\ we^{bx}\big) = 0.$

2°. The solution of the Cauchy problem with the initial condition $w(0, y) = f(y)$ can be represented in parametric form as

$$y = \xi + \frac{a}{b}\big(1 - e^{-bx}\big) f(\xi), \qquad w = e^{-bx} f(\xi).$$

⊙ *Reference*: G. B. Whitham (1974).

23. $\dfrac{\partial w}{\partial x} + (aw + bx)\dfrac{\partial w}{\partial y} = 0.$

General solution: $y = axw + \frac{1}{2}bx^2 + \Phi(w).$

24. $\dfrac{\partial w}{\partial x} + (aw + by)\dfrac{\partial w}{\partial y} = 0.$

General solution: $x = \dfrac{1}{b}\ln|aw + by| + \Phi(w).$

25. $\dfrac{\partial w}{\partial x} + (w + ax + by + c)\dfrac{\partial w}{\partial y} = 0.$

General solution: $bx = \ln\big|a + b(w + ax + by + c)\big| + \Phi(w).$

26. $\dfrac{\partial w}{\partial x} + (aw + bx^k + c)\dfrac{\partial w}{\partial y} = 0.$

General solution:

$$y = \begin{cases} axw + \dfrac{b}{k+1}x^{k+1} + cx + \Phi(w) & \text{if } k \neq -1, \\ axw + b\ln|x| + cx + \Phi(w) & \text{if } k = -1. \end{cases}$$

27. $\dfrac{\partial w}{\partial x} + axw\dfrac{\partial w}{\partial y} = bx.$

General solution: $\Phi\big(aw^2 - 2by,\ 2w - bx^2\big) = 0.$

28. $(a - w)\dfrac{\partial w}{\partial x} + (a + w)\dfrac{\partial w}{\partial y} = 0.$

General solution: $\Phi\big(w,\ x(w + a) + y(w - a)\big) = 0.$

29. $(a_1 + a_2 w)\dfrac{\partial w}{\partial x} + (b_1 + b_2 w)\dfrac{\partial w}{\partial y} = c.$

1°. General solution for $c = 0$:

$$\Phi\big(w,\ x(b_1 + b_2 w) - y(a_1 + a_2 w)\big) = 0.$$

2°. General solution for $c \neq 0$:

$$\Phi\big(a_2 w^2 + 2a_1 w - 2cx,\ b_2 w^2 + 2b_1 w - 2cy\big) = 0.$$

30. $\boldsymbol{(w-ay)\dfrac{\partial w}{\partial x}+by\dfrac{\partial w}{\partial y}=cw.}$

General solution: $c(bx+ay)-bw=\Phi\left(w^b y^{-c}\right)$.

31. $\boldsymbol{[m(w-c)-n(y-b)]\dfrac{\partial w}{\partial x}+[n(x-a)-l(w-c)]\dfrac{\partial w}{\partial y}=l(y-b)-m(x-a).}$

This is an equation of a helical surface and the surface of bodies of revolution.
General solution: $\Phi\left((x-a)^2+(y-b)^2+(w-c)^2,\ lx+my+nw\right)=0$.

32. $\boldsymbol{[b(x+y)-c(x+w)]\dfrac{\partial w}{\partial x}+[c(y+w)-a(x+y)]\dfrac{\partial w}{\partial y}=a(x+w)-b(y+w).}$

General solution: $\Phi(ax+by+cw,\ xy+yw+xw)=0$.

33. $\boldsymbol{(y^2-aw)\dfrac{\partial w}{\partial x}+by\dfrac{\partial w}{\partial y}=cw.}$

General solution: $\Phi\left(w^b y^{-c},\ aw+cx-\dfrac{c}{2b}y^2\right)=0$.

34. $\boldsymbol{[x(y+a)-w]\dfrac{\partial w}{\partial x}+[1-(y+a)^2]\dfrac{\partial w}{\partial y}=(y+a)w-x.}$

General solution: $\Phi\left(x+(y+a)w,\ x(y+a)+w\right)=0$.

35. $\boldsymbol{\dfrac{\partial w}{\partial x}+(aw^2+bw+c)\dfrac{\partial w}{\partial y}=s.}$

General solution: $\Phi\left(w-sx,\ \frac{1}{3}aw^3+\frac{1}{2}bw^2+cw-sy\right)=0$.

36. $\boldsymbol{\dfrac{\partial w}{\partial x}+(aw^2+bw+cx+s)\dfrac{\partial w}{\partial y}=0.}$

General solution: $y=x(aw^2+bw+s)+\frac{1}{2}cx^2+\Phi(w)$.

37. $\boldsymbol{\dfrac{\partial w}{\partial x}+(aw^2+bw+cy+s)\dfrac{\partial w}{\partial y}=0.}$

General solution: $x=\dfrac{1}{c}\ln|aw^2+bw+cy+s|+\Phi(w)$.

38. $\boldsymbol{\dfrac{\partial w}{\partial x}+(a_2w^2+a_1w+b_2x^2+b_1x+b_0)\dfrac{\partial w}{\partial y}=0.}$

General solution: $y=x(a_2w^2+a_1w)+\frac{1}{3}b_2x^3+\frac{1}{2}b_1x^2+b_0x$.

39. $(a+bx^2)\dfrac{\partial w}{\partial x}+(\alpha+\beta w^2)\dfrac{\partial w}{\partial y}=\gamma.$

1°. General solution for $ab>0$:

$$\Phi\Big(\sqrt{ab}\,w-\gamma\arctan\big(\sqrt{b/a}\,x\big),\ \alpha w+\tfrac{1}{3}\beta w^3-\gamma y\Big)=0.$$

2°. General solution for $ab<0$:

$$\Phi\left(2\sqrt{-ab}\,w-\gamma\ln\frac{bx-\sqrt{-ab}}{bx+\sqrt{-ab}},\ \alpha w+\tfrac{1}{3}\beta w^3-\gamma y\right)=0.$$

40. $x(w+ax)\dfrac{\partial w}{\partial x}+y(w+ay)\dfrac{\partial w}{\partial y}=w^2-a^2xy.$

General solution: $\Phi\left(\dfrac{w}{x}+a\ln|y|,\ \dfrac{w}{y}+a\ln|x|\right)=0.$

41. $ax^2(by-cw)\dfrac{\partial w}{\partial x}+by^2(cw-ax)\dfrac{\partial w}{\partial y}=cw^2(ax-by).$

General solution: $\Phi(xyw,\ abxy+bcyw+acxw)=0.$

42. $b(by+cw)^2\dfrac{\partial w}{\partial x}-a^2x(by+2cw)\dfrac{\partial w}{\partial y}=a^2xw.$

General solution: $\Phi\big(w^b(by+y+2cw),\ a^2x^2+b^2y^2-bc^2w^2\big)=0.$

43. $(ax^2-by^2-cw^2)\dfrac{\partial w}{\partial x}+2axy\dfrac{\partial w}{\partial y}=2axw.$

General solution: $\Phi\left(\dfrac{ax^2+by^2+cw^2}{y},\ \dfrac{w}{y}\right)=0.$

44. $by(3ax^2+by^2+cw^2)\dfrac{\partial w}{\partial x}-2ax(ax^2+cw^2)\dfrac{\partial w}{\partial y}=2abxyw.$

General solution: $\Phi\left(\dfrac{ax^2+by^2+cw^2}{w},\ \dfrac{2ax^2+by^2}{w^2}\right)=0.$

45. $b(a^2xy-abyw-b^2w^2)\dfrac{\partial w}{\partial x}+ab(bxw-axy-ay^2)\dfrac{\partial w}{\partial y}$
$=a^2(axy+bxw+byw+ay^2-ax^2).$

General solution: $\Phi(ax^2+ay^2+2byw,\ a^2x^2+b^2w^2+2a^2xy)=0.$

46. $xy(a^2xy+2b^2w^2)\dfrac{\partial w}{\partial x}+byw(byw-ax^2)\dfrac{\partial w}{\partial y}=bw^2(byw-ax^2).$

General solution: $\Phi\left(\dfrac{w}{y},\ \dfrac{b^2w^2}{ax}+\dfrac{bxw}{y}+ay\right)=0.$

47. $\dfrac{\partial w}{\partial x} + (aw^k + b)\dfrac{\partial w}{\partial y} = c.$

General solution:

$$\Phi\big(w,\ y - aw^k x - bx\big) = 0 \quad \text{if} \quad c = 0,$$

$$\Phi\left(w - cx,\ \frac{aw^{k+1}}{k+1} + bw - cy\right) = 0 \quad \text{if} \quad c \neq 0.$$

48. $\dfrac{\partial w}{\partial x} + (aw^k + bx)\dfrac{\partial w}{\partial y} = 0.$

General solution: $y = axw^k + \frac{1}{2}bx^2 + \Phi(w)$.

49. $\dfrac{\partial w}{\partial x} + (aw^k + by)\dfrac{\partial w}{\partial y} = 0.$

General solution: $x = \dfrac{1}{b}\ln|aw^k + by| + \Phi(w)$.

50. $\dfrac{\partial w}{\partial x} + (aw^k + bx^m)\dfrac{\partial w}{\partial y} = cx^n.$

This is a special case of equation 1.2.1.45 with $f(w) = aw^k$, $g(x) = bx^m$, and $h(x) = cx^n$.

51. $\dfrac{\partial w}{\partial x} + (aw^k + bx^m)\dfrac{\partial w}{\partial y} = cw^n.$

This is a special case of equation 1.2.1.46 with $f(w) = aw^k$, $g(x) = bx^m$, and $h(w) = cw^n$.

52. $\dfrac{\partial w}{\partial x} + ax^n y^m w^k \dfrac{\partial w}{\partial y} = 0.$

General solution:

$$\frac{1}{1-m}y^{1-m} - \frac{a}{n+1}x^{n+1}w^k = \Phi(w) \quad \text{if} \quad n \neq -1,\ m \neq 1;$$

$$\ln|y| - \frac{a}{n+1}x^{n+1}w^k = \Phi(w) \quad \text{if} \quad n \neq -1,\ m = 1;$$

$$\frac{1}{1-m}y^{1-m} - aw^k\ln|x| = \Phi(w) \quad \text{if} \quad n = -1,\ m \neq 1;$$

$$\ln|y| - aw^k\ln|x| = \Phi(w) \quad \text{if} \quad n = -1,\ m = 1.$$

53. $(ax + by + cw)^n\left(\dfrac{\partial w}{\partial x} + k\dfrac{\partial w}{\partial y}\right) = 1.$

General solution: $\displaystyle\int \frac{du}{cu^{-n} + a + bk} = x + \Phi(y - kx), \quad \text{where} \quad u = ax + by + cw.$

54. $\Big(a + \sqrt{w - \alpha x - \beta y}\,\Big)\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = \alpha a + \beta b.$

General solution:

$$\Phi\big(cy - bw,\ \alpha y + 2b\sqrt{w - \alpha x - \beta y}\,\big) = 0, \quad \text{where} \quad c = \alpha a + \beta b.$$

1.1.2. Coefficients of Equations Contain Exponential Functions

► **Equations of the form** $F(x,y)\frac{\partial w}{\partial x} + G(x,y)\frac{\partial w}{\partial y} = H(x,y,w)$.

1. $a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = e^{cw}$.

General solution: $w = -\dfrac{1}{c}\ln\left[\Phi(bx-ay) - \dfrac{c}{a}x\right]$.

2. $\dfrac{\partial w}{\partial x} + a\dfrac{\partial w}{\partial y} = b + ce^{\beta x+\lambda w}$.

General solution: $w = -\dfrac{1}{\lambda}\ln\left[e^{-b\lambda x}\Phi(y-ax) - \dfrac{c\lambda}{\beta+b\lambda}e^{\beta x}\right]$.

3. $\dfrac{\partial w}{\partial x} + a\dfrac{\partial w}{\partial y} = be^{\beta x} + ce^{\gamma x+\lambda w}$.

This is a special case of equation 1.2.1.2 with $f(x) = be^{\beta x}$ and $g(x) = ce^{\gamma x}$.

4. $a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = c + (ke^{\beta x} + se^{\gamma y})e^{\lambda w}$.

This is a special case of equation 1.2.1.4 with $f(x) = ke^{\beta x}$ and $g(y) = se^{\gamma y}$.

5. $a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = e^{c(w+\lambda x+\beta y)}$.

General solution:

$$w = \begin{cases} -\dfrac{1}{c}\ln\left[\Phi(bx-ay) - \dfrac{1}{a\lambda+b\beta}e^{c(\lambda x+\beta y)}\right] & \text{if } \lambda \neq -b\beta/a, \\ \dfrac{\beta}{a}(bx-ay) - \dfrac{1}{c}\ln\left[\Phi(bx-ay) - \dfrac{c}{a}x\right] & \text{if } \lambda = -b\beta/a. \end{cases}$$

6. $ax\dfrac{\partial w}{\partial x} + by\dfrac{\partial w}{\partial y} = e^{cw}$.

General solution: $w = -\dfrac{1}{c}\ln\left[\Phi\left(|x|^b|y|^{-a}\right) - \dfrac{c}{a}\ln|x|\right]$.

7. $ax\dfrac{\partial w}{\partial x} + by\dfrac{\partial w}{\partial y} = e^{c(w+\lambda x+\beta y)}$.

General solution: $w = -\dfrac{1}{c}\ln\left[\Phi(u) - \dfrac{c}{a}\displaystyle\int \frac{\exp(c\lambda x + c\beta x^{b/a}u^{-1/a})}{x}dx\right]$, where $u = x^b y^{-a}$.
In the integration, u is treated as a constant.

8. $a y \dfrac{\partial w}{\partial x} + b x \dfrac{\partial w}{\partial y} = e^{c(w+\lambda x+\beta y)}.$

General solution:

$$w = -\frac{1}{c}\ln\left[\Phi\left(bx^2 - ay^2\right) - \frac{c}{a^{3/2}}\int \exp\left(c\lambda x + \frac{c\beta}{\sqrt{a}}\sqrt{bx^2 - u}\right)\frac{dx}{\sqrt{bx^2 - u}}\right],$$

where $u = bx^2 - ay^2$. In the integration, u is treated as a constant.

9. $a x^n \dfrac{\partial w}{\partial x} + b y^k \dfrac{\partial w}{\partial y} = c e^{\lambda w} + s.$

This is a special case of equation 1.2.1.11 with $f(w) = ce^{\lambda w} + s$.

10. $a y^n \dfrac{\partial w}{\partial x} + b x^k \dfrac{\partial w}{\partial y} = c e^{\lambda w} + s.$

This is a special case of equation 1.2.1.12 with $f(w) = ce^{\lambda w} + s$.

11. $a e^{\lambda x} \dfrac{\partial w}{\partial x} + b \dfrac{\partial w}{\partial y} = e^{\gamma(w+\beta y)}.$

General solution: $w = -\dfrac{1}{\gamma}\ln\left[\Phi\left(a\lambda y + be^{-\lambda x}\right) - \dfrac{1}{b\beta}e^{\gamma\beta y}\right].$

12. $a e^{\lambda x} \dfrac{\partial w}{\partial x} + b e^{\beta y} \dfrac{\partial w}{\partial y} = e^{\gamma w}.$

General solution: $w = -\dfrac{1}{\gamma}\ln\left[\Phi\left(b\beta e^{-\lambda x} - a\lambda e^{-\beta y}\right) + \dfrac{\gamma}{a\lambda}e^{-\lambda x}\right].$

13. $a e^{\lambda y} \dfrac{\partial w}{\partial x} + b e^{\beta y} \dfrac{\partial w}{\partial y} = c e^{\gamma w} + k.$

This is a special case of equation 1.2.1.14 with $f(w) = ce^{\gamma w} + k$.

14. $a e^{\alpha x} \dfrac{\partial w}{\partial x} + b e^{\beta y} \dfrac{\partial w}{\partial y} = e^{c(w+\lambda x+\mu y)}.$

General solution: $w = -\dfrac{1}{c}\ln\left[\Phi(u) - \dfrac{(a\alpha)^{c\mu/\beta}c}{a}\int e^{(c\lambda-\alpha)x}\left(b\beta e^{-\alpha x} - u\right)^{-c\mu/\beta}dx\right]$, where $u = b\beta e^{-\alpha x} - a\alpha e^{-\beta y}$. In the integration, u is treated as a constant.

15. $a e^{\beta y} \dfrac{\partial w}{\partial x} + b e^{\alpha x} \dfrac{\partial w}{\partial y} = e^{c(w+\lambda x+\mu y)}.$

General solution:

$$e^{-cw} = \begin{cases} \Phi(u) - \dfrac{c\alpha}{(a\alpha)^{c\mu/\beta}}\displaystyle\int e^{c\lambda x}\left(b\beta e^{\alpha x} - u\right)^{(c\mu-\beta)/\beta}dx & \text{if } \beta \neq c\mu, \\ \Phi(u) - \dfrac{1}{a\lambda}e^{c\lambda x} & \text{if } \beta = c\mu, \end{cases}$$

where $u = b\beta e^{\alpha x} - a\alpha e^{\beta y}$. In the integration, u is treated as a constant.

16. $ae^{\alpha x+\beta y}\dfrac{\partial w}{\partial x}+b\dfrac{\partial w}{\partial y}=e^{cw}.$

General solution: $w=-\dfrac{1}{c}\ln\Big[\Phi\big(b\beta e^{-\alpha x}+a\alpha e^{\beta y}\big)-\dfrac{c}{b}y\Big].$

17. $b_1e^{\beta_1 x}\dfrac{\partial w}{\partial x}+b_2e^{\beta_2 y}\dfrac{\partial w}{\partial y}=a+(c_1e^{\gamma_1 x}+c_2e^{\gamma_2 y})e^{\lambda w}.$

This is a special case of equation 1.2.1.18 with $f_1(x)=b_1e^{\beta_1 x}$, $f_2(y)=b_2e^{\beta_2 y}$, $g_1(x)=c_1e^{\gamma_1 x}$, and $g_2(y)=c_2e^{\gamma_2 y}$.

► **Equations of the form** $F(x,y,w)\frac{\partial w}{\partial x}+G(x,y,w)\frac{\partial w}{\partial y}=H(x,y,w).$

18. $\dfrac{\partial w}{\partial x}+(ae^{\lambda w}+b)\dfrac{\partial w}{\partial y}=0.$

General solution: $y=x(ae^{\lambda w}+b)+\Phi(w).$

19. $\dfrac{\partial w}{\partial x}+(ae^{\lambda w}+bx)\dfrac{\partial w}{\partial y}=0.$

General solution: $y=axe^{\lambda w}+\frac{1}{2}bx^2+\Phi(w).$

20. $\dfrac{\partial w}{\partial x}+(ae^{\lambda w}+by)\dfrac{\partial w}{\partial y}=0.$

General solution: $x=\dfrac{1}{b}\ln|ae^{\lambda w}+by|+\Phi(w).$

21. $\dfrac{\partial w}{\partial x}+(ae^{\lambda w}+be^{\beta x}+c)\dfrac{\partial w}{\partial y}=0.$

General solution: $y=axe^{\lambda w}+\dfrac{b}{\beta}e^{\beta x}+cx+\Phi(w).$

22. $\dfrac{\partial w}{\partial x}+(ae^{\lambda w}+bx^m)\dfrac{\partial w}{\partial y}=cx^n.$

This is a special case of equation 1.2.1.45 with $f(w)=ae^{\lambda w}$, $g(x)=bx^m$, and $h(x)=cx^n$.

23. $\dfrac{\partial w}{\partial x}+(ae^{\lambda w}+bx^m)\dfrac{\partial w}{\partial y}=cw^n.$

This is a special case of equation 1.2.1.46 with $f(w)=ae^{\lambda w}$, $g(x)=bx^m$, and $h(w)=cw^n$.

24. $\dfrac{\partial w}{\partial x}+(ae^{\lambda w}+be^{\beta x})\dfrac{\partial w}{\partial y}=ce^{\gamma x}.$

This is a special case of equation 1.2.1.45 with $f(w)=ae^{\lambda w}$, $g(x)=be^{\beta x}$, and $h(x)=ce^{\gamma x}$.

25. $\dfrac{\partial w}{\partial x}+(ae^{\lambda w}+be^{\beta x})\dfrac{\partial w}{\partial y}=ce^{\gamma w}.$

This is a special case of equation 1.2.1.46 with $f(w)=ae^{\lambda w}$, $g(x)=be^{\beta x}$, and $h(w)=ce^{\gamma w}$.

▷ *See also equations of the general form containing arbitrary functions in Section 1.2.*

1.1.3. Coefficients of Equations Contain Hyperbolic Functions

► **Equations of the form $F(x,y)\frac{\partial w}{\partial x} + G(x,y)\frac{\partial w}{\partial y} = H(x,y,w)$.**

1. $a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = c\cosh^k(\lambda w) + s.$

This is a special case of equation 1.2.1.5 with $f(w) = c\cosh^k(\lambda w) + s$.

2. $a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = c\sinh^k(\lambda w) + s.$

This is a special case of equation 1.2.1.5 with $f(w) = c\sinh^k(\lambda w) + s$.

3. $a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = c\cosh(w + \alpha x + \beta y).$

This is a special case of equation 1.2.1.6 with $f(u) = c\cosh u$.

4. $a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = cx^n\cosh^k(\lambda w).$

This is a special case of equation 1.2.1.7 with $f(x) = cx^n$, $g(w) = \cosh^k(\lambda w)$.

5. $a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = cx^n\sinh^k(\lambda w).$

This is a special case of equation 1.2.1.7 with $f(x) = cx^n$, $g(w) = \sinh^k(\lambda w)$.

6. $ax\dfrac{\partial w}{\partial x} + by\dfrac{\partial w}{\partial y} = c\tanh^k(\lambda w) + s.$

This is a special case of equation 1.2.1.9 with $f(w) = c\tanh^k(\lambda w) + s$.

7. $ay\dfrac{\partial w}{\partial x} + bx\dfrac{\partial w}{\partial y} = c\tanh^k(\lambda w) + s.$

This is a special case of equation 1.2.1.10 with $f(w) = c\tanh^k(\lambda w) + s$.

8. $a\cosh^n(\lambda x)\dfrac{\partial w}{\partial x} + b\cosh^m(\beta y)\dfrac{\partial w}{\partial y} = \cosh^k(\gamma w).$

This is a special case of equation 1.2.1.15 with $f(x) = a\cosh^n(\lambda x)$, $g(y) = b\cosh^m(\beta y)$, and $h(w) = \cosh^k(\gamma w)$.

► **Equations of the form $F(x,y,w)\frac{\partial w}{\partial x} + G(x,y,w)\frac{\partial w}{\partial y} = H(x,y,w)$.**

9. $\dfrac{\partial w}{\partial x} + aw\dfrac{\partial w}{\partial y} = b\cosh(\lambda x).$

General solution:

$$y = axu + \frac{ab}{\lambda^2}\cosh(\lambda x) + \Phi(u), \quad \text{where} \quad u = w - \frac{b}{\lambda}\sinh(\lambda x).$$

10. $\dfrac{\partial w}{\partial x} + \Big[a\cosh^k(\lambda w) + b\Big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y = x\Big[a\cosh^k(\lambda w) + b\Big] + \Phi(w).$

11. $\dfrac{\partial w}{\partial x} + \Big[a\cosh^k(\lambda w) + b\cosh^n(\beta x) + c\Big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y = ax\cosh^k(\lambda w) + b\displaystyle\int \cosh^n(\beta x)\,dx + cx + \Phi(w).$

12. $\dfrac{\partial w}{\partial x} + aw\dfrac{\partial w}{\partial y} = b\sinh(\lambda x).$

General solution:

$$y = axu + \frac{ab}{\lambda^2}\sinh(\lambda x) + \Phi(u), \quad \text{where} \quad u = w - \frac{b}{\lambda}\cosh(\lambda x).$$

13. $\dfrac{\partial w}{\partial x} + \Big[a\sinh^k(\lambda w) + b\Big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y = x\Big[a\sinh^k(\lambda w) + b\Big] + \Phi(w).$

14. $\dfrac{\partial w}{\partial x} + \Big[a\sinh^k(\lambda w) + b\sinh^n(\beta x) + c\Big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y = ax\sinh^k(\lambda w) + b\displaystyle\int \sinh^n(\beta x)\,dx + cx + \Phi(w).$

15. $\dfrac{\partial w}{\partial x} + \Big[a\tanh^k(\lambda w) + b\Big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y = x\Big[a\tanh^k(\lambda w) + b\Big] + \Phi(w).$

16. $\dfrac{\partial w}{\partial x} + \Big[a\tanh^k(\lambda w) + b\tanh^n(\beta x) + c\Big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y = ax\tanh^k(\lambda w) + b\displaystyle\int \tanh^n(\beta x)\,dx + cx + \Phi(w).$

17. $\dfrac{\partial w}{\partial x} + \Big[a\coth^k(\lambda w) + b\Big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y = x\Big[a\coth^k(\lambda w) + b\Big] + \Phi(w).$

18. $\dfrac{\partial w}{\partial x} + \Big[a\coth^k(\lambda w) + b\coth^n(\beta x) + c\Big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y = ax\coth^k(\lambda w) + b\displaystyle\int \coth^n(\beta x)\,dx + cx + \Phi(w).$

1.1.4. Coefficients of Equations Contain Logarithmic Functions

► **Equations of the form** $F(x,y)\frac{\partial w}{\partial x} + G(x,y)\frac{\partial w}{\partial y} = H(x,y,w)$.

1. $a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = c\ln^k(\lambda w) + s.$

This is a special case of equation 1.2.1.5 with $f(w) = c\ln^k(\lambda w) + s$.

2. $a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = c\ln(w + \alpha x + \beta y).$

This is a special case of equation 1.2.1.6 with $f(u) = c\ln u$.

3. $a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = cx^n\ln^k(\lambda w).$

This is a special case of equation 1.2.1.7 with $f(x) = cx^n$ and $g(w) = \ln^k(\lambda w)$.

4. $ax\dfrac{\partial w}{\partial x} + by\dfrac{\partial w}{\partial y} = c\ln^k(\lambda w) + s.$

This is a special case of equation 1.2.1.9 with $f(w) = c\ln^k(\lambda w) + s$.

5. $ay\dfrac{\partial w}{\partial x} + bx\dfrac{\partial w}{\partial y} = c\ln^k(\lambda w) + s.$

This is a special case of equation 1.2.1.10 with $f(w) = c\ln^k(\lambda w) + s$.

6. $a\ln^n(\lambda x)\dfrac{\partial w}{\partial x} + b\ln^m(\beta y)\dfrac{\partial w}{\partial y} = c\ln^k(\gamma w).$

This is a special case of equation 1.2.1.15 with $f(x) = a\ln^n(\lambda x)$, $g(y) = b\ln^m(\beta y)$, and $h(w) = c\ln^k(\gamma w)$.

► **Equations of the form** $F(x,y,w)\frac{\partial w}{\partial x} + G(x,y,w)\frac{\partial w}{\partial y} = H(x,y,w)$.

7. $\dfrac{\partial w}{\partial x} + aw\dfrac{\partial w}{\partial y} = b\ln(\lambda x).$

General solution:

$$y = axu + \tfrac{1}{2}abx^2\ln(\lambda x) - \tfrac{3}{4}abx^2 + \Phi(u), \quad \text{where} \quad u = w + bx - bx\ln(\lambda x).$$

8. $\dfrac{\partial w}{\partial x} + \big[a\ln^k(\lambda w) + b\big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y = x\big[a\ln^k(\lambda w) + b\big] + \Phi(w)$.

9. $\dfrac{\partial w}{\partial x} + \big[a\ln^k(\lambda w) + bx\big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y = ax\ln^k(\lambda w) + \frac{1}{2}bx^2 + \Phi(w)$.

10. $\dfrac{\partial w}{\partial x} + \big[a\ln^k(\lambda w) + by\big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $x = \dfrac{1}{b}\ln|a\ln^k(\lambda w) + by| + \Phi(w).$

11. $\dfrac{\partial w}{\partial x} + \big[a\ln^k(\lambda w) + b\ln^n(\beta x) + c\big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y = ax\ln^k(\lambda w) + \displaystyle\int \ln^n(\beta x)\,dx + cx + \Phi(w).$

1.1.5. Coefficients of Equations Contain Trigonometric Functions

► **Equations of the form** $F(x,y,w)\frac{\partial w}{\partial x} + G(x,y,w)\frac{\partial w}{\partial y} = H(x,y,w).$

1. $a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = c\cos^k(\lambda w) + s.$

This is a special case of equation 1.2.1.5 with $f(w) = c\cos^k(\lambda w) + s$.

2. $a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = c\sin^k(\lambda w) + s.$

This is a special case of equation 1.2.1.5 with $f(w) = c\sin^k(\lambda w) + s$.

3. $a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = c\cos(w + \alpha x + \beta y).$

This is a special case of equation 1.2.1.6 with $f(u) = c\cos u$.

4. $a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = cx^n\cos^k(\lambda w).$

This is a special case of equation 1.2.1.7 with $f(x) = cx^n$ and $g(w) = \cos^k(\lambda w)$.

5. $a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = cx^n\sin^k(\lambda w).$

This is a special case of equation 1.2.1.7 with $f(x) = cx^n$ and $g(w) = \sin^k(\lambda w)$.

6. $ax\dfrac{\partial w}{\partial x} + by\dfrac{\partial w}{\partial y} = c\tan^k(\lambda w) + s.$

This is a special case of equation 1.2.1.9 with $f(w) = c\tan^k(\lambda w) + s$.

7. $ay\dfrac{\partial w}{\partial x} + bx\dfrac{\partial w}{\partial y} = c\tan^k(\lambda w) + s.$

This is a special case of equation 1.2.1.10 with $f(w) = c\tan^k(\lambda w) + s$.

8. $a\cos^n(\lambda x)\dfrac{\partial w}{\partial x}+b\cos^m(\beta y)\dfrac{\partial w}{\partial y}=\cos^k(\gamma w)+c.$

This is a special case of equation 1.2.1.15 with $f(x)=a\cos^n(\lambda x)$, $g(y)=b\cos^m(\beta y)$, and $h(w)=\cos^k(\gamma w)+c$.

► **Equations of the form** $F(x,y,w)\frac{\partial w}{\partial x}+G(x,y,w)\frac{\partial w}{\partial y}=H(x,y,w).$

9. $\dfrac{\partial w}{\partial x}+aw\dfrac{\partial w}{\partial y}=b\cos(\lambda x).$

General solution:

$$y=axu-\frac{ab}{\lambda^2}\cos(\lambda x)+\Phi(u),\quad \text{where}\quad u=w-\frac{b}{\lambda}\sin(\lambda x).$$

10. $\dfrac{\partial w}{\partial x}+\Big[a\cos^k(\lambda w)+b\Big]\dfrac{\partial w}{\partial y}=0.$

General solution: $y=x\Big[a\cos^k(\lambda w)+b\Big]+\Phi(w).$

11. $\dfrac{\partial w}{\partial x}+\Big[a\cos^k(\lambda w)+b\cos^n(\beta x)+c\Big]\dfrac{\partial w}{\partial y}=0.$

General solution: $y=ax\cos^k(\lambda w)+b\displaystyle\int\cos^n(\beta x)\,dx+cx+\Phi(w).$

12. $\dfrac{\partial w}{\partial x}+aw\dfrac{\partial w}{\partial y}=b\sin(\lambda x).$

General solution:

$$y=axu-\frac{ab}{\lambda^2}\sin(\lambda x)+\Phi(u),\quad \text{where}\quad u=w+\frac{b}{\lambda}\cos(\lambda x).$$

13. $\dfrac{\partial w}{\partial x}+\Big[a\sin^k(\lambda w)+b\Big]\dfrac{\partial w}{\partial y}=0.$

General solution: $y=x\Big[a\sin^k(\lambda w)+b\Big]+\Phi(w).$

14. $\dfrac{\partial w}{\partial x}+\Big[a\sin^k(\lambda w)+b\sin^n(\beta x)+c\Big]\dfrac{\partial w}{\partial y}=0.$

General solution: $y=ax\sin^k(\lambda w)+b\displaystyle\int\sin^n(\beta x)\,dx+cx+\Phi(w).$

15. $\dfrac{\partial w}{\partial x}+\Big[a\tan^k(\lambda w)+b\Big]\dfrac{\partial w}{\partial y}=0.$

General solution: $y=x\Big[a\tan^k(\lambda w)+b\Big]+\Phi(w).$

16. $\dfrac{\partial w}{\partial x} + \left[a\tan^k(\lambda w) + b\tan^n(\beta x) + c\right]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y = ax\tan^k(\lambda w) + b\displaystyle\int \tan^n(\beta x)\,dx + cx + \Phi(w).$

17. $\dfrac{\partial w}{\partial x} + \left[a\cot^k(\lambda w) + b\right]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y = x\left[a\cot^k(\lambda w) + b\right] + \Phi(w).$

18. $\dfrac{\partial w}{\partial x} + \left[a\cot^k(\lambda w) + b\cot^n(\beta x) + c\right]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y = ax\cot^k(\lambda w) + b\displaystyle\int \cot^n(\beta x)\,dx + cx + \Phi(w).$

1.2. Equations with Two Independent Variables Containing Arbitrary Functions

1.2.1. Equations Contain Arbitrary Functions of One Variable

► **Equations of the form** $F(x,y)\frac{\partial w}{\partial x} + G(x,y)\frac{\partial w}{\partial y} = H(x,y,w).$

1. $\dfrac{\partial w}{\partial x} + a\dfrac{\partial w}{\partial y} = f(x)w + g(x)w^k.$

General solution:

$$w^{1-k} = F(x)\Phi(y-ax) + (1-k)F(x)\int \frac{g(x)}{F(x)}\,dx, \qquad F(x) = \exp\left[(1-k)\int f(x)\,dx\right].$$

2. $\dfrac{\partial w}{\partial x} + a\dfrac{\partial w}{\partial y} = f(x) + g(x)e^{\lambda w}.$

General solution:

$$e^{-\lambda w} = F(x)\Phi(y-ax) - \lambda F(x)\int \frac{g(x)}{F(x)}\,dx, \qquad F(x) = \exp\left[-\lambda\int f(x)\,dx\right].$$

3. $a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = cw + \left[f(x) + g(y)\right]w^k.$

General solution:

$$\frac{ab}{1-k}w^{1-k} = E_1(x)\Phi(bx-ay) + bE_1(x)\int \frac{f(x)\,dx}{E_1(x)} + aE_2(y)\int \frac{g(y)\,dy}{E_2(y)},$$

where $E_1(x) = \exp\left[\dfrac{c}{a}(1-k)x\right]$ and $E_2(y) = \exp\left[\dfrac{c}{b}(1-k)y\right].$

4. $\boldsymbol{a\dfrac{\partial w}{\partial x}+b\dfrac{\partial w}{\partial y}=c+\big[f(x)+g(y)\big]e^{\lambda w}.}$

General solution:

$$\frac{ab}{\lambda}e^{-\lambda w}=E_1(x)\Phi(bx-ay)-bE_1(x)\int\frac{f(x)\,dx}{E_1(x)}-aE_2(y)\int\frac{g(y)\,dy}{E_2(y)},$$

where $E_1(x)=\exp\Big(-\dfrac{c\lambda}{a}x\Big)$ and $E_2(y)=\exp\Big(-\dfrac{c\lambda}{b}y\Big)$.

5. $\boldsymbol{a\dfrac{\partial w}{\partial x}+b\dfrac{\partial w}{\partial y}=f(w).}$

General solution: $\displaystyle\int\frac{dw}{f(w)}=\frac{x}{a}+\Phi(bx-ay).$

6. $\boldsymbol{a\dfrac{\partial w}{\partial x}+b\dfrac{\partial w}{\partial y}=f(w+\alpha x+\beta y).}$

The substitution $u=w+\alpha x+\beta y$ leads to an equation of the form 1.2.1.5:

$$a\frac{\partial u}{\partial x}+b\frac{\partial u}{\partial y}=f(u)+a\alpha+b\beta.$$

7. $\boldsymbol{a\dfrac{\partial w}{\partial x}+b\dfrac{\partial w}{\partial y}=f(x)g(w).}$

General solution: $\displaystyle\int\frac{dw}{g(w)}=\frac{1}{a}\int f(x)\,dx+\Phi(bx-ay).$

8. $\boldsymbol{\dfrac{\partial w}{\partial x}+a\dfrac{\partial w}{\partial y}=f(x)g(y)h(w).}$

General solution: $\displaystyle\int\frac{dw}{h(w)}=\int_{x_0}^{x}f(t)g(y-ax+at)\,dt+\Phi(y-ax)$, where x_0 may be taken arbitrary.

9. $\boldsymbol{ax\dfrac{\partial w}{\partial x}+by\dfrac{\partial w}{\partial y}=f(w).}$

General solution: $\displaystyle\int\frac{dw}{f(w)}=\frac{1}{a}\ln|x|+\Phi\big(|x|^b|y|^{-a}\big).$

10. $\boldsymbol{ay\dfrac{\partial w}{\partial x}+bx\dfrac{\partial w}{\partial y}=f(w).}$

General solution: $\displaystyle\int\frac{dw}{f(w)}=\frac{1}{\sqrt{ab}}\ln\big|\sqrt{ab}\,x+ay\big|+\Phi\big(ay^2-bx^2\big),\qquad ab>0.$

11. $ax^n\dfrac{\partial w}{\partial x}+by^k\dfrac{\partial w}{\partial y}=f(w).$

General solution:

$$\int\frac{dw}{f(w)}=\frac{1}{a(1-n)}x^{1-n}+\Phi(u),\qquad u=\frac{1}{a(1-n)}x^{1-n}-\frac{1}{b(1-k)}y^{1-k}.$$

12. $ay^n\dfrac{\partial w}{\partial x}+bx^k\dfrac{\partial w}{\partial y}=f(w).$

General solution:

$$a\int\frac{dw}{f(w)}=\int\left(\frac{b}{a}\frac{n+1}{k+1}x^{k+1}-u\right)^{-\frac{n}{n+1}}dx,\qquad u=\frac{b}{a}\frac{n+1}{k+1}x^{k+1}-y^{n+1}.$$

In the integration, u is considered a parameter.

13. $ae^{\lambda x}\dfrac{\partial w}{\partial x}+be^{\beta y}\dfrac{\partial w}{\partial y}=f(w).$

General solution: $\displaystyle\int\frac{dw}{f(w)}=-\frac{1}{a\lambda}e^{-\lambda x}+\Phi(u),$ where $u=a\lambda e^{-\beta y}-b\beta e^{-\lambda x}.$

14. $ae^{\lambda y}\dfrac{\partial w}{\partial x}+be^{\beta x}\dfrac{\partial w}{\partial y}=f(w).$

General solution: $\displaystyle\int\frac{dw}{f(w)}=\frac{c(\beta x-\lambda y)}{u}+\Phi(u),$ where $u=a\beta e^{\lambda y}-b\lambda e^{\beta x}.$

15. $f(x)\dfrac{\partial w}{\partial x}+g(y)\dfrac{\partial w}{\partial y}=h(w).$

General solution: $\displaystyle\int\frac{dw}{h(w)}=\int\frac{dx}{f(x)}+\Phi(u),$ where $\displaystyle u=\int\frac{dx}{f(x)}-\int\frac{dy}{g(y)}.$

16. $f(y)\dfrac{\partial w}{\partial x}+g(x)\dfrac{\partial w}{\partial y}=h(w).$

The transformation $\displaystyle\xi=\int g(x)\,dx,\ \eta=\int f(y)\,dy$ leads to an equation of the form 1.2.1.8:

$$\frac{\partial w}{\partial\xi}+\frac{\partial w}{\partial\eta}=F(\xi)G(\eta)h(w),\qquad\text{where}\quad F(\xi)=\frac{1}{g(x)},\quad G(\eta)=\frac{1}{f(y)}.$$

17. $f_1(x)\dfrac{\partial w}{\partial x}+f_2(y)\dfrac{\partial w}{\partial y}=aw+\big[g_1(x)+g_2(y)\big]w^k.$

General solution:

$$w^{1-k}=E_1(x)\Phi(u)+(1-k)E_1(x)\int\frac{g_1(x)\,dx}{f_1(x)E_1(x)}+(1-k)E_2(y)\int\frac{g_2(y)\,dy}{f_2(y)E_2(y)},$$

where

$$E_1(x)=\exp\left[a(1-k)\int\frac{dx}{f_1(x)}\right],\quad E_2(y)=\exp\left[a(1-k)\int\frac{dy}{f_2(y)}\right],\quad u=\int\frac{dx}{f_1(x)}-\int\frac{dy}{f_2(y)}.$$

18. $f_1(x)\dfrac{\partial w}{\partial x} + f_2(y)\dfrac{\partial w}{\partial y} = a + \big[g_1(x) + g_2(y)\big]e^{\lambda w}.$

General solution:

$$e^{-\lambda w} = E_1(x)\Phi(u) - \lambda E_1(x)\int \frac{g_1(x)\,dx}{f_1(x)E_1(x)} - \lambda E_2(y)\int \frac{g_2(y)\,dy}{f_2(y)E_2(y)},$$

where

$$E_1(x) = \exp\left[-a\lambda\int \frac{dx}{f_1(x)}\right], \quad E_2(y) = \exp\left[-a\lambda\int \frac{dy}{f_2(y)}\right], \quad u = \int \frac{dx}{f_1(x)} - \int \frac{dy}{f_2(y)}.$$

► **Equations of the form** $F(x,y,w)\frac{\partial w}{\partial x} + G(x,y,w)\frac{\partial w}{\partial y} = H(x,y,w).$

19. $\dfrac{\partial w}{\partial x} + aw\dfrac{\partial w}{\partial y} = f(x).$

General solution:

$$y = ax\big[w - F(x)\big] + a\int F(x)\,dx + \Phi\big(w - F(x)\big), \quad \text{where} \quad F(x) = \int f(x)\,dx.$$

20. $\dfrac{\partial w}{\partial x} + aw\dfrac{\partial w}{\partial y} = f(y).$

General solution:

$$x = \pm\int_{y_0}^{y} \frac{dz}{\sqrt{2aF(z) - 2au}} + \Phi(u), \qquad u = F(y) - \frac{1}{2}aw^2,$$

where $F(y) = \int f(y)\,dy.$

21. $\dfrac{\partial w}{\partial x} + aw\dfrac{\partial w}{\partial y} = f(y - bx).$

This is a model equation describing nonlinear waves issuing from a moving source (the variables x and y play the role of time and the spatial coordinate, respectively, and b is the source velocity).

1°. General solution:

$$x = \pm\int_{z_0}^{y-bx} \frac{dz}{\sqrt{b^2 + 2aF(z) - 2au}} + \Phi(u), \qquad u = F(y - bx) - \frac{1}{2}aw^2 + bw,$$

where $F(z) = \int f(z)\,dz$; z_0 may be taken arbitrary.

2°. Solution with steady profile:

$$w = b - \left[(b - w_0)^2 - 2\int_{\xi}^{\infty} f(z)\,dz\right]^{1/2}, \qquad \xi = y - bx,$$

where w_0 is the constant of integration.

⊙ *References for equation* 1.2.1.21: A. L. Hoffman (1967) and G. B. Whitham (1974).

22. $\dfrac{\partial w}{\partial x} + \big[aw + f(x)\big]\dfrac{\partial w}{\partial y} = g(x).$

General solution:

$$y = ax\big[w - G(x)\big] + a\int G(x)\,dx + F(x) + \Phi\big(w - G(x)\big),$$

where $F(x) = \int f(x)\,dx$ and $G(x) = \int g(x)\,dx.$

23. $\dfrac{\partial w}{\partial x} + \big[aw + yf(x)\big]\dfrac{\partial w}{\partial y} = 0.$

General solution:

$$yF(x) - aw\int F(x)\,dx = \Phi(w), \qquad \text{where} \quad F(x) = \exp\left[-\int f(x)\,dx\right].$$

24. $\dfrac{\partial w}{\partial x} + \big[aw + f(y)\big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $x = \displaystyle\int_{y_0}^{y} \frac{dt}{f(t) + aw} + \Phi(w).$

25. $\dfrac{\partial w}{\partial x} + \big[ayw + f(x)\big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y\exp(-axw) - \displaystyle\int_{x_0}^{x} f(t)\exp(-atw)\,dt = \Phi(w).$

26. $\dfrac{\partial w}{\partial x} - f(y)w\dfrac{\partial w}{\partial y} = g(x)w + h(x).$

Complete integral:*

$$w = \varphi(x)\int \frac{dy}{f(y)} + \psi(x),$$

where

$$\varphi(x) = G(x)\left[C_1 - \int G(x)\,dx\right]^{-1}, \qquad G(x) = \exp\left[\int g(x)\,dx\right],$$
$$\psi(x) = S(x)\left[C_2 + \int \frac{h(x)}{S(x)}\,dx\right], \qquad S(x) = G(x)\exp\left[\int \varphi(x)\,dx\right].$$

* The general integral for equations 1.2.1.26–1.2.1.28 can be constructed according to formulas presented in Subsection 24.1.1.

27. $\dfrac{\partial w}{\partial x} + f(y)w\dfrac{\partial w}{\partial y} = aw^2 + g(x)w + h(x).$

Complete integral:

$$w(x,y) = \varphi(x) + C_1\psi(x)\exp\left[a\int \frac{dy}{f(y)}\right],$$

where C_1 is an arbitrary constant, and the functions $\varphi(x)$ and $\psi(x)$ are determined by the following system of first order ordinary differential equations:

$$\varphi'_x = a\varphi^2 + g(x)\varphi + h(x), \tag{1}$$
$$\psi'_x = \big[a\varphi + g(x)\big]\psi. \tag{2}$$

The Riccati equation (1) is integrable in quadrature for a lot of specific functions $g(x)$ and $h(x)$ [e.g., for $h(x) \equiv 0$ and any $g(x)$]. For details, see the books by Kamke (1976) and Polyanin and Zaitsev (2003).

If the solution of equation (1) is known, equation (2) is easy to integrate—it is linear in the unknown function ψ.

28. $\dfrac{\partial w}{\partial x} - f(y)w\dfrac{\partial w}{\partial y} = g(y)w^2 + h(x)w.$

Complete integral:

$$w = H(x)\left[C_1 + \int H(x)\,dx\right]^{-1}\frac{1}{\Psi(y)}\left[C_2 - \int \frac{\Psi(y)}{f(y)}\,dy\right],$$

where

$$H(x) = \exp\left[\int h(x)\,dx\right], \quad \Psi(y) = \exp\left[\int \frac{g(y)}{f(y)}\,dy\right].$$

29. $\dfrac{\partial w}{\partial x} - \big[aw + yf(x) + g(x)\big]\dfrac{\partial w}{\partial y} - h(x)w = 0.$

The transformation

$$w(x,y) = H(x)u(t,z), \quad z = yF(x) + \int g(x)F(x)\,dx, \quad t = \int F(x)H(x)\,dx,$$

where

$$F(x) = \exp\left[\int f(x)\,dx\right], \quad H(x) = \exp\left[\int h(x)\,dx\right],$$

leads to a simpler equation of the form 1.1.1.18: $\dfrac{\partial u}{\partial t} - au\dfrac{\partial u}{\partial z} = 0.$

30. $\dfrac{\partial w}{\partial x} + f(x)w^k\dfrac{\partial w}{\partial y} = g(x)w.$

The transformation

$$\xi = \int f(x)G^k(x)\,dx, \quad u(\xi,y) = \frac{1}{G(x)}w(x,y), \qquad \text{where} \quad G(x) = \exp\left[\int g(x)\,dx\right],$$

leads to a special case of equation 1.1.1.47 with $b = c = 0$: $\dfrac{\partial u}{\partial \xi} + u^k\dfrac{\partial u}{\partial y} = 0.$

31. $\dfrac{\partial w}{\partial x} + f(y)w^k\dfrac{\partial w}{\partial y} = g(y)w^{k+1}.$

The transformation

$$\eta = \int \frac{dy}{f(y)\Psi^k(y)}, \quad u(x,\eta) = \frac{1}{\Psi(y)}w(x,y), \qquad \text{where} \quad \Psi(y) = \exp\left[\int \frac{g(y)}{f(y)}\,dy\right],$$

leads to a special case of equation 1.1.1.47 with $b = c = 0$: $\dfrac{\partial u}{\partial x} + u^k\dfrac{\partial u}{\partial \eta} = 0.$

32. $\dfrac{\partial w}{\partial x} + f(x)e^{\lambda w}\dfrac{\partial w}{\partial y} = g(x).$

The transformation

$$\xi = \int f(x)e^{\lambda G(x)}\,dx, \quad u(\xi,y) = w(x,y) - G(x), \qquad \text{where} \quad G(x) = \int g(x)\,dx,$$

leads to a special case of equation 1.1.2.18 with $b = 0$: $\dfrac{\partial u}{\partial \xi} + e^{\lambda u}\dfrac{\partial u}{\partial y} = 0.$

33. $\dfrac{\partial w}{\partial x} + f(y)e^{\lambda w}\dfrac{\partial w}{\partial y} = g(y)e^{\lambda w}.$

The transformation

$$\eta = \int \frac{dy}{f(y)e^{\lambda\Psi(y)}}, \quad u(x,\eta) = w(x,y) - \Psi(y), \qquad \text{where} \quad \Psi(y) = \int \frac{g(y)}{f(y)}\,dy,$$

leads to a special case of equation 1.1.2.18 with $b = 0$: $\dfrac{\partial u}{\partial x} + e^{\lambda u}\dfrac{\partial u}{\partial \eta} = 0.$

34. $\big[f(x) + aw\big]\dfrac{\partial w}{\partial x} + \big[g(y) + bw\big]\dfrac{\partial w}{\partial y} = 0.$

General solution:

$$\int \frac{dx}{f(x) + aw} - \int \frac{dy}{g(y) + bw} = \Phi(w).$$

In the integration, w is considered a parameter.

35. $\big[f(y) + aw\big]\dfrac{\partial w}{\partial x} + \big[g(x) + bw\big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $(bx - ay)w + \displaystyle\int g(x)\,dx - \int f(y)\,dy = \Phi(w).$

36. $\dfrac{\partial w}{\partial x} + f(w)\dfrac{\partial w}{\partial y} = 0.$

Model equation of gas dynamics. This equation is also encountered in hydrodynamics, multiphase flows, wave theory, acoustics, chemical engineering, and other applications.

1°. General solution:

$$\Phi(y - xf(w), w) = 0, \qquad \text{or} \qquad y = xf(w) + \overline{\Phi}(w),$$

where Φ and $\overline{\Phi}$ are arbitrary functions.

2°. The solution of the Cauchy problem with the initial condition

$$w = \varphi(y) \quad \text{at} \quad x = 0$$

can be represented in the parametric form

$$y = \xi + \mathcal{F}(\xi)x, \quad w = \varphi(\xi),$$

where $\mathcal{F}(\xi) = f\big(\varphi(\xi)\big)$.

3°. Consider the Cauchy problem with the discontinuous initial condition

$$w(0, y) = \begin{cases} w_1 & \text{for } y < 0, \\ w_2 & \text{for } y > 0. \end{cases}$$

It is assumed that $x \geq 0$, $f > 0$, and $f' > 0$ for $w > 0$, $w_1 > 0$, and $w_2 > 0$.

Generalized solution for $w_1 < w_2$:

$$w(x, y) = \begin{cases} w_1 & \text{for } y/x < V_1, \\ f^{-1}(y/x) & \text{for } V_1 \leq y/x \leq V_2, \\ w_2 & \text{for } y/x > V_2, \end{cases} \qquad \text{where} \quad V_1 = f(w_1), \ \ V_2 = f(w_2).$$

Here f^{-1} is the inverse of the function f, i.e., $f^{-1}\big(f(w)\big) \equiv w$. This solution is continuous in the half-plane $x > 0$ and describes a "rarefaction wave."

Generalized solution for $w_1 > w_2$:

$$w(x, y) = \begin{cases} w_1 & \text{for } y/x < V, \\ w_2 & \text{for } y/x > V, \end{cases} \qquad \text{where} \quad V = \frac{1}{w_2 - w_1} \int_{w_1}^{w_2} f(w)\, dw.$$

This solution undergoes a discontinuity along the line $y = Vx$ and describes a "shock wave."

4°. In Section 23.3, qualitative features of solutions to model equations of gas dynamics are considered, including the *wave breaking effect* and shock waves. This subsection also presents general formulas that permit one to construct generalized (discontinuous) solutions for arbitrary initial conditions. The references listed below contain a lot of solutions to Cauchy problems which describe the merging and decay of discontinuities, periodic waves, and other nonlinear physical effects.

⊙ *References for equation* 1.2.1.36: E. Hopf (1950), P. D. Lax (1954), O. A. Oleinik (1954, 1957, 1959), R. Courant (1962), G. B. Whitham (1974), J. Lighthill (1978), B. L. Rozhdestvenskii and N. N. Yanenko (1978), R. J. LeVeque (1992), A. G. Kulikovskii and E. I. Sveshnikova (1995).

37. $\dfrac{\partial w}{\partial x} + f(w)\dfrac{\partial w}{\partial y} = g(x).$

General solution:

$$y = \int_{x_0}^{x} f\big(G(t) - G(x) + w\big)\, dt + \Phi\big(w - G(x)\big), \quad \text{where} \quad G(x) = \int g(x)\, dx.$$

38. $\dfrac{\partial w}{\partial x} + f(w)\dfrac{\partial w}{\partial y} = g(y).$

General solution:

$$x = \int_{y_0}^{y} \psi\big(G(t) - G(y) + F(w)\big)\,dt + \Phi\big(F(w) - G(y)\big),$$

where $G(y) = \int g(y)\,dy$ and $F(w) = \int f(w)\,dw$. The function $\psi = \psi(z)$ is defined parametrically by $\psi = \dfrac{1}{f(w)}$, $z = F(w)$.

39. $\dfrac{\partial w}{\partial x} + f(w)\dfrac{\partial w}{\partial y} = g(y - ax).$

This is a model equation describing nonlinear waves issuing from a moving source (the variables x and y play the role of time and the spatial coordinate, respectively, and a is the source velocity).

1°. The substitution $\xi = y - ax$ leads to an equation of the form 1.2.1.38:

$$\frac{\partial w}{\partial x} + \big[f(w) - a\big]\frac{\partial w}{\partial \xi} = g(\xi).$$

2°. Solution with steady profile:

$$\int f(w)\,dw - aw = \int g(\xi)\,d\xi + C, \quad \xi = y - ax,$$

where C is the constant of integration.

40. $\dfrac{\partial w}{\partial x} + f(w)\dfrac{\partial w}{\partial y} = g(w).$

General solution: $y = \displaystyle\int \frac{f(w)}{g(w)}dw + \Phi\left(x - \int \frac{dw}{g(w)}\right).$

41. $\dfrac{\partial w}{\partial x} + \big[f(w) + ax\big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y = xf(w) + \frac{1}{2}ax^2 + \Phi(w).$

42. $\dfrac{\partial w}{\partial x} + \big[f(w) + ay\big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $x = \dfrac{1}{a}\ln\big|ay + f(w)\big| + \Phi(w).$

43. $\dfrac{\partial w}{\partial x} + f(w + ax + by)\dfrac{\partial w}{\partial y} = 0.$

The substitution $u = w + ax + by$ leads to an equation of the form 1.2.1.38:

$$\frac{\partial u}{\partial x} + f(u)\frac{\partial u}{\partial y} = a + bf(u).$$

44. $\dfrac{\partial w}{\partial x} + \big[f(w) + g(x)\big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y = xf(w) + \int g(x)\,dx + \Phi(w).$

45. $\dfrac{\partial w}{\partial x} + \big[f(w) + g(x)\big]\dfrac{\partial w}{\partial y} = h(x).$

General solution:

$$y = \int_{x_0}^{x} f\big(H(t) - H(x) + w\big)\,dt + G(x) + \Phi\big(w - H(x)\big),$$

where $G(x) = \int g(x)\,dx$ and $H(x) = \int h(x)\,dx.$

46. $\dfrac{\partial w}{\partial x} + \big[f(w) + g(x)\big]\dfrac{\partial w}{\partial y} = h(w).$

General solution:

$$y = \int \frac{f(w)}{h(w)}\,dw + \int_{w_0}^{w} \frac{g\big(H(t) - H(w) + x\big)}{h(t)}\,dt + \Phi\big(x - H(w)\big),$$

where $H(x) = \int \dfrac{dw}{h(w)}.$

47. $\dfrac{\partial w}{\partial x} + \big[f(w) + g(y)\big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $x = \displaystyle\int_{y_0}^{y} \frac{dt}{g(t) + f(w)} + \Phi(w).$

48. $\dfrac{\partial w}{\partial x} + \big[f(w) + yg(x)\big]\dfrac{\partial w}{\partial y} = 0.$

General solution:

$$yG(x) - f(w)\int G(x)\,dx = \Phi(w), \qquad \text{where} \quad G(x) = \exp\left[-\int g(x)\,dx\right].$$

49. $\dfrac{\partial w}{\partial x} + \big[f(w) + yg(x)\big]\dfrac{\partial w}{\partial y} = h(x).$

General solution:

$$yG(x) - \int G(x) f\big(H(t) - H(x) + w\big)\,dx = \Phi\big(w - H(x)\big),$$

where $G(x) = \exp\left[-\displaystyle\int g(x)\,dx\right]$ and $H(x) = \displaystyle\int h(x)\,dx.$

50. $\dfrac{\partial w}{\partial x} + \big[yf(w) + g(x)\big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y\exp\big[-xf(w)\big] - \displaystyle\int_{x_0}^{x} g(t)\exp\big[-tf(w)\big]\,dt = \Phi(w)$, where x_0 may be taken arbitrary.

51. $\dfrac{\partial w}{\partial x} + \big[xf(w) + yg(w)\big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y + x\dfrac{f(w)}{g(w)} + \dfrac{f(w)}{g^2(w)} = \exp\big[g(w)x\big]\,\Phi(w).$

52. $\dfrac{\partial w}{\partial x} + \big[xf(w) + yg(w) + h(w)\big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $y + \dfrac{xf(w) + h(w)}{g(w)} + \dfrac{f(w)}{g^2(w)} = \exp\big[g(w)x\big]\,\Phi(w).$

53. $\dfrac{\partial w}{\partial x} + \big[x^{2n+1}y^m f(w) + x^n y g(w)\big]\dfrac{\partial w}{\partial y} = 0.$

The transformation $\xi = x^{n+1}$, $\eta = y^{1-m}$ leads to an equation of the form 1.2.1.51:

$$\frac{\partial w}{\partial \xi} + \big[\xi F(w) + \eta G(w)\big]\frac{\partial w}{\partial \eta} = 0, \qquad \text{where} \quad F(w) = \frac{1-m}{1+n}f(w), \quad G(w) = \frac{1-m}{1+n}g(w).$$

54. $\dfrac{\partial w}{\partial x} + \big[e^{\lambda x}f(w) + e^{\beta y}g(w)\big]\dfrac{\partial w}{\partial y} = 0.$

General solution for $\lambda\beta \neq 0$:

$$e^{-\beta y}F(x,w) + \beta g(w)\int_{x_0}^{x} F(t,w)\,dt = \Phi(w), \qquad \text{where} \quad F(x,w) = \exp\left[\frac{\beta}{\lambda}e^{\lambda x}f(w)\right].$$

55. $\dfrac{\partial w}{\partial x} + f(x)g(y)h(w)\dfrac{\partial w}{\partial y} = 0.$

General solution: $\Phi(u,w) = 0$, where $u = \displaystyle\int \frac{dy}{g(y)} - h(w)\int f(x)\,dx.$

56. $\dfrac{\partial w}{\partial x} + f(x)g(y)h(w)\dfrac{\partial w}{\partial y} = p(x).$

General solution:

$$\int \frac{dy}{g(y)} = \int_{x_0}^{x} f(t)h\big(P(t) - P(x) + w\big)\,dt + \Phi\big(w - P(x)\big), \qquad \text{where} \quad P(x) = \int p(x)\,dx.$$

57. $\dfrac{\partial w}{\partial x} + f(x)g(y)h(w)\dfrac{\partial w}{\partial y} = p(w).$

General solution:

$$\int \frac{dy}{g(y)} = \int_{w_0}^{w} \frac{h(t)}{p(t)} f\big(P(t) - P(w) + x\big)\,dt + \Phi\big(x - P(w)\big), \qquad \text{where} \quad P(w) = \int \frac{dw}{p(w)}.$$

58. $\big[f(x) + g_1(w)\big]\dfrac{\partial w}{\partial x} + \big[h(y) + g_2(w)\big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $\displaystyle\int \frac{dx}{f(x) + g_1(w)} - \int \frac{dy}{h(y) + g_2(w)} = \Phi(w).$ In the integration, w is considered a parameter.

59. $\big[f(y) + g_1(w)\big]\dfrac{\partial w}{\partial x} + \big[h(x) + g_2(w)\big]\dfrac{\partial w}{\partial y} = 0.$

General solution: $g_2(w)x - g_1(w)y + \displaystyle\int h(x)\,dx - \int f(y)\,dy = \Phi(w).$

1.2.2. Equations Contain Arbitrary Functions of Two Variables

► **Equations of the form** $F(x,y)\frac{\partial w}{\partial x} + G(x,y)\frac{\partial w}{\partial y} = H(x,y,w).$

1. $\dfrac{\partial w}{\partial x} + f(y)\dfrac{\partial w}{\partial y} = g(x,w).$

General solution:

$$x - \int \frac{dy}{f(y)} = I(x,w),$$

where $I(x,u) = C$ is a general integral of the ordinary differential equation $u'_x = g(x,u)$.

2. $f(x,y)\dfrac{\partial w}{\partial x} + g(x,y)\dfrac{\partial w}{\partial y} = h_2(x,y)w^2 + h_1(x,y)w + h_0(x,y).$

Suppose a particular solution $w_0 = w_0(x,y)$ of the equation is known. Then the substitution $\zeta = w - w_0$ leads to an equation of the form 1.2.2.3 with $k = 2$:

$$f\frac{\partial \zeta}{\partial x} + g\frac{\partial \zeta}{\partial y} = h_2\zeta^2 + \big(2h_2w_0 + h_1\big)\zeta.$$

For $h_n = \text{const}$ ($n = 0, 1, 2$), a particular solution w_0 of the original equation can be determined by solving the quadratic equation $h_2w_0^2 + h_1w_0 + h_0 = 0$.

If the functions f and h_n ($n = 0, 1, 2$) are independent of y, then a particular solution should be sought in the form $w_0 = w_0(x)$.

3. $f(x,y)\dfrac{\partial w}{\partial x} + g(x,y)\dfrac{\partial w}{\partial y} = h_1(x,y)w + h_2(x,y)w^k.$

The substitution $\xi = w^{1-k}$ leads to the nonhomogeneous linear equation

$$f(x,y)\frac{\partial \xi}{\partial x} + g(x,y)\frac{\partial \xi}{\partial y} = (1-k)h_1(x,y)\xi + (1-k)h_2(x,y).$$

Equations of this type are considered in Polyanin, Zaitsev, and Moussiaux (2002, Chapter 5).

4. $f(x,y)\dfrac{\partial w}{\partial x}+g(x,y)\dfrac{\partial w}{\partial y}=h_1(x,y)+h_2(x,y)e^{\lambda w}.$

The substitution $\xi=e^{-\lambda w}$ leads to the nonhomogeneous linear equation

$$f(x,y)\frac{\partial \xi}{\partial x}+g(x,y)\frac{\partial \xi}{\partial y}=-\lambda h_1(x,y)\xi-\lambda h_2(x,y).$$

Equations of this type are considered in Polyanin, Zaitsev, and Moussiaux (2002, Chapter 5).

5. $f(x,y)\dfrac{\partial w}{\partial x}+g(x,y)\dfrac{\partial w}{\partial y}=h_2(x,y)e^{\lambda w}+h_1(x,y)+h_0(x,y)e^{-\lambda w}.$

The substitution $\xi=e^{\lambda w}$ leads to an equation of the form 1.2.2.2:

$$f(x,y)\frac{\partial \xi}{\partial x}+g(x,y)\frac{\partial \xi}{\partial y}=\lambda h_2(x,y)\xi^2+\lambda h_1(x,y)\xi+\lambda h_0(x,y).$$

6. $f(x,y)\dfrac{\partial w}{\partial x}+g(x,y)\dfrac{\partial w}{\partial y}=h_1(x,y)\cosh(\lambda w)+h_2(x,y).$

Applying the formula $\cosh(\lambda w)=\frac{1}{2}(e^{\lambda w}+e^{-\lambda w})$, we arrive at an equation of the form 1.2.2.5.

7. $f(x,y)\dfrac{\partial w}{\partial x}+g(x,y)\dfrac{\partial w}{\partial y}=h_1(x,y)\sinh(\lambda w)+h_2(x,y).$

Applying the formula $\sinh(\lambda w)=\frac{1}{2}(e^{\lambda w}-e^{-\lambda w})$, we arrive at an equation of the form 1.2.2.5.

8. $f(x,y)\dfrac{\partial w}{\partial x}+g(x,y)\dfrac{\partial w}{\partial y}=h_1(x,y)w\ln w+h_2(x,y)w.$

The substitution $w=e^{\xi}$ leads to the nonhomogeneous linear equation

$$f(x,y)\frac{\partial \xi}{\partial x}+g(x,y)\frac{\partial \xi}{\partial y}=h_1(x,y)\xi+h_2(x,y).$$

Equations of this type are considered in Polyanin, Zaitsev, and Moussiaux (2002, Chapter 5).

9. $f(x,y)\dfrac{\partial w}{\partial x}+g(x,y)\dfrac{\partial w}{\partial y}=h_1(x,y)w\ln w+h_2(x,y)w\ln^k w.$

The substitution $w=e^{\xi}$ leads to an equation of the form 1.2.2.3:

$$f(x,y)\frac{\partial \xi}{\partial x}+g(x,y)\frac{\partial \xi}{\partial y}=h_1(x,y)\xi+h_2(x,y)\xi^k.$$

10. $f(x,y)\dfrac{\partial w}{\partial x} + g(x,y)\dfrac{\partial w}{\partial y} = h(x,y)\varphi(w).$

The substitution $\xi = \displaystyle\int \frac{dw}{\varphi(w)}$ leads to the nonhomogeneous linear equation

$$f(x,y)\frac{\partial \xi}{\partial x} + g(x,y)\frac{\partial \xi}{\partial y} = h(x,y).$$

Equations of this type are considered in Polyanin, Zaitsev, and Moussiaux (2002, Chapter 5); the equation can be solved using the *method of characteristics* described in changed to Subsection 24.3.5.

► **Equations of the form** $F(x,y,w)\frac{\partial w}{\partial x} + G(x,y,w)\frac{\partial w}{\partial y} = H(x,y,w).$

11. $\dfrac{\partial w}{\partial x} + f(x,w)\dfrac{\partial w}{\partial y} = g(x).$

General solution:

$$y = \int_{x_0}^{x} f\big(t,\, G(t) - G(x) + w\big)\, dt + \Phi\big(w - G(x)\big), \quad \text{where} \quad G(x) = \int g(x)\, dx.$$

12. $\dfrac{\partial w}{\partial x} + f(x,w)\dfrac{\partial w}{\partial y} = g(w).$

General solution:

$$y = \int_{w_0}^{w} \frac{f\big(G(t) - G(w) + x,\, t\big)}{g(t)}\, dt + \Phi\big(x - G(w)\big), \quad \text{where} \quad G(w) = \int \frac{dw}{g(w)}.$$

13. $\dfrac{\partial w}{\partial x} + f(x,w)g(y,w)\dfrac{\partial w}{\partial y} = 0.$

General solution: $\displaystyle\int_{x_0}^{x} f(\xi, w)\, d\xi = \int_{y_0}^{y} \frac{dt}{g(t,w)} + \Phi(w)$, where $\Phi(w)$ is an arbitrary function, and x_0 and y_0 are arbitrary numbers.

14. $\dfrac{\partial w}{\partial x} + \big[f(x,w) + yg(x,w)\big]\dfrac{\partial w}{\partial y} = 0.$

General solution:

$$yG(x,w) - \int_{x_0}^{x} f(t,w)G(t,w)\, dt = \Phi(w), \quad \text{where} \quad G(x,w) = \exp\left[-\int_{x_0}^{x} g(t,w)\, dt\right].$$

15. $\dfrac{\partial w}{\partial x} + \big[y^k f(x,w) + yg(x,w)\big]\dfrac{\partial w}{\partial y} = 0.$

The substitution $z = y^{1-k}$ leads to an equation of the form 1.2.2.14:

$$\frac{\partial w}{\partial x} + (1-k)\big[f(x,w) + zg(x,w)\big]\frac{\partial w}{\partial z} = 0.$$

16. $\dfrac{\partial w}{\partial x} + \big[e^{\lambda y} f(x,w) + g(x,w)\big]\dfrac{\partial w}{\partial y} = 0.$

The substitution $z = e^{-\lambda y}$ leads to an equation of the form 1.2.2.14:

$$\frac{\partial w}{\partial x} - \lambda\big[f(x,w) + zg(x,w)\big]\frac{\partial w}{\partial z} = 0.$$

17. $\dfrac{\partial w}{\partial x} + f(ax+by,w)\dfrac{\partial w}{\partial y} = 0.$

General solution for $b \neq 0$:

$$\Phi(u,w) = 0, \qquad \text{where} \quad u = \int_c^z \frac{dt}{a + bf(t,w)} - x, \quad z = ax + by, \quad c \text{ is any.}$$

18. $\dfrac{\partial w}{\partial x} + f\left(\dfrac{y}{x}, w\right)\dfrac{\partial w}{\partial y} = 0.$

General solution:

$$\Phi(u,w) = 0, \qquad \text{where} \quad u = \int_c^{y/x} \frac{dt}{f(t,w) - t} - \ln|x|, \quad c \text{ is any.}$$

19. $\dfrac{\partial w}{\partial x} + f(x^n y^m, w)\dfrac{y}{x}\dfrac{\partial w}{\partial y} = 0.$

General solution:

$$\Phi(u,w) = 0, \qquad \text{where} \quad u = \int_c^z \frac{dt}{t\big[mf(t,w) + n\big]} - \ln|x|, \quad z = x^n y^m, \quad c \text{ is any.}$$

20. $\dfrac{\partial w}{\partial x} + e^{-ax} f(e^{ax}y, w)\dfrac{\partial w}{\partial y} = 0.$

General solution:

$$\Phi(u,w) = 0, \qquad \text{where} \quad u = \int_c^z \frac{dt}{f(t,w) + at} - x, \quad z = e^{ax}y, \quad c \text{ is any.}$$

21. $\dfrac{\partial w}{\partial x} + e^{ay} f(xe^{ay}, w)\dfrac{\partial w}{\partial y} = 0.$

General solution:

$$\Phi(u,w) = 0, \qquad \text{where} \quad u = \int_c^z \frac{dt}{t\big[atf(t,w) + 1\big]} - \ln|x|, \quad z = xe^{ay}, \quad c \text{ is any.}$$

22. $\dfrac{\partial w}{\partial x} + yf(e^{ax}y^m, w)\dfrac{\partial w}{\partial y} = 0.$

General solution:

$$\Phi(u,w) = 0, \qquad \text{where} \quad u = \int_c^z \frac{dt}{t\big[a + mf(t,w)\big]} - x, \quad z = e^{ax}y^m, \quad c \text{ is any.}$$

23. $\dfrac{\partial w}{\partial x} + x^{n-1}e^{ay} f(x^n e^{ay}, w)\dfrac{\partial w}{\partial y} = 0.$

General solution:

$$\Phi(u, w) = 0, \qquad \text{where} \quad u = \int_c^z \frac{dt}{t\big[atf(t, w) + n\big]} - \ln|x|, \quad z = x^n e^{ay}, \quad c \text{ is any.}$$

24. $\dfrac{\partial w}{\partial x} + \big[y^k f(x, w) g(e^{ax} y, w) - ay\big]\dfrac{\partial w}{\partial y} = 0.$

General solution:

$$\Phi(u, w) = 0, \qquad \text{where} \quad u = \int \frac{dv}{v^k g(v, w)} - \int f(x, w)\exp[a(1-k)x]\,dx, \quad v = e^{ax} y.$$

In the integration, w is considered a parameter.

25. $\dfrac{\partial w}{\partial x} + e^{\alpha x - \beta y} f(ae^{\alpha x} + be^{\beta y},\ w)\dfrac{\partial w}{\partial y} = 0.$

General solution:

$$\Phi(u, w) = 0, \qquad \text{where} \quad u = \int_c^z \frac{dt}{a\alpha + b\beta f(t, w)} - \frac{1}{\alpha} e^{\alpha x}, \quad z = ae^{\alpha x} + be^{\beta y}, \quad c \text{ is any.}$$

26. $x\dfrac{\partial w}{\partial x} + \big[f(x, w) g(x^n e^y, w) - n\big]\dfrac{\partial w}{\partial y} = 0.$

General solution:

$$\Phi(u, w) = 0, \qquad \text{where} \quad u = \int \frac{dv}{vg(v, w)} - \int \frac{f(x, w)}{x}\,dx, \quad v = x^n e^y.$$

In the integration, w is considered a parameter.

27. $\big[f(y, w) + amx^n y^{m-1}\big]\dfrac{\partial w}{\partial x} - \big[g(x, w) + anx^{n-1} y^m\big]\dfrac{\partial w}{\partial y} = 0.$

General solution:

$$\Phi(u, w) = 0, \qquad \text{where} \quad u = \int f(y, w)\,dy + \int g(x, w)\,dx + ax^n y^m.$$

In the integration, w is considered a parameter.

28. $\big[e^{\alpha x} f(y, w) + c\beta\big]\dfrac{\partial w}{\partial x} - \big[e^{\beta y} g(x, w) + c\alpha\big]\dfrac{\partial w}{\partial y} = 0.$

General solution:

$$\Phi(u, w) = 0, \qquad \text{where} \quad u = \int e^{-\beta y} f(y, w)\,dy + \int e^{-\alpha x} g(x, w)\,dx - ce^{-\alpha x - \beta y}.$$

In the integration, w is considered a parameter.

29. $\dfrac{\partial w}{\partial x} + f(x,y,w)\dfrac{\partial w}{\partial y} = 0.$

General solution: $\Phi\big(u(x,y,w),w\big) = 0$, where $u(x,y,a) = C$ is the general integral of the ordinary differential equation $y'_x = f(x,y,a)$ with parameter a. Solutions for a large number of ordinary differential equations with various right-hand sides dependent on free parameters can be found in the handbook Polyanin and Zaitsev (2005); see also Kamke (1977) and Murphy (1960).

30. $f_y(x,y,w)\dfrac{\partial w}{\partial x} - f_x(x,y,w)\dfrac{\partial w}{\partial y} = 0.$

General solution: $\Phi\big(w,\ f(x,y,w)\big) = 0.$

31. $f(x,w)\dfrac{\partial w}{\partial x} + g(x,w)\dfrac{\partial w}{\partial y} = h(x,w).$

Solutions are sought in the implicit form (*hodograph transformations*)

$$y = y(x,w),$$

which means that x and w are taken to be the independent variables and y the dependent variable. Taking into account the fact that the old derivatives are expressed in terms of the new ones as $w_y = 1/y_w$ and $w_x = -y_x/y_w$, one arrives at the linear equation

$$f(x,w)\frac{\partial y}{\partial x} + h(x,w)\frac{\partial y}{\partial w} = g(x,w).$$

Equations of this type are considered in Polyanin, Zaitsev, and Moussiaux (2002, Chapter 5); this equation can be solved using the *method of characteristics* described in Subsection 24.3.5.

1.3. Other Quasilinear Equations

1.3.1. Equations with Three Independent Variables

1. $\dfrac{\partial w}{\partial x} + f(x,w)\dfrac{\partial w}{\partial y} + g(x,w)\dfrac{\partial w}{\partial z} = h(x).$

General solution: $\Phi(u_1,u_2,u_3) = 0$, where

$$u_1 = w - H(x), \quad H(x) = \int h(x)\,dx,$$

$$u_2 = y - \int_a^x f\big(t, H(t) - H(x) + w\big)\,dt, \quad u_3 = z - \int_a^x g\big(t, H(t) - H(x) + w\big)\,dt.$$

In the integration, w is treated as a parameter; a is an arbitrary number.

2. $\dfrac{\partial w}{\partial x} + f(x,w)\dfrac{\partial w}{\partial y} + g(x,w)\dfrac{\partial w}{\partial z} = h(w).$

General solution: $\Phi(u_1,u_2,u_3) = 0$, where

$$u_1 = x - H(w), \quad H(w) = \int \frac{dw}{h(w)},$$

$$u_2 = y - \int_a^w \frac{f\big(H(t) - H(w) + x,\ t\big)}{h(t)}\,dt, \quad u_3 = z - \int_a^w \frac{g\big(H(t) - H(w) + x,\ t\big)}{h(t)}\,dt.$$

In the integration, w is treated as a parameter; a is an arbitrary number.

3. $\dfrac{\partial w}{\partial x} + f(x,w)\dfrac{\partial w}{\partial y} + g(x,w)\dfrac{\partial w}{\partial z} = h_1(x)h_2(w).$

The substitution $\overline{x} = \int h_1(x)\,dx$ leads to an equation of the form 1.3.1.2. The substitution $\overline{w} = \int \dfrac{dw}{h_2(w)}$ leads to an equation of the form 1.3.1.1 for $\overline{w}$.

4. $\dfrac{\partial w}{\partial x} + f_1(x,w)g_1(y,w)\dfrac{\partial w}{\partial y} + f_2(x,w)g_2(z,w)\dfrac{\partial w}{\partial z} = 0.$

General solution: $\Phi(u_1, u_2, w) = 0$, where

$$u_1 = \int f_1(x,w)\,dx - \int \frac{dy}{g_1(y,w)}, \quad u_2 = \int f_2(x,w)\,dx - \int \frac{dz}{g_2(z,w)}.$$

In the integration, w is treated as a parameter.

5. $\dfrac{\partial w}{\partial x} + f_1(x,w)g_1(y,w)\dfrac{\partial w}{\partial y} + \big[f_2(x,w) + zg_2(x,w)\big]\dfrac{\partial w}{\partial z} = 0.$

General solution: $\Phi(u_1, u_2, w) = 0$, where

$$u_1 = \int f_1(x,w)\,dx - \int \frac{dy}{g_1(y,w)},$$

$$u_2 = zG_2(x,w) - \int f_2(x,w)G_2(x,w)\,dx, \quad G_2(x,w) = \exp\left[-\int g_2(x,w)\,dx\right].$$

In the integration, w is treated as a parameter.

6. $\dfrac{\partial w}{\partial x} + f_1(x,w)g_1(y,w)\dfrac{\partial w}{\partial y} + \big[z^n f_2(x,w) + zg_2(x,w)\big]\dfrac{\partial w}{\partial z} = 0.$

The substitution $\eta = z^{1-n}$ leads to an equation of the form 1.3.1.5:

$$\frac{\partial w}{\partial x} + f_1(x,w)g_1(y,w)\frac{\partial w}{\partial y} + (1-n)\big[f_2(x,w) + \eta g_2(x,w)\big]\frac{\partial w}{\partial \eta} = 0.$$

7. $\dfrac{\partial w}{\partial x} + f_1(x,w)g_1(y,w)\dfrac{\partial w}{\partial y} + \big[e^{\beta z} f_2(x,w) + g_2(x,w)\big]\dfrac{\partial w}{\partial z} = 0.$

The substitution $\eta = e^{-\beta z}$ leads to an equation of the form 1.3.1.5:

$$\frac{\partial w}{\partial x} + f_1(x,w)g_1(y,w)\frac{\partial w}{\partial y} - \beta\big[f_2(x,w) + \eta g_2(x,w)\big]\frac{\partial w}{\partial \eta} = 0.$$

8. $\dfrac{\partial w}{\partial x} + \big[f_1(x,w) + yg_1(x,w)\big]\dfrac{\partial w}{\partial y} + \big[f_2(x,w) + zg_2(x,w)\big]\dfrac{\partial w}{\partial z} = 0.$

General solution: $\Phi(u_1, u_2, w) = 0$, where

$$u_1 = yG_1(x,w) - \int f_1(x,w)G_1(x,w)\,dx, \qquad G_1(x,w) = \exp\left[-\int g_1(x,w)\,dx\right],$$

$$u_2 = zG_2(x,w) - \int f_2(x,w)G_2(x,w)\,dx, \qquad G_2(x,w) = \exp\left[-\int g_2(x,w)\,dx\right].$$

In the integration, w is treated as a parameter.

9. $\dfrac{\partial w}{\partial x}+\big[y^k f_1(x,w)+y g_1(x,w)\big]\dfrac{\partial w}{\partial y}+\big[z^n f_2(x,w)+z g_2(x,w)\big]\dfrac{\partial w}{\partial z}=0.$

The transformation $\xi = y^{1-k}$, $\eta = z^{1-n}$ leads to an equation of the form 1.3.1.8:

$$\frac{\partial w}{\partial x}+(1-k)\big[f_1(x,w)+\xi g_1(x,w)\big]\frac{\partial w}{\partial \xi}+(1-n)\big[f_2(x,w)+\eta g_2(x,w)\big]\frac{\partial w}{\partial \eta}=0.$$

10. $\dfrac{\partial w}{\partial x}+\big[e^{\alpha y} f_1(x,w)+g_1(x,w)\big]\dfrac{\partial w}{\partial y}+\big[e^{\beta z} f_2(x,w)+g_2(x,w)\big]\dfrac{\partial w}{\partial z}=0.$

The transformation $\xi = e^{-\alpha y}$, $\eta = e^{-\beta z}$ leads to an equation of the form 1.3.1.8:

$$\frac{\partial w}{\partial x}-\alpha\big[f_1(x,w)+\xi g_1(x,w)\big]\frac{\partial w}{\partial \xi}-\beta\big[f_2(x,w)+\eta g_2(x,w)\big]\frac{\partial w}{\partial \eta}=0.$$

11. $\dfrac{\partial w}{\partial x}+\big[y^k f_1(x,w)+y g_1(x,w)\big]\dfrac{\partial w}{\partial y}+\big[e^{\beta z} f_2(x,w)+g_2(x,w)\big]\dfrac{\partial w}{\partial z}=0.$

The transformation $\xi = y^{1-k}$, $\eta = e^{-\beta z}$ leads to an equation of the form 1.3.1.8:

$$\frac{\partial w}{\partial x}+(1-k)\big[f_1(x,w)+\xi g_1(x,w)\big]\frac{\partial w}{\partial \xi}-\beta\big[f_2(x,w)+\eta g_2(x,w)\big]\frac{\partial w}{\partial \eta}=0.$$

12. $\dfrac{\partial w}{\partial x}+f(a_1x+b_1y,w)\dfrac{\partial w}{\partial y}+g(a_2x+b_2z,w)\dfrac{\partial w}{\partial z}=0.$

General solution: $\Phi(u_1,u_2,w)=0$, where

$$u_1 = x-\int_{c_1}^{\xi_1}\frac{dt}{a_1+b_1f(t,w)}, \qquad \xi_1 = a_1x+b_1y \quad (b_1\neq 0),$$
$$u_2 = x-\int_{c_2}^{\xi_2}\frac{dt}{a_2+b_2g(t,w)}, \qquad \xi_2 = a_2x+b_2z \quad (b_2\neq 0),$$

and c_1 and c_2 are arbitrary numbers. For $b_1 = 0$ or $b_2 = 0$, one should use the formulas

$$u_1 = y-\frac{1}{a_1}\int_{c_1}^{a_1x} f(t,w)\,dt, \quad u_2 = z-\frac{1}{a_2}\int_{c_2}^{a_2x} g(t,w)\,dt.$$

13. $\dfrac{\partial w}{\partial x}+f(y+ax,w)\dfrac{\partial w}{\partial y}+g\left(\dfrac{z}{x},w\right)\dfrac{\partial w}{\partial z}=0.$

General solution: $\Phi(u_1,u_2,w)=0$, where

$$u_1 = x-\int_{c_1}^{y+ax}\frac{dt}{f(t,w)+a}, \quad u_2 = \int_{c_2}^{z/x}\frac{dt}{g(t,w)-t}-\ln|x|,$$

and c_1 and c_2 are arbitrary numbers.

14. $\dfrac{\partial w}{\partial x} + f\left(\dfrac{y}{x}, w\right)\dfrac{\partial w}{\partial y} + g\left(\dfrac{z}{x}, w\right)\dfrac{\partial w}{\partial z} = 0.$

General solution: $\Phi(u_1, u_2, w) = 0$, where

$$u_1 = \int_a^{y/x} \frac{dt}{f(t,w) - t} - \ln|x|, \quad u_2 = \int_b^{z/x} \frac{dt}{g(t,w) - t} - \ln|x|,$$

and a and b are arbitrary numbers.

15. $\dfrac{\partial w}{\partial x} + \dfrac{y}{x} f(x^n y^m, w)\dfrac{\partial w}{\partial y} + \dfrac{z}{x} g(x^k z^p, w)\dfrac{\partial w}{\partial z} = 0.$

General solution: $\Phi(u_1, u_2, w) = 0$, where

$$u_1 = \int_a^{x^n y^m} \frac{dt}{t[mf(t,w) + n]} - \ln|x|, \quad u_2 = \int_b^{x^k z^p} \frac{dt}{t[pg(t,w) + k]} - \ln|x|,$$

and a and b are arbitrary numbers.

16. $\dfrac{\partial w}{\partial x} + e^{\alpha y} f(x e^{\alpha y}, w)\dfrac{\partial w}{\partial y} + e^{\beta z} g(x e^{\beta z}, w)\dfrac{\partial w}{\partial z} = 0.$

General solution: $\Phi(u_1, u_2, w) = 0$, where

$$u_1 = \int_{c_1}^{x e^{\alpha y}} \frac{dt}{t[\alpha t f(t,w) + 1]} - \ln|x|, \quad u_2 = \int_{c_2}^{x e^{\beta z}} \frac{dt}{t[\beta t g(t,w) + 1]} - \ln|x|,$$

and c_1 and c_2 are arbitrary numbers.

17. $\dfrac{\partial w}{\partial x} + e^{\alpha y} f(x e^{\alpha y}, w)\dfrac{\partial w}{\partial y} + e^{-\beta x} g(z e^{\beta x}, w)\dfrac{\partial w}{\partial z} = 0.$

General solution: $\Phi(u_1, u_2, w) = 0$, where

$$u_1 = \int_{c_1}^{x e^{\alpha y}} \frac{dt}{t[\alpha t f(t,w) + 1]} - \ln|x|, \quad u_2 = \int_{c_2}^{z e^{\beta x}} \frac{dt}{g(t,w) + \beta t} - x,$$

and c_1 and c_2 are arbitrary numbers.

18. $\dfrac{\partial w}{\partial x} + y f(e^{\alpha x} y^k, w)\dfrac{\partial w}{\partial y} + z g(e^{\beta x} z^n, w)\dfrac{\partial w}{\partial z} = 0.$

General solution: $\Phi(u_1, u_2, w) = 0$, where

$$u_1 = \int_{c_1}^{e^{\alpha x} y^k} \frac{dt}{t[\alpha + k f(t,w)]} - x, \quad u_2 = \int_{c_2}^{e^{\beta x} z^n} \frac{dt}{t[\beta + n g(t,w)]} - x,$$

and c_1 and c_2 are arbitrary numbers.

19. $\dfrac{\partial w}{\partial x}+e^{-\alpha x}f(ye^{\alpha x},w)\dfrac{\partial w}{\partial y}+e^{-\beta x}g(ze^{\beta x},w)\dfrac{\partial w}{\partial z}=0.$

General solution: $\Phi(u_1,u_2,w)=0$, where

$$u_1=\int_{c_1}^{ye^{\alpha x}}\frac{dt}{f(t,w)+\alpha t}-x,\quad u_2=\int_{c_2}^{ze^{\beta x}}\frac{dt}{g(t,w)+\beta t}-x,$$

and c_1 and c_2 are arbitrary numbers.

20. $\dfrac{\partial w}{\partial x}+\dfrac{1}{x}f(x^ke^{\alpha y},w)\dfrac{\partial w}{\partial y}+\dfrac{1}{x}g(x^ne^{\beta z},w)\dfrac{\partial w}{\partial z}=0.$

General solution: $\Phi(u_1,u_2,w)=0$, where

$$u_1=\int_{c_1}^{x^ke^{\alpha y}}\frac{dt}{t[k+\alpha f(t,w)]}-\ln|x|,\quad u_2=\int_{c_2}^{x^ne^{\beta z}}\frac{dt}{t[n+\beta g(t,w)]}-\ln|x|,$$

and c_1 and c_2 are arbitrary numbers.

21. $f(x,w)\dfrac{\partial w}{\partial x}+g(x,w)\dfrac{\partial w}{\partial y}+h(x,w)\dfrac{\partial w}{\partial z}=0.$

General solution: $\Phi(u_1,u_2,w)=0$, where

$$u_1=y-\int\frac{g(x,w)}{f(x,w)}\,dx,\quad u_2=z-\int\frac{h(x,w)}{f(x,w)}\,dx.$$

In the integration, w is treated as a parameter.

22. $f(x,w)\dfrac{\partial w}{\partial x}+g(y,w)\dfrac{\partial w}{\partial y}+h(z,w)\dfrac{\partial w}{\partial z}=0.$

General solution: $\Phi(u_1,u_2,w)=0$, where

$$u_1=\int\frac{dy}{g(y,w)}-\int\frac{dx}{f(x,w)},\quad u_2=\int\frac{dz}{h(z,w)}-\int\frac{dx}{f(x,w)}.$$

In the integration, w is treated as a parameter.

1.3.2. Equations with Arbitrary Number of Independent Variables

1. $\dfrac{\partial w}{\partial x_1}+f_2(x_1,w)\dfrac{\partial w}{\partial x_2}+\cdots+f_n(x_1,w)\dfrac{\partial w}{\partial x_n}=g(x_1).$

General solution: $\Phi(u_1,u_2,\dots,u_n)=0$, where

$$u_1=w-G(x_1),\qquad G(x)=\int g(x)\,dx,$$

$$u_k=x_k-\int_a^{x_1}f_k\big(t,G(t)-G(x_1)+w\big)\,dt,\qquad k=2,\dots,n.$$

In the integration, w is treated as a parameter; a is an arbitrary number.

2. $\dfrac{\partial w}{\partial x_1} + f_2(x_1, w)\dfrac{\partial w}{\partial x_2} + \cdots + f_n(x_1, w)\dfrac{\partial w}{\partial x_n} = g(w).$

General solution: $\Phi(u_1, u_2, \ldots, u_n) = 0$, where

$$u_1 = x_1 - G(w), \qquad G(w) = \int \frac{dw}{g(w)},$$

$$u_k = x_k - \int_a^w \frac{f_k\big(G(t) - G(w) + x_1,\ t\big)}{g(t)}\,dt, \qquad k = 2, \ldots, n.$$

In the integration, w is treated as a parameter; a is an arbitrary number.

3. $\dfrac{\partial w}{\partial x_1} + f_2(x_1, w)\dfrac{\partial w}{\partial x_2} + \cdots + f_n(x_1, w)\dfrac{\partial w}{\partial x_n} = g(x_1)h(w).$

The substitution $x = \displaystyle\int g(x_1)\,dx_1$ leads to an equation of the form 1.3.2.2. The substitution $\overline{w} = \displaystyle\int \frac{dw}{h(w)}$ leads to an equation of the form 1.3.2.1 for $\overline{w}$.

4. $\dfrac{\partial w}{\partial x_1} + f_2(x_1, w)g_2(x_2, w)\dfrac{\partial w}{\partial x_2} + \cdots + f_n(x_1, w)g_n(x_n, w)\dfrac{\partial w}{\partial x_n} = 0.$

General solution: $\Phi(w, u_2, \ldots, u_n) = 0$, where

$$u_k = \int f_k(x_1, w)\,dx_1 - \int \frac{dx_k}{g_k(x_k, w)}, \qquad k = 2, \ldots, n.$$

In the integration, w is treated as a parameter.

5. $\dfrac{\partial w}{\partial x_1} + \big[f_2(x_1, w) + x_2 g_2(x_1, w)\big]\dfrac{\partial w}{\partial x_2} + \cdots + \big[f_n(x_1, w) + x_n g_n(x_1, w)\big]\dfrac{\partial w}{\partial x_n} = 0.$

General solution: $\Phi(w, u_2, \ldots, u_{n-1}) = 0$, where

$$u_k = x_k G_k(x_1, w) - \int f_k(x_1, w) G_k(x_1, w)\,dx_1, \quad G_k(x_1, w) = \exp\left[-\int g_k(x_1, w)\,dx_1\right].$$

In the integration, w is treated as a parameter; $k = 2, \ldots, n$.

6. $\dfrac{\partial w}{\partial x_1} + \big[x_2^{k_2} f_2(x_1, w) + x_2 g_2(x_1, w)\big]\dfrac{\partial w}{\partial x_2} + \cdots + \big[x_n^{k_n} f_n(x_1, w) + x_n g_n(x_1, w)\big]\dfrac{\partial w}{\partial x_n} = 0.$

The transformation $z_1 = x_1$, $z_2 = x_2^{1-k_2}$, $\ldots$, $z_n = x_n^{1-k_n}$ leads to an equation of the form 1.3.2.5:

$$\frac{\partial w}{\partial z_1} + (1-k_2)\big[f_2(z_1, w) + z_2 g_2(z_1, w)\big]\frac{\partial w}{\partial z_2} + \cdots + (1-k_n)\big[f_n(z_1, w) + z_n g_n(z_1, w)\big]\frac{\partial w}{\partial z_n} = 0.$$

7. $$\frac{\partial w}{\partial x_1} + \big[e^{a_2x_2}f_2(x_1, w) + g_2(x_1, w)\big]\frac{\partial w}{\partial x_2} + \cdots + \big[e^{a_nx_n}f_n(x_1, w) + g_n(x_1, w)\big]\frac{\partial w}{\partial x_n} = 0.$$

The transformation $z_1 = x_1$, $z_2 = e^{-a_2x_2}$, …, $z_n = e^{-a_nx_n}$ leads to an equation of the form 1.3.2.5:

$$\frac{\partial w}{\partial z_1} - a_2\big[f_2(z_1, w) + z_2g_2(z_1, w)\big]\frac{\partial w}{\partial z_2} - \cdots - a_n\big[f_n(z_1, w) + z_ng_n(z_1, w)\big]\frac{\partial w}{\partial z_n} = 0.$$

8. $$\frac{\partial w}{\partial x_1} + f_2(a_2x_1 + b_2x_2, w)\frac{\partial w}{\partial x_2} + \cdots + f_n(a_nx_1 + b_nx_n, w)\frac{\partial w}{\partial x_n} = 0.$$

General solution: $\Phi(w, u_2, \ldots, u_n) = 0$, where

$$u_k = x_1 - \int_{c_k}^{z_k} \frac{dt}{a_k + b_kf_k(t, w)}, \qquad z_k = a_kx_1 + b_kx_k \quad \text{if } b_k \neq 0,$$
$$u_k = x_k - \frac{1}{a_k}\int_{c_k}^{z_k} f_k(t, w)\,dt, \qquad z_k = a_kx_1 \quad \text{if } b_k = 0,$$

and the c_k are arbitrary numbers. In the integration, w is treated as a parameter.

9. $$\frac{\partial w}{\partial x_1} + f_2\left(\frac{x_2}{x_1}, w\right)\frac{\partial w}{\partial x_2} + \cdots + f_n\left(\frac{x_n}{x_1}, w\right)\frac{\partial w}{\partial x_n} = 0.$$

General solution: $\Phi(w, u_2, \ldots, u_n) = 0$, where

$$u_k = \int_{c_k}^{z_k} \frac{dt}{f_k(t, w) - t} - \ln|x_1|, \qquad z_k = \frac{x_k}{x_1}, \quad c_k \text{ are any}, \quad k = 2, \ldots, n.$$

In the integration, w is treated as a parameter.

10. $$\frac{\partial w}{\partial x_1} + \frac{x_2}{x_1}f_2(x_1^{k_2}x_2^{m_2}, w)\frac{\partial w}{\partial x_2} + \cdots + \frac{x_n}{x_1}f_n(x_1^{k_n}x_n^{m_n}, w)\frac{\partial w}{\partial x_n} = 0.$$

General solution: $\Phi(w, u_2, \ldots, u_n) = 0$, where

$$u_i = \int_{c_i}^{z_i} \frac{dt}{t[m_if_i(t, w) + k_i]} - \ln|x_1|, \qquad z_i = x_1^{k_i}x_i^{m_i}, \quad c_i \text{ are any}, \quad i = 2, \ldots, n.$$

In the integration, w is treated as a parameter.

11. $$\frac{\partial w}{\partial x_1} + e^{a_2x_2}f_2(x_1e^{a_2x_2}, w)\frac{\partial w}{\partial x_2} + \cdots + e^{a_nx_n}f_n(x_1e^{a_nx_n}, w)\frac{\partial w}{\partial x_n} = 0.$$

General solution: $\Phi(w, u_2, \ldots, u_n) = 0$, where

$$u_k = \int_{c_k}^{z_k} \frac{dt}{t[a_kt f_k(t, w) + 1]} - \ln|x_1|, \qquad z_k = x_1e^{a_kx_k}, \quad c_k \text{ are any}, \quad k = 2, \ldots, n.$$

In the integration, w is treated as a parameter.

12. $\dfrac{\partial w}{\partial x_1} + x_2 f_2(e^{a_2x_1}x_2^{k_2}, w)\dfrac{\partial w}{\partial x_2} + \cdots + x_n f_n(e^{a_nx_1}x_n^{k_n}, w)\dfrac{\partial w}{\partial x_n} = 0.$

General solution: $\Phi(w, u_2, \ldots, u_n) = 0$, where

$$u_i = \int_{c_i}^{z_i} \frac{dt}{t[a_i + k_i f_i(t, w)]} - x_1, \qquad z_i = e^{a_i x_1} x_i^{k_i}, \quad c_i \text{ are any}, \quad i = 2, \ldots, n.$$

In the integration, w is treated as a parameter.

13. $\dfrac{\partial w}{\partial x_1} + e^{-a_2x_1} f_2(x_2 e^{a_2x_1}, w)\dfrac{\partial w}{\partial x_2} + \cdots + e^{-a_nx_1} f_n(x_n e^{a_nx_1}, w)\dfrac{\partial w}{\partial x_n} = 0.$

General solution: $\Phi(w, u_2, \ldots, u_n) = 0$, where

$$u_k = \int_{c_k}^{z_k} \frac{dt}{f_k(t, w) + a_k t} - x_1, \qquad z_k = x_k e^{a_k x_1}, \quad c_k \text{ are any}, \quad k = 2, \ldots, n.$$

In the integration, w is treated as a parameter.

14. $\dfrac{\partial w}{\partial x_1} + \dfrac{1}{x_1} f_2(x_1^{k_2} e^{a_2x_2}, w)\dfrac{\partial w}{\partial x_2} + \cdots + \dfrac{1}{x_1} f_n(x_1^{k_n} e^{a_nx_n}, w)\dfrac{\partial w}{\partial x_n} = 0.$

General solution: $\Phi(w, u_2, \ldots, u_n) = 0$, where

$$u_m = \int_{c_m}^{z_m} \frac{dt}{t[k_m + a_m f_m(t, w)]} - \ln|x_1|, \qquad z_m = x_1^{k_m} e^{a_m x_m}, \quad c_m \text{ are any}, \quad m = 2, \ldots, n.$$

In the integration, w is treated as a parameter.

15. $f_1(x_1, w)\dfrac{\partial w}{\partial x_1} + f_2(x_1, w)\dfrac{\partial w}{\partial x_2} + \cdots + f_n(x_1, w)\dfrac{\partial w}{\partial x_n} = 0.$

General solution:

$$\Phi(u_2, u_3, \ldots, u_n, w) = 0, \qquad \text{where} \quad u_k = x_k - \int \frac{f_k(x_1, w)}{f_1(x_1, w)}\, dx_1.$$

In the integration, w is treated as a parameter; $k = 2, \ldots, n$.

16. $f_1(x_1, w)\dfrac{\partial w}{\partial x_1} + f_2(x_2, w)\dfrac{\partial w}{\partial x_2} + \cdots + f_n(x_n, w)\dfrac{\partial w}{\partial x_n} = 0.$

General solution:

$$\Phi(u_1, u_2, \ldots, u_{n-1}, w) = 0, \qquad \text{where} \quad u_k = \int \frac{dx_k}{f_k(x_k, w)} - \int \frac{dx_n}{f_n(x_n, w)}.$$

In the integration, w is treated as a parameter; $k = 1, \ldots, n-1$.

Chapter 2
First-Order Equations with Two Independent Variables Quadratic in Derivatives

Preliminary remarks. For brevity, we only give complete integrals for most equations. Subsection 24.1.1 presents formulas that allow one to derive the general integral using a complete integral.

2.1. Equations Containing Arbitrary Parameters

2.1.1. Equations of the Form $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = f(x, y, w)$

1. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = a.$

Complete integral: $w = aC_1x + \dfrac{y}{C_1} + C_2.$

⊙ Reference: E. Kamke (1965).

2. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = axy + b.$

Complete integral: $w = y\sqrt{ax^2 + C_1} + b\displaystyle\int \frac{dx}{\sqrt{ax^2 + C_1}} + C_2.$

⊙ Reference: E. Kamke (1965).

3. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = axy + bx + cy + s.$

Complete integral: $w = y\sqrt{ax^2 + 2cx + C_1} + \displaystyle\int \frac{(bx + s)\,dx}{\sqrt{ax^2 + 2cx + C_1}} + C_2.$

4. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = ax^k y + bx^n.$

Complete integral:

$$w = \varphi(x)y + b\int \frac{x^n}{\varphi(x)}\,dx + C_1, \qquad \varphi(x) = \pm\left(\frac{2a}{k+1}x^{k+1} + C_2\right)^{1/2}.$$

5. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = ax^n y^k + bx^m y^{2k+1}.$

This is a special case of equation 2.2.1.3 with $f(x) = ax^n$ and $g(x) = bx^m$.

6. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = ax^n e^{\lambda y} + bx^m e^{2\lambda y}.$

This is a special case of equation 2.2.1.4 with $f(x) = ax^n$ and $g(x) = bx^m$.

7. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = aw + bx^n.$

Complete integral: $w = (ax + C_1)(y + C_2) + b(ax + C_1)\displaystyle\int \frac{x^n\,dx}{(ax + C_1)^2}.$

8. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = bw^a.$

Complete integral: $$w = \begin{cases} \left[\dfrac{2-a}{2C_1}\left(bC_1^2 x + y + C_2\right)\right]^{\frac{2}{2-a}} & \text{if } a \neq 2, \\ C_2 \exp\left(bC_1 x + \dfrac{y}{C_1}\right) & \text{if } a = 2. \end{cases}$$

⊙ Reference: E. Kamke (1965).

9. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = Ax^a y^b w^c.$

Complete integral: $$w = \begin{cases} \left[\dfrac{2-c}{2C_1}\left(AC_1^2 u + v + C_2\right)\right]^{\frac{2}{2-c}} & \text{if } c \neq 2, \\ C_2 \exp\left(AC_1 u + \dfrac{v}{C_1}\right) & \text{if } c = 2, \end{cases}$$

where $$u = \begin{cases} \dfrac{x^{a+1}}{a+1} & \text{if } a \neq -1, \\ \ln|x| & \text{if } a = -1, \end{cases} \qquad v = \begin{cases} \dfrac{y^{b+1}}{b+1} & \text{if } b \neq -1, \\ \ln|y| & \text{if } b = -1. \end{cases}$$

⊙ Reference: E. Kamke (1965).

10. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = \dfrac{bw^2}{w + a}.$

Complete integral in implicit form: $x + bC_1^2 y + C_2 = C_1\left(2\sqrt{w + a} + u\right)$, where

$$u = \begin{cases} \sqrt{a}\ln\dfrac{\sqrt{w+a} - \sqrt{a}}{\sqrt{w+a} + \sqrt{a}} & \text{if } a > 0, \\ 2\sqrt{-a}\arctan\sqrt{\dfrac{w+a}{-a}} & \text{if } a < 0. \end{cases}$$

11. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = (xy + a)w^k.$

The substitution $z = \dfrac{2}{2-k}w^{\frac{2-k}{2}}$ leads to an equation of the form 2.1.1.2: $\dfrac{\partial z}{\partial x}\dfrac{\partial z}{\partial y} = xy + a.$

12. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = aw^{k+1} + bx^n w^{2k}, \qquad k \neq 1.$

The substitution $u = w^{1-k}$ leads to an equation of the form 2.1.1.7:

$$\frac{\partial u}{\partial x}\frac{\partial u}{\partial y} = a(1-k)^2 u + b(1-k)^2 x^n.$$

13. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = ae^{\lambda w} + bx^n e^{2\lambda w}.$

The substitution $u = e^{-\lambda w}$ leads to an equation of the form 2.1.1.7: $\dfrac{\partial u}{\partial x}\dfrac{\partial u}{\partial y} = a\lambda^2 u + b\lambda^2 x^n.$

2.1.2. Equations of the Form $f(x,y,w)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + g(x,y,w)\dfrac{\partial w}{\partial x} = h(x,y,w)$

1. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + a\dfrac{\partial w}{\partial x} = bw.$

Complete integral: $w = (by + C_1)\Big(x + C_2 - \dfrac{a}{b}\ln|by + C_1|\Big).$

2. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + (x + a)\dfrac{\partial w}{\partial x} + bx + c = 0.$

Complete integral: $w = C_1 y - bx + (ab + bC_1 - c)\ln|x + a + C_1| + C_2.$

3. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + a(x + b)\dfrac{\partial w}{\partial x} + cy + s = 0.$

Complete integral for $a \neq 0$:

$$w = -(x+b)(ay + C_1) + \frac{1}{a^2}\big[acy + (as - cC_1)\ln|ay + C_1|\big] + C_2.$$

Complete integrals for $a = 0$ and $c \neq 0$:

$$w = -C_1(x+b) + \frac{y(cy + 2s)}{2C_1} + C_2, \qquad w = \pm\frac{cy + s}{c}\sqrt{C_1^2 - 2c(x+b)} + C_2.$$

4. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + axy\dfrac{\partial w}{\partial x} + b = 0, \qquad a \neq 0.$

Complete integral:

$$w = -\frac{1}{2}axy^2 - \frac{1}{2}aC_1 x + \frac{b}{a}\varphi(y) + C_2, \quad \varphi(y) = \begin{cases} \dfrac{2}{\sqrt{C_1}}\arctan\dfrac{y}{\sqrt{C_1}} & \text{if } C_1 > 0, \\ \dfrac{1}{\sqrt{-C_1}}\ln\left|\dfrac{y - \sqrt{-C_1}}{y + \sqrt{-C_1}}\right| & \text{if } C_1 < 0. \end{cases}$$

5. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + axy\dfrac{\partial w}{\partial x} + by^k = 0.$

Complete integral: $w = -\dfrac{1}{2}axy^2 - \dfrac{1}{2}C_1x + 2b\displaystyle\int \frac{y^k\,dy}{ay^2 + C_1} + C_2.$

6. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + ax^k\dfrac{\partial w}{\partial x} + bx^n = 0.$

Complete integral: $w = C_1y - b\displaystyle\int \frac{x^n\,dx}{ax^k + C_1} + C_2.$

7. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + ay^k\dfrac{\partial w}{\partial x} + bx + c = 0.$

Complete integral: $w = \pm\Big(x + \dfrac{c}{b}\Big)\sqrt{C_1 - 2by} - \dfrac{a}{k+1}y^{k+1} + C_2.$

8. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + axy^k\dfrac{\partial w}{\partial x} + by^n = 0.$

Complete integral:

$$w = -x\varphi(y) + b\int \frac{y^n\,dy}{\varphi(y)} + C_2, \quad \varphi(y) = \frac{a}{k+1}y^{k+1} + C_1.$$

9. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + ae^x\dfrac{\partial w}{\partial x} + b = 0, \quad b \neq 0.$

Complete integral: $w = \dfrac{b}{C_1}\big(\ln|C_1 + ae^x| - x\big) + C_1y + C_2.$

10. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + a\sin x\dfrac{\partial w}{\partial x} + b = 0, \quad b \neq 0.$

Complete integral: $w = -\dfrac{2b}{\sqrt{C_1^2 - a^2}}\arctan\dfrac{a + C_1\tan(x/2)}{\sqrt{C_1^2 - a^2}} + C_1y + C_2.$

11. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + a\sin(\mu y)\dfrac{\partial w}{\partial x} = b\sin(\lambda x).$

Complete integral: $w = \dfrac{bC_1}{\lambda}\cos(\lambda x) + \dfrac{a}{\mu}\cos(\mu y) - \dfrac{y}{C_1} + C_2.$

12. $a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + (bx + cy + sw)\dfrac{\partial w}{\partial x} = 1, \quad s \neq 0.$

The substitution $z = bx + cy + sw - ac/s$ leads to an equation of the form 2.1.3.14: $(z_x - b)(az_y + sz) = s^2$.

⊙ Reference: E. Kamke (1965).

13. $a y \dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + w\dfrac{\partial w}{\partial x} + b = 0.$

Complete integral: $w = \dfrac{y^{-1/a}}{2C_1}\left(2C_1^2 x - b y^{2/a} + C_2\right).$

Another complete integral for $a = -2$: $w^2 = 2(x - C_1)(C_2 y - b).$

14. $a y \dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + (bx + cy + sw)\dfrac{\partial w}{\partial x} = 1, \quad a \neq 0.$

Complete integral:

$$w = \begin{cases} -\dfrac{c}{a+s}y + C_1 y^{-s/a} + \varphi(x) & \text{if } a + s \neq 0; \\ \dfrac{c}{s}y(\ln y - 1) + C_1 y + \varphi(x) & \text{if } a + s = 0. \end{cases}$$

Here $\varphi(x) = \dfrac{1}{s}\sqrt{2sx + C_2}$ for $b = 0$. If $b \neq 0$, the function φ is defined implicitly by $x = C_2 e^{b\varphi} - sb^{-2}(b\varphi + 1)$.

15. $w\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + a\dfrac{\partial w}{\partial x} + bw = 0.$

Complete integral in implicit form:

$$\pm a \ln\left|\frac{a + \sqrt{a^2 - 4bC_1 w^2}}{w}\right| \mp \sqrt{a^2 - 4bC_1 w^2} - a \ln w = 2b(x + C_1 y + C_2).$$

2.1.3. Equations of the Form $f(x,y,w)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + g(x,y,w)\dfrac{\partial w}{\partial x} + h(x,y,w)\dfrac{\partial w}{\partial y} = s(x,y,w)$

1. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y}.$

Complete integrals:

$$w = C_1 + C_2 x + C_3 y, \qquad \text{where} \quad C_2 C_3 = aC_2 + bC_3,$$
$$w = bx + ay \pm \sqrt{C_1 x + 4abxy} + C_2,$$
$$w = bx + ay \pm \sqrt{(2ay + C_1)(2bx + C_1)} + C_2.$$

2. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + a\dfrac{\partial w}{\partial x} + bx\dfrac{\partial w}{\partial y} = 0, \qquad ab \neq 0.$

Complete integral: $w = -\dfrac{bC_1 x^2}{2(a + C_1)} + C_1 y + C_2.$

3. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = ax\dfrac{\partial w}{\partial x} + ay\dfrac{\partial w}{\partial y}.$

Four different complete integrals:

$$w = \frac{a}{2C_1}(x + C_1 y)^2 + C_2, \quad w = ax\big(y + \sqrt{y^2 + C_1}\,\big) + C_2, \quad w = ay\big(x + \sqrt{x^2 + C_1}\,\big) + C_2,$$

$$w = a\left(xy + \frac{1}{2}\int \sqrt{u^2 + C_1}\,du + \frac{1}{2}\int \sqrt{v^2 + C_1}\,dv\right) + C_2, \qquad u = x + y, \quad v = x - y.$$

4. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + ay\dfrac{\partial w}{\partial x} + bx\dfrac{\partial w}{\partial y} = 0, \qquad ab \neq 0.$

1°. Complete integral:

$$w = \frac{C_1 - 1}{2}\left(bx^2 - \frac{a}{C_1}y^2\right) + C_2.$$

2°. If $ab > 0$, then numbers α and β can be defined such that $a = \pm\alpha^2$ and $b = \pm\beta^2$, with both upper signs or both lower signs being taken at a time. If we set $u = \beta x + \alpha y$ and $v = \beta x - \alpha y$, then we arrive at an equation of the form 2.2.6.10: $w_u^2 \pm uw_u = w_v^2 \pm vw_v$. Thus, we obtain another complete integral.

5. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = x\dfrac{\partial w}{\partial x} + y\dfrac{\partial w}{\partial y} + ax + by + c.$

Complete integral:

$$w = xy \mp (x + b)\sqrt{y^2 + 2ay + C_1} \pm (ab - c)\ln\left|y + \sqrt{y^2 + 2ay + C_1} + a\right| + C_2.$$

6. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = x\dfrac{\partial w}{\partial x} + y\dfrac{\partial w}{\partial y} + axy + b.$

Complete integral for $a \neq -1$:

$$w = xy \pm x\sqrt{(a+1)y^2 + C_1} \pm \frac{b}{\sqrt{a+1}}\ln\left|\sqrt{a+1}\,y + \sqrt{(a+1)y^2 + C_1}\right| + C_2.$$

Complete integral for $a = -1$:

$$w = xy - C_1 x + \frac{b}{C_1}y + C_2.$$

7. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = x\dfrac{\partial w}{\partial x} + y\dfrac{\partial w}{\partial y} + axy + bx.$

Complete integrals for $a \neq -1$:

$$w = x\left[y \pm \sqrt{(a+1)y^2 + 2by + C_1}\,\right] + C_2,$$

$$w = xy \pm y\sqrt{(a+1)x^2 + C_1} \pm \frac{b}{a+1}\sqrt{(a+1)x^2 + C_1} + C_2.$$

Complete integrals for $a = -1$:

$$w = \frac{x}{C_1}(y - bx) - \frac{y}{2} + C_2, \qquad w = xy \pm x\sqrt{2by + C_1} + C_2.$$

8. $\left(\dfrac{\partial w}{\partial x}+ax\right)\left(\dfrac{\partial w}{\partial y}+by\right)=c.$

Complete integral: $w=-\frac{1}{2}x\left(ax+C_1\pm\sqrt{C_1^2-4c}\right)-\frac{1}{2}y\left(by+C_1\mp\sqrt{C_1^2-4c}\right)+C_2.$

9. $\left(\dfrac{\partial w}{\partial x}+ay\right)\left(\dfrac{\partial w}{\partial y}+ax\right)=b.$

Complete integral: $w=-axy+C_1x+\dfrac{b}{C_1}y+C_2.$

10. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}+ay\dfrac{\partial w}{\partial x}+bx\dfrac{\partial w}{\partial y}+cx^2+sy^2=0, \qquad 4cs=a^2b^2.$

The transformation

$$z=w+\frac{bx^2}{2}+\frac{ay^2}{2}, \quad u=\frac{\lambda x-\lambda^{-1}y}{\sqrt{2}}, \quad v=\frac{\lambda x+\lambda^{-1}y}{\sqrt{2}}, \qquad \lambda=\sqrt{\frac{2c}{ab}},$$

leads to an equation of the form 2.1.6.4: $z_u^2-z_v^2=2abu^2$.

11. $a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}+x\dfrac{\partial w}{\partial x}+y\dfrac{\partial w}{\partial y}=w.$

Complete integral: $w=C_1x+C_2y+aC_1C_2.$

12. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}+b(ax+by)\dfrac{\partial w}{\partial x}+a(ax+by)\dfrac{\partial w}{\partial y}+abc=0.$

Complete integral:

$$w=-\frac{(ax+by)^2}{2}-aC_1x+bC_1y\pm\frac{1}{2}(ax+by)\sqrt{(ax+by)^2-c+C_1^2}$$
$$\pm\frac{1}{2}(C_1^2-c)\ln\left|ax+by+\sqrt{(ax+by)^2-c+C_1^2}\,\right|+C_2.$$

13. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}+b(ax+by)\dfrac{\partial w}{\partial x}-a(ax+by)\dfrac{\partial w}{\partial y}+abc=0.$

Complete integral: $w=C_1(by-ax)\mp\dfrac{1}{3C_1}(2aC_1x+2bC_1y-c+C_1^2)^{3/2}+C_2.$

14. $\left(\dfrac{\partial w}{\partial x}+a\right)\left(\dfrac{\partial w}{\partial y}+bw\right)=c.$

The transformation $x=u$, $y=\ln v$, $w=cz+v-au$ leads to an equation of the form 2.1.2.14:

$$cv\frac{\partial z}{\partial u}\frac{\partial z}{\partial v}+[-abu+(b+1)v+bcz]\frac{\partial z}{\partial u}=1.$$

⊙ Reference: E. Kamke (1965).

15. $2x\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} - w\dfrac{\partial w}{\partial y} + a\dfrac{\partial w}{\partial x} = 0.$

Complete integral in implicit form: $(aC_1w + C_1^2x^2)^{3/2} - \frac{3}{2}aC_1^2(xw + ay) = C_1^3x^3 + C_2.$

16. $y\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} - w\dfrac{\partial w}{\partial x} + a\dfrac{\partial w}{\partial y} = 0, \qquad a \neq 0.$

Complete integrals:

$$w = C_1y \pm \sqrt{2aC_1x + C_2}, \quad w = \frac{x - C_2}{C_1}\left(y \pm \sqrt{y^2 + aC_1}\right), \quad w = \frac{C_2y}{ax + C_1} - \frac{ax + C_1}{2y}.$$

17. $(ax + by)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + b\dfrac{\partial w}{\partial x} + a\dfrac{\partial w}{\partial y} = 0.$

Complete integral:

$$w = C_1(ax - by) - \ln|ax + by| \pm \sqrt{1 + C_1^2(ax + by)^2} \mp \operatorname{arctanh}\frac{1}{\sqrt{1 + C_1^2(ax + by)^2}} + C_2.$$

18. $(x^2 + a)\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y} - 1\right) + xy^2\dfrac{\partial w}{\partial y} = 0.$

Complete integral:

$$w = \pm\frac{C_1^2}{2}\ln(x^2 + a) + C_2 + \begin{cases} C_1 \arctan\dfrac{y}{C_1} & \text{for the upper sign,} \\ C_1 \operatorname{arctanh}\dfrac{y}{C_1} & \text{for the lower sign.} \end{cases}$$

19. $c(ax - by)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + b(ax - cw)\dfrac{\partial w}{\partial x} + a(cw - by)\dfrac{\partial w}{\partial y} = 0.$

General integral in parametric form:

$$x = \frac{1}{a}\left[\Phi(z) + \frac{z}{u}(2u - v + 1)\Phi'_z(z)\right], \quad y = \frac{1}{b}\left[\Phi(z) + \frac{z}{v}(2v - u + 1)\Phi'_z(z)\right],$$
$$w = \frac{1}{c}\left[xu + yv - (u + v - 1)\Phi(z)\right], \qquad z = \frac{1}{uv}(u + v - 1)^3.$$

20. $w\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = a\left(x\dfrac{\partial w}{\partial x} + y\dfrac{\partial w}{\partial y}\right).$

Complete integral: $w^2 = \dfrac{a}{C_1C_2}(C_1x + C_2y)^2 + C_3.$

21. $aw\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + x^2y\dfrac{\partial w}{\partial x} + xy^2\dfrac{\partial w}{\partial y} = xyw.$

Complete integral: $w^2 = C_1x^2 + C_2y^2 + aC_1C_2.$

22. $(a + b)w\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + by\dfrac{\partial w}{\partial x} + ax\dfrac{\partial w}{\partial y} = 0.$

Complete integral: $w^2 = C_3 - \dfrac{aC_2 + bC_1}{(a + b)C_1C_2}(C_1x^2 + C_2y^2).$

2.1.4. Equations of the Form $\dfrac{\partial w}{\partial x} + f(x,y,w)\left(\dfrac{\partial w}{\partial y}\right)^2 = g(x,y,w)$

▷ *Equations of this type are encountered in mechanics, where x plays the role of time and y plays the role of the spatial coordinate.*

1. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 = by.$

This equation governs the free vertical drop of a point body near the Earth's surface (y is the vertical coordinate measured downward, x time, $m = \frac{1}{2a}$ the mass of the body, and $g = 2ab$ the gravitational acceleration).

Complete integral: $w = -C_1 x \pm \dfrac{2a}{3b}\left(\dfrac{by + C_1}{a}\right)^{3/2} + C_2.$

⊙ Reference: A. P. Markeev (1990).

2. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 + by^2 = 0.$

This equation governs free oscillations of a point body of mass $m = 1/(2a)$ in an elastic field with elastic coefficient $k = 2b$ (x is time and y is the displacement from the equilibrium).

Complete integral: $w = -C_1 x + C_2 \pm \int \sqrt{\dfrac{C_1 - by^2}{a}}\, dx + C_2.$

⊙ Reference: F. R. Gantmakher (1966).

3. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 = bx^k + cy^n.$

This is a special case of equation 2.2.2.1 with $f(x) = bx^k$ and $g(y) = cy^n$. Complete integral:

$$w = -C_1 x + \frac{b}{k+1}x^{k+1} + \int \sqrt{\frac{cy^n + C_1}{a}}\, dy + C_2.$$

4. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 = bx^k y + cx^n.$

This is a special case of equation 2.2.2.2 with $f(x) = bx^k$ and $g(x) = cx^n$. Complete integral:

$$w = y\left(\frac{bx^{k+1}}{k+1} + C_1\right) + \frac{cx^{n+1}}{n+1} - \frac{ab^2x^{2k+3}}{(k+1)^2(2k+3)} - \frac{2abC_1x^{k+2}}{(k+1)(k+2)} - aC_1^2x + C_2.$$

5. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 = bx^k y^2 + cx^n y + sx^m.$

This is a special case of equation 2.2.2.3 with $f(x) = bx^k$, $g(x) = cx^n$, and $h(x) = sx^m$.

6. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2=k(bx+cy)^n.$

This is a special case of equation 2.2.2.4 with $f(\xi)=k\xi^n$. Complete integral:

$$w=C_1x+C_2-\frac{b}{2ac^2}(bx+cy)\pm\frac{1}{2ac^2}\int\sqrt{4ac^2k\xi^n+b^2-4ac^2C_1}\,d\xi,\qquad \xi=bx+cy.$$

7. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2=bx^k+ce^{\beta y}.$

This is a special case of equation 2.2.2.1 with $f(x)=bx^k$ and $g(y)=ce^{\beta y}$. Complete integral:

$$w=-C_1x+\frac{b}{k+1}x^{k+1}+\int\sqrt{\frac{ce^{\beta y}+C_1}{a}}\,dy+C_2.$$

8. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2=be^{\lambda x}+ce^{\beta y}.$

This is a special case of equation 2.2.2.1 with $f(x)=be^{\lambda x}$ and $g(y)=ce^{\beta y}$. Complete integral:

$$w=-C_1x+\frac{b}{\lambda}e^{\lambda x}+\int\sqrt{\frac{ce^{\beta y}+C_1}{a}}\,dy+C_2.$$

9. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2=be^{\lambda x}+cy^k.$

This is a special case of equation 2.2.2.1 with $f(x)=be^{\lambda x}$ and $g(y)=cy^k$. Complete integral:

$$w=-C_1x+\frac{b}{\lambda}e^{\lambda x}+\int\sqrt{\frac{cy^k+C_1}{a}}\,dy+C_2.$$

10. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2=bx^ky+ce^{\beta x}.$

This is a special case of equation 2.2.2.2 with $f(x)=bx^k$ and $g(x)=ce^{\beta x}$.

11. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2=be^{\lambda x}y+ce^{\beta x}.$

This is a special case of equation 2.2.2.2 with $f(x)=be^{\lambda x}$ and $g(x)=ce^{\beta x}$. Complete integral:

$$w=y\left(\frac{b}{\lambda}e^{\lambda x}+C_1\right)+\frac{c}{\beta}e^{\beta x}-\frac{ab^2}{2\lambda^3}e^{2\lambda x}-\frac{2abC_1}{\lambda^2}e^{\lambda x}-aC_1^2x+C_2.$$

12. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2=be^{\lambda x}y+cx^k.$

This is a special case of equation 2.2.2.2 with $f(x)=be^{\lambda x}$ and $g(x)=cx^k$.

13. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2=ke^{bx+cy}.$

This is a special case of equation 2.2.2.4 with $f(\xi)=ke^{\xi}$. Complete integral:

$$w=C_1x+C_2-\frac{b}{2ac^2}(bx+cy)\pm\frac{1}{2ac^2}\int\sqrt{4ac^2ke^{\xi}+b^2-4ac^2C_1}\,d\xi,\qquad \xi=bx+cy.$$

14. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2=bx^kw+cx^n.$

This is a special case of equation 2.2.2.7 with $f(x)=bx^k$ and $g(x)=cx^n$. Complete integral:

$$w=F(x)(C_1+C_2y)+F(x)\int\left[cx^n-aC_2^2F^2(x)\right]\frac{dx}{F(x)},\qquad F(x)=\exp\left(\frac{b}{k+1}x^{k+1}\right).$$

15. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2=bx^kw+ce^{\beta x}.$

This is a special case of equation 2.2.2.7 with $f(x)=bx^k$ and $g(x)=ce^{\beta x}$. Complete integral:

$$w=F(x)(C_1+C_2y)+F(x)\int\left[ce^{\beta x}-aC_2^2F^2(x)\right]\frac{dx}{F(x)},\qquad F(x)=\exp\left(\frac{b}{k+1}x^{k+1}\right).$$

16. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2=be^{\lambda x}w+cx^k.$

This is a special case of equation 2.2.2.7 with $f(x)=be^{\lambda x}$ and $g(x)=cx^k$. Complete integral:

$$w=F(x)(C_1+C_2y)+F(x)\int\left[cx^k-aC_2^2F^2(x)\right]\frac{dx}{F(x)},\qquad F(x)=\exp\left(\frac{b}{\lambda}e^{\lambda x}\right).$$

17. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2=be^{\lambda x}w+ce^{\beta x}.$

This is a special case of equation 2.2.2.7 with $f(x)=be^{\lambda x}$ and $g(x)=ce^{\beta x}$. Complete integral:

$$w=F(x)(C_1+C_2y)+F(x)\int\left[ce^{\beta x}-aC_2^2F^2(x)\right]\frac{dx}{F(x)},\qquad F(x)=\exp\left(\frac{b}{\lambda}e^{\lambda x}\right).$$

18. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2=bw^2+cx^kw+sx^n.$

This is a special case of equation 2.2.2.8 with $f(x)=cx^k$ and $g(x)=sx^n$.

19. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2=bw^2+cx^kw+se^{\beta x}.$

This is a special case of equation 2.2.2.8 with $f(x)=cx^k$ and $g(x)=e^{\beta x}$.

20. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 = bw^2 + ce^{\lambda x}w + se^{\beta x}.$

This is a special case of equation 2.2.2.8 with $f(x) = ce^{\lambda x}$ and $g(x) = e^{\beta x}$.

21. $\dfrac{\partial w}{\partial x} + ax^k\left(\dfrac{\partial w}{\partial y}\right)^2 = bx^n w + c_1 x^m y + c_2 x^l.$

This is a special case of equation 2.2.2.9 with $f(x) = ax^k$, $g(x) = bx^n$, $h(x) = c_1 x^m$, and $s(x) = c_2 x^l$.

22. $\dfrac{\partial w}{\partial x} + ay^k\left(\dfrac{\partial w}{\partial y}\right)^2 = bw^2 + c_1 x^n w + c_2 x^m.$

This is a special case of equation 2.2.2.10 with $f(y) = ay^k$, $g(x) = c_1 x^n$, and $h(x) = c_2 x^m$.

23. $\dfrac{\partial w}{\partial x} + ae^{\lambda x}\left(\dfrac{\partial w}{\partial y}\right)^2 = be^{\beta x}w + c_1 e^{\gamma x}y + c_2 e^{\mu x}.$

This is a special case of equation 2.2.2.9 with $f(x) = ae^{\lambda x}$, $g(x) = be^{\beta x}$, $h(x) = c_1 e^{\gamma x}$, and $s(x) = c_2 e^{\mu x}$.

24. $\dfrac{\partial w}{\partial x} + ae^{\lambda y}\left(\dfrac{\partial w}{\partial y}\right)^2 = bw^2 + c_1 e^{\beta x}w + c_2 e^{\gamma x}.$

This is a special case of equation 2.2.2.10 with $f(y) = ae^{\lambda y}$, $g(x) = c_1 e^{\beta x}$, and $h(x) = c_2 e^{\gamma x}$.

25. $\dfrac{\partial w}{\partial x} + \left(ax^k y + bx^n\right)\left(\dfrac{\partial w}{\partial y}\right)^2 = 0.$

This is a special case of equation 2.2.2.11 with $f(x) = ax^k$ and $g(x) = bx^n$. Complete integral:

$$w = \varphi(x)y - b\int x^n \varphi^2(x)\,dx + C_1, \qquad \varphi(x) = \left(\frac{a}{k+1}x^{k+1} + C_2\right)^{-1}.$$

26. $\dfrac{\partial w}{\partial x} + \left(ax^k y + bx^n\right)\left(\dfrac{\partial w}{\partial y}\right)^2 = cx^m w + s_0 x^l.$

This is a special case of equation 2.2.2.12 with $f(x) = ax^k$, $g(x) = bx^n$, $h(x) = cx^m$, $r(x) = 0$, and $s(x) = s_0 x^l$.

27. $\dfrac{\partial w}{\partial x} + \left(ax^k y + be^{\lambda x}\right)\left(\dfrac{\partial w}{\partial y}\right)^2 = 0.$

This is a special case of equation 2.2.2.11 with $f(x) = ax^k$ and $g(x) = be^{\lambda x}$. Complete integral:

$$w = \varphi(x)y - b\int e^{\lambda x}\varphi^2(x)\,dx + C_1, \qquad \varphi(x) = \left(\frac{a}{k+1}x^{k+1} + C_2\right)^{-1}.$$

28. $\dfrac{\partial w}{\partial x}+\left(ax^ny^k+bx^my^{2k-2}\right)\left(\dfrac{\partial w}{\partial y}\right)^2=0.$

This is a special case of equation 2.2.2.13 with $f(x)=ax^n$ and $g(x)=bx^m$.

29. $\dfrac{\partial w}{\partial x}+\left(ax^ny^k+bx^my^{2k-2}\right)\left(\dfrac{\partial w}{\partial y}\right)^2=cx^qw+s_0x^l.$

This is a special case of equation 2.2.2.14 with $f(x)=ax^n$, $g(x)=bx^m$, $h(x)=cx^q$, and $s(x)=s_0x^l$.

30. $\dfrac{\partial w}{\partial x}+A(ax+by)^k\left(\dfrac{\partial w}{\partial y}\right)^2=B(ax+by)^n.$

This is a special case of equation 2.2.2.17 with $f(\xi)=A\xi^k$ and $g(\xi)=B\xi^n$. Complete integral:

$$w=C_1x+C_2-\frac{a\xi^{1-k}}{2b^2A(1-k)}\pm\frac{a}{2b^2A}\int\xi^{-k}\sqrt{4b^2AB\xi^{k+n}-4b^2AC_1\xi^k+a^2}\,d\xi,\quad \xi=ax+by.$$

31. $\dfrac{\partial w}{\partial x}+A(ax+by)^k\left(\dfrac{\partial w}{\partial y}\right)^2=Be^{ax+by}.$

This is a special case of equation 2.2.2.17 with $f(\xi)=A\xi^k$ and $g(\xi)=Be^{\xi}$.

32. $\dfrac{\partial w}{\partial x}+\left(ae^{\lambda x}y+be^{\beta x}\right)\left(\dfrac{\partial w}{\partial y}\right)^2=0.$

This is a special case of equation 2.2.2.11 with $f(x)=ae^{\lambda x}$ and $g(x)=be^{\beta x}$. Complete integral:

$$w=\varphi(x)y-b\int e^{\beta x}\varphi^2(x)\,dx+C_1,\qquad \varphi(x)=\left(\frac{a}{\lambda}e^{\lambda x}+C_2\right)^{-1}.$$

33. $\dfrac{\partial w}{\partial x}+\left(ae^{\lambda x}y+bx^k\right)\left(\dfrac{\partial w}{\partial y}\right)^2=0.$

This is a special case of equation 2.2.2.11 with $f(x)=ae^{\lambda x}$ and $g(x)=bx^k$. Complete integral:

$$w=\varphi(x)y-b\int x^k\varphi^2(x)\,dx+C_1,\qquad \varphi(x)=\left(\frac{a}{\lambda}e^{\lambda x}+C_2\right)^{-1}.$$

34. $\dfrac{\partial w}{\partial x}+\left(ae^{\lambda x}y+be^{\beta x}\right)\left(\dfrac{\partial w}{\partial y}\right)^2=ce^{\gamma x}w+s_0e^{\mu x}.$

This is a special case of equation 2.2.2.12 with $f(x)=ae^{\lambda x}$, $g(x)=be^{\beta x}$, $h(x)=ce^{\gamma x}$, $r(x)=0$, and $s(x)=s_0e^{\mu x}$.

35. $\dfrac{\partial w}{\partial x}+\left(ae^{\beta x}+be^{\lambda y+\mu x}\right)\left(\dfrac{\partial w}{\partial y}\right)^2=0.$

This is a special case of equation 2.2.2.15 with $f(x)=ae^{\beta x}$ and $g(x)=be^{\mu x}$,

36. $\dfrac{\partial w}{\partial x}+\left(ae^{\lambda x}y^{k}+be^{\beta x}y^{2k-2}\right)\left(\dfrac{\partial w}{\partial y}\right)^{2}=0.$

This is a special case of equation 2.2.2.13 with $f(x)=ae^{\lambda x}$ and $g(x)=be^{\beta x}$.

37. $\dfrac{\partial w}{\partial x}+\left(ae^{\lambda x}y^{k}+be^{\beta x}y^{2k-2}\right)\left(\dfrac{\partial w}{\partial y}\right)^{2}=ce^{\gamma x}w+s_0e^{\mu x}.$

This is a special case of equation 2.2.2.14 with $f(x)=ae^{\lambda x}$, $g(x)=be^{\beta x}$, $h(x)=ce^{\gamma x}$, and $s(x)=s_0e^{\mu x}$.

38. $\dfrac{\partial w}{\partial x}+\left(ax^{k}+bx^{n}e^{\lambda y}\right)\left(\dfrac{\partial w}{\partial y}\right)^{2}=0.$

This is a special case of equation 2.2.2.15 with $f(x)=ax^k$ and $g(x)=bx^n$.

39. $\dfrac{\partial w}{\partial x}+\left(ae^{\beta x}+be^{\lambda y+\mu x}\right)\left(\dfrac{\partial w}{\partial y}\right)^{2}=cw+s_0e^{\gamma x}.$

This is a special case of equation 2.2.2.16 with $f(x)=ae^{\beta x}$, $g(x)=be^{\mu x}$, $h(x)=c$, and $s(x)=s_0e^{\gamma x}$.

40. $\dfrac{\partial w}{\partial x}+Ae^{ax+by}\left(\dfrac{\partial w}{\partial y}\right)^{2}=Be^{\lambda(ax+by)}.$

This is a special case of equation 2.2.2.17 with $f(\xi)=Ae^{\xi}$ and $g(\xi)=Be^{\lambda\xi}$. Complete integral:

$$w=C_1x+C_2+\frac{a}{2b^2A}e^{-\xi}\pm\frac{1}{2b^2A}\int e^{-\xi}\sqrt{4b^2ABe^{(\lambda+1)\xi}-4b^2AC_1e^{\xi}+a^2}\,d\xi,\qquad \xi=ax+by.$$

41. $\dfrac{\partial w}{\partial x}+Ae^{ax+by}\left(\dfrac{\partial w}{\partial y}\right)^{2}=B(ax+by)^{k}.$

This is a special case of equation 2.2.2.17 with $f(\xi)=Ae^{\xi}$ and $g(\xi)=B\xi^k$.

42. $\dfrac{\partial w}{\partial x}+\left(a_2x^{k_2}w+a_1x^{k_1}y+a_0x^{k_0}\right)\left(\dfrac{\partial w}{\partial y}\right)^{2}=b_2x^{n_2}w+b_1x^{n_1}y+b_0x^{n_0}.$

This is a special case of equation 2.2.2.19 with $f_m(x)=a_mx^{k_m}$ and $g_m(x)=b_mx^{n_m}$ ($m=0,\,1,\,2$).

43. $\dfrac{\partial w}{\partial x}+\left(a_2e^{\lambda_2x}w+a_1e^{\lambda_1x}y+a_0e^{\lambda_0x}\right)\left(\dfrac{\partial w}{\partial y}\right)^{2}=b_2e^{\beta_2x}w+b_1e^{\beta_1x}y+b_0e^{\beta_0x}.$

This is a special case of equation 2.2.2.19 with $f_m(x)=a_me^{\lambda_mx}$ and $g_m(x)=b_me^{\beta_mx}$ ($m=0,\,1,\,2$).

44. $\dfrac{\partial w}{\partial x}-aw^{k}\left(\dfrac{\partial w}{\partial y}\right)^{2}=0.$

Complete integral: $w=\left[\dfrac{k+1}{a}\left(C_1^2x+C_1y+C_2\right)\right]^{\frac{1}{k+1}}.$

45. $\dfrac{\partial w}{\partial x} - aw^k\left(\dfrac{\partial w}{\partial y}\right)^2 - \left(bx^n y + cx^m\right)\dfrac{\partial w}{\partial y} = 0.$

This is a special case of equation 2.2.2.24 with $f(w) = aw^k$, $g(x) = bx^n$, and $h(x) = cx^m$.

46. $\dfrac{\partial w}{\partial x} + ax^n w^k\left(\dfrac{\partial w}{\partial y}\right)^2 = bx^m w.$

This is a special case of equation 2.2.2.20 with $f(x) = ax^n$ and $g(x) = bx^m$.

47. $\dfrac{\partial w}{\partial x} + ay^k w^n\left(\dfrac{\partial w}{\partial y}\right)^2 = bw^m.$

This is a special case of equation 2.2.2.25 with $f(y) = ay^k$, $g(w) = w^n$, and $h(w) = bw^m$.

48. $\dfrac{\partial w}{\partial x} + by^n w^k\left(\dfrac{\partial w}{\partial y}\right)^2 = aw^{k+2} + cx^m w.$

This is a special case of equation 2.2.2.21 with $f(y) = by^n$ and $g(x) = cx^m$.

49. $\dfrac{\partial w}{\partial x} + A(w + ax + by)^k\left(\dfrac{\partial w}{\partial y}\right)^2 = B(w + ax + by)^n.$

This is a special case of equation 2.2.2.27 with $f(u) = Au^k$ and $g(u) = Bu^n$.

50. $\dfrac{\partial w}{\partial x} + ae^{\lambda x} w^k\left(\dfrac{\partial w}{\partial y}\right)^2 = be^{\beta x} w.$

This is a special case of equation 2.2.2.20 with $f(x) = ae^{\lambda x}$ and $g(x) = be^{\beta x}$.

51. $\dfrac{\partial w}{\partial x} + ae^{\lambda y} w^k\left(\dfrac{\partial w}{\partial y}\right)^2 = be^{\beta w}.$

This is a special case of equation 2.2.2.25 with $f(y) = ae^{\lambda y}$, $g(w) = w^k$, and $h(w) = be^{\beta w}$.

52. $\dfrac{\partial w}{\partial x} + be^{\lambda y} w^k\left(\dfrac{\partial w}{\partial y}\right)^2 = aw^{k+2} + ce^{\beta x} w.$

This is a special case of equation 2.2.2.21 with $f(y) = be^{\lambda y}$ and $g(x) = ce^{\beta x}$.

53. $\dfrac{\partial w}{\partial x} - ae^{\beta w}\left(\dfrac{\partial w}{\partial y}\right)^2 = 0.$

Complete integral: $w = \dfrac{1}{\beta}\ln\left[\beta(aC_1^2 x + C_1 y + C_2)\right].$

54. $\dfrac{\partial w}{\partial x} - ax^k e^{\beta w}\left(\dfrac{\partial w}{\partial y}\right)^2 - bx^n = 0.$

This is a special case of equation 2.2.2.22 with $f(x) = ax^k$ and $g(x) = bx^n$.

55. $\dfrac{\partial w}{\partial x} - ae^{\lambda x+\beta w}\left(\dfrac{\partial w}{\partial y}\right)^2 - be^{\gamma x} = 0.$

This is a special case of equation 2.2.2.22 with $f(x) = ae^{\lambda x}$ and $g(x) = be^{\gamma x}$.

56. $\dfrac{\partial w}{\partial x} - ae^{\beta w}\left(\dfrac{\partial w}{\partial y}\right)^2 - \left(be^{\lambda x}y + ce^{\mu x}\right)\dfrac{\partial w}{\partial y} = 0.$

This is a special case of equation 2.2.2.24 with $f(w) = ae^{\beta w}$, $g(x) = be^{\lambda x}$, and $h(x) = ce^{\mu x}$.

57. $\dfrac{\partial w}{\partial x} + ae^{\lambda y+\beta w}\left(\dfrac{\partial w}{\partial y}\right)^2 = be^{\gamma w}.$

This is a special case of equation 2.2.2.25 with $f(y) = ae^{\lambda y}$, $g(w) = e^{\beta w}$, and $h(w) = be^{\gamma w}$.

58. $\dfrac{\partial w}{\partial x} - ax^k y^n w^m\left(\dfrac{\partial w}{\partial y}\right)^2 = 0.$

Complete integral: $w = \left[(m+1)\left(\dfrac{aC_1^2}{k+1}x^{k+1} + \dfrac{2C_1}{2-n}y^{\frac{2-n}{2}} + C_2\right)\right]^{\frac{1}{m+1}}.$

59. $\dfrac{\partial w}{\partial x} - ax^k e^{\lambda y} w^m\left(\dfrac{\partial w}{\partial y}\right)^2 = 0.$

Complete integral: $w = \left[(m+1)\left(\dfrac{aC_1^2}{k+1}x^{k+1} - \dfrac{2C_1}{\lambda}e^{-\frac{1}{2}\lambda y} + C_2\right)\right]^{\frac{1}{m+1}}.$

60. $\dfrac{\partial w}{\partial x} - ae^{\lambda x} y^n w^m\left(\dfrac{\partial w}{\partial y}\right)^2 = 0.$

Complete integral: $w = \left[(m+1)\left(\dfrac{aC_1^2}{\lambda}e^{\lambda x} + \dfrac{2C_1}{2-n}y^{\frac{2-n}{2}} + C_2\right)\right]^{\frac{1}{m+1}}.$

61. $\dfrac{\partial w}{\partial x} - ax^k y^n e^{\lambda w}\left(\dfrac{\partial w}{\partial y}\right)^2 = 0.$

Complete integral: $w = \dfrac{1}{\lambda}\ln\left(\dfrac{aC_1^2\lambda}{k+1}x^{k+1} + \dfrac{2C_1\lambda}{2-n}y^{\frac{2-n}{2}} + C_2\right).$

62. $\dfrac{\partial w}{\partial x} - ae^{\lambda x+\beta y+\gamma w}\left(\dfrac{\partial w}{\partial y}\right)^2 = 0.$

Complete integral: $w = \dfrac{1}{\gamma}\ln\left(\dfrac{aC_1^2\gamma}{\lambda}e^{\lambda x} - \dfrac{2C_1\gamma}{\beta}e^{-\frac{1}{2}\beta y} + C_2\right).$

63. $\dfrac{\partial w}{\partial x} + Ae^{w+ax+by}\left(\dfrac{\partial w}{\partial y}\right)^2 = Be^{\lambda(w+ax+by)}.$

This is a special case of equation 2.2.2.27 with $f(u) = Ae^u$ and $g(u) = Be^{\lambda u}$.

2.1.5. Equations of the Form

$$\frac{\partial w}{\partial x} + f(x,y,w)\left(\frac{\partial w}{\partial x}\right)^2 + g(x,y,w)\frac{\partial w}{\partial y} = h(x,y,w)$$

▷ *Equations of this type are encountered in mechanics, where x plays the role of time and y plays the role of the spatial coordinate.*

1. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 + b\dfrac{\partial w}{\partial y} = cx^k + sy^n.$

Complete integral: $w = -C_1 x + C_2 + \dfrac{c}{k+1}x^{k+1} - \dfrac{b}{2a}y \pm \dfrac{1}{2a}\displaystyle\int \sqrt{4asy^n + b^2 + 4aC_1}\,dy.$

2. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 + b\dfrac{\partial w}{\partial y} = cx^k + se^{\beta y}.$

Complete integral: $w = -C_1 x + C_2 + \dfrac{c}{k+1}x^{k+1} - \dfrac{b}{2a}y \pm \dfrac{1}{2a}\displaystyle\int \sqrt{4ase^{\beta y} + b^2 + 4aC_1}\,dy.$

3. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 + b\dfrac{\partial w}{\partial y} = ce^{\lambda x} + sy^k.$

Complete integral: $w = -C_1 x + C_2 + \dfrac{c}{\lambda}e^{\lambda x} - \dfrac{b}{2a}y \pm \dfrac{1}{2a}\displaystyle\int \sqrt{4asy^k + b^2 + 4aC_1}\,dy.$

4. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 + b\dfrac{\partial w}{\partial y} = ce^{\lambda x} + se^{\beta y}.$

Complete integral: $w = -C_1 x + C_2 + \dfrac{c}{\lambda}e^{\lambda x} - \dfrac{b}{2a}y \pm \dfrac{1}{2a}\displaystyle\int \sqrt{4ase^{\beta y} + b^2 + 4aC_1}\,dy.$

5. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 + b\dfrac{\partial w}{\partial y} = cx^k y + sx^n.$

Complete integral:

$$w = y\left(\frac{cx^{k+1}}{k+1} + C_1\right) + \frac{sx^{n+1}}{n+1} - \frac{ac^2x^{2k+3}}{(k+1)^2(2k+3)} - \frac{c(2aC_1+b)x^{k+2}}{(k+1)(k+2)} - (aC_1^2 + bC_1)x + C_2.$$

6. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 + b\dfrac{\partial w}{\partial y} = cx^k y + se^{\beta x}.$

This is a special case of equation 2.2.3.2 with $f(x) = cx^k$ and $g(x) = se^{\beta x}$.

7. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 + b\dfrac{\partial w}{\partial y} = ce^{\lambda x} y + sx^k.$

This is a special case of equation 2.2.3.2 with $f(x) = ce^{\lambda x}$ and $g(x) = sx^k$.

8. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2+b\dfrac{\partial w}{\partial y}=ce^{\lambda x}y+se^{\beta x}.$

Complete integral:

$$w=y\left(\frac{c}{\lambda}e^{\lambda x}+C_1\right)+\frac{s}{\beta}e^{\beta x}-\frac{ac^2}{2\lambda^3}e^{2\lambda x}-\frac{c(2aC_1+b)}{\lambda^2}e^{\lambda x}-(aC_1^2+bC_1)x+C_2.$$

9. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2+b\dfrac{\partial w}{\partial y}=cx^kw+sx^n.$

Complete integral:

28. $\dfrac{\partial w}{\partial x} + aw^k\left(\dfrac{\partial w}{\partial y}\right)^2 + be^{\lambda w}\dfrac{\partial w}{\partial y} = 0.$

Complete integral in implicit form: $C_1 x + C_2 y + \displaystyle\int \frac{aC_2^2 w^k\,dw}{C_1 + bC_2 e^{\lambda w}} = C_3.$

29. $\dfrac{\partial w}{\partial x} + aw^k\left(\dfrac{\partial w}{\partial y}\right)^2 + bw^n\dfrac{\partial w}{\partial y} = cw^m.$

This is a special case of equation 2.2.3.12 with $f(w) = aw^k$, $g(w) = bw^n$, and $h(w) = cw^m$.

30. $\dfrac{\partial w}{\partial x} - aw^k\left(\dfrac{\partial w}{\partial y}\right)^2 - (bx^n y + cx^m)\dfrac{\partial w}{\partial y} = 0.$

This is a special case of equation 2.2.3.13 with $f(w) = aw^k$, $g(x) = bx^n$, and $h(x) = cx^m$.

31. $\dfrac{\partial w}{\partial x} + ae^{\lambda w}\left(\dfrac{\partial w}{\partial y}\right)^2 + bw^n\dfrac{\partial w}{\partial y} = 0.$

Complete integral in implicit form: $C_1x + C_2y + \displaystyle\int \frac{aC_2^2e^{\lambda w}\,dw}{C_1 + bC_2w^n} = C_3.$

32. $\dfrac{\partial w}{\partial x} + ae^{\lambda w}\left(\dfrac{\partial w}{\partial y}\right)^2 + be^{\beta w}\dfrac{\partial w}{\partial y} = 0.$

Complete integral in implicit form: $C_1x + C_2y + \displaystyle\int \frac{aC_2^2e^{\lambda w}\,dw}{C_1 + bC_2e^{\beta w}} = C_3.$

33. $\dfrac{\partial w}{\partial x} + ae^{\lambda w}\left(\dfrac{\partial w}{\partial y}\right)^2 + be^{\beta w}\dfrac{\partial w}{\partial y} = ce^{\gamma w}.$

This is a special case of equation 2.2.3.12 with $f(w) = ae^{\lambda w}$, $g(w) = be^{\beta w}$, and $h(w) = ce^{\gamma w}$.

34. $\dfrac{\partial w}{\partial x} - ae^{\lambda w}\left(\dfrac{\partial w}{\partial y}\right)^2 - (be^{\beta x}y + ce^{\gamma x})\dfrac{\partial w}{\partial y} = 0.$

This is a special case of equation 2.2.3.13 with $f(w) = ae^{\lambda w}$, $g(x) = be^{\beta x}$, and $h(x) = ce^{\gamma x}$.

35. $\dfrac{\partial w}{\partial x} + A(w + ax + by)^k\left(\dfrac{\partial w}{\partial y}\right)^2 + B(w + ax + by)^n\dfrac{\partial w}{\partial y} = C(w + ax + by)^m.$

This is a special case of equation 2.2.3.14 with $f(z) = Az^k$, $g(z) = Bz^n$, and $h(z) = Cz^m$.

36. $\dfrac{\partial w}{\partial x} + Ae^{w+ax+by}\left(\dfrac{\partial w}{\partial y}\right)^2 + Be^{\lambda(w+ax+by)}\dfrac{\partial w}{\partial y} = Ce^{\beta(w+ax+by)}.$

This is a special case of equation 2.2.3.14 with $f(z) = Ae^z$, $g(z) = Be^{\lambda z}$, and $h(z) = Ce^{\beta z}$.

2.1.6. Equations of the Form

$$f(x, y, w)\left(\frac{\partial w}{\partial x}\right)^2 + g(x, y, w)\left(\frac{\partial w}{\partial y}\right)^2 = h(x, y, w)$$

▷ *Equations of this type are encountered in mechanics, geometric optics, and differential geometry. In particular, the equation* $\left(\frac{\partial w}{\partial x}\right)^2 + \left(\frac{\partial w}{\partial y}\right)^2 = f(x, y)$ *describes the two-dimensional wave front in the process of propagation of light in an inhomogeneous medium with variable refractive index* $f(x, y)$.

1. $a\left(\dfrac{\partial w}{\partial x}\right)^2 + b\left(\dfrac{\partial w}{\partial y}\right)^2 = c.$

For $a = b$, this is a *differential equation of light rays*.
Complete integral: $w = C_1x + C_2y + C_3$, where $aC_1^2 + bC_2^2 = c$.
An alternative form of the complete integral: $\dfrac{w^2}{c} = \dfrac{(x - C_1)^2}{a} + \dfrac{(y - C_2)^2}{b}.$

2. $\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2=a-2by.$

This equation governs parabolic motion of a point mass in vacuum (the coordinate x is measured along the Earth's surface, the coordinate y is measured vertically upward from the Earth's surface, and a is the gravitational acceleration).

Complete integral: $w=C_1x\pm\frac{1}{3b}(a-C_1^2-2by)^{3/2}+C_2$.

⊙ Reference: P. Appell (1953).

3. $\left(\dfrac{\partial w}{\partial x}\right)^2+a\left(\dfrac{\partial w}{\partial y}\right)^2=bx+cy.$

Complete integral for $b^2+ac^2\neq 0$:

$$w=\frac{bC_1}{b^2+ac^2}(by-acx)-\frac{2}{3}\frac{[(b^2+ac^2)(bx+cy)-ab^2C_1^2]^{3/2}}{(b^2+ac^2)^2}+C_2.$$

Complete integral for $b^2+ac^2=0$:

$$w=\frac{c}{4C_1b^2}(bx+cy)^2-\frac{C_1}{2}y+\frac{C_1b}{2c}x+C_2.$$

Another complete integral for $a=1$, $b=k^2$, and $c=\pm k^2$:

$$w=\tfrac{2}{3}k(x+C_1)^{3/2}\pm\tfrac{2}{3}k(y\mp C_1)^{3/2}+C_2.$$

4. $\left(\dfrac{\partial w}{\partial x}\right)^2+a\left(\dfrac{\partial w}{\partial y}\right)^2=b_1x^2+b_2y^2+c_1x+c_2y+s.$

A separable equation. Complete integral:

$$w=\pm\int\sqrt{b_1x^2+c_1x+s-C_1}\,dx\pm\int\sqrt{\frac{b_2y^2+c_2y+C_1}{a}}\,dy+C_2.$$

5. $\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2=ax^2+bxy+cy^2+s.$

Let the numbers A, B, k_1, and k_2 satisfy the following algebraic system of equations (k_1 or k_2 can be set equal to unity):

$$Ak_1^2+Bk_2^2=a,\quad 2(A-B)k_1k_2=b,\quad Ak_2^2+Bk_1^2=c.$$

Then the transformation $\xi=k_1x+k_2y$, $\eta=k_2x-k_1y$ leads to an equation of the form 2.1.6.4:

$$\left(\frac{\partial w}{\partial\xi}\right)^2+\left(\frac{\partial w}{\partial\eta}\right)^2=\frac{A}{k_1^2+k_2^2}\xi^2+\frac{B}{k_1^2+k_2^2}\eta^2+\frac{s}{k_1^2+k_2^2}.$$

6. $\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2=ax^2+bxy+cy^2+\beta x+\gamma y+s.$

The transformation used for solving equation 2.1.6.5 brings the above equation to a separable equation of the form 2.1.6.4.

7. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\left(\dfrac{\partial w}{\partial y}\right)^2 = bx^k.$

Complete integral: $w = C_1 y + C_2 \pm \int \sqrt{bx^k - aC_1^2}\, dx.$

8. $\left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2 = ax^k + by^n + c.$

A separable equation. Complete integral:

$$w = \pm \int \sqrt{ax^k + C_1}\, dx \pm \int \sqrt{by^n + c - C_1}\, dy + C_2.$$

⊙ Reference: E. Kamke (1965).

9. $\left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2 = \dfrac{a}{\sqrt{x^2 + y^2}} + b.$

This equation arises from the solution of the *two-body problem in celestial mechanics*.

By using the polar coordinates $x = r\cos\theta$ and $y = r\sin\theta$, one can obtain a separable equation. This equation has the complete integral

$$w = \pm \int \sqrt{b + \frac{a}{r} - \frac{C_1^2}{r^2}}\, dr + C_1\theta + C_2.$$

⊙ References: P. Appell (1953), R. Courant (1962), and E. Kamke (1965).

10. $\left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2 = a(x^2 + y^2)^k.$

This is a special case of equation 2.2.4.4 with $f(z) = az^k$.

11. $\left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2 = a(x^2 + y^2)(xy)^k.$

This is a special case of equation 2.2.4.5 with $f(z) = az^k$.

12. $\left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2 = a(x^2 + y^2)(x^2 - y^2)^k.$

This is a special case of equation 2.2.4.6 with $f(z) = az^k$.

13. $\left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2 = A(ax + by)^k + B(bx - ay)^n + s.$

This is a special case of equation 2.2.4.3 with $f(z) = Az^k$ and $g(u) = Bu^n + s$.

14. $a\left(\dfrac{\partial w}{\partial x}\right)^2 + b\left(\dfrac{\partial w}{\partial y}\right)^2 = cw.$

Complete integral: $w = \dfrac{c}{4(aC_1^2 + bC_2^2)}(C_1 x + C_2 y + C_3)^2.$

15. $\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2=aw^2+b.$

Complete integral in implicit form: $x\cos C_1+y\sin C_1+C_2=\pm\displaystyle\int\frac{dw}{\sqrt{aw^2+b}}$.
Whence, in particular, for $a=1$ and $b=0$ we have $w=\widetilde{C}_2\exp\bigl(x\cos C_1+y\sin C_1\bigr)$.

16. $\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2+1=\dfrac{a^2}{w^2}.$

This equation describes a family of spherical surfaces of radius a with centers at points of the xy-plane. Complete integral in implicit form: $(x-C_1)^2+(y-C_2)^2+w^2=a^2$.

Another complete integral: $\dfrac{(y-C_1x-C_2)^2}{1+C_1^2}+w^2=a^2$.

17. $\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2=aw^k.$

This is a special case of equation 2.2.4.7 with $f(w)=aw^k$.

18. $\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2=\bigl(ax^2+bxy+cy^2+s\bigr)w^k.$

The substitution $u=\dfrac{2}{2-k}w^{\frac{2-k}{2}}$ leads to an equation of the form 2.1.6.5:

$$\left(\frac{\partial u}{\partial x}\right)^2+\left(\frac{\partial u}{\partial y}\right)^2=ax^2+bxy+cy^2+s.$$

19. $\left(\dfrac{\partial w}{\partial x}\right)^2+axy\left(\dfrac{\partial w}{\partial y}\right)^2=b.$

Complete integral: $w=-\dfrac{2\bigl(b-aC_1^2x\bigr)^{3/2}}{3aC_1^2}+2C_1\sqrt{y}+C_2$.

20. $\left(\dfrac{\partial w}{\partial x}\right)^2+A(ax+by)^k\left(\dfrac{\partial w}{\partial y}\right)^2=B(ax+by)^n.$

This is a special case of equation 2.2.4.15 with $f(z)=1$, $g(z)=Az^k$, and $h(z)=Bz^n$.

21. $a\left(\dfrac{\partial w}{\partial x}\right)^2+bw\left(\dfrac{\partial w}{\partial y}\right)^2=c^2.$

Complete integral: $bC_2^2w=-aC_1^2+\left[\dfrac{3bcC_2^2}{2}(C_1x+C_2y+C_3)\right]^{2/3}$.

22. $x\left(\dfrac{\partial w}{\partial x}\right)^2 + ay\left(\dfrac{\partial w}{\partial y}\right)^2 = bx + cy.$

Complete integral:

$$w = \sqrt{x(bx + C_1)} + \frac{C_1}{2\sqrt{b}} \ln\left|2bx + 2\sqrt{bx(bx + C_1)} + C_1\right| + \sqrt{\frac{y(cy - C_1)}{a}} - \frac{C_1}{2\sqrt{ac}} \ln\left|2cy + 2\sqrt{cy(cy - C_1)} - C_1\right| + C_2.$$

23. $ax^2\left(\dfrac{\partial w}{\partial x}\right)^2 + by^2\left(\dfrac{\partial w}{\partial y}\right)^2 = w^c.$

The transformation

$$u = \ln x, \quad v = \ln y, \quad w = \begin{cases} \left(\dfrac{2-c}{2}z\right)^{\frac{2}{2-c}} & \text{if } c \neq 2, \\ e^z & \text{if } c = 2 \end{cases}$$

leads to an equation of the form 2.1.6.1: $az_u^2 + bz_v^2 = 1$.

24. $(x^2 - a^2)\left(\dfrac{\partial w}{\partial x}\right)^2 - (y^2 - a^2)\left(\dfrac{\partial w}{\partial y}\right)^2 = b(x^2 - y^2) + kx.$

This equation arises from the solution of the plane problem of attraction between two identical fixed point bodies (the variables x and y play the role of elliptic coordinates and a is the distance between the bodies).

Complete integral: $w = \pm \int \sqrt{\dfrac{bx^2 + kx + C_1}{x^2 - a^2}}\, dx \pm \int \sqrt{\dfrac{by^2 + C_1}{y^2 - a^2}}\, dy + C_2.$

⊙ Reference: V. I. Arnold (1980).

25. $(x + a_1)(x + a_2)\left(\dfrac{\partial w}{\partial x}\right)^2 - (y + a_1)(y + a_2)\left(\dfrac{\partial w}{\partial y}\right)^2 = k\sqrt{x + a_1} + b\sqrt{y + a_2} + c(x - y).$

Complete integral:

$$w = \int \sqrt{\frac{C_1 + cx + k\sqrt{x + a_1}}{(x + a_1)(x + a_2)}}\, dx + \int \sqrt{\frac{C_1 + cy - b\sqrt{y + a_1}}{(y + a_1)(y + a_2)}}\, dy + C_2.$$

For $2k = m_1 + m_2$, $2b = m_1 - m_2$, $x = \lambda_1$, and $y = \lambda_2$, this equation governs the motion of a point body of unit mass in the xy-plane under the action of the gravitational forces produced by two point masses m_1 and m_2 located at the points ($x = \pm 1$, $y = 0$) in elliptic coordinates (λ_1, λ_2).

⊙ Reference: E. Kamke (1965).

26. $$4y(a-x)(b-x)(c-x)\left(\frac{\partial w}{\partial x}\right)^2-4x(a-y)(b-y)(c-y)\left(\frac{\partial w}{\partial y}\right)^2=xy(x-y).$$

This equation is encountered in searching for geodesic lines on an ellipsoid with semiaxes a, b, and c. Complete integral:

$$w=\frac{1}{2}\int\sqrt{\frac{x(x+C_1)}{F(x)}}\,dx+\frac{1}{2}\int\sqrt{\frac{y(y+C_1)}{F(y)}}\,dy+C_2,\qquad F(t)=(a-t)(b-t)(c-t).$$

⊙ Reference: E. Kamke (1965).

27. $$ax^k\left(\frac{\partial w}{\partial x}\right)^2+by^n\left(\frac{\partial w}{\partial y}\right)^2=cx^m+sy^l+\beta.$$

A separable equation. Complete integral:

$$w=\pm\int\sqrt{\frac{cx^m+C_1}{ax^k}}\,dx\pm\int\sqrt{\frac{sy^l+\beta-C_1}{by^n}}\,dy+C_2.$$

The signs before each integral can chosen independently of each other.

28. $$(\sin x)^2\left[\left(\frac{\partial w}{\partial x}\right)^2-a\right]+b\left(\frac{\partial w}{\partial y}\right)^2=0.$$

This equation arises in introducing orthogonal geodesic parametric lines on a unit sphere. Complete integral:

$$w=C_1y+C_2\pm\int\sqrt{a-\frac{bC_1^2}{(\sin x)^2}}\,dx.$$

⊙ Reference: E. Kamke (1965).

29. $$A(ax+by)^k\left(\frac{\partial w}{\partial x}\right)^2+B(ax+by)^n\left(\frac{\partial w}{\partial y}\right)^2=C(ax+by)^m.$$

This is a special case of equation 2.2.4.15 with $f(z)=Az^k$, $g(z)=Bz^n$, and $h(z)=Cz^m$.

30. $$A(w+ax+by)^k\left(\frac{\partial w}{\partial x}\right)^2+B(w+ax+by)^n\left(\frac{\partial w}{\partial y}\right)^2=C(w+ax+by)^m.$$

This is a special case of equation 2.2.4.16 with $f(z)=Az^k$, $g(z)=Bz^n$, and $h(z)=Cz^m$.

31. $$ax^kw^{n_1}\left(\frac{\partial w}{\partial x}\right)^2+by^mw^{n_2}\left(\frac{\partial w}{\partial y}\right)^2=cw^{n_3}+s.$$

This is a special case of equation 2.2.4.17 with $f_1(x)=ax^k$, $g_1(w)=w^{n_1}$, $f_2(y)=by^m$, $g_2(w)=w^{n_2}$, and $h(w)=cw^{n_3}+s$.

32. $$Ae^{ax+by}\left(\frac{\partial w}{\partial x}\right)^2+Be^{\lambda(ax+by)}\left(\frac{\partial w}{\partial y}\right)^2=Ce^{(ax+by)}.$$

This is a special case of equation 2.2.4.15 with $f(z)=Ae^z$, $g(z)=Be^{\lambda z}$, and $h(z)=Ce^{\beta z}$.

33. $Ae^{w+ax+by}\left(\dfrac{\partial w}{\partial x}\right)^2 + Be^{\lambda(w+ax+by)}\left(\dfrac{\partial w}{\partial y}\right)^2 = Ce^{(w+ax+by)}.$

This is a special case of equation 2.2.4.16 with $f(z) = Ae^z$, $g(z) = Be^{\lambda z}$, and $h(z) = Ce^{\beta z}$.

34. $ae^{\lambda_1 x+\beta_1 w}\left(\dfrac{\partial w}{\partial x}\right)^2 + be^{\lambda_2 y+\beta_2 w}\left(\dfrac{\partial w}{\partial y}\right)^2 = ce^{\gamma w} + s.$

This is a special case of equation 2.2.4.17 with $f_1(x) = ae^{\lambda_1 x}$, $g_1(w) = e^{\beta_1 w}$, $f_2(y) = be^{\lambda_2 y}$, $g_2(w) = e^{\beta_2 w}$, and $h(w) = ce^{\gamma w} + s$.

2.1.7. Equations of the Form

$$f(x,y)\left(\frac{\partial w}{\partial x}\right)^2 + g(x,y)\frac{\partial w}{\partial x}\frac{\partial w}{\partial y} = h(x,y,w)$$

1. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + bx + cy = 0.$

1°. Complete integral for $b \neq 0$:

$$w = \frac{3ab^2x + b(ac-2b)y + aC_1(b+ac)}{3a^2b^2}\sqrt{a(aC_1-2by)} + C_2.$$

2°. Complete integral for $b \neq -ac$:

$$w = \frac{abC_1x - (ac+2b)C_1y}{2b(b+ac)} - \frac{\left[(aC_1)^2 - 4b(b+ac)(bx+cy)\right]^{-3/2}}{12b^2(b+ac)^2} + C_2.$$

3°. Complete integral for $b = 0$:

$$w = C_1x - \frac{y}{2aC_1}(cy + 2C_1^2) + C_2.$$

4°. Complete integral for $b = -ac$:

$$w = \frac{c^2(2y-ax)x}{2C_1} - \frac{(c^3y + 2C_1^2)y}{2acC_1} + C_2.$$

2. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + bxy = 0.$

Complete integral: $w = \left(x - \dfrac{y}{2a}\right)\sqrt{C_1 - \dfrac{b}{a}y^2} - \dfrac{C_1}{2\sqrt{-ab}}\ln\left|\sqrt{-ab}\,y + \sqrt{a(aC_1 - by^2)}\right| + C_2.$

3. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + bw = 0.$

Complete integrals:

$$w = \frac{(by + C_1)(y - ax + C_2)}{a^2}, \qquad w = -\frac{b(C_1x + y + C_2)^2}{4C_1(a + C_1)}.$$

4. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + bw + cy^k = 0.$

Complete integral: $w = \dfrac{by + C_1}{a^2}\left[y - ax + a^2 c\displaystyle\int \frac{y^k\,dy}{(by + C_1)^2} + C_2\right].$

5. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + by^k w = 0.$

Complete integral: $w = \dfrac{1}{a^2}(y - ax + C_1)\left(\dfrac{b}{k+1}y^{k+1} + C_2\right).$

6. $a\left(\dfrac{\partial w}{\partial x}\right)^2 + b\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = cw^2.$

Complete integral: $w = C_3 \exp\bigl(C_1 x + C_2 y\bigr),$ where $aC_1^2 + bC_1C_2 = c.$

7. $\left(\dfrac{\partial w}{\partial x}\right)^2 + ay\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + (bx + c)y = 0.$

Complete integral:

$$w = \begin{cases} \dfrac{abx + ac - 2b}{a^2 b}\sqrt{-a(2by + C_1)} + \dfrac{2\sqrt{aC_1}}{a^2}\arctan\sqrt{-1 - \dfrac{2by}{C_1}} + C_2 & \text{if } b \neq 0, \\ C_1 x - \dfrac{cy + C_1^2 \ln|y|}{aC_1} + C_2 & \text{if } b = 0. \end{cases}$$

8. $\left(\dfrac{\partial w}{\partial x}\right)^2 + ay\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + bxy + c = 0.$

Complete integral: $w = \dfrac{ax - 2}{a}\sqrt{C_1 - \dfrac{2by}{a}} - \dfrac{2(c + C_1)}{a(-C_1)^{1/2}}\arctan\sqrt{\dfrac{2by}{aC_1} - 1} + C_2.$

9. $\left(\dfrac{\partial w}{\partial x}\right)^2 + ay\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + bw = 0.$

Complete integral: $w = \dfrac{(\ln|y| - ax + C_1)(b\ln|y| + C_2)}{a^2}.$

10. $\left(\dfrac{\partial w}{\partial x}\right)^2 + (ay + b)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + cyw = 0.$

Complete integral:

$$w = \begin{cases} \dfrac{\bigl(\ln|ay + b| - ax + C_1\bigr)\bigl(acy - bc\ln|ay + b| + C_2\bigr)}{a^3} & \text{if } a \neq 0, \\ \dfrac{(y - bx + C_1)(cy^2 + C_2)}{2b^2} & \text{if } a = 0. \end{cases}$$

11. $\left(\dfrac{\partial w}{\partial x}\right)^2 + axy\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + b = 0.$

Complete integral:

$$w = -\frac{1}{4}x\left(aC_1x - \sqrt{a^2C_1^2x^2 - 4b}\right) + C_1\ln|y| - \frac{b}{aC_1}\ln\left|aC_1x + \sqrt{a^2C_1^2x^2 - 4b}\right| + C_2.$$

12. $\left(\dfrac{\partial w}{\partial x}\right)^2 + \dfrac{ax}{y}\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + b = 0.$

Complete integral:

$$w = -\frac{1}{4}x\left(aC_1x - \sqrt{a^2C_1^2x^2 - 4b}\right) + \frac{1}{2}C_1y^2 - \frac{b}{aC_1}\ln\left|aC_1x + \sqrt{a^2C_1^2x^2 - 4b}\right| + C_2.$$

13. $\left(\dfrac{\partial w}{\partial x}\right)^2 + \dfrac{a}{xy}\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + b = 0.$

Complete integral:

$$w = \frac{aC_1}{2}\ln|x| + \frac{1}{2}\sqrt{a^2{C_1}^2 - 4bx^2} - \frac{aC_1}{2}\operatorname{arctanh}\frac{aC_1}{\sqrt{a^2{C_1}^2 - 4bx^2}} - \frac{C_1}{2}y^2 + C_2.$$

14. $\left(\dfrac{\partial w}{\partial x}\right)^2 + y^a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + x^b = 0.$

Complete integral:

$$w = \begin{cases} -\dfrac{C_1}{2}x + \dfrac{1}{2}\displaystyle\int\sqrt{C_1^2 - 4x^b}\,dx - \dfrac{C_1y^{1-a}}{a-1} + C_2 & \text{if } a \neq 1, \\ -\dfrac{C_1}{2}x + \dfrac{1}{2}\displaystyle\int\sqrt{C_1^2 - 4x^b}\,dx + C_1\ln|y| + C_2 & \text{if } a = 1. \end{cases}$$

15. $\left(\dfrac{\partial w}{\partial x}\right)^2 + A(ax+by)^k\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + B(ax+by)^n = 0.$

This is a special case of equation 2.2.5.14 with $f(z) = az^k$, $g(z) = bz^n$, and $h(w) = 1$.

16. $\left(\dfrac{\partial w}{\partial x}\right)^2 + aw\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + b = 0.$

Complete integral: $w = \dfrac{C_1}{a} + \left(\dfrac{9b}{4aC_1}\right)^{1/3}(y - C_1x + C_2)^{2/3}.$

17. $\left(\dfrac{\partial w}{\partial x}\right)^2 + aw^2\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = b^2w^2.$

Complete integral in implicit form:

$$\pm b(C_1x + C_2y + C_3) = R + C_1\ln\frac{R - C_1}{w}, \qquad \text{where} \quad R^2 = aC_1C_2w^2 + C_1^2.$$

18. $\boldsymbol{x\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + by^2 = 0.}$

Complete integral: $w = -C_1 x e^{-y/a} + \dfrac{b}{C_1}(y^2 - 2ay + 2a^2)e^{y/a} + C_2.$

19. $\boldsymbol{x\left(\dfrac{\partial w}{\partial x}\right)^2 + ay\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = b.}$

Complete integral: $w = \dfrac{b}{C_1}y^{1/a} + C_1 x y^{-1/a} + C_2.$

Other complete integrals for $a = 1$:

$$w = \frac{2}{C_1}\sqrt{bC_1(C_1x + y)} + C_2, \qquad w = \sqrt{4bx + C_1^2} + C_1 \ln\left|\frac{\sqrt{4bx + C_1^2} - C_1}{y}\right| + C_2.$$

20. $\boldsymbol{ax\left(\dfrac{\partial w}{\partial x}\right)^2 - (ay + b)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + cy(ay + b)^2 = 0.}$

Complete integral: $w = C_1 x(ay + b) + \dfrac{cy^2}{2C_1} + C_2.$

21. $\boldsymbol{(x + y)\left(\dfrac{\partial w}{\partial x}\right)^2 + ay\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + b = 0.}$

Complete integral:

$$w = \begin{cases} C_1\left(x - \dfrac{y}{a-1}\right)y^{-1/a} - \dfrac{b}{C_1}y^{1/a} + C_2 & \text{if } a \neq 1, \\ \dfrac{C_1 x}{y} - \dfrac{by}{C_1} - C_1 \ln|y| + C_2 & \text{if } a = 1. \end{cases}$$

22. $\boldsymbol{w\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + b = 0.}$

Complete integral: $w = \dfrac{a}{C_1} - \left(\dfrac{9b}{4C_1^2}\right)^{1/3}(C_1 x - y + C_2)^{2/3}.$

23. $\boldsymbol{w\left(\dfrac{\partial w}{\partial x}\right)^2 + aw\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + b = 0.}$

Complete integral: $w = \left[\dfrac{9b}{4C_1(a - C_1)}\right]^{1/3}(y - C_1 x + C_2)^{2/3}.$

24. $\boldsymbol{y(w^2 + a)\left(\dfrac{\partial w}{\partial x}\right)^2 + bxw\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = cx^2 y.}$

Complete integral in implicit form:

$$\int \sqrt{C_1(C_1 w^2 + bC_2 w + aC_1)}\, dw = \tfrac{1}{2}\sqrt{c}(C_1 x^2 + C_2 y^2) + C_3.$$

2.1.8. Other Equations

1. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + by\dfrac{\partial w}{\partial x} + cx + d = 0.$

Complete integral: $w = -\dfrac{1}{2}aC_1x - \dfrac{1}{12c}\left(a^2C_1^2 - 4d - 4cx\right)^{3/2} - \dfrac{b}{2a}y^2 + C_1y + C_2.$

2. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + by^2\dfrac{\partial w}{\partial x} - cx^2 = 0.$

Complete integral:

$$w = -\frac{1}{2}aC_1x + \frac{x}{4}\sqrt{a^2C_1^2 + 4cx^2} - \frac{b}{3a}y^3 + C_1y + \frac{a^2C_1^2}{8\sqrt{c}}\ln\left|2\sqrt{c}\,x + \sqrt{a^2C_1^2 + 4cx^2}\,\right| + C_2.$$

3. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + be^{cw}\dfrac{\partial w}{\partial y} = 0.$

Complete integral: $w = \dfrac{1}{c}\ln\left|\dfrac{C_1(a - C_1)}{bc(C_1x - y + C_2)}\right|.$

4. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + b\dfrac{\partial w}{\partial x} + c\dfrac{\partial w}{\partial y} + d = 0.$

Complete integral: $w = C_1x - \dfrac{C_1^2 + bC_1 + d}{aC_1 + c}y + C_2.$

5. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + b\left(x\dfrac{\partial w}{\partial x} + y\dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral: $w = -\dfrac{b(x + C_1y)^2}{2(1 + aC_1)} + C_2.$

6. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + (bw + c)\dfrac{\partial w}{\partial x} + (pw + q)\dfrac{\partial w}{\partial y} = 0.$

Complete integral: $w = \dfrac{1}{p - bC_1}\left\{\exp\left[\dfrac{p - bC_1}{C_1(a - C_1)}(y - C_1x + C_2)\right] + cC_1 - q\right\}.$

7. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + bw^2\dfrac{\partial w}{\partial x} + cw\dfrac{\partial w}{\partial y} = 0.$

Complete integral: $w = c\left\{bC_1 - \exp\left[\dfrac{c}{C_1(a - C_1)}(C_1x - y + C_2)\right]\right\}^{-1}.$

8. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + bw\left(x\dfrac{\partial w}{\partial x} + y\dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral: $w = \exp\left[\dfrac{b(C_1x - y)^2 + C_2}{2C_1(a - C_1)}\right].$

9. $\left(\dfrac{\partial w}{\partial x}\right)^2 + \dfrac{y}{x}\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + \dfrac{a}{x}\dfrac{\partial w}{\partial y} = 0.$

Complete integral: $w = -\dfrac{a}{C_1}\ln|C_1x + y| + C_2.$

10. $\left(\dfrac{\partial w}{\partial x}\right)^2 + aw\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + bw^2\dfrac{\partial w}{\partial y} = 0.$

Complete integral in implicit form: $\dfrac{aw\ln|w| + C_1}{bw} = \dfrac{y}{C_1} - x + C_2.$

11. $\left(\dfrac{\partial w}{\partial x}\right)^2 + aw\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + b\left(x\dfrac{\partial w}{\partial x} + y\dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral: $w = \dfrac{C_1^2 \pm \sqrt{abC_1(y - C_1x)^2 + C_2}}{aC_1}.$

12. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\left(\dfrac{\partial w}{\partial y}\right)^2 = bw\dfrac{\partial w}{\partial x} + cw^2 + d.$

Complete integral in implicit form:

$$x + C_1y + C_2 = 2(aC_1^2 + 1)\int \frac{dw}{bw \pm \sqrt{(acC_1^2 + b^2)w^2 + adC_1^2}}.$$

13. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\left(\dfrac{\partial w}{\partial y}\right)^2 + b\dfrac{\partial w}{\partial x} + c\dfrac{\partial w}{\partial y} + d = 0.$

Complete integral:

$$w = Ax + C_1y + C_2, \quad A = -\tfrac{1}{2}b + \tfrac{1}{2}\sqrt{b^2 - 4d - 4cC_1 - 4aC_1^2}.$$

14. $a\left(\dfrac{\partial w}{\partial x}\right)^2 + b\left(\dfrac{\partial w}{\partial y}\right)^2 + cx\dfrac{\partial w}{\partial x} + sy\dfrac{\partial w}{\partial y} = k.$

This is a special case of equation 2.2.6.10.

15. $a\left(\dfrac{\partial w}{\partial x} + cy\right)^2 + b\left(\dfrac{\partial w}{\partial y} + cx\right)^2 = k.$

Complete integral: $w = -cxy + C_1x + C_2y + C_3,$ where $aC_1^2 + bC_2^2 = k.$

16. $a\left(\dfrac{\partial w}{\partial x}\right)^2 + b\left(\dfrac{\partial w}{\partial y}\right)^2 = c\left(x\dfrac{\partial w}{\partial x} + y\dfrac{\partial w}{\partial y} - w\right).$

Complete integral: $w = C_1x + C_2y - \dfrac{aC_1^2 + bC_2^2}{c}.$

17. $\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2+(x+a)\dfrac{\partial w}{\partial x}+(y+b)\dfrac{\partial w}{\partial y}=w+c.$

Complete integral: $w=C_1(x+a)+C_2(y+b)+C_1^2+C_2^2-c.$

18. $\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2=a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}.$

Complete integral: $w=C_1x+C_2y+C_3,\quad$ where $\quad C_1^2+C_2^2=aC_1C_2.$

19. $x\left(\dfrac{\partial w}{\partial x}\right)^2+ay\left(\dfrac{\partial w}{\partial y}\right)^2+b\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}=0.$

Complete integral:

$$w=C_1(y-ax)+\frac{bC_1}{2}\ln\left|\frac{y}{x}\right|\pm C_1\sqrt{b^2-4axy}\mp|b|C_1\operatorname{arctanh}\frac{\sqrt{b^2-4axy}}{|b|}+C_2.$$

20. $\left(x\dfrac{\partial w}{\partial x}+y\dfrac{\partial w}{\partial y}\right)^2-a^2\left[\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2+1\right]=0.$

Complete integral:

$$w=a\operatorname{arccosh}\frac{x\cos C_1+y\sin C_1}{a}+C_2.$$

By passing to the polar coordinates $x=\rho\cos\theta$ and $y=\rho\sin\theta$, one arrives at an alternative form of the complete integral:

$$w=a\ln\sqrt{\frac{\sigma+1}{\sigma-1}}-C_1\arctan\frac{a\sigma}{C_1}+C_1\theta+C_2,\qquad\text{where}\quad\sigma^2=\frac{\rho^2+C_1^2}{\rho^2-a^2}.$$

21. $\left(ay\dfrac{\partial w}{\partial x}-bx\dfrac{\partial w}{\partial y}\right)^2=a\left(\dfrac{\partial w}{\partial x}\right)^2+b\left(\dfrac{\partial w}{\partial y}\right)^2+ab.$

By passing to the polar coordinates $x\sqrt{b}=\rho\cos\theta$ and $y\sqrt{a}=\rho\sin\theta$, one arrives at a separable equation. A complete integral of this equation is

$$w=\sigma-C_1\arctan\frac{\sigma}{C_1}+C_1\theta+C_2,\quad\text{where}\quad\sigma^2=\rho^2(C_1^2-1)-C_1^2.$$

22. $\left(y\dfrac{\partial w}{\partial x}-x\dfrac{\partial w}{\partial y}\right)^2=a(x^2+y^2)\left[\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2+1\right].$

By passing to the polar coordinates $x=\rho\cos\theta$ and $y=\rho\sin\theta$, one arrives at a separable equation. A complete integral of this equation (for $0\le a<1$) is

$$w=C_1\sqrt{\frac{a}{1-a}}\,\theta+\sigma+\frac{C_1}{2}\ln\left|\frac{\sigma-C_1}{\sigma+C_1}\right|+C_2,\quad\text{where}\quad\sigma^2=C_1^2-\rho^2$$

(hence, one must require that $\rho^2<C_1^2$).

23. $\boldsymbol{w\left(\dfrac{\partial w}{\partial x}-\dfrac{\partial w}{\partial y}\right)^2+a\left(\dfrac{\partial w}{\partial x}+\dfrac{\partial w}{\partial y}\right)^2=b.}$

Complete integral:

$$w=-a\left(\frac{C_1+C_2}{C_1-C_2}\right)^2+b^{1/3}\left[\frac{3(C_1x+C_2y+C_3)}{2(C_1-C_2)}\right]^{2/3}\qquad\text{if}\quad C_1\neq C_2.$$

24. $\boldsymbol{\left(x\dfrac{\partial w}{\partial x}+y\dfrac{\partial w}{\partial y}\right)^2=(1-w^2)\left[a^2\left(\dfrac{\partial w}{\partial x}\right)^2+b^2\left(\dfrac{\partial w}{\partial y}\right)^2\right].}$

The general integral can be found by solving the equation

$$\arctan\sqrt{\frac{b^2x^2+a^2y^2}{a^2b^2(1-w^2)}-1}-\arctan\frac{ay}{bx}=\sqrt{1-w^2}\,\Phi(w)$$

for w.

25. $\boldsymbol{\left(y\dfrac{\partial w}{\partial x}-x\dfrac{\partial w}{\partial y}\right)^2+a\left(x\dfrac{\partial w}{\partial x}+y\dfrac{\partial w}{\partial y}\right)=b.}$

Complete integral: $w=\dfrac{b-C_1^2}{2a}\ln(x^2+y^2)-C_1\arctan\dfrac{y}{x}+C_2.$

26. $\boldsymbol{\left(x\dfrac{\partial w}{\partial x}+y\dfrac{\partial w}{\partial y}-w\right)^2=a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}.}$

Complete integral: $w=C_1x+C_2y\pm\sqrt{aC_1C_2}.$

27. $\boldsymbol{\left(x\dfrac{\partial w}{\partial x}+y\dfrac{\partial w}{\partial y}-w\right)^2=a\left(\dfrac{\partial w}{\partial x}\right)^2+b\left(\dfrac{\partial w}{\partial y}\right)^2+c.}$

Complete integral: $w=C_1x+C_2y\pm\sqrt{aC_1^2+bC_2^2+c}.$

28. $\boldsymbol{\left(x\dfrac{\partial w}{\partial x}+y\dfrac{\partial w}{\partial y}-w\right)^2=ax\left(\dfrac{\partial w}{\partial x}\right)^2+by\left(\dfrac{\partial w}{\partial y}\right)^2.}$

Complete integral: $\sqrt{C_3w}=\sqrt{C_1x}+\sqrt{C_2y}-A,$ where $aC_1+bC_2=A^2.$

29. $\boldsymbol{\left(x\dfrac{\partial w}{\partial x}+y\dfrac{\partial w}{\partial y}-w\right)^2=a^2(x^2+y^2+w^2)^2\left[\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2+1\right].}$

Complete integral in implicit form:

$$(x-C_1)^2+(y-C_2)^2+(w-C_3)^2=\tfrac{1}{4}a^{-2},\qquad\text{where}\quad C_1^2+C_2^2+C_3^2=\tfrac{1}{4}a^{-2}.$$

30. $\boldsymbol{x^2\left(x\dfrac{\partial w}{\partial x}+y\dfrac{\partial w}{\partial y}-w\right)^2=ay^2\dfrac{\partial w}{\partial y}.}$

This equation describes a family of cones whose vertices lie on the w-axis. Complete integral: $w=-\dfrac{C_1^2x^2}{ay}+C_1+C_2x.$

31. $\left(w\dfrac{\partial w}{\partial x}+x\right)^2+\left(w\dfrac{\partial w}{\partial y}+y\right)^2-a^2w^2\left[\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2+1\right]=0.$

Complete integral: $(x-C_1)^2+(y-C_2)^2+w^2=\dfrac{C_1^2+C_2^2}{a^2}\quad(w\neq 0).$

2.2. Equations Containing Arbitrary Functions

2.2.1. Equations of the Form $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}=f(x,y,w)$

1. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}=ay+f(x).$

Complete integral: $w=\pm y\sqrt{2ax+C_1}\pm\displaystyle\int\frac{f(x)\,dx}{\sqrt{2ax+C_1}}+C_2.$

2. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}=f(x)y+g(x).$

Complete integral:

$$w=\varphi(x)y+\int\frac{g(x)}{\varphi(x)}\,dx+C_1,\qquad \varphi(x)=\pm\left[2\int f(x)\,dx+C_2\right]^{1/2}.$$

3. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}=f(x)y^k+g(x)y^{2k+1}.$

Complete integral:

$$w=\varphi(x)y^{k+1}+\frac{1}{k+1}\int\frac{f(x)}{\varphi(x)}\,dx+C_1,\qquad \varphi(x)=\pm\left[\frac{2}{k+1}\int g(x)\,dx+C_2\right]^{1/2}.$$

4. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}=f(x)e^{\lambda y}+g(x)e^{2\lambda y}.$

Complete integral:

$$w=\varphi(x)e^{\lambda y}+\frac{1}{\lambda}\int\frac{f(x)}{\varphi(x)}\,dx+C_1,\qquad \varphi(x)=\pm\left[\frac{2}{\lambda}\int g(x)\,dx+C_2\right]^{1/2}.$$

5. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}=f(x)g(y).$

Complete integral: $w=C_1\displaystyle\int f(x)\,dx+\frac{1}{C_1}\int g(y)\,dy+C_2.$

6. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}=f(ax+by).$

Complete integral:

$$w=C_1(ax-by)\pm\int\left[C_1^2+\frac{1}{ab}f(z)\right]^{1/2}dz+C_2,\qquad z=ax+by.$$

7. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = f(xy).$

Complete integral:

$$w = C_1 \ln\frac{x}{y} \pm \int \frac{1}{z}\left[C_1^2 + zf(z)\right]^{1/2} dz + C_2, \qquad z = xy.$$

8. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = \dfrac{f(x^a y^b)}{xy}.$

Complete integral:

$$w = C_1 \ln\left(x^a y^{-b}\right) \pm \int \frac{1}{z}\left[C_1^2 + \frac{1}{ab}f(z)\right]^{1/2} dz + C_2, \qquad z = x^a y^b.$$

9. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = aw + f(x).$

Complete integral: $w = (ax + C_1)(y + C_2) + (ax + C_1)\displaystyle\int \frac{f(x)\,dx}{(ax + C_1)^2}.$

10. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = f(x)w + g(x)y + h(x).$

Complete integral:

$$w = \varphi(x)y + \psi(x),$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(x)$ are determined by the ordinary differential equations

$$\varphi\varphi'_x = f(x)\varphi + g(x), \tag{1}$$
$$\varphi\psi'_y = f(x)\psi + h(x). \tag{2}$$

The exact solutions of Abel's equation (1) for various $f(x)$ and $g(x)$ can be found in the book by Zaitsev and Polyanin (1993, 1994) and Polyanin and Zaitsev (2003). Equation (2) is linear in ψ and, hence, integrable for any $f(x)$ and $h(x)$, provided that the function φ is known.

For the simplest cases where f and/or g are identically zero, equation (1) has the solutions

$$\varphi(x) = \int f(x)\,dx + C_1 \qquad \text{for } g(x) \equiv 0 \text{ and any } f(x),$$

$$\varphi(x) = \pm\left[2\int g(x)\,dx + C_1\right]^{1/2} \qquad \text{for } f(x) \equiv 0 \text{ and any } g(x).$$

11. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = aw^{k+1} + f(x)w^{2k}.$

The substitution $u = w^{1-k}$ leads to an equation of the form 2.2.1.9:

$$\frac{\partial u}{\partial x}\frac{\partial u}{\partial y} = a(1-k)^2 u + (1-k)^2 f(x).$$

12. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = ae^{\lambda w} + f(x)e^{2\lambda w}.$

The substitution $u = e^{-\lambda w}$ leads to an equation of the form 2.2.1.9: $\dfrac{\partial u}{\partial x}\dfrac{\partial u}{\partial y} = a\lambda^2 u + \lambda^2 f(x)$.

13. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = f(ax + by)g(w).$

Complete integral in implicit form:

$$\int \frac{dw}{\sqrt{g(w)}} = C_1(ax - by) \pm \int \left[C_1^2 + \frac{1}{ab}f(z)\right]^{1/2} dz + C_2, \qquad z = ax + by.$$

14. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = f(xy)g(w).$

Complete integral in implicit form:

$$\int \frac{dw}{\sqrt{g(w)}} = C_1 \ln\frac{x}{y} \pm \int \frac{1}{z}\left[C_1^2 + zf(z)\right]^{1/2} dz + C_2, \qquad z = xy.$$

15. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = \dfrac{1}{xy}f(x^a y^b)g(w).$

Complete integral in implicit form:

$$\int \frac{dw}{\sqrt{g(w)}} = C_1 \ln\left(x^a y^{-b}\right) \pm \int \frac{1}{z}\left[C_1^2 + \frac{1}{ab}f(z)\right]^{1/2} dz + C_2, \qquad z = x^a y^b.$$

16. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = f(x)g(y)h(w).$

Complete integral in implicit form: $\displaystyle\int \frac{dw}{\sqrt{h(w)}} = C_1 \int f(x)\,dx + \frac{1}{C_1}\int g(y)\,dy + C_2.$

2.2.2. Equations of the Form $f(x,y)\dfrac{\partial w}{\partial x} + g(x,y,w)\left(\dfrac{\partial w}{\partial y}\right)^2 = h(x,y,w)$

▷ *Equations of this type are encountered in mechanics, where x plays the role of time and y plays the role of the spatial coordinate.*

1. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 = f(x) + g(y).$

Complete integral: $\displaystyle w = -C_1 x + \int f(x)\,dx + \int \sqrt{\frac{g(y) + C_1}{a}}\,dy + C_2.$

2. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 = f(x)y + g(x).$

Complete integral:

$$w = \varphi(x)y + \int \left[g(x) - a\varphi^2(x)\right] dx + C_1, \quad \varphi(x) = \int f(x)\,dx + C_2.$$

3. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 = f(x)y^2 + g(x)y + h(x).$

Complete integral:

$$w = \varphi(x)y^2 + \psi(x)y + \chi(x),$$

where the functions $\varphi(x)$, $\psi(x)$, and $\chi(x)$ are determined by solving the following system of ordinary differential equations:

$$\varphi'_x = -4a\varphi^2 + f(x), \tag{1}$$
$$\psi'_x = -4a\varphi\psi + g(x), \tag{2}$$
$$\chi'_x = -a\psi^2 + h(x). \tag{3}$$

Riccati's equation (1) can be integrated in quadrature for numerous $f(x)$. For details, see Kamke (1976) and Polyanin and Zaitsev (2003). For example, if $f(x) = \text{const}$, then the particular solution $\varphi = \frac{1}{2}\sqrt{f}$ can be used.

Given a solution of equation (1), equations (2) and (3) are easy to integrate, since they are linear in the unknowns ψ and χ.

4. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 = f(bx + cy).$

Complete integral:

$$w = C_1 x + C_2 - \frac{b}{2ac^2}(bx + cy) \pm \frac{1}{2ac^2}\int \sqrt{4ac^2 f(\xi) + b^2 - 4ac^2 C_1}\, d\xi, \quad \xi = bx + cy.$$

5. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 = f\left(\dfrac{y}{x}\right).$

1°. Complete integral:

$$w = x\varphi\left(\frac{y}{x}, C_1\right) + C_2,$$

where the function $\varphi = \varphi(z, C_1)$ is the general solution of the first-order ordinary differential equation

$$\varphi - z\varphi'_z + a(\varphi'_z)^2 = f(z).$$

2°. Apply the Lagrange–Charpit method (see Subsection 24.1.3). The characteristic system has a first integral of the form

$$x\frac{\partial w}{\partial x} + y\frac{\partial w}{\partial y} - w = C_1. \tag{1}$$

We use (1) to eliminate $\frac{\partial w}{\partial x}$ from the original equation, thus obtaining the equation

$$ax\left(\frac{\partial w}{\partial y}\right)^2 - y\frac{\partial w}{\partial y} + w + C_1 - xf\left(\frac{y}{x}\right) = 0,$$

which can be treated as an ordinary differential equation for w with parameter x. Making the change of variables

$$w(y,x) = -\frac{1}{4a}xu^2(\xi,x) + \frac{1}{4a}x\xi^2 + xf(\xi) - C_1, \qquad \xi = \frac{y}{x}, \tag{2}$$

we arrive at an Abel equation of the second kind for u:

$$uu'_\xi \pm u = \frac{2a}{x}f'_\xi(\xi), \tag{3}$$

where x is treated as a parameter. The constant of integration in the general solution of equation (3) will depend on x, i.e., $C_2 = C_2(x)$. This dependence can be found by substituting the general solution of equation (3) into (1) and by taking into account relation (2).

The books by Polyanin and Zaitsev (2003) and Zaitsev and Polyanin (1994) present cases where equation (3) is integrable in quadrature.

6. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 = f(x) + g\left(\dfrac{y}{x}\right).$

The substitution $w(x,y) = u(x,y) + \int f(x)\,dx$ leads to an equation of the form 2.2.2.5:

$$\frac{\partial u}{\partial x} + a\left(\frac{\partial u}{\partial y}\right)^2 = g\left(\frac{y}{x}\right).$$

7. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 = f(x)w + g(x).$

Complete integral:

$$w = F(x)(C_1 + C_2 y) + F(x)\int \left[g(x) - aC_2^2F^2(x)\right]\frac{dx}{F(x)}, \qquad F(x) = \exp\left[\int f(x)\,dx\right].$$

8. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 = bw^2 + f(x)w + g(x).$

For $b = 0$, see equation 2.2.2.7. Complete integral for $b \neq 0$:

$$w = \varphi(x) + C_1\psi(x)\exp\left(\pm y\sqrt{b/a}\,\right).$$

The function $\varphi = \varphi(x)$ is determined by the first order ordinary differential equation

$$\varphi' = b\varphi^2 + f(x)\varphi + g(x), \tag{1}$$

and the function $\psi(x)$ is related to $\varphi(x)$ by

$$\psi(x) = \exp\left\{\int \left[2b\varphi(x) + f(x)\right]dx\right\}. \tag{2}$$

Riccati's equation (1) can be integrated in quadrature for various f and g, in particular, for $g(x) \equiv 0$ and arbitrary $f(x)$ and for $f(x) = \text{const}$ and $g(x) = \text{const}$. For details, see the books by Kamke (1976) and Polyanin and Zaitsev (2003).

9. $\dfrac{\partial w}{\partial x} + f(x)\left(\dfrac{\partial w}{\partial y}\right)^2 = g(x)w + h(x)y + s(x).$

Complete integral:

$$w = G(x)\big[y\varphi(x) + \psi(x)\big], \qquad G(x) = \exp\left[\int g(x)\,dx\right],$$

where

$$\varphi(x) = C_1 + \int \frac{h(x)}{G(x)}\,dx, \quad \psi(x) = C_2 + \int \big[s(x) - f(x)G^2(x)\varphi^2(x)\big]\,\frac{dx}{G(x)}.$$

10. $\dfrac{\partial w}{\partial x} + f(y)\left(\dfrac{\partial w}{\partial y}\right)^2 = bw^2 + g(x)w + h(x).$

The substitution $\xi = \displaystyle\int \frac{dy}{\sqrt{|f_1(y)|}}$ leads to an equation of the form 2.2.2.8.

11. $\dfrac{\partial w}{\partial x} + \big[f(x)y + g(x)\big]\left(\dfrac{\partial w}{\partial y}\right)^2 = 0.$

Complete integral:

$$w = \varphi(x)y - \int g(x)\varphi^2(x)\,dx + C_1, \qquad \varphi(x) = \left[C_2 + \int f(x)\,dx\right]^{-1}.$$

12. $\dfrac{\partial w}{\partial x} + \big[f(x)y + g(x)\big]\left(\dfrac{\partial w}{\partial y}\right)^2 = h(x)w + r(x)y + s(x).$

Complete integral:

$$w = \varphi(x)y + \psi(x).$$

The functions $\varphi(x)$ and $\psi(x)$ are determined by solving the ordinary differential equations

$$\varphi' + f(x)\varphi^2 = h(x)\varphi + r(x), \tag{1}$$
$$\psi' + g(x)\varphi^2 = h(x)\psi + s(x), \tag{2}$$

where the prime denotes the derivative with respect to x.

Riccati's equation (1) can be integrated in quadrature for various $f(x)$, $h(x)$, and $g(x)$. For details, see the books by Kamke (1976) and Polyanin and Zaitsev (2003). In particular, for $r(x) \equiv 0$ the general solution of equation (1) has the form

$$\varphi(x) = H(x)\left[C_1 + \int f(x)H(x)\,dx\right]^{-1}, \qquad H(x) = \exp\left[\int h(x)\,dx\right].$$

Equation (2) is linear in ψ and is easy to integrate (for known φ). We have

$$\psi(x) = C_2H(x) + H(x)\int \big[s(x) - g(x)\varphi^2(x)\big]\,\frac{dx}{H(x)}.$$

13. $\dfrac{\partial w}{\partial x} + \left[f(x)y^k + g(x)y^{2k-2}\right]\left(\dfrac{\partial w}{\partial y}\right)^2 = 0.$

The substitution $\xi = y^{2-k}$ leads to an equation of the form 2.2.2.11:

$$\frac{\partial w}{\partial x} + (2-k)^2\left[f(x)\xi + g(x)\right]\left(\frac{\partial w}{\partial \xi}\right)^2 = 0.$$

14. $\dfrac{\partial w}{\partial x} + \left[f(x)y^k + g(x)y^{2k-2}\right]\left(\dfrac{\partial w}{\partial y}\right)^2 = h(x)w + s(x).$

1°. If $k \neq 2$, then the substitution $\xi = y^{2-k}$ leads to an equation of the form 2.2.2.12 with $r(x) = 0$:

$$\frac{\partial w}{\partial x} + (2-k)^2\left[f(x)\xi + g(x)\right]\left(\frac{\partial w}{\partial \xi}\right)^2 = h(x)w + s(x).$$

2°. If $k = 2$, then by introducing the new variable $\xi = \ln|y|$, we arrive at an equation of the form 2.2.2.12.

15. $\dfrac{\partial w}{\partial x} + \left[f(x) + g(x)e^{\lambda y}\right]\left(\dfrac{\partial w}{\partial y}\right)^2 = 0.$

The substitution $\xi = e^{-\lambda y}$ leads to an equation of the form 2.2.2.11:

$$\frac{\partial w}{\partial x} - \lambda\left[f(x)\xi + g(x)\right]\left(\frac{\partial w}{\partial \xi}\right)^2 = 0.$$

16. $\dfrac{\partial w}{\partial x} + \left[f(x) + g(x)e^{\lambda y}\right]\left(\dfrac{\partial w}{\partial y}\right)^2 = h(x)w + s(x).$

The substitution $\xi = e^{-\lambda y}$ leads to an equation of the form 2.2.2.12 with $r(x) = 0$:

$$\frac{\partial w}{\partial x} - \lambda\left[f(x)\xi + g(x)\right]\left(\frac{\partial w}{\partial \xi}\right)^2 = h(x)w + s(x).$$

17. $\dfrac{\partial w}{\partial x} + f(ax+by)\left(\dfrac{\partial w}{\partial y}\right)^2 = g(ax+by).$

Complete integral:

$$w = C_1 x + C_2 + \int \frac{-a \pm \sqrt{4b^2 f(\xi)g(\xi) - 4b^2 C_1 f(\xi) + a^2}}{2b^2 f(\xi)}\,d\xi, \qquad \xi = ax + by.$$

18. $\dfrac{\partial w}{\partial x} + f\left(\dfrac{y}{x}\right)\left(\dfrac{\partial w}{\partial y}\right)^2 = g\left(\dfrac{y}{x}\right).$

Complete integral:

$$w = x\varphi\left(\frac{y}{x}, C_1\right) + C_2,$$

where the function $\varphi = \varphi(z, C_1)$ is the general solution of the first-order ordinary differential equation

$$\varphi - z\varphi'_z + f(z)(\varphi'_z)^2 = g(z).$$

19. $\dfrac{\partial w}{\partial x} + \big[f_2(x)w + f_1(x)y + f_0(x)\big]\left(\dfrac{\partial w}{\partial y}\right)^2 = g_2(x)w + g_1(x)y + g_0(x).$

Complete integral:

$$w = \varphi(x)y + \psi(x),$$

where the functions $\varphi(x)$ and $\psi(x)$ are determined by the following system of ordinary differential equations:

$$\varphi'_x + f_2(x)\varphi^3 + f_1(x)\varphi^2 - g_2(x)\varphi - g_1(x) = 0, \tag{1}$$

$$\psi'_x + \big[f_2(x)\varphi^2 - g_2(x)\big]\psi + f_0(x)\varphi^2 - g_0(x) = 0. \tag{2}$$

Equation (1) can be integrated in quadrature for a lot of functions $f_n(x)$ and $g_n(x)$, in particular, for $f_2(x) = g_1(x) = 0$ and $f_1(x) = g_1(x) = 0$. For details, see Kamke (1976) and Polyanin and Zaitsev (2003).

Given a solution of equation (1), equation (2) is easy to integrate, since it is linear in the unknown ψ.

20. $\dfrac{\partial w}{\partial x} + f(x)w^k\left(\dfrac{\partial w}{\partial y}\right)^2 = g(x)w.$

1°. The substitution $u = \frac{1}{k+1}w^{k+1}$ leads to an equation of the form 2.2.2.9:

$$\frac{\partial u}{\partial x} + f(x)\left(\frac{\partial u}{\partial y}\right)^2 = (k+1)g(x)u.$$

2°. The transformation

$$w(x,y) = G(x)v(z,y), \quad z = \int f(x)G^{k+1}(x)\,dx, \qquad G(x) = \exp\left[\int g(x)\,dx\right],$$

leads to a simpler equation of the form 2.1.4.44 with $a = -1$:

$$\frac{\partial v}{\partial z} + v^k\left(\frac{\partial v}{\partial y}\right)^2 = 0.$$

21. $\dfrac{\partial w}{\partial x} + f(y)w^k\left(\dfrac{\partial w}{\partial y}\right)^2 = aw^{k+2} + g(x)w.$

The substitution $u = \frac{1}{k+1}w^{k+1}$ leads to an equation of the form 2.2.2.10 with $h(x) \equiv 0$:

$$\frac{\partial u}{\partial x} + f(y)\left(\frac{\partial u}{\partial y}\right)^2 = a(k+1)^2u^2 + (k+1)g(x)u.$$

22. $\dfrac{\partial w}{\partial x} - f(x)e^{\beta w}\left(\dfrac{\partial w}{\partial y}\right)^2 - g(x) = 0.$

The transformation

$$w(x,y) = u(z,y) + G(x), \quad z = \int f(x)\exp\big[\beta G(x)\big]\,dx, \qquad G(x) = \int g(x)\,dx,$$

leads to a simpler equation, $\dfrac{\partial u}{\partial z} - e^{\beta u}\left(\dfrac{\partial u}{\partial y}\right)^2 = 0$, which has the complete integral

$$\beta u = 2\ln\big(C_1 - \tfrac{1}{2}\beta y\big) - \ln\big(C_2 - \beta z\big).$$

23. $\dfrac{\partial w}{\partial x} - f(w)\left(\dfrac{\partial w}{\partial y}\right)^2 = 0.$

Complete integral in implicit form: $\displaystyle\int f(w)\,dw = C_1^2 x + C_1 y + C_2.$

24. $\dfrac{\partial w}{\partial x} - f(w)\left(\dfrac{\partial w}{\partial y}\right)^2 - \big[yg(x) + h(x)\big]\dfrac{\partial w}{\partial y} = 0.$

The transformation

$$t = \int \varphi^2(x)\,dx, \quad z = \varphi(x)y + \int h(x)\varphi(x)\,dx, \qquad \varphi(x) = \exp\left[\int g(x)\,dx\right],$$

leads to a simpler equation of the form 2.2.2.23:

$$\frac{\partial w}{\partial t} - f(w)\left(\frac{\partial w}{\partial z}\right)^2 = 0.$$

25. $\dfrac{\partial w}{\partial x} + f(y)g(w)\left(\dfrac{\partial w}{\partial y}\right)^2 = h(w).$

Complete integral: $\displaystyle x + C_1\int \frac{dy}{\sqrt{f(y)}} + \int \frac{2C_1^2 g(w)\,dw}{1 + \sqrt{1 + 4C_1^2 g(w)h(w)}} = C_2.$

26. $\dfrac{\partial w}{\partial x} - f(x)g(y)h(w)\left(\dfrac{\partial w}{\partial y}\right)^2 = 0.$

Complete integral in implicit form: $\displaystyle\int h(w)\,dw = C_1^2\int f(x)\,dx + C_1\int \frac{dy}{\sqrt{g(y)}} + C_2.$

27. $\dfrac{\partial w}{\partial x} + f(w + ax + by)\left(\dfrac{\partial w}{\partial y}\right)^2 = g(w + ax + by).$

Complete integral:

$$w = -ax - by + \varphi(\xi) + C_3, \qquad \xi = C_1 x + C_2 y,$$

where

$$\varphi(\xi) = \int \frac{2bC_2 f(\xi) - C_1 \pm \sqrt{4C_2^2 f(\xi)g(\xi) + 4C_2(aC_2 - bC_1)f(\xi) + C_1^2}}{2C_2^2 f(\xi)}\,d\xi.$$

One of the constants C_1 or C_2 can be set equal to unity.

28. $f_1(x)\dfrac{\partial w}{\partial x} + f_2(y)\left(\dfrac{\partial w}{\partial y}\right)^2 = g_1(x) + g_2(y).$

Complete integral: $\displaystyle w = \int \frac{g_1(x) - C_1}{f_1(x)}\,dx + \int \sqrt{\frac{g_2(y) + C_1}{f_2(y)}}\,dy + C_2.$

29. $f(x)\dfrac{\partial w}{\partial x}+g(y)\left(\dfrac{\partial w}{\partial y}\right)^2=aw+h_1(x)+h_2(y).$

Complete integral:

$$w=\varphi(x)+\psi(y).$$

Here

$$\varphi(x)=E(x)\left[C_1+\int\frac{h_1(x)\,dx}{f(x)E(x)}\right],\quad E(x)=\exp\left[a\int\frac{dx}{f(x)}\right].$$

The function $\psi(y)$ is determined by the ordinary differential equation $g(y)(\psi'_y)^2=a\psi+h_2(y)$. By the change $z=\int\dfrac{dy}{\sqrt{|g(y)|}}$, this equation can be reduced to an equation which is discussed in detail in Zaitsev and Polyanin (1994) and Polyanin and Zaitsev (2003).

2.2.3. Equations of the Form

$$\frac{\partial w}{\partial x}+f(x,y,w)\left(\frac{\partial w}{\partial x}\right)^2+g(x,y,w)\frac{\partial w}{\partial y}=h(x,y,w)$$

▷ *Equations of this type are encountered in mechanics, where x plays the role of time and y plays the role of the spatial coordinate.*

1. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2+b\dfrac{\partial w}{\partial y}=f(x)+g(y).$

Complete integral:

$$w=-C_1x+C_2+\int f(x)\,dx-\frac{b}{2a}y\pm\frac{1}{2a}\int\sqrt{4ag(y)+b^2+4aC_1}\,dy.$$

2. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2+b\dfrac{\partial w}{\partial y}=f(x)y+g(x).$

Complete integral:

$$w=\varphi(x)y+\int\left[g(x)-a\varphi^2(x)-b\varphi(x)\right]dx+C_1,\qquad\varphi(x)=\int f(x)\,dx+C_2.$$

3. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2+b\dfrac{\partial w}{\partial y}=f(x)w+g(x).$

Complete integral:

$$w=(C_1y+C_2)F(x)+F(x)\int\left[g(x)-aC_1^2F^2(x)-bC_1F(x)\right]\frac{dx}{F(x)},\quad F(x)=\exp\left[\int f(x)\,dx\right].$$

4. $\dfrac{\partial w}{\partial x}+f(x)\left(\dfrac{\partial w}{\partial y}\right)^2+g(x)\dfrac{\partial w}{\partial y}=h(x).$

Complete integral: $w=C_1y+C_2+\int\left[h(x)-C_1^2f(x)-C_1g(x)\right]dx.$

5. $\dfrac{\partial w}{\partial x} + f(x)\left(\dfrac{\partial w}{\partial y}\right)^2 + g(x)\dfrac{\partial w}{\partial y} = h(x)w + p(x)y + s(x).$

Complete integral:

$$w = y\varphi(x) + \psi(x),$$

where

$$\varphi(x) = C_1 H(x) + H(x)\int \frac{p(x)}{H(x)}\,dx, \quad H(x) = \exp\left[\int h(x)\,dx\right],$$
$$\psi(x) = C_2 H(x) + H(x)\int \left[s(x) - f(x)\varphi^2(x) - g(x)\varphi(x)\right]\frac{dx}{H(x)}.$$

6. $\dfrac{\partial w}{\partial x} + f(x)\left(\dfrac{\partial w}{\partial y}\right)^2 + \left[g_1(x)y + g_0(x)\right]\dfrac{\partial w}{\partial y} = s(x)w + h_2(x)y^2 + h_1(x)y + h_0(x).$

Complete integral:

$$w = \varphi(x)y^2 + \psi(x)y + \chi(x),$$

where the functions $\varphi(x)$, $\psi(x)$, and $\chi(x)$ are determined by solving the following system of ordinary differential equations:

$$\varphi'_x + 4f(x)\varphi^2 + \left[2g_1(x) - s(x)\right]\varphi - h_2(x) = 0, \tag{1}$$
$$\psi'_x + \left[4f(x)\varphi + g_1(x) - s(x)\right]\psi + 2g_0(x)\varphi - h_1(x) = 0, \tag{2}$$
$$\chi'_x - s(x)\chi + f(x)\psi^2 + g_0(x)\psi - h_0(x) = 0. \tag{3}$$

Riccati's equation (1) can be integrated in quadrature for a lot of functions $f(x)$, $g_1(x)$, $s(x)$, and $h_2(x)$, in particular, for $h_2(x) \equiv 0$ (the other functions can be arbitrary). For details, see Kamke (1976) and Polyanin and Zaitsev (2003).

Given a solution of equation (1), equations (2) and (3) are easy to integrate, since they are linear in the unknowns ψ and χ.

7. $\dfrac{\partial w}{\partial x} + f(y)\left(\dfrac{\partial w}{\partial y}\right)^2 + g(y)\dfrac{\partial w}{\partial y} = h(y).$

Complete integral: $w = -C_1 x + C_2 + \displaystyle\int \frac{-g(y) \pm \sqrt{g^2(y) + 4f(y)h(y) + 4C_1 f(y)}}{2f(y)}\,dy.$

8. $\dfrac{\partial w}{\partial x} + f(y)\left(\dfrac{\partial w}{\partial y}\right)^2 + g(y)\dfrac{\partial w}{\partial y} = h(x) + r(y).$

Complete integral:

$$w = -C_1 x + C_2 + \int h(x)\,dx + \int \frac{-g(y) \pm \sqrt{g^2(y) + 4f(y)r(y) + 4C_1 f(y)}}{2f(y)}\,dy.$$

9. $\dfrac{\partial w}{\partial x} + f(ax + by)\left(\dfrac{\partial w}{\partial y}\right)^2 + g(ax + by)\dfrac{\partial w}{\partial y} = h(ax + by).$

For $b = 0$, see equation 2.2.3.4. For $b \neq 0$, by passing from x and y to the new variables x and $\xi = ax + by$, we arrive at an equation of the form 2.2.3.7:

$$\frac{\partial w}{\partial x} + b^2 f(\xi)\left(\frac{\partial w}{\partial \xi}\right)^2 + \left[a + bg(\xi)\right]\frac{\partial w}{\partial \xi} = h(\xi).$$

10. $$\frac{\partial w}{\partial x} + \big[f_2(x)w + f_1(x)y + f_0(x)\big]\left(\frac{\partial w}{\partial y}\right)^2 + \big[g_2(x)w + g_1(x)y + g_0(x)\big]\frac{\partial w}{\partial y} = h_2(x)w + h_1(x)y + h_0(x).$$

Complete integral:

$$w = \varphi(x)y + \psi(x),$$

where the functions $\varphi(x)$ and $\psi(x)$ are determined by solving the following system of ordinary differential equations:

$$\varphi'_x + f_2(x)\varphi^3 + \big[f_1(x) + g_2(x)\big]\varphi^2 + \big[g_1(x) - h_2(x)\big]\varphi - h_1(x) = 0, \tag{1}$$

$$\psi'_x + \big[f_2(x)\varphi^2 + g_2(x)\varphi - h_2(x)\big]\psi + f_0(x)\varphi^2 + g_0(x)\varphi - h_0(x) = 0. \tag{2}$$

Equation (1) can be integrated in quadrature for a lot of functions $f_n(x)$, $g_n(x)$, and $h_n(x)$, in particular, for $f_2(x) = 0$, $h_1(x) = 0$ and $f_1(x) = -g_2(x)$, $h_1(x) = 0$. For details, see Kamke (1976) and Polyanin and Zaitsev (2003).

Given a solution of equation (1), equation (2) is easy to integrate, since it is linear in the unknown ψ.

11. $$\frac{\partial w}{\partial x} + f(w)\left(\frac{\partial w}{\partial y}\right)^2 + g(w)\frac{\partial w}{\partial y} = 0.$$

Complete integral in implicit form: $C_1x + C_2y + \displaystyle\int \frac{C_2^2 f(w)\,dw}{C_1 + C_2 g(w)} = C_3.$

One of the constants C_1, C_2, or C_3 can be set equal to ± 1.

12. $$\frac{\partial w}{\partial x} + f(w)\left(\frac{\partial w}{\partial y}\right)^2 + g(w)\frac{\partial w}{\partial y} = h(w).$$

Complete integral in implicit form:

$$C_1x + C_2y + \int \frac{2C_2^2 f(w)\,dw}{C_1 + C_2 g(w) \pm \sqrt{[C_1 + C_2 g(w)]^2 + 4C_2^2 f(w)h(w)}} = C_3.$$

One of the constants C_1, C_2, or C_3 can be set equal to ± 1.

13. $$\frac{\partial w}{\partial x} - f(w)\left(\frac{\partial w}{\partial y}\right)^2 - \big[yg(x) + h(x)\big]\frac{\partial w}{\partial y} = 0.$$

The transformation

$$t = \int \varphi^2(x)\,dx, \quad z = \varphi(x)y + \int h(x)\varphi(x)\,dx, \qquad \varphi(x) = \exp\left[\int g(x)\,dx\right],$$

leads to a simpler equation of the form 2.2.2.23:

$$\frac{\partial w}{\partial t} - f(w)\left(\frac{\partial w}{\partial z}\right)^2 = 0.$$

14. $\dfrac{\partial w}{\partial x} + f(w+ax+by)\left(\dfrac{\partial w}{\partial y}\right)^2 + g(w+ax+by)\dfrac{\partial w}{\partial y} = h(w+ax+by).$

The substitution $u = w + ax + by$ leads to an equation of the form 2.2.3.12:

$$\frac{\partial u}{\partial x} + f(u)\left(\frac{\partial u}{\partial y}\right)^2 + \big[g(u) - 2bf(u)\big]\frac{\partial u}{\partial y} = h(u) - b^2 f(u) + bg(u) + a.$$

2.2.4. Equations of the Form $f(x,y,w)\left(\dfrac{\partial w}{\partial x}\right)^2 + g(x,y,w)\left(\dfrac{\partial w}{\partial y}\right)^2 = h(x,y,w)$

▷ *Equations of this type are encountered in mechanics, geometric optics, and differential geometry.*

1. $\left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2 = f(x).$

Complete integral: $w = C_1 y + C_2 \pm \displaystyle\int \sqrt{f(x) - C_1^2}\,dx.$

⊙ Reference: E. Kamke (1965).

2. $\left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2 = f(x) + g(y).$

Complete integral: $w = \pm \displaystyle\int \sqrt{f(x) + C_1}\,dx \pm \int \sqrt{g_2(y) - C_1}\,dy + C_2$. The signs before each of the integrals can be chosen independently of each other.

3. $\left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2 = f(ax+by) + g(bx-ay).$

The transformation $\xi = ax + by$, $\eta = bx - ay$ leads to an equation of the form 2.2.4.2:

$$\left(\frac{\partial w}{\partial \xi}\right)^2 + \left(\frac{\partial w}{\partial \eta}\right)^2 = \frac{1}{a^2+b^2}f(\xi) + \frac{1}{a^2+b^2}g(\eta).$$

4. $\left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2 = f(x^2+y^2).$

Hamilton's equation for the plane motion of a point mass under the action of a central force. Complete integral:

$$w = C_1 \arctan\frac{x}{y} + C_2 \pm \frac{1}{2}\int \sqrt{zf(z) - C_1^2}\,\frac{dz}{z}, \qquad z = x^2 + y^2.$$

⊙ Reference: E. Kamke (1965).

5. $\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2=(x^2+y^2)f(xy).$

Complete integral:

$$w=C_1(x^2-y^2)+C_2\pm\int\sqrt{f(z)-4C_1^2}\,dz,\qquad z=xy.$$

6. $\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2=(x^2+y^2)f(x^2-y^2).$

Complete integral:

$$w=C_1xy+C_2\pm\frac{1}{2}\int\sqrt{f(z)-C_1^2}\,dz,\qquad z=x^2-y^2.$$

7. $\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2=f(w).$

Complete integral in implicit form: $\displaystyle\int\frac{dw}{\sqrt{f(w)}}=\pm\sqrt{(x+C_1)^2+(y+C_2)^2}.$

8. $\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2=f(x,y)g(w).$

The substitution $u=\displaystyle\int\frac{dw}{\sqrt{g(w)}}$ leads to a simpler equation: $\left(\dfrac{\partial u}{\partial x}\right)^2+\left(\dfrac{\partial u}{\partial y}\right)^2=f(x,y)$.
For solutions of this equation for some types of the right-hand side, see 2.2.4.1–2.2.4.6.

9. $\left(\dfrac{\partial w}{\partial x}\right)^2+\dfrac{1}{x^2}\left(\dfrac{\partial w}{\partial y}\right)^2=f(x).$

This equation governs the plane motion of a point mass in a central force field, with x and y being the polar coordinates.

Complete integral: $\displaystyle w=C_1y\pm\int\sqrt{f(x)-\frac{C_1^2}{x^2}}\,dx+C_2.$

⊙ Reference: P. Appell (1953).

10. $\left(\dfrac{\partial w}{\partial x}\right)^2+f(x)\left(\dfrac{\partial w}{\partial y}\right)^2=g(x).$

Complete integral: $\displaystyle w=C_1y+C_2+\int\sqrt{g(x)-C_1^2f(x)}\,dx.$

11. $\left(\dfrac{\partial w}{\partial x}\right)^2+f(y)\left(\dfrac{\partial w}{\partial y}\right)^2=g(y).$

Complete integral: $\displaystyle w=C_1x+C_2+\int\sqrt{\frac{g(y)-C_1^2}{f(y)}}\,dy.$

12. $\left(\dfrac{\partial w}{\partial x}\right)^2 + f(w)\left(\dfrac{\partial w}{\partial y}\right)^2 = g(w).$

Complete integral in implicit form: $\displaystyle\int \sqrt{\frac{C_1^2 + C_2^2 f(w)}{g(w)}}\, dw = C_1 x + C_2 y + C_3.$
One of the constants C_1 or C_2 can be set equal to ± 1.

13. $\left(\dfrac{\partial w}{\partial x}\right)^2 - f(x,y,w)\left(\dfrac{\partial w}{\partial y}\right)^2 = 0.$

The equation can be factorized. Equating each of the factors to zero, we obtain two simpler equations: $\dfrac{\partial w}{\partial x} \pm \sqrt{f(x,y,w)}\,\dfrac{\partial w}{\partial y} = 0.$

14. $f_1(x)\left(\dfrac{\partial w}{\partial x}\right)^2 + f_2(y)\left(\dfrac{\partial w}{\partial y}\right)^2 = g_1(x) + g_2(y).$

A separable equation. This equation is encountered in differential geometry in studying geodesic lines of Liouville surfaces. Complete integral:

$$w = \pm \int \sqrt{\frac{g_1(x) + C_1}{f_1(x)}}\, dx \pm \int \sqrt{\frac{g_2(y) - C_1}{f_2(y)}}\, dy + C_2.$$

The signs before each of the integrals can be chosen independently of each other.

⊙ References: P. Appell (1953), E. Kamke (1965).

15. $f(ax+by)\left(\dfrac{\partial w}{\partial x}\right)^2 + g(ax+by)\left(\dfrac{\partial w}{\partial y}\right)^2 = h(ax+by).$

Complete integral:

$$w = C_1 x + C_2 + \int \frac{-aC_1 f(z) \pm \sqrt{a^2 f(z)h(z) + b^2 g(z)h(z) - b^2 C_1^2 f(z)g(z)}}{a^2 f(z) + b^2 g(z)}\, dz, \quad z = ax + by.$$

16. $f(w+ax+by)\left(\dfrac{\partial w}{\partial x}\right)^2 + g(w+ax+by)\left(\dfrac{\partial w}{\partial y}\right)^2 = h(w+ax+by).$

Complete integral:

$$w = -ax - by + \varphi(\xi), \qquad \xi = C_1 x + C_2 y + C_3,$$

where the function $\varphi = \varphi(\xi)$ is defined implicitly by

$$\xi = \int \frac{\left[C_1^2 f(\varphi) + C_2^2 g(\varphi)\right] d\varphi}{aC_1 f(\varphi) + bC_2 g(\varphi) \pm \sqrt{C_1^2 f(\varphi)h(\varphi) + C_2^2 g(\varphi)h(\varphi) - (aC_2 - bC_1)^2 f(\varphi)g(\varphi)}}.$$

One of the constants C_1 or C_2 can be set equal to ± 1.

17. $f_1(x)g_1(w)\left(\dfrac{\partial w}{\partial x}\right)^2 + f_2(y)g_2(w)\left(\dfrac{\partial w}{\partial y}\right)^2 = h(w).$

Complete integral:

$$\int \sqrt{\frac{C_1^2 g_1(w) + C_2^2 g_2(w)}{h(w)}}\, dw = C_1 \int \frac{dx}{\sqrt{f_1(x)}} + C_2 \int \frac{dy}{\sqrt{f_2(y)}} + C_3.$$

One of the constants C_1 or C_2 can be set equal to ± 1.

2.2.5. Equations of the Form $\left(\dfrac{\partial w}{\partial x}\right)^2 + f(x,y,w)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = g(x,y,w)$

1. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = f(x).$

Complete integral: $w = C_1(ax - 2y) \pm \int \sqrt{a^2 C_1^2 + f(x)}\, dx + C_2.$

2. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = f(y).$

Complete integral: $w = C_1(y - ax) - \dfrac{1}{a^2 C_1}\int f(y)\, dy + C_2.$

3. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + bw + f(y) = 0.$

Complete integral: $w = \dfrac{by + C_1}{a^2}\left[y - ax + a^2 \int \dfrac{f(y)\, dy}{(by + C_1)^2} + C_2\right].$

4. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + f(y)w = 0.$

Complete integral: $w = \dfrac{y - ax + C_1}{a^2}\left[\int f(y)\, dy + C_2\right].$

5. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = f(w).$

Complete integral in implicit form: $\displaystyle\int \frac{dw}{\sqrt{f(w)}} = C_1 x + \frac{1 - C_1^2}{aC_1} y + C_2.$

6. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = f(x)g(w).$

The substitution $z = \displaystyle\int \frac{dw}{\sqrt{|g(w)|}}$ leads to an equation of the form 2.2.5.1.

7. $\left(\dfrac{\partial w}{\partial x}\right)^2 + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = f(y)g(w).$

The substitution $z = \displaystyle\int \frac{dw}{\sqrt{|g(w)|}}$ leads to an equation of the form 2.2.5.2.

8. $\left(\dfrac{\partial w}{\partial x}\right)^2 + f(x)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + g(x) = 0.$

Complete integral: $w = 2C_1 y + C_2 + \displaystyle\int \left[-C_1 f(x) \pm \sqrt{C_1^2 f^2(x) - g(x)}\right] dx.$

9. $\left(\dfrac{\partial w}{\partial x}\right)^2 + f(y)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + g(x) = 0.$

Complete integral: $w = -\dfrac{C_1}{2}x \pm \dfrac{1}{2}\displaystyle\int \sqrt{C_1^2 - 4g(x)}\, + C_1 \int \frac{dy}{f(y)} + C_2.$

10. $\left(\dfrac{\partial w}{\partial x}\right)^2 + f(y)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + g(y) = 0.$

Complete integral: $w = C_1 x + C_2 - \displaystyle\int \frac{g(y) + C_1^2}{f(y)}\, dy.$

11. $\left(\dfrac{\partial w}{\partial x}\right)^2 + f(y)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = g(y)w + xh(y) + r(y).$

Complete integral:

$$w = x\varphi(y) + \psi(y),$$

where the function $\varphi(y)$ and $\psi(y)$ are determined by the following system of ordinary differential equations:

$$f(y)\varphi\varphi'_y = g(y)\varphi + h(y), \tag{1}$$

$$f(y)\varphi\psi'_y = g(y)\psi - \varphi^2 + r(y). \tag{2}$$

Abel's equation (1) can be considered independently. Given its solution, the solution of equation (2), which is linear in ψ, is easy to find.

For the simplest cases where g and/or h are identically zero, equation (1) has the solutions

$$\varphi(y) = \int \frac{g(y)}{f(y)}\, dy + C_1 \qquad \text{for } h(y) \equiv 0 \text{ and any } g(y),$$

$$\varphi(y) = \pm\left[2\int \frac{h(y)}{f(y)}\, dy + C_1\right]^{1/2} \qquad \text{for } g(y) \equiv 0 \text{ and any } h(y).$$

For other solutions of Abel's equation (1) see Polyanin and Zaitsev (2003).

12. $\left(\dfrac{\partial w}{\partial x}\right)^2 + f(y)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + g(x)h(w) = 0.$

The substitution $z = \displaystyle\int \frac{dw}{\sqrt{|g(w)|}}$ leads to an equation of the form 2.2.5.9.

13. $\left(\dfrac{\partial w}{\partial x}\right)^2 + f(y)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + g(y)h(w) = 0.$

The substitution $z = \displaystyle\int \frac{dw}{\sqrt{|g(w)|}}$ leads to an equation of the form 2.2.5.10.

14. $\left(\dfrac{\partial w}{\partial x}\right)^2 + f(ax+by)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + g(ax+by)h(w) = 0.$

Complete integral in implicit form:

$$\int \frac{dw}{\sqrt{h(w)}} = C_1 y + \int \frac{-aC_1 f(z) \pm \sqrt{a^2 C_1^2 f^2(z) - 4ag(z)\big[a + bf(z)\big]}}{2a\big[a + bf(z)\big]}\,dz + C_2,$$

where $z = ax + by$.

15. $\left(\dfrac{\partial w}{\partial x}\right)^2 + f(w+ax+by)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + g(w+ax+by) = 0.$

Complete integral:

$$w = -ax - by + \varphi(z), \qquad z = C_1 x + C_2 y + C_3,$$

where the function $\varphi = \varphi(z)$ is defined implicitly by

$$z = \int \frac{2C_1[C_1 + C_2 f(\varphi)]\,d\varphi}{\Delta(\varphi) \pm \sqrt{\Delta^2(\varphi) - 4C_1[C_1 + C_2 f(\varphi)][a^2 + abf(\varphi) + g(\varphi)]}},$$
$$\Delta(\varphi) = 2aC_1 + (aC_2 + bC_1)f(\varphi).$$

One of the constants C_1 or C_2 can be set equal to ± 1.

16. $\left(\dfrac{\partial w}{\partial x}\right)^2 + f(x)g(y)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + h(x)\varphi(w) = 0.$

Complete integral in implicit form:

$$\int \frac{dw}{\sqrt{\varphi(w)}} = \int \Big[C_1 f(x) \pm \sqrt{C_1^2 f^2(x) - h(x)}\Big]\,dx - 2C_1 \int \frac{dy}{g(y)} + C_2.$$

17. $\left(\dfrac{\partial w}{\partial x}\right)^2 + f(y)g(w)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} - h(w) = 0.$

Complete integral in implicit form: $\displaystyle\int \sqrt{\frac{1 + C_1 g(w)}{h(w)}}\,dw = x + C_1 \int \frac{dy}{f(y)} + C_2.$

2.2.6. Other Equations

1. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + f(x)\dfrac{\partial w}{\partial x} + g(x)\dfrac{\partial w}{\partial y} + h(x) = 0.$

Complete integral: $w = -\displaystyle\int \frac{C_1 g(x) + h(x)}{C_1 + f(x)}\,dx + C_1 y + C_2.$

2. $\left(\dfrac{\partial w}{\partial x} + ay\right)\left(\dfrac{\partial w}{\partial y} + ax\right) = f(x)g(y).$

Complete integral: $w = -axy + C_1\displaystyle\int f(x)\,dx + \frac{1}{C_1}\int g(y)\,dy + C_2.$

3. $\left[\dfrac{\partial w}{\partial x} + f_1(x)\right]\left[\dfrac{\partial w}{\partial y} + f_2(y)\right] = g_1(x)g_2(y).$

Complete integral: $w = \displaystyle\int \left[C_1 g_1(x) - f_1(x)\right]dx + \int \left[\frac{1}{C_1}g_2(y) - f_2(y)\right]dy + C_2.$

4. $\left(\dfrac{\partial w}{\partial x}\right)^2 + f(y)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + g(x)\dfrac{\partial w}{\partial x} = h(x).$

Complete integral: $w = -\dfrac{C_1}{2}x - \dfrac{1}{2}\displaystyle\int \left\{g(x) - \sqrt{\left[g(x) + C_1\right]^2 + 4h(x)}\right\}dx + C_1\int \frac{dy}{f(y)} + C_2.$

5. $\left(\dfrac{\partial w}{\partial x}\right)^2 + f(y)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + g(y)\dfrac{\partial w}{\partial x} = h(x).$

Complete integral: $w = C_1 x \pm \displaystyle\int \sqrt{C_1^2 + h(x)}\,dx - \int \frac{2C_1 + g(y)}{f(y)}\,dy + C_2.$

6. $\left(\dfrac{\partial w}{\partial x}\right)^2 + f(x)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + f(x)g(y)\dfrac{\partial w}{\partial x} = h(x).$

Complete integral: $w = 2C_1 y - \displaystyle\int g(y)\,dy + \int \left[-C_1 f(x) \pm \sqrt{C_1^2 f^2(x) + h(x)}\right]dx + C_2.$

7. $\left(\dfrac{\partial w}{\partial x}\right)^2 + f(x)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + g(x)\dfrac{\partial w}{\partial x} + h(x)\dfrac{\partial w}{\partial y} + s(x) = 0.$

Complete integral:

$$w = \frac{1}{2}\int \left\{-C_1 f(x) - g(x) + \sqrt{\left[C_1 f(x) + g(x)\right]^2 - 4C_1 h(x) - 4s(x)}\right\}dx + C_1 y + C_2.$$

8. $\left(\dfrac{\partial w}{\partial x}\right)^2 + f(y)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + g(y)\dfrac{\partial w}{\partial x} + h(y)\dfrac{\partial w}{\partial y} + s(y) = 0.$

Complete integral: $w = C_1 x - \displaystyle\int \frac{C_1^2 + C_1 g(y) + s(y)}{C_1 f(y) + h(y)}\,dy + C_2.$

9. $\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2=f(x^2+y^2)\left(x\dfrac{\partial w}{\partial x}+y\dfrac{\partial w}{\partial y}\right)^2+g(x^2+y^2)w^2.$

Complete integral:

$$w=C_1\exp\left[C_2\arcsin\frac{x}{\sqrt{z}}\pm\frac{1}{2}\int\sqrt{\frac{zg(z)-C_2^2}{1-zf(z)}}\frac{dz}{z}\right],\qquad z=x^2+y^2.$$

10. $f_1(x)\left(\dfrac{\partial w}{\partial x}\right)^2+f_2(y)\left(\dfrac{\partial w}{\partial y}\right)^2+g_1(x)\dfrac{\partial w}{\partial x}+g_2(y)\dfrac{\partial w}{\partial y}=h_1(x)+h_2(y).$

A separable equation. Complete integral:

$$w=\int\frac{-g_1(x)\pm\sqrt{g_1^2(x)+4f_1(x)h_1(x)+4C_1f_1(x)}}{2f_1(x)}\,dx$$
$$+\int\frac{-g_2(y)\pm\sqrt{g_2^2(y)+4f_2(y)h_2(y)-4C_1f_2(y)}}{2f_2(y)}\,dy+C_2.$$

The signs before the roots can be chosen independently of each other.

11. $f_1(x)\left(\dfrac{\partial w}{\partial x}\right)^2+f_2(x)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}+f_3(x)\left(\dfrac{\partial w}{\partial y}\right)^2=g(w).$

Complete integral in implicit form:

$$\int\frac{dw}{\sqrt{g(w)}}=C_1y+C_2-\int\frac{C_1f_2(x)\pm\sqrt{C_1^2f_2^2(x)+4f_1(x)-4C_1^2f_1(x)f_3(x)}}{2f_1(x)}\,dx.$$

12. $f_1(x)\left(\dfrac{\partial w}{\partial x}\right)^2+f_2(x)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}+f_3(x)\left(\dfrac{\partial w}{\partial y}\right)^2$
$$+g_1(x)\frac{\partial w}{\partial x}+g_2(x)\frac{\partial w}{\partial y}+h(x)=0.$$

Complete integral:

$$w=C_1y+C_2-\int\frac{g_1(x)+C_1f_2(x)\pm\sqrt{[g_1(x)+C_1f_2(x)]^2-4f_1(x)\Delta(x)}}{2f_1(x)}\,dx,$$
$$\Delta(x)=C_1^2f_3(x)+C_1g_2(x)+h(x).$$

13. $f_1(ax+by)\left(\dfrac{\partial w}{\partial x}\right)^2+f_2(ax+by)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}+f_3(ax+by)\left(\dfrac{\partial w}{\partial y}\right)^2$
$$+g_1(ax+by)\frac{\partial w}{\partial x}+g_2(ax+by)\frac{\partial w}{\partial y}+h(ax+by)=0.$$

For $b=0$, see equation 2.2.6.12. For $b\neq0$, the transformation $w(x,y)=u(\xi,x)$, $\xi=ax+by$ leads to an equation of the form 2.2.6.12:

$$\left[a^2f_1(\xi)+abf_2(\xi)+b^2f_3(\xi)\right]\left(\frac{\partial u}{\partial\xi}\right)^2+\left[2af_1(\xi)+bf_2(\xi)\right]\frac{\partial u}{\partial\xi}\frac{\partial u}{\partial x}+f_1(\xi)\left(\frac{\partial u}{\partial x}\right)^2$$
$$+\left[ag_1(\xi)+bg_2(\xi)\right]\frac{\partial u}{\partial\xi}+g_1(\xi)\frac{\partial u}{\partial x}+h(\xi)=0.$$

14. $f(x^2+y^2)\left[\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2\right]=\left(x\dfrac{\partial w}{\partial x}+y\dfrac{\partial w}{\partial y}-w\right)^2.$

Complete integral:

$$w=C_1\exp\left(C_2\arcsin\frac{x}{\sqrt{x^2+y^2}}\right)\Psi(x^2+y^2),$$

where $\Psi=\Psi(z)$ is a solution of the nonlinear ordinary differential equation

$$z(2z\Psi'_z-\Psi)^2=f(z)[4z^2(\Psi'_z)^2+C_2^2\Psi^2],\qquad z=x^2+y^2.$$

In particular, if $f(z)=z$, then $\Psi(z)=z^{(1-C_2^2)/4}$.

15. $f_1(w)\left(\dfrac{\partial w}{\partial x}\right)^2+f_2(w)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}+f_3(w)\left(\dfrac{\partial w}{\partial y}\right)^2$
$$+g_1(w)\frac{\partial w}{\partial x}+g_2(w)\frac{\partial w}{\partial y}+h(w)=0.$$

Complete integral in implicit form:

$$C_1x+C_2y+\int\frac{2F(w)\,dw}{G(w)\pm\sqrt{G^2(w)-4F(w)h(w)}}=C_3,$$

where $F(w)=C_1^2f_1(w)+C_1C_2f_2(w)+C_2^2f_3(w)$ and $G(w)=C_1g_1(w)+C_2g_2(w)$.

16. $f_1(w+ax+by)\left(\dfrac{\partial w}{\partial x}\right)^2+f_2(w+ax+by)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}+f_3(w+ax+by)\left(\dfrac{\partial w}{\partial y}\right)^2$
$$+g_1(w+ax+by)\frac{\partial w}{\partial x}+g_2(w+ax+by)\frac{\partial w}{\partial y}+h(w+ax+by)=0.$$

The substitution $u(x,y)=w(x,y)+ax+by$ leads to an equation of the form 2.2.6.15:

$$f_1(u)\left(\frac{\partial u}{\partial x}\right)^2+f_2(u)\frac{\partial u}{\partial x}\frac{\partial u}{\partial y}+f_3(u)\left(\frac{\partial u}{\partial y}\right)^2+\left[g_1(u)-2af_1(u)-bf_2(u)\right]\frac{\partial u}{\partial x}$$
$$+\left[g_2(u)-2bf_3(u)-af_2(u)\right]\frac{\partial u}{\partial y}+h(u)+a^2f_1(u)+abf_2(u)+b^2f_3(u)-ag_1(u)-bg_2(u)=0.$$

Chapter 3
First-Order Nonlinear Equations with Two Independent Variables of General Form

3.1. Nonlinear Equations Containing Arbitrary Parameters

3.1.1. Equations Contain the Fourth Powers of Derivatives

1. $\left(\dfrac{\partial w}{\partial x}\right)^4 = a\dfrac{\partial w}{\partial y} + bx + c.$

Complete integrals:

$$w = \frac{4}{5b}(bx + aC_1 + c)^{5/4} + C_1 y + C_2, \qquad w = \frac{aC_1 x - bxy - cy}{a} - \frac{(aC_1 - by)^5}{5a^5 b} + C_2.$$

2. $\left(\dfrac{\partial w}{\partial x}\right)^4 = a\dfrac{\partial w}{\partial y} + by + c.$

Complete integral: $w = C_1 x - \dfrac{y(by + 2c - 2C_1^4)}{2a} + C_2.$

3. $\left(\dfrac{\partial w}{\partial x}\right)^4 + a\dfrac{\partial w}{\partial y} = bx^k.$

Complete integral: $w = \displaystyle\int \left(bx^k + aC_1\right)^{1/4} dy - C_1 y + C_2.$

4. $\left(\dfrac{\partial w}{\partial x}\right)^4 + a\dfrac{\partial w}{\partial y} = by^k.$

Complete integral: $w = aC_1 x - a^3 C_1^4 y + \dfrac{b}{a(k+1)} y^{k+1} + C_2.$

5. $\left(\dfrac{\partial w}{\partial x}\right)^4 + a\dfrac{\partial w}{\partial y} = bxy^k + cy^n.$

Complete integral:

$$w = x\varphi(y) + \frac{c}{a(n+1)} y^{n+1} - \frac{1}{a}\int \varphi^4(y)\, dy + C_1, \qquad \varphi(y) = \frac{b}{a(k+1)} y^{k+1} + C_2.$$

6. $\left(\dfrac{\partial w}{\partial x}\right)^4 + a\dfrac{\partial w}{\partial y} = bx^k + cy^n.$

Complete integral: $w = \displaystyle\int \left(bx^k + aC_1\right)^{1/4} dx - C_1 y + \frac{c}{a(n+1)} y^{n+1} + C_2.$

7. $\left(\dfrac{\partial w}{\partial x}\right)^4 - aw^k \dfrac{\partial w}{\partial y} = 0.$

Complete integral: $w = \left[\dfrac{3-k}{3}\left(aC_1 x + a^3 C_1^4 y + C_2\right)\right]^{\frac{3}{3-k}}.$

8. $\left(\dfrac{\partial w}{\partial x}\right)^4 - ax^n y^m w^k \dfrac{\partial w}{\partial y} = 0.$

Complete integral: $w = \left[\dfrac{3-k}{3}\left(\dfrac{4aC_1}{n+4} x^{\frac{n+4}{4}} + \dfrac{a^3 C_1^4}{1-m} y^{1-m} + C_2\right)\right]^{\frac{3}{3-k}}.$

9. $\left(\dfrac{\partial w}{\partial x}\right)^4 + a\left(\dfrac{\partial w}{\partial y}\right)^3 + b\left(\dfrac{\partial w}{\partial x}\right)^2 + c\dfrac{\partial w}{\partial y} + d = 0.$

Complete integral: $w = \pm\dfrac{x}{2}\sqrt{-2b + 2\sqrt{b^2 - 4d - 4aC_1^3 - 4cC_1}} + C_1 y + C_2.$

10. $\left[a^2\left(\dfrac{\partial w}{\partial x}\right)^2 - 2w\right]^2 = b\left(\dfrac{\partial w}{\partial y}\right)^3.$

Complete integral: $w = \dfrac{1}{2}\left(\dfrac{x}{a} + C_1\right)^2 + \dfrac{4}{27b}(y + C_2)^3.$

11. $ay^k\left(\dfrac{\partial w}{\partial x}\right)^4 = \left(\dfrac{\partial w}{\partial y}\right)^2 + b\dfrac{\partial w}{\partial y}.$

Complete integral: $w = C_1 x - \dfrac{1}{2}\displaystyle\int \left(b \pm \sqrt{b^2 + 4aC_1^4 y^k}\right) dy + C_2.$

12. $\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y}\right)^3 = ay + bx^k.$

Complete integral: $w = (4ax + C_1)^{1/4} y + b\displaystyle\int x^k (4ax + C_1)^{-3/4}\, dx + C_2.$

13. $\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y}\right)^3 = ax^k y + bx^n.$

Complete integral:

$$w = \varphi(x) y + b\int \frac{x^n\, dx}{[\varphi(x)]^3} + C_2, \qquad \varphi(x) = \left(\frac{4a}{k+1} x^{k+1} + C_1\right)^{1/4}.$$

14. $\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y}\right)^3 = ax^k y^n.$

Complete integral: $w = \dfrac{aC_1^3}{k+1}x^{k+1} + \dfrac{3}{C_1(n+3)}y^{\frac{n+3}{3}} + C_2.$

15. $\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y}\right)^3 = aw + bx^k.$

Complete integral: $w = (3ax + C_1)^{1/3}(y + C_2) + b(3ax + C_1)^{1/3}\displaystyle\int x^k(3ax + C_1)^{-4/3}\,dx.$

16. $\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y}\right)^3 = ax^n w + bx^m y + cx^l.$

This is a special case of equation 3.2.1.22 with $k = 3$, $f(x) = ax^n$, $g(x) = bx^m$, and $h(x) = cx^l$.

17. $w^2\left(\dfrac{\partial w}{\partial x}\right)^2\left(\dfrac{\partial w}{\partial y}\right)^2 = a^2y^2\left(\dfrac{\partial w}{\partial x}\right)^2 + b^2x^2\left(\dfrac{\partial w}{\partial y}\right)^2.$

Complete integral: $w^2 = \dfrac{\sqrt{C_1^2+1}}{C_1}(bx^2 + aC_1y^2) + C_2.$

3.1.2. Equations Contain Derivatives in Radicands

1. $\dfrac{\partial w}{\partial x} + \sqrt{a + b\left(\dfrac{\partial w}{\partial y}\right)^2} = 0.$

This equation is encountered in optimal control and differential games; see Subbotin (1991, 1995).

Complete integral: $w = C_1y - \sqrt{a + bC_1^2}\,x + C_2.$

See also Example 24.7 in Subsection 24.3.6, where the Cauchy problem for this equation with $a = b = 1$ is considered.

2. $\dfrac{\partial w}{\partial x} + \sqrt{a + b\left(\dfrac{\partial w}{\partial y}\right)^2} - x\sqrt{c + k\left(\dfrac{\partial w}{\partial y}\right)^2} = 0.$

Complete integral: $w = C_1y + \frac{1}{2}x^2\sqrt{c + kC_1^2} - x\sqrt{a + bC_1^2} + C_2.$

The Cauchy problem for this equation with $b = k = 1$, $a > 0$, and $c > 0$ was considered in the book by Melikyan (1998).

3. $x\dfrac{\partial w}{\partial x} + y\dfrac{\partial w}{\partial y} - w + \sqrt{a\left(\dfrac{\partial w}{\partial x}\right)^2 + b\left(\dfrac{\partial w}{\partial y}\right)^2 + c} = 0.$

Complete integral: $w = C_1x + C_2y + \sqrt{aC_1^2 + bC_2^2 + c}.$

3.1.3. Equations Contain Arbitrary Powers of Derivatives

1. $\left(\dfrac{\partial w}{\partial x}\right)^k + a\dfrac{\partial w}{\partial y} = bx^n.$

Complete integral: $w = \displaystyle\int (bx^n + aC_1)^{1/k}\,dy - C_1 y + C_2.$

2. $\left(\dfrac{\partial w}{\partial x}\right)^k + a\dfrac{\partial w}{\partial y} = by^n.$

Complete integral: $w = aC_1 x - a^{k-1}C_1^k y + \dfrac{b}{a(n+1)}y^{n+1} + C_2.$

3. $\left(\dfrac{\partial w}{\partial x}\right)^k + a\dfrac{\partial w}{\partial y} = bx^n + cy^m.$

Complete integral: $w = \displaystyle\int (bx^n + aC_1)^{1/k}\,dx - C_1 y + \frac{c}{a(m+1)}y^{m+1} + C_2.$

4. $\left(\dfrac{\partial w}{\partial x}\right)^k + a\dfrac{\partial w}{\partial y} = bxy^n + cy^m.$

Complete integral:

$$w = x\varphi(y) + \frac{c}{a(m+1)}y^{m+1} - \frac{1}{a}\int \varphi^k(y)\,dy + C_1, \qquad \varphi(y) = \frac{b}{a(n+1)}y^{n+1} + C_2.$$

5. $\left(\dfrac{\partial w}{\partial x}\right)^k - aw^n\dfrac{\partial w}{\partial y} = 0.$

Complete integral: $w = \left[\dfrac{n-k+1}{1-k}\left(aC_1 x + a^{k-1}C_1^k y + C_2\right)\right]^{\frac{1-k}{n-k+1}}.$

6. $\left(\dfrac{\partial w}{\partial x}\right)^k - ax^n y^m w^l\dfrac{\partial w}{\partial y} = 0.$

Complete integral: $w = \left[\dfrac{l-k+1}{1-k}\left(\dfrac{akC_1}{n+k}x^{\frac{n+k}{k}} + \dfrac{a^{k-1}C_1^k}{1-m}y^{1-m} + C_2\right)\right]^{\frac{1-k}{l-k+1}}.$

7. $\left(\dfrac{\partial w}{\partial x}\right)^k + ay^n\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = by^m w + cxy^l + dy^s.$

This is a special case of equation 3.2.1.17 with $f(y) = ay^n$, $g(y) = by^m$, $h(y) = cy^l$, and $r(y) = dy^s$.

8. $y^n\left(\dfrac{\partial w}{\partial x}\right)^k = a\left(\dfrac{\partial w}{\partial y}\right)^2 + b\dfrac{\partial w}{\partial y}.$

Complete integral: $w = C_1 x + C_2 - \dfrac{b}{2a}y \pm \dfrac{1}{2a}\displaystyle\int \sqrt{b^2 + 4aC_1^k y^n}\,dy.$

9. $(axy^n + by^m)\left(\dfrac{\partial w}{\partial x}\right)^k - \dfrac{\partial w}{\partial y} = 0.$

Complete integral:

$$w = x\varphi(y) + b\int y^m\varphi^k(y)\,dy + C_1, \qquad \varphi(y) = \left[\frac{a(1-k)}{n+1}y^{n+1} + C_2\right]^{\frac{1}{1-k}}.$$

10. $ay^m w^n\left(\dfrac{\partial w}{\partial x}\right)^k - \dfrac{\partial w}{\partial y} + by^s w = 0.$

The transformation

$$w(x,y) = G(y)u(x,z), \quad z = a\int y^m G^{n+k-1}(y)\,dy, \qquad G(y) = \exp\left(\frac{b}{s+1}y^{s+1}\right),$$

leads to a simpler equation of the form 3.1.3.5: $\left(\dfrac{\partial u}{\partial x}\right)^k - u^{-n}\dfrac{\partial u}{\partial z} = 0.$

11. $\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y}\right)^k = ay + bx^n.$

Complete integral: $w = \big[a(k+1)x + C_1\big]^{\frac{1}{k+1}}y + b\displaystyle\int x^n\big[a(k+1)x + C_1\big]^{-\frac{k}{k+1}}dx + C_2.$

12. $\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y}\right)^k = ax^n y + bx^m.$

This is a special case of equation 3.2.1.19 with $f(x) = ax^n$ and $g(x) = bx^m$.

13. $\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y}\right)^k = ax^n y^m.$

Complete integral: $w = \dfrac{aC_1^k}{n+1}x^{n+1} + \dfrac{k}{C_1(m+k)}y^{\frac{m+k}{k}} + C_2.$

14. $\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y}\right)^k = aw + bx^n.$

Complete integral: $w = (akx + C_1)^{\frac{1}{k}}(y + C_2) + b(akx + C_1)^{\frac{1}{k}}\displaystyle\int x^n(akx + C_1)^{-\frac{k+1}{k}}dx.$

15. $\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y}\right)^k = ax^n w + bx^m y + cx^l.$

This is a special case of equation 3.2.1.22 with $f(x) = ax^n$, $g(x) = bx^m$, and $h(x) = cx^l$.

16. $\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y}\right)^k + a\dfrac{\partial w}{\partial y} + bx + c = 0.$

Complete integral: $w = -\dfrac{bx + 2aC_1 + 2c}{2C_1^k}x + C_1 y + C_2.$

17. $\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y}\right)^k + a\dfrac{\partial w}{\partial x} + bx + c = 0.$

Complete integral: $w = -\dfrac{bx + 2c}{2(a + C_1^k)}x + C_1 y + C_2.$

18. $\left(\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}\right)^k = x\dfrac{\partial w}{\partial x} - y\dfrac{\partial w}{\partial y}.$

Complete integral:

$$C_1^{-k} w = \frac{1}{2}\ln\left|\frac{x}{y}\right| \pm R \pm \frac{1}{2}\ln\left|\frac{R-1}{R+1}\right| + C_2, \qquad \text{where} \quad R = \sqrt{4xyC_1^{1-2k} + 1}.$$

19. $\left(x\dfrac{\partial w}{\partial y} - y\dfrac{\partial w}{\partial x}\right)^k = \left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2.$

Complete integral:

$$w = C_1 \arctan\frac{y}{x} + C_2 + \int \sqrt{C_1^k R^2 - C_1^2}\,\frac{dR}{R}, \qquad \text{where} \quad R = \sqrt{x^2 + y^2}.$$

20. $\left(y\dfrac{\partial w}{\partial x} + x\dfrac{\partial w}{\partial y}\right)^k = \left(\dfrac{\partial w}{\partial x}\right)^2 - \left(\dfrac{\partial w}{\partial y}\right)^2.$

Complete integral:

$$C_1 w = \frac{1}{2}\ln\left|\frac{x+y}{x-y}\right| \pm R \pm \frac{1}{2}\ln\left|\frac{R-1}{R+1}\right| + C_2, \qquad \text{where} \quad R = \sqrt{(x+y)(x-y)C_1^{2-k} + 1}.$$

21. $\left(\dfrac{\partial w}{\partial x}\right)^k + a\left(\dfrac{\partial w}{\partial y}\right)^n = b.$

Complete integral: $w = (b - aC_1)^{1/k}x + C_1^{1/n}y + C_2.$

22. $\left(\dfrac{\partial w}{\partial x}\right)^k + a\left(\dfrac{\partial w}{\partial y}\right)^k = w.$

Complete integral: $w = \left(1 + aC_1^k\right)^{\frac{1}{1-k}}\left[\dfrac{k-1}{k}(x + C_1 y + C_2)\right]^{\frac{k}{k-1}}.$

23. $ax^m\left(\dfrac{\partial w}{\partial x}\right)^k + by^l\left(\dfrac{\partial w}{\partial y}\right)^n = cx^p + sy^q.$

Complete integral: $w = \displaystyle\int\left(\frac{cx^p - C_1}{ax^m}\right)^{1/k} dx + \int\left(\frac{sy^q + C_1}{by^l}\right)^{1/n} dy + C_2.$

24. $axy^m\left(\dfrac{\partial w}{\partial x}\right)^k + by^l\left(\dfrac{\partial w}{\partial x}\right)^n - \dfrac{\partial w}{\partial y} = 0.$

This is a special case of equation 3.2.2.5 with $f(y) = ay^m$ and $g(y) = by^l$.

25. $e^{ax}\left(\dfrac{\partial w}{\partial x}\right)^k + e^{by}\left(\dfrac{\partial w}{\partial y}\right)^k = c.$

Complete integral:

$$w = \begin{cases} -\dfrac{kC_1}{a}e^{-ax/k} - \dfrac{k(c-C_1^k)^{1/k}}{b}e^{-by/k} + C_2 & \text{if } a \neq 0, \\ C_1 x - \dfrac{k(c-C_1^k)^{1/k}}{b}e^{-by/k} + C_2 & \text{if } a = 0. \end{cases}$$

26. $a\left(\dfrac{\partial w}{\partial x} + cy\right)^k + b\left(\dfrac{\partial w}{\partial y} + cx\right)^n = cx^m + sy^l.$

This is a special case of equation 3.2.2.10 with $f(x) = cx^m$ and $g(y) = sy^l$.

27. $\left(\dfrac{\partial w}{\partial x}\right)^k \left(\dfrac{\partial w}{\partial y}\right)^n = ax^m y^l.$

Complete integral: $w = \dfrac{ka^{1/k}}{(m+k)C_1^n} x^{\frac{m+k}{k}} + \dfrac{nC_1^k}{n+l} y^{\frac{n+l}{n}} + C_2.$

28. $\left(\dfrac{\partial w}{\partial x}\right)^k \left(\dfrac{\partial w}{\partial y}\right)^n = ax^m y^l w^s.$

This is a special case of equation 3.2.2.8 with $f(x) = ax^m$, $g(y) = y^l$, and $h(w) = w^s$.

29. $\left(\dfrac{\partial w}{\partial x}\right)^k \left(\dfrac{\partial w}{\partial y}\right)^n = ax^m \dfrac{\partial w}{\partial y} + bx^l.$

Complete integral: $w = C_1 y + C_1^{-n/k} \displaystyle\int (aC_1 x^m + bx^l)^{1/k}\, dx + C_2.$

30. $\left(\dfrac{\partial w}{\partial x} + ay\right)^k \left(\dfrac{\partial w}{\partial y} + ax\right)^n = bx^m y^l.$

This is a special case of equation 3.2.2.11 with $f(x) = bx^m$ and $g(y) = y^l$.

3.1.4. More Complicated Equations

1. $\dfrac{\partial w}{\partial x} - a\exp\left(\lambda \dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral: $w = ae^{\lambda C_1} x + C_1 y + C_2.$

2. $\dfrac{\partial w}{\partial x} - a\exp\left(\lambda \dfrac{\partial w}{\partial y}\right) = bx^k.$

Complete integral: $w = C_1 y + ae^{\lambda C_1} x + \dfrac{b}{k+1} x^{k+1} + C_2.$

3. $\dfrac{\partial w}{\partial x} - (ay + bx^k)\exp\left(\lambda\dfrac{\partial w}{\partial y}\right) = 0.$

This is a special case of equation 3.3.1.6 with $f(u) = \exp(\lambda u)$ and $g(x) = bx^k$.

4. $ay\dfrac{\partial w}{\partial x} - \exp\left(\dfrac{\partial w}{\partial y}\right) + bxy = 0.$

Complete integral: $w = \dfrac{2C_1x - bx^2}{2a} + y\ln\bigl(C_1y\bigr) - y + C_2.$

5. $\dfrac{\partial w}{\partial x} - a\sinh\left(\lambda\dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral: $w = a\sinh(\lambda C_1)x + C_1y + C_2.$

6. $\dfrac{\partial w}{\partial x} - ax^k\sinh\left(\lambda\dfrac{\partial w}{\partial y}\right) = bx^n.$

Complete integral: $w = C_1y + \dfrac{a\sinh(\lambda C_1)}{k+1}x^{k+1} + \dfrac{b}{n+1}x^{n+1} + C_2.$

7. $\dfrac{\partial w}{\partial x} - aw\sinh\left(\lambda\dfrac{\partial w}{\partial y}\right) = 0.$

This is a special case of equation 3.3.1.10 with $f(u) = a\sinh(\lambda u)$ and $\beta = 0$.

8. $\dfrac{\partial w}{\partial x} - a\ln\left(\lambda\dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral: $w = a\ln(\lambda C_1)x + C_1y + C_2.$

9. $\dfrac{\partial w}{\partial x} - a\ln\left(\lambda\dfrac{\partial w}{\partial y}\right) = bx^k.$

Complete integral: $w = C_1y + a\ln(\lambda C_1)x + \dfrac{b}{k+1}x^{k+1} + C_2.$

10. $\dfrac{\partial w}{\partial x} - ax^k\ln\left(\lambda\dfrac{\partial w}{\partial y}\right) = bx^n.$

Complete integral: $w = C_1y + \dfrac{a\ln(\lambda C_1)}{k+1}x^{k+1} + \dfrac{b}{n+1}x^{n+1} + C_2.$

11. $\dfrac{\partial w}{\partial x} - aw\ln\left(\dfrac{\lambda}{w}\dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral: $w = C_1\exp\bigl[C_2y + a\ln(\lambda C_2)x\bigr].$

12. $\dfrac{\partial w}{\partial x} - a\cos\left(\lambda\dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral: $w = a\cos(\lambda C_1)x + C_1y + C_2.$

13. $\dfrac{\partial w}{\partial x} + a\cos\left(\lambda\dfrac{\partial w}{\partial y}\right) = bx^k y + cx^n.$

This is a special case of equation 3.3.1.3 with $f(u) = a\cos(\lambda u)$, $g(x) = bx^k$, $h(x) = cx^n$.

14. $\dfrac{\partial w}{\partial x} - ax^k \sin\left(\lambda\dfrac{\partial w}{\partial y}\right) - bx^n\dfrac{\partial w}{\partial y} = 0.$

Complete integral: $w = \dfrac{a\sin(\lambda C_1)}{k+1}x^{k+1} + \dfrac{bC_1}{n+1}x^{n+1} + C_1 y + C_2.$

15. $\dfrac{\partial w}{\partial x} - (ax^k y + bx^n)\sin\left(\lambda\dfrac{\partial w}{\partial y}\right) = 0.$

This is a special case of equation 3.3.1.7 with $f(u) = \sin(\lambda u)$, $g(x) = ax^k$, and $h(x) = bx^n$.

16. $\dfrac{\partial w}{\partial x} - a\sin\left(\lambda x\dfrac{\partial w}{\partial y}\right) = b.$

Complete integral: $w = \dfrac{a}{\lambda C_1}\cos(\lambda C_1 x) + bx - C_1 y + C_2.$

17. $\dfrac{\partial w}{\partial x} - aw\sin\left(\dfrac{\lambda}{w}\dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral: $w = C_1\exp\bigl[C_2 y + a\sin(\lambda C_2)x\bigr].$

▷ *For solutions of other nonlinear equations, see also Sections 3.2 and 3.3, where equations of a general form with arbitrary functions are considered.*

3.2. Equations Containing Arbitrary Functions of Independent Variables

3.2.1. Equations Contain One Arbitrary Power of Derivative

1. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^k = f(x).$

Complete integral: $w = -aC_1^k x + \displaystyle\int f(x)\,dx + C_1 y + C_2.$

2. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^k = f(y).$

Complete integral: $w = -C_1 x + \displaystyle\int\left[\frac{f(y)+C_1}{a}\right]^{1/k} dy + C_2.$

3. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^k = yf(x) + g(x).$

Complete integral:

$$w = y\varphi(x) + \int\bigl[g(x) - a\varphi^k(x)\bigr]\,dx + C_1, \quad \varphi(x) = \int f(x)\,dx + C_2.$$

4. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^k=f(x)+g(y).$

Complete integral: $w=-C_1x+\displaystyle\int f(x)\,dx+\int\left[\frac{g(y)+C_1}{a}\right]^{1/k}dy+C_2.$

5. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^k=f(x)w+g(x).$

Complete integral:

$$w=C_1F(x)+C_2yF(x)+F(x)\int\left[g(x)-aC_2^kF^k(x)\right]\frac{dx}{F(x)},\qquad F(x)=\exp\left[\int f(x)\,dx\right].$$

6. $\dfrac{\partial w}{\partial x}+f(x)\left(\dfrac{\partial w}{\partial y}\right)^k=g(x)w+h(x)y+s(x).$

Complete integral:

$$w=G(x)\left[y\varphi(x)+\psi(x)\right],\qquad G(x)=\exp\left[\int g(x)\,dx\right],$$

where

$$\varphi(x)=C_1+\int\frac{h(x)}{G(x)}\,dx,\quad \psi(x)=C_2+\int\left[s(x)-f(x)G^k(x)\varphi^k(x)\right]\frac{dx}{G(x)}.$$

7. $\dfrac{\partial w}{\partial x}+f(x)\left(\dfrac{\partial w}{\partial y}\right)^k+g(x)\dfrac{\partial w}{\partial y}=0.$

Complete integral: $w=C_1y+C_2-\displaystyle\int\left[C_1^kf(x)+C_1g(x)\right]dx.$

8. $\dfrac{\partial w}{\partial x}-\left[yf(x)+g(x)\right]\left(\dfrac{\partial w}{\partial y}\right)^k=0.$

Complete integral:

$$w=y\varphi(x)+\int\varphi^k(x)g(x)\,dx+C_1,\qquad \varphi(x)=\left[(1-k)\int f(x)\,dx+C_2\right]^{\frac{1}{1-k}}.$$

9. $\dfrac{\partial w}{\partial x}-f(x)w^n\left(\dfrac{\partial w}{\partial y}\right)^k-g(x)w=0.$

The transformation

$$w(x,y)=G(x)u(z,y),\quad z=\int f(x)G^{n+k-1}(x)\,dx,\qquad G(x)=\exp\left[\int g(x)\,dx\right],$$

leads to a simpler equation, $\dfrac{\partial u}{\partial z}-u^n\left(\dfrac{\partial u}{\partial y}\right)^k=0$. For $n+k\neq1$, the last equation has the complete integral

$$u=\left(C_1y+C_1^k\lambda^{k-1}z+C_2\right)^{\lambda},\qquad \lambda=\frac{k-1}{n+k-1}.$$

10. $\dfrac{\partial w}{\partial x} - f(x)e^{\beta w}\left(\dfrac{\partial w}{\partial y}\right)^k - g(x) = 0.$

The transformation

$$w(x,y) = u(z,y) + G(x), \quad z = \int f(x)\exp\bigl[\beta G(x)\bigr]\,dx, \qquad G(x) = \int g(x)\,dx,$$

leads to a simpler equation, $\dfrac{\partial u}{\partial z} - e^{\beta u}\left(\dfrac{\partial u}{\partial y}\right)^k = 0$, which has the complete integral

$$u = \frac{k}{\beta}\ln\left(C_1 - \frac{\beta}{k}y\right) - \frac{1}{\beta}\ln(C_2 - \beta z).$$

11. $\dfrac{\partial w}{\partial x} - f(w)\left(\dfrac{\partial w}{\partial y}\right)^k = 0.$

Complete integral in implicit form: $\displaystyle\int \bigl[f(w)\bigr]^{\frac{1}{k-1}}\,dw = C_1^k x + C_1 y + C_2.$

12. $\dfrac{\partial w}{\partial x} - f(w)\left(\dfrac{\partial w}{\partial y}\right)^k - \bigl[yg(x) + h(x)\bigr]\dfrac{\partial w}{\partial y} = 0.$

The transformation

$$t = \int \varphi^k(x)\,dx, \quad z = \varphi(x)y + \int h(x)\varphi(x)\,dx, \qquad \varphi(x) = \exp\left[\int g(x)\,dx\right],$$

leads to a simpler equation of the form 3.2.1.11: $\dfrac{\partial w}{\partial t} - f(w)\left(\dfrac{\partial w}{\partial z}\right)^k = 0.$

13. $\dfrac{\partial w}{\partial x} - f(w)\left(\dfrac{\partial w}{\partial y}\right)^k + g(w)\dfrac{\partial w}{\partial y} = 0.$

Complete integral in implicit form: $\displaystyle\int \left[\frac{f(w)}{C_1 + g(w)}\right]^{\frac{1}{k-1}} dw = C_1 x + y + C_2.$

14. $\dfrac{\partial w}{\partial x} - f(x)g(y)h(w)\left(\dfrac{\partial w}{\partial y}\right)^k = 0.$

Complete integral in implicit form:

$$\int \bigl[h(w)\bigr]^{\frac{1}{k-1}}\,dw = C_1^k \int f(x)\,dx + C_1 \int [g(y)]^{-\frac{1}{k}}\,dy + C_2.$$

15. $f(x)\dfrac{\partial w}{\partial x} + g(y)\left(\dfrac{\partial w}{\partial y}\right)^k + h(x) = 0.$

Complete integral: $\displaystyle w = C_1 \int \frac{dy}{\bigl[g(y)\bigr]^{1/k}} - \int \frac{C_1^k + h(x)}{f(x)}dx + C_2.$

16. $\left(\dfrac{\partial w}{\partial x}\right)^2 + f(x)\dfrac{\partial w}{\partial x} = g(x)\left(\dfrac{\partial w}{\partial y}\right)^k + h(x).$

Complete integral: $w = C_1 y - \dfrac{1}{2}\displaystyle\int\left[f(x) \pm \sqrt{f^2(x) + 4C_1^k g(x) + 4h(x)}\right] dx + C_2.$

17. $\left(\dfrac{\partial w}{\partial x}\right)^k + f(y)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} = g(y)w + xh(y) + r(y).$

Complete integral:

$$w = x\varphi(y) + \psi(y),$$

where the function $\varphi(y)$ and $\psi(y)$ are determined by solving the following system of ordinary differential equations:

$$f(y)\varphi\varphi'_y = g(y)\varphi + h(y), \tag{1}$$

$$f(y)\varphi\psi'_y = g(y)\psi - \varphi^k + r(y). \tag{2}$$

Abel's equation (1) can be considered independently. Given its solution, the solution of equation (2), which is linear in ψ, is easy to find.

For the simplest cases where g and/or h are identically zero, equation (1) has the solutions

$$\varphi(y) = \int \frac{g(y)}{f(y)}\,dy + C_1 \qquad \text{for} \quad h(y) \equiv 0 \quad \text{and any} \quad g(y),$$

$$\varphi(y) = \pm\left[2\int \frac{h(y)}{f(y)}\,dy + C_1\right]^{1/2} \qquad \text{for} \quad g(y) \equiv 0 \quad \text{and any} \quad h(y).$$

18. $\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y}\right)^k = ay + f(x).$

Complete integral: $w = \big[a(k+1)x + C_1\big]^{\frac{1}{k+1}} y + \displaystyle\int f(x)\big[a(k+1)x + C_1\big]^{-\frac{k}{k+1}}\,dx + C_2.$

19. $\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y}\right)^k = f(x)y + g(x).$

Complete integral:

$$w = \varphi(x)y + \int \frac{g(x)}{[\varphi(x)]^k}\,dx + C_1, \qquad \varphi(x) = \left[(k+1)\int f(x)\,dx + C_2\right]^{\frac{1}{k+1}}.$$

20. $\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y}\right)^k = f(x)g(y).$

Complete integral: $w = C_1^k \displaystyle\int f(x)\,dx + \frac{1}{C_1}\int \big[g(y)\big]^{1/k}\,dy + C_2.$

21. $\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y}\right)^k = aw + f(x).$

Complete integral: $w = (akx + C_1)^{\frac{1}{k}}(y + C_2) + (akx + C_1)^{\frac{1}{k}} \int f(x)(akx + C_1)^{-\frac{k+1}{k}}\,dx.$

22. $\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y}\right)^k = f(x)w + g(x)y + h(x).$

Complete integral:

$$w = y\varphi(x) + \psi(x),$$

where the function $\varphi(x)$ and $\psi(x)$ are determined by solving the following system of ordinary differential equations:

$$\varphi^k \varphi'_x = f(x)\varphi + g(x), \tag{1}$$
$$\varphi^k \psi'_x = f(x)\psi + h(x). \tag{2}$$

Equation (1) can be considered independently. Given its solution, the solution of equation (2), which is linear in ψ, is easy to find.

3.2.2. Equations Contain Two or Three Arbitrary Powers of Derivatives

1. $f(x)\left(\dfrac{\partial w}{\partial x}\right)^k + g(y)\left(\dfrac{\partial w}{\partial y}\right)^n = h_1(x) + h_2(y).$

Complete integral: $w = \displaystyle\int \left[\frac{h_1(x) + C_1}{f(x)}\right]^{1/k} dx + \int \left[\frac{h_2(y) - C_1}{g(y)}\right]^{1/n} dy + C_2.$

2. $f(x)\left(\dfrac{\partial w}{\partial x}\right)^k + g(y)\left(\dfrac{\partial w}{\partial y}\right)^n = aw + h_1(x) + h_2(y).$

Complete integral:

$$w = \varphi(x) + \psi(y),$$

where the functions $\varphi(x)$ and $\psi(y)$ are determined from the ordinary differential equations

$$f(x)(\varphi'_x)^k - a\varphi - h_1(x) = C_1,$$
$$g(y)(\psi'_y)^n - a\psi - h_2(y) = -C_1.$$

By the substitutions $z = \int |f(x)|^{-1/k}\,dx$ and $t = \int |g(y)|^{-1/n}\,dy$, respectively, these equations can be reduced to equations some solvable cases of which can be found in Zaitsev and Polyanin (1994) and Polyanin and Zaitsev (1995).

3. $\left(\dfrac{\partial w}{\partial x}\right)^k - f(w)\left(\dfrac{\partial w}{\partial y}\right)^n = 0, \qquad n \neq k.$

Complete integral in implicit form: $\displaystyle\int [f(w)]^{\frac{1}{n-k}}\,dw = C_1^n x + C_1^k y + C_2.$

4. $\left(\dfrac{\partial w}{\partial x}\right)^k - f(x)g(y)h(w)\left(\dfrac{\partial w}{\partial y}\right)^n = 0, \qquad n \neq k.$

Complete integral in implicit form:

$$\int \big[h(w)\big]^{\frac{1}{n-k}}\,dw = C_1^n \int \big[f(x)\big]^{\frac{1}{k}}\,dx + C_1^k \int \big[g(y)\big]^{-\frac{1}{n}}\,dy + C_2.$$

5. $xf(y)\left(\dfrac{\partial w}{\partial x}\right)^k + g(y)\left(\dfrac{\partial w}{\partial x}\right)^n - \dfrac{\partial w}{\partial y} = 0.$

Complete integral:

$$w = x\varphi(y) + \int g(y)\varphi^n(y)\,dy + C_1.$$

$$\varphi(y) = \left[(1-k)\int f(y)\,dy + C_2\right]^{\frac{1}{1-k}} \quad \text{if} \quad k \neq 1,$$

$$\varphi(y) = C_2 \exp\left[\int f(y)\,dy\right] \quad \text{if} \quad k = 1.$$

6. $f(x)w^n\left(\dfrac{\partial w}{\partial x}\right)^k + g(y)w^k\left(\dfrac{\partial w}{\partial y}\right)^n = w^{n+k}\ln w.$

Complete integral:

$$w = \exp\left\{\left[\frac{k-1}{k}\int \big[f(x)\big]^{-\frac{1}{k}}\,dx + C_1\right]^{\frac{k}{k-1}} + \left[\frac{n-1}{n}\int \big[g(y)\big]^{-\frac{1}{n}}\,dy + C_2\right]^{\frac{n}{n-1}}\right\}.$$

7. $\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y}\right)^k + \big[f_1(x)y + f_2(x)\big]\left(\dfrac{\partial w}{\partial y}\right)^n + f_3(x)\dfrac{\partial w}{\partial x} = g_1(x)w + g_2(x)y + g_3(x).$

A complete integral of this equation can be sought in the form $w = y\varphi(x) + \psi(x)$.

8. $\left(\dfrac{\partial w}{\partial x}\right)^k\left(\dfrac{\partial w}{\partial y}\right)^n = f(x)g(y)h(w).$

Complete integral in implicit form:

$$\int \big[h(w)\big]^{-\frac{1}{k+n}}\,dw = C_1^n \int \big[f(x)\big]^{\frac{1}{k}}\,dx + \frac{1}{C_1^k}\int \big[g(y)\big]^{\frac{1}{n}}\,dy + C_2.$$

9. $\left(\dfrac{\partial w}{\partial x}\right)^k\left(\dfrac{\partial w}{\partial y}\right)^n = f(x)\dfrac{\partial w}{\partial y} + g(x).$

Complete integral: $w = C_1 y + C_1^{-n/k}\int \big[C_1 f(x) + g(x)\big]^{1/k}\,dx + C_2.$

10. $a\left(\dfrac{\partial w}{\partial x}+cy\right)^k+b\left(\dfrac{\partial w}{\partial y}+cx\right)^n=f(x)+g(y).$

Complete integral: $w=-cxy+\displaystyle\int\left[\frac{f(x)+C_1}{a}\right]^{1/k}dx+\int\left[\frac{g(y)-C_1}{b}\right]^{1/n}dy+C_2.$

11. $\left(\dfrac{\partial w}{\partial x}+ay\right)^k\left(\dfrac{\partial w}{\partial y}+ax\right)^n=f(x)g(y).$

Complete integral: $w=-axy+C_1^n\displaystyle\int\big[f(x)\big]^{1/k}dx+\frac{1}{C_1^k}\int\big[g(y)\big]^{1/n}dy+C_2.$

12. $\left[\dfrac{\partial w}{\partial x}+f_1(x)\right]^k\left[\dfrac{\partial w}{\partial y}+f_2(y)\right]^n=g_1(x)g_2(y).$

Complete integral: $w=\displaystyle\int\big[C_1^n g_1^{1/k}(x)-f_1(x)\big]\,dx+\int\left[\frac{1}{C_1^k}g_2^{1/n}(y)-f_2(y)\right]dy+C_2.$

13. $\dfrac{\partial w}{\partial x}+f_1(x)\sqrt{g_1(x)+\left(\dfrac{\partial w}{\partial y}\right)^k}+f_2(x)\sqrt{g_2(x)+\left(\dfrac{\partial w}{\partial y}\right)^n}=0.$

Such equations are encountered in optimal control and differential games ($k=n=2$); see Melikyan (1998).

Complete integral: $w=C_1y+C_2-\displaystyle\int\left[f_1(x)\sqrt{g_1(x)+C_1^k}+f_2(x)\sqrt{g_2(x)+C_1^n}\right]dx.$

14. $\left(\dfrac{\partial w}{\partial x}\right)^k+f(y)\left(\dfrac{\partial w}{\partial x}\right)^{k-n}\left(\dfrac{\partial w}{\partial y}\right)^n=g(w).$

Complete integral in implicit form: $\displaystyle\int\frac{dw}{[g(w)]^{1/k}}=C_1x+\left(\frac{1-C_1^k}{C_1^{k-n}}\right)^{1/n}\int\frac{dy}{[f(y)]^{1/n}}+C_2.$

15. $\left(\dfrac{\partial w}{\partial x}\right)^k\left(\dfrac{\partial w}{\partial y}\right)^n=f(x)\left(\dfrac{\partial w}{\partial y}\right)^m+g(x).$

Complete integral: $w=C_1y+C_1^{-n/k}\displaystyle\int\big[C_1^m f(x)+g(x)\big]^{1/k}dx+C_2.$

3.3. Equations Containing Arbitrary Functions of Derivatives

3.3.1. Equations Contain Arbitrary Functions of One Variable

1. $\dfrac{\partial w}{\partial x}+f\left(\dfrac{\partial w}{\partial y}\right)=0.$

This equation is encountered in optimal control and differential games; see Subbotin (1991, 1995).

1°. Complete integral: $w = C_1 y - f(C_1)x + C_2$.

2°. On differentiating the equation with respect to y, we arrive at the quasilinear equation

$$\frac{\partial u}{\partial x} + f'(u)\frac{\partial u}{\partial y} = 0, \qquad u = \frac{\partial w}{\partial y},$$

which is discussed in detail in Section 23.3 (see equation (23.3.1.1)).

3°. The solution of the Cauchy problem with the initial condition $w(0, y) = \varphi(y)$ can be written in parametric form as

$$y = f'(\zeta)x + \xi, \quad w = \big[\zeta f'(\zeta) - f(\zeta)\big]x + \varphi(\xi), \qquad \text{where} \quad \zeta = \varphi'(\xi).$$

See also Examples 24.7 and 24.8 in Subsection 24.3.6.

2. $\dfrac{\partial w}{\partial x} + f\left(\dfrac{\partial w}{\partial y}\right) = g(x).$

Complete integral: $w = C_1 y - f(C_1)x + \displaystyle\int g(x)\,dx + C_2.$

3. $\dfrac{\partial w}{\partial x} + f\left(\dfrac{\partial w}{\partial y}\right) = g(x)y + h(x).$

Complete integral:

$$w = \varphi(x)y + \int \big[h(x) - f\big(\varphi(x)\big)\big]\,dx + C_1, \qquad \varphi(x) = \int g(x)\,dx + C_2.$$

4. $\dfrac{\partial w}{\partial x} + f\left(\dfrac{\partial w}{\partial y}\right) = g(x)w + h(x).$

Complete integral:

$$w = (C_1 y + C_2)\varphi(x) + \varphi(x)\int \big[h(x) - f(C_1\varphi(x))\big]\,\frac{dx}{\varphi(x)}, \qquad \varphi(x) = \exp\left[\int g(x)\,dx\right].$$

5. $\dfrac{\partial w}{\partial x} + f\left(\dfrac{\partial w}{\partial y}\right) = g(x)w + h(x)y + s(x).$

This is a special case of equation 3.3.2.4 with $F(x, u) = f(u) - s(x)$.

6. $\dfrac{\partial w}{\partial x} - \big[ay + g(x)\big]f\left(\dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral:

$$w = \varphi(x)y + \int f\big(\varphi(x)\big)g(x)\,dx + C_1,$$

where the function $\varphi(x)$ is defined implicitly by the relation $\displaystyle\int \frac{d\varphi}{f(\varphi)} = ax + C_2.$

7. $\dfrac{\partial w}{\partial x} - \big[g(x)y + h(x)\big] f\left(\dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral:

$$w = \varphi(x)y + \int f\big(\varphi(x)\big)h(x)\,dx + C_1,$$

where the function $\varphi(x)$ is defined implicitly by the relation $\displaystyle\int \frac{d\varphi}{f(\varphi)} = \int g(x)\,dx + C_2.$

8. $\dfrac{\partial w}{\partial x} + \big[g_1(x)y + g_0(x)\big] f\left(\dfrac{\partial w}{\partial y}\right) + h_2(x)w + h_1(x)y + h_0(x) = 0.$

1°. Complete integral:

$$w = \varphi(x)y + \psi(x),$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(x)$ are determined by solving the ordinary differential equations

$$\varphi'_x + g_1(x)f(\varphi) + h_2(x)\varphi + h_1(x) = 0, \tag{1}$$
$$\psi'_x + g_0(x)f(\varphi) + h_2(x)\psi + h_0(x) = 0. \tag{2}$$

2°. For $g_1(x) \equiv 0$, the general solutions of equations (1) and (2) are

$$\varphi(x) = C_1 H(x) - H(x)\int \frac{h_1(x)}{H(x)}\,dx, \qquad H(x) = \exp\left[-\int h_2(x)\,dx\right],$$
$$\psi(x) = C_2 H(x) - H(x)\int \frac{h_0(x) + g_0(x)f(\varphi(x))}{H(x)}\,dx.$$

9. $\dfrac{\partial w}{\partial x} - wf\left(\dfrac{1}{w}\dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral: $w = C_1 \exp\big[C_2 y + f(C_2)x\big].$

10. $\dfrac{\partial w}{\partial x} - wf\left(w^{\beta}\dfrac{\partial w}{\partial y}\right) = 0.$

For $\beta = -1$, see equation 3.3.1.9. Complete integral for $\beta \neq -1$:

$$w = \big[(1+\beta)y + C_1\big]^{\frac{1}{1+\beta}}\varphi(x + C_2),$$

where the function $\varphi(x)$ is defined implicitly by the relation $\displaystyle x = \int \frac{d\varphi}{\varphi f\left(\varphi^{\beta+1}\right)}.$

11. $\dfrac{\partial w}{\partial x} - f\left(e^{\beta w}\dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral:

$$w = \frac{1}{\beta}\ln(\beta y + C_1) + \varphi(x + C_2),$$

where the function $\varphi(x)$ is defined implicitly by the relation $\displaystyle x = \int \frac{d\varphi}{f\left(e^{\beta\varphi}\right)}.$

12. $\dfrac{\partial w}{\partial x} - g(x)w^{\beta} f\left(\dfrac{1}{w}\dfrac{\partial w}{\partial y}\right) = h(x)w.$

The transformation

$$w(x,y) = H(x)u(z,y), \quad z = \int g(x)H^{\beta-1}(x)\,dx, \qquad H(x) = \exp\left[\int h(x)\,dx\right],$$

leads to a simpler equation, $\dfrac{\partial u}{\partial z} - u^{\beta} f\left(\dfrac{1}{u}\dfrac{\partial u}{\partial y}\right) = 0,$ which, by solving for $\dfrac{\partial u}{\partial y}$, may be rewritten in the form of equation 3.3.1.10.

13. $\dfrac{\partial w}{\partial x} - g(x)e^{\beta w} f\left(\dfrac{\partial w}{\partial y}\right) = h(x).$

The transformation

$$w(x,y) = u(z,y) + H(x), \quad z = \int g(x)\exp\big[\beta H(x)\big]\,dx, \qquad H(x) = \int h(x)\,dx,$$

leads to a simpler equation, $\dfrac{\partial u}{\partial z} - e^{\beta u} f\left(\dfrac{\partial u}{\partial y}\right) = 0,$ which, by solving for $\dfrac{\partial u}{\partial y}$, may be rewritten in the form of equation 3.3.1.11.

14. $x\dfrac{\partial w}{\partial x} + y\dfrac{\partial w}{\partial y} = \left(\dfrac{\partial w}{\partial x}\right)^{k} f\left(\dfrac{\partial w}{\partial y} \Big/ \dfrac{\partial w}{\partial x}\right).$

Complete integral: $w = \dfrac{k-1}{k}\big[f(C_1)\big]^{\frac{1}{1-k}}(x + C_1 y)^{\frac{k}{k-1}} + C_2.$

15. $\left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2 = f\left(x\dfrac{\partial w}{\partial y} - y\dfrac{\partial w}{\partial x}\right).$

Complete integral: $w = C_1 \arctan\dfrac{y}{x} + C_2 + \displaystyle\int \sqrt{f(C_1)R^2 - C_1^2}\,\frac{dR}{R},$ where $R = \sqrt{x^2 + y^2}.$

16. $\Phi\left(\dfrac{\partial w}{\partial x} + f_1(x)\right)\Psi\left(\dfrac{\partial w}{\partial y} + f_2(y)\right) = g_1(x)g_2(y).$

Complete integral:

$$w = \int \big[\varphi\big(C_1 g_1(x)\big) - f_1(x)\big]\,dx + \int \big[\psi\big(C_1^{-1} g_2(y)\big) - f_2(y)\big]\,dy + C_2,$$

where φ is the inverse of Φ and ψ is the inverse of Ψ.

3.3.2. Equations Contain Arbitrary Functions of Two Variables

1. $\dfrac{\partial w}{\partial x} - F\left(x, \dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral: $w = \displaystyle\int F(x, C_1)\,dx + C_1 y + C_2.$

⊙ Reference: E. Kamke (1965).

2. $\dfrac{\partial w}{\partial x} + F\left(x, \dfrac{\partial w}{\partial y}\right) = aw.$

Complete integral: $w = e^{ax}(C_1 y + C_2) - e^{ax} \int e^{-ax} F(x, C_1 e^{ax})\, dx.$

3. $\dfrac{\partial w}{\partial x} + F\left(x, \dfrac{\partial w}{\partial y}\right) = g(x)w.$

Complete integral:

$$w = \varphi(x)(C_1 y + C_2) - \varphi(x) \int F\big(x, C_1\varphi(x)\big) \frac{dx}{\varphi(x)}, \qquad \varphi(x) = \exp\left[\int g(x)\, dx\right].$$

4. $\dfrac{\partial w}{\partial x} + F\left(x, \dfrac{\partial w}{\partial y}\right) = g(x)w + h(x)y.$

Complete integral:

$$w = y\varphi(x) + \psi(x),$$

where

$$\varphi(x) = C_1 G(x) + G(x) \int \frac{h(x)}{G(x)}\, dx, \qquad G(x) = \exp\left[\int g(x)\, dx\right],$$
$$\psi(x) = C_2 G(x) - G(x) \int F\big(x, \varphi(x)\big) \frac{dx}{G(x)}.$$

5. $\dfrac{\partial w}{\partial x} - F\left(\dfrac{y}{x}, \dfrac{\partial w}{\partial y}\right) = 0.$

This is a special case of equation 3.3.4.6.

6. $\dfrac{\partial w}{\partial x} - wF\left(x, \dfrac{1}{w}\dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral: $w = C_1 \exp\left[C_2 y + \int F(x, C_2)\, dx\right].$

7. $\dfrac{\partial w}{\partial x} - g(x)F\left(w, \dfrac{\partial w}{\partial y}\right) - h(x)\dfrac{\partial w}{\partial y} = 0.$

By passing to the new variables $t = \int g(x)\, dx$, $z = y + \int h(x)\, dx$, we obtain a simpler equation, $\dfrac{\partial w}{\partial t} - F\left(w, \dfrac{\partial w}{\partial z}\right) = 0$, which is a special case of equation 3.3.3.4.

8. $\left(\dfrac{\partial w}{\partial x}\right)^2 + g(x)\dfrac{\partial w}{\partial x} = F\left(x, \dfrac{\partial w}{\partial y}\right).$

Complete integral: $w = -\dfrac{1}{2} \int \left[g(x) \pm \sqrt{g^2(x) + 4F(x, C_1)}\right] dx + C_1 y + C_2.$

9. $F\left(\dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral:

$$w = C_1 x + C_2 y + C_3,$$

where C_1 and C_3 are arbitrary constants and the constant C_2 is related to C_1 by $F(C_1, C_2) = 0$.

⊙ Reference: E. Kamke (1965).

10. $w = x\dfrac{\partial w}{\partial x} + y\dfrac{\partial w}{\partial y} + F\left(\dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}\right).$

Clairaut's equation. Complete integral: $w = C_1 x + C_2 y + F(C_1, C_2)$.

⊙ References: R. Courant (1962), E. Kamke (1965).

11. $F_1\left(x, \dfrac{\partial w}{\partial x}\right) = F_2\left(y, \dfrac{\partial w}{\partial y}\right).$

A separable equation. Complete integral:

$$w = \varphi(x) + \psi(y) + C_1,$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(y)$ are determined from the ordinary differential equations

$$F_1\left(x, \varphi'_x\right) = C_2, \qquad F_2\left(y, \psi'_y\right) = C_2.$$

⊙ Reference: E. Kamke (1965).

12. $F_1\left(x, \dfrac{\partial w}{\partial x}\right) + F_2\left(y, \dfrac{\partial w}{\partial y}\right) + aw = 0.$

A separable equation. Complete integral:

$$w = \varphi(x) + \psi(y),$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(y)$ are determined from the ordinary differential equations

$$F_1\left(x, \varphi'_x\right) + a\varphi = C_1,$$
$$F_2\left(y, \psi'_y\right) + a\psi = -C_1,$$

where C_1 is an arbitrary constant. If $a \neq 0$, one can set $C_1 = 0$ in these equations.

⊙ Reference: E. Kamke (1965).

13. $F_1\left(x, \dfrac{1}{w}\dfrac{\partial w}{\partial x}\right) + w^k F_2\left(y, \dfrac{1}{w}\dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral:

$$w(x, y) = \varphi(x)\psi(y).$$

The functions $\varphi = \varphi(x)$ and $\psi = \psi(y)$ are determined by solving the ordinary differential equations

$$\varphi^{-k} F_1\left(x, \frac{\varphi'_x}{\varphi}\right) = C, \qquad \psi^k F_2\left(y, \frac{\psi'_y}{\psi}\right) = -C,$$

where C is an arbitrary constant.

14. $\boldsymbol{F_1\left(x, \dfrac{\partial w}{\partial x}\right) + e^{\lambda w} F_2\left(y, \dfrac{\partial w}{\partial y}\right) = 0.}$

Complete integral:

$$w(x, y) = \varphi(x) + \psi(y).$$

The functions $\varphi = \varphi(x)$ and $\psi = \psi(y)$ are determined by solving the ordinary differential equations

$$e^{-\lambda\varphi} F_1\big(x, \varphi'_x\big) = C, \qquad e^{\lambda\psi} F_2\big(y, \psi'_y\big) = -C,$$

where C is an arbitrary constant.

15. $\boldsymbol{F_1\left(x, \dfrac{1}{w}\dfrac{\partial w}{\partial x}\right) + F_2\left(y, \dfrac{1}{w}\dfrac{\partial w}{\partial y}\right) = k \ln w.}$

Complete integral:

$$w(x, y) = \varphi(x)\psi(y).$$

The functions $\varphi = \varphi(x)$ and $\psi = \psi(y)$ are determined by solving the ordinary differential equations

$$F_1\left(x, \frac{\varphi'_x}{\varphi}\right) - k \ln \varphi = C, \qquad F_2\left(y, \frac{\psi'_y}{\psi}\right) - k \ln \psi = -C,$$

where C is an arbitrary constant.

16. $\boldsymbol{\dfrac{\partial w}{\partial x} + y F_1\left(x, \dfrac{\partial w}{\partial y}\right) + F_2\left(x, \dfrac{\partial w}{\partial y}\right) = 0.}$

Complete integral:

$$w = \varphi(x)y - \int F_2\big(x, \varphi(x)\big)\, dx + C_1,$$

where the function $\varphi(x)$ is determined by solving the ordinary differential equation

$$\varphi'_x + F_1(x, \varphi) = 0.$$

17. $\boldsymbol{\dfrac{\partial w}{\partial x} + w F_1\left(x, \dfrac{\partial w}{\partial y}\right) + y F_2\left(x, \dfrac{\partial w}{\partial y}\right) + F_3\left(x, \dfrac{\partial w}{\partial y}\right) = 0.}$

Complete integral:

$$w = \varphi(x)y + \psi(x),$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(x)$ are determined by solving the following system of ordinary differential equations:

$$\varphi'_x + F_1(x, \varphi)\varphi + F_2(x, \varphi) = 0, \tag{1}$$
$$\psi'_x + F_1(x, \varphi)\psi + F_3(x, \varphi) = 0. \tag{2}$$

Equation (1) can be considered independently. Given its solution, the integration of equation (2), which is linear in ψ, is easy.

18. $\boldsymbol{F_1\left(y, \dfrac{\partial w}{\partial x}\right)\dfrac{\partial w}{\partial y} + wF_2\left(y, \dfrac{\partial w}{\partial x}\right) + xF_3\left(y, \dfrac{\partial w}{\partial x}\right) + F_4\left(y, \dfrac{\partial w}{\partial x}\right) = 0.}$

Complete integral:

$$w = x\varphi(y) + \psi(y),$$

where the functions $\varphi(y)$ and $\psi(y)$ are determined by solving the following system of ordinary differential equations:

$$F_1(y,\varphi)\varphi'_y + F_2(y,\varphi)\varphi + F_3(y,\varphi) = 0, \tag{1}$$

$$F_1(y,\varphi)\psi'_y + F_2(y,\varphi)\psi + F_4(y,\varphi) = 0. \tag{2}$$

Equation (1) can be considered independently. Given its solution, the solution of equation (2), which is linear in ψ, is easy to find.

19. $\boldsymbol{F\left(\dfrac{\partial w}{\partial x} + ay,\ \dfrac{\partial w}{\partial y} + ax\right) = 0.}$

Complete integral: $w = -axy + C_1x + C_2y + C_3,$ where $F(C_1, C_2) = 0.$

20. $\boldsymbol{F\left(\dfrac{\partial w}{\partial x} + akx^{k-1}y^n,\ \dfrac{\partial w}{\partial y} + anx^k y^{n-1}\right) = 0.}$

Complete integral: $w = -ax^k y^n + C_1x + C_2y + C_3,$ where $F(C_1, C_2) = 0.$

21. $\boldsymbol{\left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2 = F\left(x^2 + y^2,\ y\dfrac{\partial w}{\partial x} - x\dfrac{\partial w}{\partial y}\right).}$

Complete integral:

$$w = -C_1 \arctan\frac{y}{x} + \frac{1}{2}\int \sqrt{\xi F(\xi, C_1) - C_1^2}\,\frac{d\xi}{\xi} + C_2, \qquad \xi = x^2 + y^2.$$

⊙ Reference: E. Kamke (1965).

3.3.3. Equations Contain Arbitrary Functions of Three Variables

1. $\boldsymbol{\dfrac{\partial w}{\partial x} + F\left(x, y, \dfrac{\partial w}{\partial y}\right) = g(x)w.}$

The substitution

$$w(x,y) = G(x)u(x,y), \qquad G(x) = \exp\left[\int g(x)\,dx\right],$$

leads to a similar equation which does not depend on u explicitly:

$$\frac{\partial u}{\partial x} + \mathcal{F}\left(x, y, \frac{\partial u}{\partial y}\right) = 0, \qquad \text{where} \quad \mathcal{F}\big(x, y, p\big) = \frac{1}{G(x)}F\big(x, y, G(x)p\big).$$

It follows that the original equation has a complete integral of the following structure: $w = C_1G(x) + \varphi(x, y, C_2).$

2. $F\left(x, \dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral: $w = C_1 y + \varphi(x, C_1) + C_2$, where the function $\varphi = \varphi(x, C_1)$ is determined from the ordinary differential equation $F\left(x, \varphi'_x, C_1\right) = 0$.

3. $F\left(ax + by, \dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}\right) = 0.$

For $b = 0$, see equation 3.3.3.2. Complete integral for $b \neq 0$:

$$w = C_1 x + \varphi(z, C_1) + C_2, \qquad z = ax + by,$$

where the function $\varphi = \varphi(z)$ is determined from the nonlinear ordinary differential equation $F\left(z, a\varphi'_z + C_1, b\varphi'_z\right) = 0$.

4. $F\left(w, \dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}\right) = 0.$

We seek a particular solution of the equation in the form

$$w = w(z), \qquad z = C_1 x + C_2 y,$$

where C_1 and C_2 are arbitrary constants. We arrive at the following ordinary differential equation for $w = w(z)$:

$$F\left(w, C_1 w'_z, C_2 w'_z\right) = 0.$$

Solving this equation for the derivative yields $w'_z = f(w)$. By integrating the last equation, we obtain a complete integral of the original partial differential equation in implicit form:

$$\int \frac{dw}{f(w)} = C_1 x + C_2 y + C_3.$$

This equation defines cylindrical surfaces whose elements are parallel to the xy-plane.

⊙ Reference: E. Kamke (1965).

5. $F\left(ax + by + cw, \dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}\right) = 0.$

For $c = 0$, see equation 3.3.3.3. If $c \neq 0$, then the substitution $cu = ax + by + cw$ leads to an equation of the form 3.3.3.4: $F\left(cu, \dfrac{\partial u}{\partial x} - \dfrac{a}{c}, \dfrac{\partial u}{\partial y} - \dfrac{b}{c}\right) = 0$.

6. $F\left(x, \dfrac{\partial w}{\partial x} + ay, \dfrac{\partial w}{\partial y} + ax\right) = 0.$

Complete integral:

$$w = -axy + C_1 y + \varphi(x) + C_2,$$

where the function $\varphi(x)$ is determined by solving the first-order ordinary differential equation $F\left(x, \varphi'_x, C_1\right) = 0$.

7. $F\left(w,\ f(x)\dfrac{\partial w}{\partial x},\ g(y)\dfrac{\partial w}{\partial y}\right)=0.$

The transformation $\xi=\int\dfrac{dx}{f(x)}$, $\eta=\int\dfrac{dy}{g(y)}$ leads to the equation of the form 3.3.3.4: $F\left(w,w_\xi,w_\eta\right)=0$.

⊙ Reference: E. Kamke (1965).

8. $F\left(\dfrac{\partial w}{\partial x},\ \dfrac{\partial w}{\partial y},\ x\dfrac{\partial w}{\partial x}+y\dfrac{\partial w}{\partial y}\right)=0.$

This is a special case of equation 3.3.4.3.

9. $F\left(\dfrac{\partial w}{\partial x},\ \dfrac{\partial w}{\partial y},\ w-x\dfrac{\partial w}{\partial x}-y\dfrac{\partial w}{\partial y}\right)=0.$

Clairaut's equation (*in implicit form*). Complete integral: $w=C_1x+C_2y+C_3$, where the constants C_1, C_2, and C_3 are related by $F(C_1,C_2,C_3)=0$.

⊙ References: R. Courant (1962), E. Kamke (1965).

10. $F\left(y,\ \dfrac{\partial w}{\partial x},\ \dfrac{\partial w}{\partial y}+f(y)w+xg(y)+h(y)\right)=0.$

Complete integral:

$$w=x\varphi(y)+\psi(y),\quad \text{where } \varphi(y)=C_1F(y)-F(y)\int\frac{g(y)}{F(y)}\,dy,\ \ F(y)=\exp\left[-\int f(y)\,dy\right].$$

The function $\psi(y)$ is determined by solving the nonlinear ordinary differential equation $F\left(y,\ \varphi(y),\ \psi'_y+f(y)\psi+h(y)\right)=0$.

11. $xF\left(y,\dfrac{\partial w}{\partial x},x\dfrac{\partial w}{\partial x}-w\right)+\dfrac{\partial w}{\partial y}G\left(y,\dfrac{\partial w}{\partial x},x\dfrac{\partial w}{\partial x}-w\right)=H\left(y,\dfrac{\partial w}{\partial x},x\dfrac{\partial w}{\partial x}-w\right).$

The Euler transformation $x=W_X$, $y=Y$, $w=XW_X-W$, where $W=W(X,Y)$, brings the nonlinear equation in question to the quasilinear equation

$$F(Y,X,W)\frac{\partial W}{\partial X}-G(Y,X,W)\frac{\partial W}{\partial Y}=H(Y,X,W).$$

Equations of this type are considered in Chapter 23.

⊙ Reference: E. Kamke (1965).

12. $xF\left(u,\dfrac{\partial w}{\partial x},\dfrac{\partial w}{\partial y}\right)+yG\left(u,\dfrac{\partial w}{\partial x},\dfrac{\partial w}{\partial y}\right)=H\left(u,\dfrac{\partial w}{\partial x},\dfrac{\partial w}{\partial y}\right),\quad u=x\dfrac{\partial w}{\partial x}+y\dfrac{\partial w}{\partial y}-w.$

The Legendre transformation $x=W_X$, $y=W_Y$, $w=XW_X+YW_Y-W$, where $W=W(X,Y)$, brings the nonlinear equation in question to the quasilinear equation

$$F(W,X,Y)\frac{\partial W}{\partial X}+G(W,X,Y)\frac{\partial W}{\partial Y}=H(W,X,Y).$$

Equations of this type are considered in Chapter 23.

⊙ Reference: E. Kamke (1965).

3.3.4. Equations Contain Arbitrary Functions of Four Variables

1. $F\left(x, \dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}, w - y\dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral:

$$w = C_1 y + \varphi(x),$$

where the function $\varphi(x)$ is determined from the nonlinear ordinary differential equation $F\big(x, \varphi'_x, C_1, \varphi\big) = 0$.

⊙ Reference: E. Kamke (1965).

2. $F\left(y, \dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}, w - x\dfrac{\partial w}{\partial x}\right) = 0.$

Complete integral:

$$w = C_1 x + \varphi(y),$$

where the function $\varphi(y)$ is determined from the nonlinear ordinary differential equation $F\big(y, C_1, \varphi'_y, \varphi\big) = 0$.

⊙ Reference: E. Kamke (1965).

3. $F\left(w, \dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}, x\dfrac{\partial w}{\partial x} + y\dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral:

$$w = \varphi(\xi), \qquad \xi = C_1 x + C_2 y,$$

where the function $\varphi(\xi)$ is determined by solving the nonlinear ordinary differential equation $F\big(\varphi, C_1\varphi'_\xi, C_2\varphi'_\xi, \xi\varphi'_\xi\big) = 0$.

4. $F\left(ax + by, \dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}, w - x\dfrac{\partial w}{\partial x} - y\dfrac{\partial w}{\partial y}\right) = 0.$

Complete integral:

$$w = C_1 x + C_2 y + \varphi(\xi), \qquad \xi = ax + by,$$

where the function $\varphi(\xi)$ is determined by solving the nonlinear ordinary differential equation $F\big(\xi, a\varphi'_\xi + C_1, b\varphi'_\xi + C_2, \varphi - \xi\varphi'_\xi\big) = 0$.

5. $F\left(x, \dfrac{\partial w}{\partial x}, G\left(y, \dfrac{\partial w}{\partial y}\right)\right) = 0.$

Complete integral:

$$w = \varphi(x, C_1) + \psi(y, C_1) + C_2,$$

where the functions φ and ψ are determined by the ordinary differential equations

$$F(x, \varphi'_x, C_1) = 0, \qquad G(y, \psi'_y) = C_1.$$

On solving these equations for the derivatives, we obtain linear separable equations, which are easy to integrate.

6. $\boldsymbol{F\left(\dfrac{y}{x}, \dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}, x\dfrac{\partial w}{\partial x} + y\dfrac{\partial w}{\partial y} - w\right) = 0.}$

1°. Complete integral:

$$w = x\varphi\left(\frac{y}{x}, C_1, C_2\right) + C_2,$$

where the function $\varphi = \varphi(z, C_1, C_2)$ is the general solution of the first-order ordinary differential equation

$$F\big(z, \varphi - z\varphi'_z, \varphi'_z, C_2\big) = 0.$$

2°. A complete integral, $w = w(x, y, C_1, C_2)$, may be obtained by solving the equations

$$x\frac{\partial w}{\partial x} + y\frac{\partial w}{\partial y} - w = C_1, \qquad F\left(\frac{y}{x}, \frac{\partial w}{\partial x}, \frac{\partial w}{\partial y}, C_1\right) = 0,$$

for the derivatives $\frac{\partial w}{\partial x}$ and $\frac{\partial w}{\partial y}$ followed by determining w with the aid of the Lagrange–Charpit method (see Subsection 24.1.3).

⊙ Reference: E. Kamke (1965).

Chapter 4
First-Order Nonlinear Equations with Three or More Independent Variables

4.1. Nonlinear Equations with Three Variables Quadratic in Derivatives

4.1.1. Equations Contain Squares of One or Two Derivatives

1. $\dfrac{\partial w}{\partial x} + a\dfrac{\partial w}{\partial y} + b\dfrac{\partial w}{\partial z} + c\left(\dfrac{\partial w}{\partial x}\right)^2 = k.$

Complete integral: $w = C_1x + C_2y + C_3z + C_4$, where $C_1 + aC_2 + bC_3 + cC_1^2 = k.$

2. $\dfrac{\partial w}{\partial x} + ax\dfrac{\partial w}{\partial y} + bx\dfrac{\partial w}{\partial z} + c\left(\dfrac{\partial w}{\partial y}\right)^2 = k.$

Complete integral: $w = C_1y + C_2z - \frac{1}{2}(aC_1 + bC_2)x^2 + (k - cC_1^2)x + C_3.$

3. $\dfrac{\partial w}{\partial x} + ay\dfrac{\partial w}{\partial y} + by\dfrac{\partial w}{\partial z} + c\left(\dfrac{\partial w}{\partial y}\right)^2 = k.$

Complete integral:

$$w = aC_1z + (C_2e^{-ax} - bC_1)y + (k - b^2cC_1^2)x - \frac{2bc}{a}C_1C_2e^{-ax} + \frac{cC_2^2}{2a}e^{-2ax} + C_3.$$

4. $\dfrac{\partial w}{\partial x} + ay\dfrac{\partial w}{\partial y} + bz\dfrac{\partial w}{\partial z} + c\left(\dfrac{\partial w}{\partial x}\right)^2 = k.$

Complete integral: $w = C_1x + C_2\ln|y| + C_3|z| + C_4$, where $C_1 + aC_2 + bC_3 + cC_1^2 = k.$

5. $\dfrac{\partial w}{\partial x} + az\dfrac{\partial w}{\partial y} + by\dfrac{\partial w}{\partial z} + c\left(\dfrac{\partial w}{\partial y}\right)^2 = kx + s.$

Complete integral:

$$w = \left(C_1e^{\lambda x} + C_2e^{-\lambda x}\right)y - \frac{\lambda}{b}\left(C_1e^{\lambda x} - C_2e^{-\lambda x}\right)z + \tfrac{1}{2}kx^2 + (s - 2cC_1C_2)x - \frac{cC_1^2}{2\lambda}e^{2\lambda x} + \frac{cC_2^2}{2\lambda}e^{-2\lambda x} + C_3, \qquad \lambda = \sqrt{ab}.$$

6. $\dfrac{\partial w}{\partial x} + axz\dfrac{\partial w}{\partial y} + bxy\dfrac{\partial w}{\partial z} + c\left(\dfrac{\partial w}{\partial y}\right)^2 = kx + s.$

Complete integral:

$$w = y\left[C_1\exp(\lambda x^2) + C_2\exp(-\lambda x^2)\right] - \frac{2\lambda}{b}z\left[C_1\exp(\lambda x^2) - C_2\exp(-\lambda x^2)\right]$$
$$+ \tfrac{1}{2}kx^2 + sx - c\int\left[C_1\exp(\lambda x^2) + C_2\exp(-\lambda x^2)\right]^2 dx + C_3, \qquad \lambda = \tfrac{1}{2}\sqrt{ab}.$$

7. $\dfrac{\partial w}{\partial x} + \dfrac{1}{2}\left(\dfrac{\partial w}{\partial y}\right)^2 + \dfrac{1}{2}\left(\dfrac{\partial w}{\partial z}\right)^2 + az = 0.$

A problem of the motion of a material point under gravity is reduced to this equation; x is time, y and z are the longitudinal and transverse spatial coordinates, and a is the acceleration due to gravity.

Complete integral: $w = -C_1x + C_2y + C_3 \pm \dfrac{1}{3a}(2C_1 - C_2^2 - 2az)^{3/2}.$

⊙ Reference: G. K. Suslov (1946).

8. $\dfrac{\partial w}{\partial x} + \dfrac{1}{2}\left(\dfrac{\partial w}{\partial y}\right)^2 + \dfrac{1}{2}\left(\dfrac{\partial w}{\partial z}\right)^2 = \dfrac{a}{\sqrt{y^2+z^2}}.$

A problem on the motion of two point bodies attracting to each other according to Newton's law of universal gravitation is reduced to this equation. By passing to the polar coordinates $y = r\cos\theta$ and $z = r\sin\theta$, we arrive at the separable equation

$$\frac{\partial w}{\partial x} + \frac{1}{2}\left(\frac{\partial w}{\partial r}\right)^2 + \frac{1}{2r^2}\left(\frac{\partial w}{\partial \theta}\right)^2 = \frac{a}{r}.$$

Complete integral:

$$w = -C_1x - C_2\theta \mp \int\left(2C_1 + \frac{2a}{r} - \frac{C_2^2}{r^2}\right)^{1/2} dr + C_3.$$

⊙ Reference: R. Courant (1962).

9. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 + b\left(\dfrac{\partial w}{\partial z}\right)^2 = cw + kx^n.$

This is a special case of equation 4.3.1.2 with $f(x) = c$ and $g(x) = kx^n$. Complete integral:

$$w = (C_1 + C_2y + C_3z)e^{cx} - \frac{1}{c}(aC_2^2 + bC_3^2)e^{2cx} + ke^{cx}\int x^n e^{-cx}\,dx.$$

10. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^2 + b\left(\dfrac{\partial w}{\partial z}\right)^2 = cw + ke^{\beta x}.$

This is a special case of equation 4.3.1.2 with $f(x) = c$ and $g(x) = ke^{\beta x}$. Complete integral:

$$w = (C_1 + C_2y + C_3z)e^{cx} - \frac{1}{c}(aC_2^2 + bC_3^2)e^{2cx} + \frac{k}{\beta - c}e^{\beta x}.$$

11. $\dfrac{\partial w}{\partial x}+a_1\left(\dfrac{\partial w}{\partial y}\right)^2+a_2\left(\dfrac{\partial w}{\partial z}\right)^2=bw^2+cx^nw+kx^m.$

This is a special case of equation 4.3.1.3 with $f(x)=cx^n$ and $g(x)=kx^m$.

12. $\dfrac{\partial w}{\partial x}+a_1\left(\dfrac{\partial w}{\partial y}\right)^2+a_2\left(\dfrac{\partial w}{\partial z}\right)^2+b_1\dfrac{\partial w}{\partial y}+b_2\dfrac{\partial w}{\partial z}=0.$

Complete integral: $w=-(a_1C_1^2+a_2C_2^2+b_1C_1+b_2C_2)x+C_1y+C_2z+C_3.$

13. $\dfrac{\partial w}{\partial x}+a_1\left(\dfrac{\partial w}{\partial y}\right)^2+a_2\left(\dfrac{\partial w}{\partial z}\right)^2+b_1z\dfrac{\partial w}{\partial y}+b_2y\dfrac{\partial w}{\partial z}=0.$

Complete integral:

$$w=y\varphi_1(x)+z\varphi_2(x)-\int\left[a_1\varphi_1^2(x)+a_2\varphi_2^2(x)\right]dx+C_3,$$

where

$$\varphi_1(x)=C_1e^{\lambda x}+C_2e^{-\lambda x},\quad \varphi_2(x)=-\frac{\lambda}{b_2}\left(C_1e^{\lambda x}-C_2e^{-\lambda x}\right),\quad \lambda=\sqrt{b_1b_2}.$$

14. $\dfrac{\partial w}{\partial x}+a_1\left(\dfrac{\partial w}{\partial y}\right)^2+a_2\left(\dfrac{\partial w}{\partial z}\right)^2+\left(b_{11}y+b_{12}z\right)\dfrac{\partial w}{\partial y}+\left(b_{21}y+b_{22}z\right)\dfrac{\partial w}{\partial z}=sw+c_1y+c_2z+c_0.$

This is a special case of equation 4.3.1.17.

15. $\dfrac{\partial w}{\partial x}+a_1\left(\dfrac{\partial w}{\partial y}\right)^2+a_2\left(\dfrac{\partial w}{\partial z}\right)^2+b_1x^kz\dfrac{\partial w}{\partial y}+b_2x^ky\dfrac{\partial w}{\partial z}=cx^n.$

Complete integral:

$$w=y\varphi_1(x)+z\varphi_2(x)+\frac{c}{n+1}x^{n+1}-\int\left[a_1\varphi_1^2(x)+a_2\varphi_2^2(x)\right]dx+C_3,$$

where

$$\varphi_1(x)=C_1\exp(\lambda x^{k+1})+C_2\exp(-\lambda x^{k+1}),\quad \lambda=\frac{\sqrt{b_1b_2}}{k+1},$$
$$\varphi_2(x)=-\frac{\lambda(k+1)}{b_2}\left[C_1\exp(\lambda x^{k+1})-C_2\exp(-\lambda x^{k+1})\right].$$

16. $\dfrac{\partial w}{\partial x}+a_1\left(\dfrac{\partial w}{\partial y}\right)^2+a_2\left(\dfrac{\partial w}{\partial z}\right)^2+b_1e^{\beta x}z\dfrac{\partial w}{\partial y}+b_2e^{\beta x}y\dfrac{\partial w}{\partial z}=0.$

Complete integral:

$$w=y\varphi_1(x)+z\varphi_2(x)-\int\left[a_1\varphi_1^2(x)+a_2\varphi_2^2(x)\right]dx+C_3,$$

where

$$\varphi_1(x)=b_2\left[C_1\exp\left(\lambda e^{\beta x}\right)+C_2\exp\left(-\lambda e^{\beta x}\right)\right],\quad \lambda=\frac{\sqrt{b_1b_2}}{\beta},$$

This is a special case of equation 4.3.1.27.

8. $a_1x^{k_1}w^{n_1}\left(\dfrac{\partial w}{\partial x}\right)^2 + a_2y^{k_2}w^{n_2}\left(\dfrac{\partial w}{\partial y}\right)^2 + a_3z^{k_3}w^{n_3}\left(\dfrac{\partial w}{\partial z}\right)^2 = bw^m.$

This is a special case of equation 4.3.1.28.

4.1.3. Equations Contain Products of Derivatives with Respect to Different Variables

1. $\dfrac{\partial w}{\partial x} + ax^k\left(\dfrac{\partial w}{\partial y} + bz\right)\left(\dfrac{\partial w}{\partial z} + by\right) = cx^n.$

Complete integral: $w = -byz + C_1y + C_2z + \dfrac{c}{n+1}x^{n+1} - \dfrac{aC_1C_2}{k+1}x^{k+1} + C_3.$

2. $\dfrac{\partial w}{\partial x} + ae^{\lambda x}\left(\dfrac{\partial w}{\partial y} + bz\right)\left(\dfrac{\partial w}{\partial z} + by\right) = ce^{\beta x} + k.$

Complete integral: $w = -byz + C_1y + C_2z + \dfrac{c}{\beta}e^{\beta x} + kx - \dfrac{a}{\lambda}C_1C_2e^{\lambda x} + C_3.$

3. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial z} + by\dfrac{\partial w}{\partial y} + cz\dfrac{\partial w}{\partial z} = kx^n + s.$

Complete integral:

$$w = y\varphi(x) + z\psi(x) + \int \frac{kx^n + s}{\varphi(x) + a\psi(x)}\,dx + C_3,$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(x)$ are determined by the following autonomous system of ordinary differential equations:

$$(\varphi + a\psi)\varphi' + b\varphi = 0, \quad (\varphi + a\psi)\psi' + c\psi = 0.$$

If $bc \neq 0$, the general solution of this system is given by

$$\varphi + abC_1\varphi^{c/b} + bx = C_2, \quad \psi = cC_1\varphi^{c/b}.$$

In two degenerate cases, we have

$$\varphi = C_1, \quad C_1\ln|\psi| + a\psi + cx = C_2 \qquad \text{if } b = 0;$$
$$\psi = C_1, \quad aC_1\ln|\varphi| + \varphi + bx = C_2 \qquad \text{if } c = 0.$$

4. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial z} + bz\dfrac{\partial w}{\partial y} + cy\dfrac{\partial w}{\partial z} = kx^n + s.$

Complete integral:

$$w = y\varphi(x) + z\psi(x) + \int \frac{kx^n + s}{\varphi(x) + a\psi(x)}\,dx + C_3,$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(x)$ are determined by the following autonomous system of ordinary differential equations:

$$(\varphi + a\psi)\varphi' + c\psi = 0, \quad (\varphi + a\psi)\psi' + b\varphi = 0.$$

If $bc \neq 0$, the general solution of this system is given by

$$bc\varphi^2 + cC_1 = (C_2 + bcx + a\varphi)^2, \quad c\psi^2 = b\varphi^2 + C_1.$$

In the degenerate cases, we have

$$\psi = C_1, \quad \varphi^2 + 2aC_1\varphi + 2cC_1x = C_2 \qquad \text{if } b = 0;$$
$$\varphi = C_1, \quad a\psi^2 + 2C_1\psi + 2bC_1x = C_2 \qquad \text{if } c = 0.$$

5. $az\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + by\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial z} + x + cy^2 - s = 0.$

The Legendre transformation (both direct and inverse transformations are given)

$$x = \frac{\partial W}{\partial X}, \quad y = \frac{\partial W}{\partial Y}, \quad z = \frac{\partial W}{\partial Z}, \quad w = X\frac{\partial W}{\partial X} + Y\frac{\partial W}{\partial Y} + Z\frac{\partial W}{\partial Z} - W;$$
$$X = \frac{\partial w}{\partial x}, \quad Y = \frac{\partial w}{\partial y}, \quad Z = \frac{\partial w}{\partial z}, \quad W = x\frac{\partial w}{\partial x} + y\frac{\partial w}{\partial y} + z\frac{\partial w}{\partial z} - w,$$

brings this equation to an equation of the form 4.1.1.6 (with $k = 0$):

$$\frac{\partial W}{\partial X} + bXZ\frac{\partial W}{\partial Y} + aXY\frac{\partial W}{\partial Z} + c\left(\frac{\partial W}{\partial Y}\right)^2 = s.$$

6. $z\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + ay\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial z} = bx^n w^k\dfrac{\partial w}{\partial x} + cx^m w^{k+1}.$

There is a solution in the form of the product of a function of one variable and a function of two variables:

$$w = f(x)g(y, \xi), \qquad \xi = ay^2 - z^2.$$

The dependence $f = f(x)$ can be found by solving the first-order ordinary differential equation

$$(bx^n f^{k-1} - C_1)f'_x + cx^m f^k = 0,$$

which is integrable by quadrature, e.g., for $n = 0$ or $k = 1$. The function $g = g(y, \xi)$ is determined by

$$g(y, \xi) = \begin{cases} \left[\Phi(\xi) \pm C_1(1-k)\displaystyle\int_{y_0}^{y} \frac{dt}{\sqrt{at^2 - \xi}}\right]^{\frac{1}{1-k}} & \text{if } k \neq 1, \\ \Phi(\xi)\exp\left(\pm C_1 \displaystyle\int_{y_0}^{y} \frac{dt}{\sqrt{at^2 - \xi}}\right) & \text{if } k = 1, \end{cases}$$

where $\Phi = \Phi(\xi)$ is an arbitrary function. To obtain a complete integral, one should set $\Phi = C_3$ (the constant C_2 occurs in the solution of the equation for f).

7. $a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}+b\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial z}+c\dfrac{\partial w}{\partial y}\dfrac{\partial w}{\partial z}=k.$

Complete integral: $w=C_1x+C_2y+C_3z+C_4$, where $aC_1C_2+bC_1C_3+cC_2C_3=k$.

⊙ Reference: E. Kamke (1965).

8. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}+a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial z}+b\dfrac{\partial w}{\partial y}\dfrac{\partial w}{\partial z}=cw.$

Complete integral: $w=\dfrac{cC_1C_2}{4(C_1+aC_2+b)}\left(x+\dfrac{y}{C_2}+\dfrac{z}{C_1}+C_3\right)^2.$

9. $az^k\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}+by^n\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial z}+cx^m\dfrac{\partial w}{\partial y}\dfrac{\partial w}{\partial z}=0.$

$$w=\frac{aC_1}{k+1}z^{k+1}+\frac{bC_2}{n+1}y^{n+1}+\frac{cC_3}{m+1}x^{m+1}+C_4,$$

where $C_1C_2+C_1C_3+C_2C_3=0$.

10. $aw^k\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}+bw^n\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial z}+cw^m\dfrac{\partial w}{\partial y}\dfrac{\partial w}{\partial z}=1.$

Complete integral:

$$\int\sqrt{aC_1C_2w^k+bC_1C_3w^n+cC_2C_3w^m}\,dw=C_1x+C_2y+C_3z+C_4.$$

One of the constants C_1, C_2, or C_3 can be set equal to unity.

4.1.4. Equations Contain Squares and Products of Derivatives

1. $\dfrac{\partial w}{\partial x}+a_1w^{k_1}\left(\dfrac{\partial w}{\partial y}\right)^2+a_2w^{k_2}\dfrac{\partial w}{\partial y}\dfrac{\partial w}{\partial z}+a_3w^{k_3}\left(\dfrac{\partial w}{\partial z}\right)^2=bw^n+c.$

Complete integral:

$$C_1x+C_2y+C_3z+2\int\frac{f(w)\,dw}{C_1+\sqrt{C_1^2+4(bw^n+c)f(w)}}=C_4,$$

where $f(w)=a_1C_2^2w^{k_1}+a_2C_2C_3w^{k_2}+a_3C_3^2w^{k_3}$. One of the constants C_1, C_2, or C_3 can be set equal to ±1.

2. $\left(\dfrac{\partial w}{\partial x}\right)^2+ax^k\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}+bxz^n\left(\dfrac{\partial w}{\partial y}\right)^2+cxz^m\dfrac{\partial w}{\partial y}\dfrac{\partial w}{\partial z}=sx^p.$

Complete integral:

$$w=C_1y-\frac{aC_1}{2(k+1)}x^{k+1}\pm\int\sqrt{\tfrac14a^2C_1^2x^{2k}+sx^p-C_2x}\,dx+\frac{C_2}{cC_1(1-m)}z^{1-m}-\frac{bC_1}{c(n-m+1)}z^{n-m+1}.$$

3. $\left(\dfrac{\partial w}{\partial x}\right)^2+a_1\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}+a_2\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial z}+a_3\dfrac{\partial w}{\partial y}\dfrac{\partial w}{\partial z}=w^k\left(b_1\dfrac{\partial w}{\partial x}+b_2\dfrac{\partial w}{\partial y}+b_3\dfrac{\partial w}{\partial z}\right).$

Complete integral:

$$\frac{b_1C_1+b_2C_2+b_3C_3}{C_1^2+a_1C_1C_2+a_2C_1C_3+a_3C_2C_3}\big(C_1x+C_2y+C_3z\big)=\begin{cases}\frac{1}{1-k}w^{1-k} & \text{if } k\neq 1,\\ |\ln w| & \text{if } k=1.\end{cases}$$

4. $a_1\left(\dfrac{\partial w}{\partial x}\right)^2+a_1\left(\dfrac{\partial w}{\partial y}\right)^2+a_2\left(\dfrac{\partial w}{\partial z}\right)^2+b_1\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}+b_2\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial z}+b_3\dfrac{\partial w}{\partial y}\dfrac{\partial w}{\partial z}=cw+s.$

Complete integral:

$$w=\begin{cases}\frac{1}{4}(C_1x+C_2y+C_3z+C_4)^2-s/c & \text{if } c\neq 0,\\ C_1x+C_2y+C_3z+C_4 & \text{if } c=0,\end{cases}$$

where the constants C_1, C_2, and C_3 are related by the one constraint

$$a_1C_1^2+a_2C_2^2+a_3C_3^2+b_1C_1C_2+b_2C_1C_3+b_3C_2C_3=c.$$

5. $\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2+\left(\dfrac{\partial w}{\partial z}\right)^2=\big[a(x^2+y^2+z^2)+b\big]^c\left(x\dfrac{\partial w}{\partial x}+y\dfrac{\partial w}{\partial y}+z\dfrac{\partial w}{\partial z}\right)^2.$

This is a special case of equation 4.3.2.3; see item 2° for $k=2$ and $f(r)=(ar+b)^c$ [for $c=-1$, see also E. Kamke (1965)].

4.2. Other Nonlinear Equations with Three Variables Containing Parameters

4.2.1. Equations Cubic in Derivatives

1. $\left(\dfrac{\partial w}{\partial x}\right)^3-aw^k\dfrac{\partial w}{\partial x}-bw^n\dfrac{\partial w}{\partial y}-cw^m\dfrac{\partial w}{\partial z}=0.$

Complete integral: $\displaystyle\int\frac{dw}{\sqrt{aw^k+bC_1w^n+cC_2w^m}}=x+C_1y+C_2z+C_3.$

2. $\left(\dfrac{\partial w}{\partial x}\right)^3-aw^k\left(\dfrac{\partial w}{\partial x}\right)^2-bw^n\left(\dfrac{\partial w}{\partial y}\right)^2-cw^m\left(\dfrac{\partial w}{\partial z}\right)^2=0.$

Complete integral: $\displaystyle\int\frac{dw}{aw^k+bC_1^2w^n+cC_2^2w^m}=x+C_1y+C_2z+C_3.$

3. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}\dfrac{\partial w}{\partial z}=ax^ky^nz^m.$

This is a special case of equation 4.3.2.1 with $f(x)=ax^k$, $g(y)=y^n$, and $h(z)=z^m$.

Complete integral: $\displaystyle w=\frac{aC_1}{k+1}x^{k+1}+\frac{C_2}{n+1}y^{n+1}+\frac{1}{C_1C_2(m+1)}z^{m+1}+C_3.$

4. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}\dfrac{\partial w}{\partial z} = ax^k y^n z^m w^s.$

This is a special case of equation 4.3.2.2 with $f(x) = ax^k$, $g(y) = y^n$, $h(z) = z^m$, and $\varphi(w) = w^s$.

5. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}\dfrac{\partial w}{\partial z} = ax\left(\dfrac{\partial w}{\partial x}\right)^2 + by\left(\dfrac{\partial w}{\partial y}\right)^2 + cz\left(\dfrac{\partial w}{\partial z}\right)^2.$

The Legendre transformation (both direct and inverse transformations are specified)

$$x = \frac{\partial W}{\partial X}, \quad y = \frac{\partial W}{\partial Y}, \quad z = \frac{\partial W}{\partial Z}, \quad w = X\frac{\partial W}{\partial X} + Y\frac{\partial W}{\partial Y} + Z\frac{\partial W}{\partial Z} - W;$$
$$X = \frac{\partial w}{\partial x}, \quad Y = \frac{\partial w}{\partial y}, \quad Z = \frac{\partial w}{\partial z}, \quad W = x\frac{\partial w}{\partial x} + y\frac{\partial w}{\partial y} + z\frac{\partial w}{\partial z} - w,$$

leads to the linear equation

$$aX^2\frac{\partial W}{\partial X} + bY^2\frac{\partial W}{\partial Y} + cZ^2\frac{\partial W}{\partial Z} = XYZ.$$

The general solution of this equation is (Polyanin, Zaitsev, and Moussiaux (2002, p. 178))

$$W = W_0(X, Y, Z) + \Phi\left(\frac{1}{aX} - \frac{1}{bY}, \frac{1}{aX} - \frac{1}{cZ}\right),$$

where $W_0 = W_0(X, Y, Z)$ is a particular solution,

$$W_0 = XYZ\left[\frac{aX\ln(aX)}{(aX - bY)(aX - cZ)} + \frac{bY\ln(bY)}{(bY - aX)(bY - cZ)} + \frac{cZ\ln(cZ)}{(cZ - aX)(cZ - bY)}\right].$$

6. $\dfrac{\partial w}{\partial x}\left(\dfrac{\partial w}{\partial y} + az\right)\left(\dfrac{\partial w}{\partial z} + ay\right) = b.$

Complete integral: $w = -ayz + C_1x + C_2y + \dfrac{b}{C_1C_2}z + C_3.$

7. $\left(\dfrac{\partial w}{\partial x} + ayz\right)\left(\dfrac{\partial w}{\partial y} + axz\right)\left(\dfrac{\partial w}{\partial z} + axy\right) = b.$

Complete integral: $w = -axyz + C_1x + C_2y + \dfrac{b}{C_1C_2}z + C_3.$

8. $\left(\dfrac{\partial w}{\partial x} - aw\right)\left(\dfrac{\partial w}{\partial y} - bw\right)\left(\dfrac{\partial w}{\partial z} - cw\right) = k\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}\dfrac{\partial w}{\partial z}.$

Complete integral: $\ln|w| = C_1x + C_2y + C_3z + C_4$, where $(C_1 - a)(C_2 - b)(C_3 - c) = kC_1C_2C_3$.

4.2.2. Equations Contain Roots and Moduli of Derivatives

1. $\dfrac{\partial w}{\partial x}+\sqrt{a+b\left(\dfrac{\partial w}{\partial y}\right)^2+c\left(\dfrac{\partial w}{\partial z}\right)^2}=0.$

Equations of this type are encountered in differential games [e.g., see Subbotin (1991, 1995)]. Complete integral: $w=-Ax+C_1y+C_2z+C_3,$ where $A=\sqrt{a+bC_1^2+cC_2^2}.$

2. $\dfrac{\partial w}{\partial x}+a_1\sqrt{1+b_1\left(\dfrac{\partial w}{\partial y}\right)^2}+a_2\sqrt{1+b_2\left(\dfrac{\partial w}{\partial z}\right)^2}=0.$

Complete integral: $w=-Ax+C_1y+C_2z+C_3,$ where $A=a_1\sqrt{1+b_1C_1^2}+a_2\sqrt{1+b_2C_2^2}.$

3. $\dfrac{\partial w}{\partial x}+\sqrt{a+b\left(\dfrac{\partial w}{\partial y}+kz\right)^2+c\left(\dfrac{\partial w}{\partial z}+ky\right)^2}=0.$

Complete integral: $w=-kyz-Ax+C_1y+C_2z+C_3,$ where $A=\sqrt{a+bC_1^2+cC_2^2}.$

4. $\dfrac{\partial w}{\partial x}+z\dfrac{\partial w}{\partial y}+\left|\dfrac{\partial w}{\partial y}\right|-\left|\dfrac{\partial w}{\partial z}\right|=0.$

This equation is encountered in differential games.

An exact closed-form solution of this equation subject to the initial condition

$$w=\max\{|y|,|z|\}\qquad\text{at}\qquad x=2$$

was obtained in Taras'ev (1985). In the domain $1\le x\le 2$, this solution is given by

$$w(x,y,z)=\begin{cases}\max\{\varphi_1,\varphi_3,\varphi_6\} & \text{if } \varphi_1+\varphi_3\ge 0,\\ \max\{\varphi_2,\varphi_4,\varphi_5\} & \text{if } \varphi_2+\varphi_4\ge 0,\\ \max\{\varphi_5,\varphi_6\} & \text{if } \varphi_1+\varphi_3\le 0 \text{ and } \varphi_2+\varphi_4\le 0,\end{cases}$$

where

$$\begin{aligned}&\varphi_1=\varphi_1(x,y,z)=x+y+2z-\tfrac{1}{2}x^2-xz,\\ &\varphi_3=\varphi_3(x,y,z)=2-x+z,\\ &\varphi_5=\varphi_5(x,y,z)=2-\varphi_3-2(1-\varphi_1-\varphi_3)^{1/2},\\ &\varphi_k=\varphi_k(x,y,z)=\varphi_{k-1}(x,-y,-z),\qquad k=2,\ 4,\ 6.\end{aligned}$$

At the points (x,y,z) of matching various φ_n and φ_m, the function w is continuous but can be nondifferentiable.

In the domain $0\le x\le 1$, the solution has a more sophisticated structure and is defined by 12 different functions, 6 of which are defined implicitly.

⊙ References: A. M. Taras'ev (1985) and A. I. Subbotin (1991).

4.2.3. Equations Contain Arbitrary Powers of Derivatives

1. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^k+b\left(\dfrac{\partial w}{\partial z}\right)^n=cw+sx^m.$

This is a special case of equation 4.3.2.4 with $f(x)=c$ and $g(x)=sx^m$.

2. $\dfrac{\partial w}{\partial x}+a_1\left(\dfrac{\partial w}{\partial y}\right)^k+a_2\left(\dfrac{\partial w}{\partial z}\right)^n+b_1x^m z\dfrac{\partial w}{\partial y}+b_2x^m y\dfrac{\partial w}{\partial z}=0.$

This is a special case of equation 4.3.2.5 with $f(x)=x^m$.

3. $\dfrac{\partial w}{\partial x}+a_1\left(\dfrac{\partial w}{\partial y}\right)^k+a_2\left(\dfrac{\partial w}{\partial z}\right)^n+b_1e^{\lambda x} z\dfrac{\partial w}{\partial y}+b_2e^{\lambda x} y\dfrac{\partial w}{\partial z}=0.$

This is a special case of equation 4.3.2.5 with $f(x)=e^{\lambda x}$.

4. $\dfrac{\partial w}{\partial x}+a_1x^{n_1}\left(\dfrac{\partial w}{\partial y}\right)^{k_1}+a_2x^{n_2}\left(\dfrac{\partial w}{\partial z}\right)^{k_2}=bx^s w+c_1x^{m_1}y+c_2x^{m_2}z.$

This is a special case of equation 4.3.2.6 with $f_1(x)=a_1x^{n_1}$, $f_2(x)=a_2x^{n_2}$, $g(x)=bx^s$, $h_1(x)=c_1x^{m_1}$, and $h_2(x)=c_2x^{m_2}$.

5. $\dfrac{\partial w}{\partial x}+a_1e^{\lambda_1 x}\left(\dfrac{\partial w}{\partial y}\right)^{k_1}+a_2e^{\lambda_2 x}\left(\dfrac{\partial w}{\partial z}\right)^{k_2}=be^{\beta x}w+c_1e^{\gamma_1 x}y+c_2e^{\gamma_2 x}z.$

This is a special case of equation 4.3.2.6 with $f_1(x)=a_1e^{\lambda_1 x}$, $f_2(x)=a_2e^{\lambda_2 x}$, $g(x)=be^{\beta x}$, $h_1(x)=c_1e^{\gamma_1 x}$, and $h_2(x)=c_2e^{\gamma_2 x}$.

6. $\dfrac{\partial w}{\partial x}+a_1x^{k_1}\left(\dfrac{\partial w}{\partial y}+bz\right)^{n_1}+a_2x^{k_2}\left(\dfrac{\partial w}{\partial z}+by\right)^{n_2}=cx^m.$

Complete integral: $w=-byz+C_1y+C_2z+\dfrac{c}{m+1}x^{m+1}-\dfrac{a_1C_1^{n_1}}{k_1+1}x^{k_1+1}-\dfrac{a_2C_2^{n_2}}{k_2+1}x^{k_2+1}+C_3.$

7. $\dfrac{\partial w}{\partial x}+a_1e^{\lambda_1 x}\left(\dfrac{\partial w}{\partial y}+bz\right)^{n_1}+a_2e^{\lambda_2 x}\left(\dfrac{\partial w}{\partial z}+by\right)^{n_2}=ce^{\beta x}.$

Complete integral: $w=-byz+C_1y+C_2z+\dfrac{c}{\beta}e^{\beta x}-\dfrac{a_1}{\lambda_1}C_1^{n_1}e^{\lambda_1 x}-\dfrac{a_2}{\lambda_2}C_2^{n_2}e^{\lambda_2 x}+C_3.$

8. $\dfrac{\partial w}{\partial x}+ax^k\left(\dfrac{\partial w}{\partial y}+bz\right)^n\left(\dfrac{\partial w}{\partial z}+by\right)^m=cx^s.$

Complete integral: $w=-byz+C_1y+C_2z+\dfrac{c}{s+1}x^{s+1}-\dfrac{aC_1^nC_2^m}{k+1}x^{k+1}+C_3.$

9. $\dfrac{\partial w}{\partial x}+ae^{\lambda x}\left(\dfrac{\partial w}{\partial y}+bz\right)^n\left(\dfrac{\partial w}{\partial z}+by\right)^m=ce^{\beta x}.$

Complete integral: $w=-byz+C_1y+C_2z+\dfrac{c}{\beta}e^{\beta x}-\dfrac{a}{\lambda}C_1^nC_2^me^{\lambda x}+C_3.$

10. $a\left(\dfrac{\partial w}{\partial x}\right)^k+b\left(\dfrac{\partial w}{\partial y}\right)^k+c\left(\dfrac{\partial w}{\partial z}\right)^k=\left(x\dfrac{\partial w}{\partial x}+y\dfrac{\partial w}{\partial y}+z\dfrac{\partial w}{\partial z}\right)^n.$

Complete integral: $w=\dfrac{k-n}{k}\left(aC_1^k+bC_2^k+cC_3^k\right)^{\frac{1}{n-k}}\left(C_1x+C_2y+C_3z\right)^{\frac{k}{k-n}}+C_4.$
One of the constants C_1, C_2, or C_3 can be set equal to ±1.

11. $$a_1 w^{k_1}\left(\frac{\partial w}{\partial x}\right)^n + a_2 w^{k_2}\left(\frac{\partial w}{\partial y}\right)^n + a_3 w^{k_3}\left(\frac{\partial w}{\partial z}\right)^n - b_1 w^{s_1}\left(\frac{\partial w}{\partial x}\right)^m - b_2 w^{s_2}\left(\frac{\partial w}{\partial y}\right)^m - b_3 w^{s_3}\left(\frac{\partial w}{\partial z}\right)^m = 0.$$

Complete integral:

$$\int\left(\frac{a_1 C_1^n w^{k_1} + a_2 C_2^n w^{k_2} + a_3 C_3^n w^{k_3}}{b_1 C_1^m w^{s_1} + b_2 C_2^m w^{s_2} + b_3 C_3^m w^{s_3}}\right)^{\frac{1}{n-m}} dw = C_1 x + C_2 y + C_3 z + C_4.$$

One of the constants C_1, C_2, or C_3 can be set equal to unity.

12. $$a\left(\frac{\partial w}{\partial x}\right)^k + b\left(\frac{\partial w}{\partial y}\right)^n + c\left(\frac{\partial w}{\partial z}\right)^m = 1.$$

Complete integral: $w = C_1 x + C_2 y + C_3 z + C_4$, where $aC_1^k + bC_2^n + cC_3^m = 1$.

13. $$a\left(\frac{\partial w}{\partial x}\right)^k + b\left(\frac{\partial w}{\partial y}\right)^n + c\left(\frac{\partial w}{\partial z}\right)^m + x\frac{\partial w}{\partial x} + y\frac{\partial w}{\partial y} + z\frac{\partial w}{\partial z} = w.$$

Complete integral: $w = C_1 x + C_2 y + C_3 z + aC_1^k + bC_2^n + cC_3^m$.

14. $$a_1\left(\frac{\partial w}{\partial x} + byz\right)^{k_1} + a_2\left(\frac{\partial w}{\partial y} + bxz\right)^{k_2} + a_3\left(\frac{\partial w}{\partial z} + bxy\right)^{k_3} = c.$$

Complete integral: $w = -bxyz + C_1 x + C_2 y + C_3 z + C_4$, where $a_1 C_1^{k_1} + a_2 C_2^{k_2} + a_3 C_3^{k_3} = c$.

15. $$a_1 x^{k_1}\left(\frac{\partial w}{\partial x}\right)^{n_1} + a_2 y^{k_2}\left(\frac{\partial w}{\partial y}\right)^{n_2} + a_3 z^{k_3}\left(\frac{\partial w}{\partial z}\right)^{n_3} = b_1 x^{m_1} + b_2 y^{m_2} + b_3 z^{m_3}.$$

This is a special case of equation 4.3.2.9.

16. $$\left(\frac{\partial w}{\partial x}\right)^{k_1}\left(\frac{\partial w}{\partial y}\right)^{k_2}\left(\frac{\partial w}{\partial z}\right)^{k_3} = a x^{n_1} y^{n_2} z^{n_3} w^m.$$

This is a special case of equation 4.3.2.10.

17. $$a\left(\frac{\partial w}{\partial x}\right)^k\left(\frac{\partial w}{\partial y}\right)^n\left(\frac{\partial w}{\partial z}\right)^m = x\frac{\partial w}{\partial x} + y\frac{\partial w}{\partial y} + z\frac{\partial w}{\partial z}.$$

Complete integral:

$$w = \frac{k+n+m-1}{k+n+m}\left(C_1 x + C_2 y + \beta z\right)^{\frac{k+n+m}{k+n+m-1}} + C_3, \qquad \beta = \left(aC_1^k C_2^n\right)^{-\frac{1}{m}}.$$

18. $$a\left(\frac{\partial w}{\partial x}\right)^k\left(\frac{\partial w}{\partial y}\right)^n\left(\frac{\partial w}{\partial z}\right)^m + x\frac{\partial w}{\partial x} + y\frac{\partial w}{\partial y} + z\frac{\partial w}{\partial z} = w.$$

Complete integral: $w = C_1 x + C_2 y + C_3 z + aC_1^k C_2^n C_3^m$.

19. $\left(\dfrac{\partial w}{\partial x}+ayz\right)^k\left(\dfrac{\partial w}{\partial y}+axz\right)^n\left(\dfrac{\partial w}{\partial z}+axy\right)^m=b.$

Complete integral: $w=-axyz+C_1x+C_2y+C_3z+C_4,$ where $C_1^kC_2^nC_3^m=b.$

20. $\dfrac{\partial w}{\partial x}+a_1x^{n_1}\left(\dfrac{\partial w}{\partial y}\right)^{k_1}\left(\dfrac{\partial w}{\partial z}\right)^{m_1}+a_2x^{n_2}\left(\dfrac{\partial w}{\partial y}\right)^{k_2}\left(\dfrac{\partial w}{\partial z}\right)^{m_2}=bx^sw.$

This is a special case of equation 4.3.4.3 with $F(x,u,v)=a_1x^{n_1}u^{k_1}v^{m_1}+a_2x^{n_2}u^{k_2}v^{m_2}$, and $g(x)=bx^s$.

21. $\dfrac{\partial w}{\partial x}+a_1x^{n_1}\left(\dfrac{\partial w}{\partial y}\right)^{k_1}\left(\dfrac{\partial w}{\partial z}\right)^{m_1}+a_2x^{n_2}\left(\dfrac{\partial w}{\partial y}\right)^{k_2}\left(\dfrac{\partial w}{\partial z}\right)^{m_2}$
$=bx^sw+c_1x^{q_1}y+c_2x^{q_2}z.$

This is a special case of equation 4.3.4.4.

22. $\dfrac{\partial w}{\partial x}+a_1e^{\lambda_1x}\left(\dfrac{\partial w}{\partial y}\right)^{k_1}\left(\dfrac{\partial w}{\partial z}\right)^{m_1}+a_2e^{\lambda_2x}\left(\dfrac{\partial w}{\partial y}\right)^{k_2}\left(\dfrac{\partial w}{\partial z}\right)^{m_2}=be^{\beta x}w.$

This is a special case of equation 4.3.4.3.

4.3. Nonlinear Equations with Three Variables Containing Arbitrary Functions

4.3.1. Equations Quadratic in Derivatives

1. $\left(\dfrac{\partial w}{\partial x}\right)^2+f(x)\dfrac{\partial w}{\partial x}+g_1(y)\dfrac{\partial w}{\partial y}+g_2(z)\dfrac{\partial w}{\partial z}+h(x)=0.$

Complete integral:

$$w=\frac{1}{2}\int\left[-f(x)+\sqrt{f^2(x)-4h(x)-4C_1-4C_2}\right]dx+C_1\int\frac{dy}{g_1(y)}+C_2\int\frac{dz}{g_2(z)}+C_3.$$

2. $\dfrac{\partial w}{\partial x}+a\left(\dfrac{\partial w}{\partial y}\right)^2+b\left(\dfrac{\partial w}{\partial z}\right)^2=f(x)w+g(x).$

Complete integral:

$$w=C_1F(x)+(C_2y+C_3z)F(x)+F(x)\int\frac{g(x)-\lambda F^2(x)}{F(x)}\,dx,$$

where

$$F(x)=\exp\left[\int f(x)\,dx\right],\qquad \lambda=aC_2^2+bC_3^2.$$

3. $\dfrac{\partial w}{\partial x} + a_1\left(\dfrac{\partial w}{\partial y}\right)^2 + a_2\left(\dfrac{\partial w}{\partial z}\right)^2 = bw^2 + f(x)w + g(x).$

For $b = 0$, see equation 4.3.1.2. Complete integral for $b \neq 0$:

$$w = \varphi(x) + C_3\psi(x)\exp(C_1 y + C_2 z).$$

The constants C_1 and C_2 are related by the constraint $a_1C_1^2 + a_2C_2^2 = b$. The function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$\varphi'_x = b\varphi^2 + f(x)\varphi + g(x), \tag{1}$$

and the function $\psi = \psi(x)$ is expressed via $\varphi(x)$ as follows:

$$\psi(x) = \exp\left\{\int \left[2b\varphi(x) + f(x)\right] dx\right\}. \tag{2}$$

The Riccati equation (1) can be integrated by quadrature for many f and g, in particular, for $g(x) \equiv 0$ and any $f(x)$, as well as for $f(x) = \text{const}$ and $g(x) = \text{const}$. For details, see the books Kamke (1976) and Polyanin and Zaitsev (2003).

4. $\dfrac{\partial w}{\partial x} + a_1\left(\dfrac{\partial w}{\partial y}\right)^2 + a_2\left(\dfrac{\partial w}{\partial z}\right)^2 + b_1 f(x) z\dfrac{\partial w}{\partial y} + b_2 f(x) y\dfrac{\partial w}{\partial z} = 0.$

This is a special case of equation 4.3.1.17, item 2°. Complete integral:

$$w = y\varphi_1(x) + z\varphi_2(x) - \int \left[a_1\varphi_1^2(x) + a_2\varphi_2^2(x)\right] dx + C_3,$$

where the functions $\varphi_1(x)$ and $\varphi_2(x)$ are given by

$$\varphi_1(x) = C_1 b_2 \exp\left[\lambda \int f(x)\,dx\right] + C_2 b_2 \exp\left[-\lambda \int f(x)\,dx\right], \quad \lambda = \sqrt{b_1 b_2},$$
$$\varphi_2(x) = -C_1\lambda \exp\left[\lambda \int f(x)\,dx\right] + C_2\lambda \exp\left[-\lambda \int f(x)\,dx\right].$$

5. $\dfrac{\partial w}{\partial x} + a_1\left(\dfrac{\partial w}{\partial y}\right)^2 + a_2\left(\dfrac{\partial w}{\partial z}\right)^2 + f(x) z\dfrac{\partial w}{\partial y} + g(x) y\dfrac{\partial w}{\partial z} = 0.$

Complete integral:

$$w = y\varphi_1(x) + z\varphi_2(x) - \int \left[a_1\varphi_1^2(x) + a_2\varphi_2^2(x)\right] dx + C_3, \qquad \varphi_2(x) = -\frac{1}{g(x)}\frac{d\varphi_1}{dx},$$

where the function $\varphi_1 = \varphi_1(x)$ is determined by the second-order linear ordinary differential equation

$$\frac{d}{dx}\left[\frac{1}{g(x)}\frac{d\varphi_1}{dx}\right] - f(x)\varphi_1 = 0.$$

6. $\dfrac{\partial w}{\partial x} + f(x)\left(\dfrac{\partial w}{\partial y}\right)^2 + g(x)\left(\dfrac{\partial w}{\partial z}\right)^2 = aw.$

Complete integral: $w = C_1 e^{ax} + e^{ax}(C_2 y + C_3 z) - e^{ax}\displaystyle\int e^{ax}\left[C_2^2 f(x) + C_3^2 g(x)\right] dx.$

7. $\dfrac{\partial w}{\partial x} + f(x)\left(\dfrac{\partial w}{\partial y}\right)^2 + g(x)\left(\dfrac{\partial w}{\partial z}\right)^2 = h(x)w.$

Complete integral:

$$w = \varphi(x)(C_1 + C_2 y + C_3 z) - \varphi(x)\int \varphi(x)\left[C_2^2 f(x) + C_3^2 g(x)\right] dx,$$

where $\varphi(x) = \exp\left[\displaystyle\int h(x)\,dx\right]$.

8. $\dfrac{\partial w}{\partial x} + f_1(x)\left(\dfrac{\partial w}{\partial y}\right)^2 + f_2(x)\left(\dfrac{\partial w}{\partial z}\right)^2 = g(x)w + h_1(x)y + h_2(x)z.$

Complete integral:

$$w = G(x)\left[y\varphi_1(x) + z\varphi_2(x) + \psi(x)\right],$$

where

$$\varphi_1(x) = C_1 + \int \frac{h_1(x)}{G(x)}\,dx, \quad \varphi_2(x) = C_2 + \int \frac{h_2(x)}{G(x)}\,dx,$$
$$\psi(x) = C_3 - \int G(x)\left[f_1(x)\varphi_1^2(x) + f_2(x)\varphi_2^2(x)\right] dx, \quad G(x) = \exp\left[\int g(x)\,dx\right].$$

9. $\dfrac{\partial w}{\partial x} + f_1(y)\left(\dfrac{\partial w}{\partial y}\right)^2 + f_2(z)\left(\dfrac{\partial w}{\partial z}\right)^2 = g(x) + h_1(y) + h_2(z).$

Equations of this type are often encountered in mechanics; the variable x plays the role of time, and y and z are generalized coordinates.

Complete integral:

$$w = C_1 - (C_2 + C_3)x + \int g(x)\,dx + \int \sqrt{\frac{C_2 + h_1(y)}{f_1(y)}}\,dy + \int \sqrt{\frac{C_2 + h_2(z)}{f_2(z)}}\,dz.$$

10. $\dfrac{\partial w}{\partial x} + f_1(y)\left(\dfrac{\partial w}{\partial y}\right)^2 + f_2(z)\left(\dfrac{\partial w}{\partial z}\right)^2 = bw^2 + g(x)w + h(x).$

The transformation $\xi = \displaystyle\int \frac{dy}{\sqrt{|f_1(y)|}}$, $\eta = \displaystyle\int \frac{dz}{\sqrt{|f_2(z)|}}$ leads to an equation of the form 4.3.1.3.

11. $\dfrac{\partial w}{\partial x} + f(x)\left(\dfrac{\partial w}{\partial y} + az\right)^2 + g(x)\left(\dfrac{\partial w}{\partial z} + ay\right)^2 = h(x).$

Complete integral: $w = -ayz + C_1 y + C_2 z + \displaystyle\int \left[h(x) - C_1^2 f(x) - C_2^2 g(x)\right] dx + C_3.$

12. $$\frac{\partial w}{\partial x} + \big[f_1(x)y + g_1(x)\big]\left(\frac{\partial w}{\partial y}\right)^2 + \big[f_2(x)z + g_2(x)\big]\left(\frac{\partial w}{\partial z}\right)^2 = a(x)w + b(x) + h_1(x)y + h_2(x)z.$$

Complete integral:

$$w = \varphi_1(x)y + \varphi_2(x)z + \psi(x),$$

where the functions $\varphi_1(x)$, $\varphi_2(x)$, and $\psi(x)$ are determined by solving the ordinary differential equations

$$\varphi_k' + f_k(x)\varphi_k^2 = a(x)\varphi_k + h_k(x), \qquad k = 1,\ 2; \tag{1}$$

$$\psi' + g_1(x)\varphi_1^2 + g_2(x)\varphi_2^2 = a(x)\psi + b(x). \tag{2}$$

The prime denotes the derivative with respect to x.

The Riccati equations (1) can be integrated by quadrature for many $f_k(x)$, $h_k(x)$, and $a(x)$; for details, see the books Kamke (1976) and Polyanin and Zaitsev (1995). In particular, for $h_k \equiv 0$ the solutions of equations (1) are given by

$$\varphi_k(x) = A(x)\left[C_k + \int A(x)f_k(x)\,dx\right]^{-1}, \qquad A(x) = \exp\left[\int a(x)\,dx\right].$$

Equation (2) is linear with respect to ψ and can be readily integrated (for known φ_k):

$$\psi(x) = C_3A(x) + A(x)\int \big[b(x) - g_1(x)\varphi_1^2(x) - g_2(x)\varphi_2^2(x)\big]\frac{dx}{A(x)}.$$

13. $$\frac{\partial w}{\partial x} + \big[f_1(x)y^k + g_1(x)y^{2k-2}\big]\left(\frac{\partial w}{\partial y}\right)^2 + \big[f_2(x)z^n + g_2(x)z^{2n-2}\big]\left(\frac{\partial w}{\partial z}\right)^2 = a(x)w + b(x).$$

1°. If $k \neq 2$ and $n \neq 2$, then the transformation $\xi = y^{2-k}$, $\eta = z^{2-n}$ leads to an equation of the form 4.3.1.12:

$$\frac{\partial u}{\partial x} + (2-k)^2\big[f_1(x)\xi + g_1(x)\big]\left(\frac{\partial u}{\partial \xi}\right)^2 + (2-n)^2\big[f_2(x)\eta + g_2(x)\big]\left(\frac{\partial u}{\partial \eta}\right)^2 = a(x)u + b(x).$$

2°. If $k = 2$ and $n \neq 2$, then we introduce the new variables $\xi = \ln|y|$ and $\eta = z^{2-n}$ to arrive at an equation of the form 4.3.1.12. The case $k \neq 2$ and $n = 2$ is treated analogously.

14. $$\frac{\partial w}{\partial x} + f(ax+by+cz)\left(\frac{\partial w}{\partial y}\right)^2 + g(ax+by+cz)\left(\frac{\partial w}{\partial z}\right)^2 = h(ax+by+cz).$$

Complete integral:

$$w = C_1x + C_2y + C_3z + \varphi(\xi) + C_4, \qquad \xi = ax + by + cz,$$

where

$$\varphi(\xi) = \int \frac{-G(\xi) \pm \sqrt{G^2(\xi) - 4F(\xi)H(\xi)}}{2F(\xi)}\,d\xi, \quad F(\xi) = b^2f(\xi) + c^2g(\xi),$$

$$G(\xi) = a + 2bC_2f(\xi) + 2cC_3g(\xi), \quad H(\xi) = C_1 + C_2^2f(\xi) + C_3^2g(\xi) - h(\xi).$$

One of the constants C_1, C_2, or C_3 can be set equal to unity.

15. $\dfrac{\partial w}{\partial x} + f(x)\left(\dfrac{\partial w}{\partial y} + az\right)\left(\dfrac{\partial w}{\partial z} + ay\right) = g(x).$

Complete integral: $w = -ayz + C_1 y + C_2 z + \displaystyle\int \big[g(x) - C_1 C_2 f(x)\big]\,dx + C_3.$

16. $\dfrac{\partial w}{\partial x} + f_{11}(x)\left(\dfrac{\partial w}{\partial y}\right)^2 + f_{12}(x)\dfrac{\partial w}{\partial y}\dfrac{\partial w}{\partial z} + f_{22}(x)\left(\dfrac{\partial w}{\partial z}\right)^2$
$= g(x)w + h_{11}(x)y^2 + h_{12}(x)yz + h_{22}(x)z^2 + h_1(x)y + h_2(x)z + h_0(x).$

This is a special case of equation 4.6.1.10. A complete integral can be sought in the form

$$w = \varphi_{11}(x)y^2 + \varphi_{12}(x)yz + \varphi_{22}(x)z^2 + \psi_1(x)y + \psi_2(x)z + \psi_0(x).$$

Substituting this expression into the original partial differential equation yields a system of ordinary differential equations for $\varphi_{km}(x)$ and $\psi_k(x)$. If all $h_k(x) \equiv 0$, then we may set $\psi_k(x) \equiv 0$.

17. $\dfrac{\partial w}{\partial x} + f_{11}(x)\left(\dfrac{\partial w}{\partial y}\right)^2 + f_{12}(x)\dfrac{\partial w}{\partial y}\dfrac{\partial w}{\partial z} + f_{22}(x)\left(\dfrac{\partial w}{\partial z}\right)^2 + \big[g_{11}(x)y + g_{12}(x)z\big]\dfrac{\partial w}{\partial y}$
$+ \big[g_{21}(x)y + g_{22}(x)z\big]\dfrac{\partial w}{\partial z} = s(x)w + h_1(x)y + h_2(x)z + h_0(x).$

This is a special case of equation 4.3.4.5.

1°. Complete integral:

$$w = \varphi_1(x)y + \varphi_2(x)z + \psi(x).$$

The functions $\varphi_1(x)$, $\varphi_2(x)$, and $\psi(x)$ are determined by solving the system of ordinary differential equations

$$\varphi_1' + (g_{11} - s)\varphi_1 + g_{21}\varphi_2 = h_1, \tag{1}$$
$$\varphi_2' + g_{12}\varphi_1 + (g_{22} - s)\varphi_2 = h_2, \tag{2}$$
$$\psi' - s\psi = h_0 - f_{11}\varphi_1^2 - f_{12}\varphi_1\varphi_2 - f_{22}\varphi_2^2, \tag{3}$$

where $f_{ij} = f_{ij}(x)$, $g_{ij} = g_{ij}(x)$, $h_k = h_k(x)$, and $s = s(x)$; the prime denotes the derivative with respect to x.

Having found $\varphi_1 = \varphi_1(x)$ and $\varphi_2 = \varphi_2(x)$ from the linear system of equations (1) and (2), one can determine the solution of equation (3) according to the formula

$$\psi(x) = C_3 S + S\int (h_0 - f_{11}\varphi_1^2 - f_{12}\varphi_1\varphi_2 - f_{22}\varphi_2^2)\,\frac{dx}{S}, \qquad S = \exp\left(\int s\,dx\right).$$

2°. Consider the special case $h_1 \equiv 0$ and $h_2 \equiv 0$. In addition, assume that

$$g_{11} = a_1 g(x) + s(x), \quad g_{12} = a_2 g(x), \quad g_{21} = a_3 g(x), \quad g_{22} = a_4 g(x) + s(x), \tag{4}$$

where $g = g(x)$ and $s = s(x)$ are arbitrary functions and a_1, a_2, a_3, and a_4 are arbitrary numbers. With these assumptions, the general solution of the linear homogeneous system (1), (2) has the form

$$\begin{aligned}
\varphi_1 &= C_1 \exp\left(\lambda_1 \int g\,dx\right) + C_2 \exp\left(\lambda_2 \int g\,dx\right),\\
\varphi_2 &= -\frac{a_1 + \lambda_1}{a_3} C_1 \exp\left(\lambda_1 \int g\,dx\right) - \frac{a_1 + \lambda_2}{a_3} C_2 \exp\left(\lambda_2 \int g\,dx\right),
\end{aligned} \tag{5}$$

where λ_1 and λ_2 are the roots of the quadratic equation $(\lambda + a_1)(\lambda + a_4) - a_2 a_3 = 0$.

3°. Let $h_1 = h_1(x)$ and $h_2 = h_2(x)$ be arbitrary functions and let the $g_{ij} = g_{ij}(x)$ be defined by (4). In this case, the general solution of the linear nonhomogeneous system of equations (1) and (2) can be obtained by variation of constants or with the aid of the Wronskian determinant [see, for example, Murphy (1960), Kamke (1977), and Zwillinger (1998)].

18. $$\frac{\partial w}{\partial x} + w^k f(x)\left(\frac{\partial w}{\partial y}\right)^2 + w^k g(x)\left(\frac{\partial w}{\partial z}\right)^2 = h(x)w.$$

The substitution $u = \dfrac{1}{k+1}w^{k+1}$ leads to an equation of the form 4.3.1.7:

$$\frac{\partial u}{\partial x} + f(x)\left(\frac{\partial u}{\partial y}\right)^2 + g(x)\left(\frac{\partial u}{\partial z}\right)^2 = (k+1)h(x)u.$$

19. $$\frac{\partial w}{\partial x} + w^k f_1(y)\left(\frac{\partial w}{\partial y}\right)^2 + w^k f_2(z)\left(\frac{\partial w}{\partial z}\right)^2 = aw^{k+2} + g(x)w.$$

The substitution $u = \dfrac{1}{k+1}w^{k+1}$ leads to an equation of the form 4.3.1.10 with $h(x) \equiv 0$:

$$\frac{\partial u}{\partial x} + f_1(y)\left(\frac{\partial u}{\partial y}\right)^2 + f_2(z)\left(\frac{\partial u}{\partial z}\right)^2 = a(k+1)^2u^2 + (k+1)g(x)u.$$

20. $$\frac{\partial w}{\partial x} + f_1(y)g_1(w)\left(\frac{\partial w}{\partial y}\right)^2 + f_2(z)g_2(w)\left(\frac{\partial w}{\partial z}\right)^2 = 0.$$

Complete integral:

$$x + \int \left[C_1^2 g_1(w) + C_2^2 g_2(w)\right] dw = C_1 \int \frac{dy}{\sqrt{f_1(y)}} + C_2 \int \frac{dz}{\sqrt{f_2(z)}} + C_3.$$

It has been assumed in the products $f_1 g_1$ and $f_2 g_2$ that both f_1 and f_2 are nonnegative, and g_1 and g_2 can have any sign.

21. $$\frac{\partial w}{\partial x} + f_1(y)g_1(w)\left(\frac{\partial w}{\partial y}\right)^2 + f_2(z)g_2(w)\left(\frac{\partial w}{\partial z}\right)^2 = h(w).$$

Complete integral:

$$x + C_1 \int \frac{dy}{\sqrt{f_1(y)}} + C_2 \int \frac{dz}{\sqrt{f_2(z)}} + \int \frac{2\varphi(w)\,dw}{1 + \sqrt{1 + 4h(w)\varphi(w)}} = C_3,$$

where $\varphi(w) = C_1^2 g_1(w) + C_2^2 g_2(w)$.

22. $$\frac{\partial w}{\partial x} + \frac{1}{f_1(y) + f_2(z)}\left[g_1(y)\left(\frac{\partial w}{\partial y}\right)^2 + g_2(z)\left(\frac{\partial w}{\partial z}\right)^2 - h_1(y) - h_2(z)\right] = 0.$$

Liouville's equation. It is encountered in problems of mechanics (x is time, and y and z are generalized coordinates). Complete integral:

$$w = -C_1 x + \int \sqrt{\frac{C_1 f_1(y) + h_1(y) + C_2}{g_1(y)}}\, dy + \int \sqrt{\frac{C_1 f_2(z) + h_2(z) - C_2}{g_2(z)}}\, dz + C_3.$$

⊙ Reference: E. N. Berezkin (1968).

23. $f_1(x)\left(\frac{\partial w}{\partial x}\right)^2 + f_2(y)\left(\frac{\partial w}{\partial y}\right)^2 + f_3(z)\left(\frac{\partial w}{\partial z}\right)^2 = g_1(x) + g_2(y) + g_3(z).$

Complete integral:

$$w = \pm\int\left[\frac{g_1(x)+C_1}{f_1(x)}\right]^{1/2}dx \pm \int\left[\frac{g_2(y)+C_2}{f_2(y)}\right]^{1/2}dy \pm \int\left[\frac{g_3(z)-C_1-C_2}{f_3(z)}\right]^{1/2}dz + C_3.$$

24. $f_1(x)\left(\frac{\partial w}{\partial x}\right)^2 + f_2(y)\left(\frac{\partial w}{\partial y}\right)^2 + \big[g_1(x)+g_2(y)\big]\left(\frac{\partial w}{\partial z}\right)^2 = h_1(x) + h_2(y).$

A problem of the motion of a point mass being attracted by two fixed centers according to Newton's law of universal gravitation can be reduced to a special case of this equation [see Appell (1953)]. Complete integral:

$$w = C_1 z + C_2 \pm \int\sqrt{\frac{h_1(x) - C_1^2 g_1(x) + C_3}{f_1(x)}}\,dx \pm \int\sqrt{\frac{h_2(y) - C_1^2 g_2(y) - C_3}{f_2(y)}}\,dy.$$

The signs before integrals may be chosen independently.

25. $f_1(x)\left(\frac{\partial w}{\partial x}\right)^2 + f_2(y)\left(\frac{\partial w}{\partial y}\right)^2 + f_3(z)\left(\frac{\partial w}{\partial z}\right)^2 = aw + g_1(x) + g_2(y) + g_3(z).$

This is a special case of equation 4.6.1.17 with $n = 3$.

26. $f_1(x)\left(\frac{\partial w}{\partial x}\right)^2 + f_2(y)\left(\frac{\partial w}{\partial y}\right)^2 + f_3(z)\left(\frac{\partial w}{\partial z}\right)^2 = \big[g_1(x)+g_2(y)+g_3(z)\big]h(w).$

The substitution $u = \int\frac{dw}{\sqrt{h(w)}}$ leads to an equation of the form 4.3.1.23:

$$f_1(x)\left(\frac{\partial u}{\partial x}\right)^2 + f_2(y)\left(\frac{\partial u}{\partial y}\right)^2 + f_3(z)\left(\frac{\partial u}{\partial z}\right)^2 = g_1(x) + g_2(y) + g_3(z).$$

27. $f(ax+by+cz)\left(\frac{\partial w}{\partial x}\right)^2 + g(ax+by+cz)\left(\frac{\partial w}{\partial y}\right)^2 + h(ax+by+cz)\left(\frac{\partial w}{\partial z}\right)^2 = k.$

Complete integral:

$$w = C_1 x + C_2 y + C_3 z + \varphi(\xi) + C_4, \qquad \xi = ax + by + cz,$$

where

$$\varphi(\xi) = \int\frac{-G(\xi) \pm \sqrt{G^2(\xi) - 4F(\xi)H(\xi)}}{2F(\xi)}\,d\xi, \quad F(\xi) = a^2 f(\xi) + b^2 g(\xi) + c^2 h(\xi),$$
$$G(\xi) = 2aC_1 f(\xi) + 2bC_2 g(\xi) + 2cC_3 h(\xi), \quad H(\xi) = C_1^2 f(\xi) + C_2^2 g(\xi) + C_3^2 h(\xi) - k.$$

One of the constants C_1, C_2, or C_3 can be set equal to unity.

28. $f_1(x)g_1(w)\left(\dfrac{\partial w}{\partial x}\right)^2 + f_2(y)g_2(w)\left(\dfrac{\partial w}{\partial y}\right)^2 + f_3(z)g_3(w)\left(\dfrac{\partial w}{\partial z}\right)^2 = h(w).$

Complete integral:

$$\int\sqrt{\frac{C_1^2g_1(w)+C_2^2g_2(w)+C_3^2g_3(w)}{h(w)}}\,dw = C_1\int\frac{dx}{\sqrt{f_1(x)}}+C_2\int\frac{dy}{\sqrt{f_2(y)}}+C_3\int\frac{dz}{\sqrt{f_3(z)}}+C_4.$$

One of the constants C_1, C_2, or C_3 can be set equal to ±1.

29. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + f(x)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial z} + g(x)\dfrac{\partial w}{\partial y}\dfrac{\partial w}{\partial z} = h(x).$

Complete integral: $w = C_1y + C_2z + \displaystyle\int\frac{h(x)-C_1C_2g(x)}{C_1+C_2f(x)}\,dx + C_3.$

30. $f(y)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + g(z)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial z} = h(x).$

Complete integral: $w = \dfrac{1}{C_1+C_2}\displaystyle\int h(x)\,dx + C_1\int\frac{dy}{f(y)} + C_2\int\frac{dz}{g(z)} + C_3.$

31. $f(z)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + g(y)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial z} + h(x)\dfrac{\partial w}{\partial y}\dfrac{\partial w}{\partial z} = 0.$

Complete integral: $w = C_1\displaystyle\int h(x)\,dx - \frac{C_1}{C_2+1}\int g(y)\,dy + \frac{C_1}{C_2}\int f(z)\,dz + C_3.$

4.3.2. Equations with Power Nonlinearity in Derivatives

1. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}\dfrac{\partial w}{\partial z} = f(x)g(y)h(z).$

Complete integral: $w = C_1\displaystyle\int f(x)\,dx + C_2\int g(y)\,dy + \frac{1}{C_1C_2}\int h(z)\,dz + C_3.$

2. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}\dfrac{\partial w}{\partial z} = f(x)g(y)h(z)\varphi(w).$

Complete integral:

$$\int\frac{dw}{\varphi^{1/3}(w)} = C_1\int f(x)\,dx + C_2\int g(y)\,dy + \frac{1}{C_1C_2}\int h(z)\,dz + C_3.$$

3. $\left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2 + \left(\dfrac{\partial w}{\partial z}\right)^2 = f\left(x^2+y^2+z^2\right)\left(x\dfrac{\partial w}{\partial x} + y\dfrac{\partial w}{\partial y} + z\dfrac{\partial w}{\partial z}\right)^k.$

1°. By passing from x, y, z to the spherical coordinates r, θ, φ,

$$x = r\sin\theta\cos\varphi, \quad y = r\sin\theta\sin\varphi, \quad z = r\cos\theta,$$

we arrive at the equation

$$r^2\left(\frac{\partial w}{\partial r}\right)^2 - r^2f(r^2)\left(r\frac{\partial w}{\partial r}\right)^k + \left(\frac{\partial w}{\partial\theta}\right)^2 + \frac{1}{\sin^2\theta}\left(\frac{\partial w}{\partial\varphi}\right)^2 = 0.$$

A complete integral of this equation can be found by the method of separation of variables as the sum of functions depending on different variables (linear in φ).

2°. Complete integral for $k = 2$:

$$w = C_1 \int \frac{dr}{r\sqrt{r^2 f(r^2) - 1}} + \int \sqrt{C_1^2 - \frac{C_2^2}{\sin^2\theta}}\, d\theta + C_2\varphi + C_3.$$

4. $\dfrac{\partial w}{\partial x} + a\left(\dfrac{\partial w}{\partial y}\right)^k + b\left(\dfrac{\partial w}{\partial z}\right)^n = f(x)w + g(x).$

Complete integral:

$$w = C_1 F(x) + (C_2 y + C_3 z)F(x) + F(x)\int \left[g(x) - aC_2^k F^k(x) - bC_3^n F^n(x)\right]\frac{dx}{F(x)},$$

where $F(x) = \exp\left[\int f(x)\,dx\right]$.

5. $\dfrac{\partial w}{\partial x} + a_1\left(\dfrac{\partial w}{\partial y}\right)^k + a_2\left(\dfrac{\partial w}{\partial z}\right)^n + b_1 f(x) z\dfrac{\partial w}{\partial y} + b_2 f(x) y\dfrac{\partial w}{\partial z} = 0.$

Complete integral:

$$w = y\varphi_1(x) + z\varphi_2(x) - \int \left[a_1\varphi_1^k(x) + a_2\varphi_2^n(x)\right]dx + C_3,$$

where

$$\varphi_1(x) = C_1 b_2 \exp\left[\lambda\int f(x)\,dx\right] + C_2 b_2 \exp\left[-\lambda\int f(x)\,dx\right], \quad \lambda = \sqrt{b_1 b_2},$$
$$\varphi_2(x) = -C_1\lambda \exp\left[\lambda\int f(x)\,dx\right] + C_2\lambda \exp\left[-\lambda\int f(x)\,dx\right].$$

6. $\dfrac{\partial w}{\partial x} + f_1(x)\left(\dfrac{\partial w}{\partial y}\right)^k + f_2(x)\left(\dfrac{\partial w}{\partial z}\right)^n = g(x)w + h_1(x)y + h_2(x)z.$

Complete integral:

$$w = G(x)\left[y\varphi_1(x) + z\varphi_2(x) + \psi(x)\right],$$

where

$$G(x) = \exp\left[\int g(x)\,dx\right], \quad \varphi_1(x) = C_1 + \int \frac{h_1(x)}{G(x)}\,dx, \quad \varphi_2(x) = C_2 + \int \frac{h_2(x)}{G(x)}\,dx,$$
$$\psi(x) = C_3 - \int \left[f_1(x)G^{k-1}(x)\varphi_1^k(x) + f_2(x)G^{n-1}(x)\varphi_2^n(x)\right]dx.$$

7. $\dfrac{\partial w}{\partial x} + f(x)\left(\dfrac{\partial w}{\partial y} + az\right)^k + g(x)\left(\dfrac{\partial w}{\partial z} + ay\right)^n = h(x).$

Complete integral: $w = -ayz + C_1 y + C_2 z + \int \left[h(x) - C_1^k f(x) - C_2^n g(x)\right]dx + C_3.$

8. $\dfrac{\partial w}{\partial x}+f(x)\left(\dfrac{\partial w}{\partial y}+az\right)^k\left(\dfrac{\partial w}{\partial z}+ay\right)^n=g(x).$

Complete integral: $w=-ayz+C_1y+C_2z+\displaystyle\int\left[g(x)-C_1^kC_2^nf(x)\right]dx+C_3.$

9. $f_1(x)\left(\dfrac{\partial w}{\partial x}\right)^k+f_2(y)\left(\dfrac{\partial w}{\partial y}\right)^n+f_3(z)\left(\dfrac{\partial w}{\partial z}\right)^m=g_1(x)+g_2(y)+g_3(z).$

Complete integral:

$$w=\int\left[\frac{g_1(x)+C_1}{f_1(x)}\right]^{1/k}dx+\int\left[\frac{g_2(y)+C_2}{f_2(y)}\right]^{1/n}dy+\int\left[\frac{g_3(z)-C_1-C_2}{f_3(z)}\right]^{1/m}dz+C_3.$$

10. $\left(\dfrac{\partial w}{\partial x}\right)^k\left(\dfrac{\partial w}{\partial y}\right)^n\left(\dfrac{\partial w}{\partial z}\right)^m=f(x)g(y)h(z)\varphi(w).$

This is a special case of equation 4.6.2.4.

4.3.3. Equations with Arbitrary Dependence on Derivatives

1. $f_1(x)\left(\dfrac{\partial w}{\partial x}\right)^k+f_2(y)\left(\dfrac{\partial w}{\partial y}\right)^n+\left[g_1(x)+g_2(y)\right]F\left(\dfrac{\partial w}{\partial z}\right)=h_1(x)+h_2(y).$

Complete integral:

$$w=C_1z+C_2+\int\left[\frac{h_1(x)-F(C_1)g_1(x)+C_3}{f_1(x)}\right]^{1/k}dx+\int\left[\frac{h_2(y)-F(C_1)g_2(y)-C_3}{f_2(y)}\right]^{1/n}dy.$$

2. $\dfrac{\partial w}{\partial x}+f(x)F\left(ay+\dfrac{\partial w}{\partial y}\right)+g(x)G\left(bz+\dfrac{\partial w}{\partial z}\right)=h(x).$

Complete integral:

$$w=-\int\left[F(C_1)f(x)+G(C_2)g(x)-h(x)\right]dx-\tfrac{1}{2}ay^2-\tfrac{1}{2}bz^2+C_1y+C_2z+C_3.$$

3. $\dfrac{\partial w}{\partial x}+f(x)F\left(y^b\dfrac{\partial w}{\partial y}\right)+g(x)G\left(z^a\dfrac{\partial w}{\partial z}\right)=h(x).$

1°. Complete integral for $a\neq1$ and $b\neq1$:

$$w=-\int[F(C_2)f(x)+G(C_1)g(x)-h(x)]\,dx+\frac{C_1}{1-a}z^{1-a}+\frac{C_2}{1-b}y^{1-b}+C_3.$$

2°. Complete integral for $a=1$ and $b\neq1$:

$$w=-\int[F(C_2)f(x)+G(C_1)g(x)-h(x)]\,dx+C_1\ln|z|+\frac{C_2}{1-b}y^{1-b}+C_3.$$

3°. Complete integral for $a=1$ and $b=1$:

$$w=-\int[F(C_2)f(x)+G(C_1)g(x)-h(x)]\,dx+C_1\ln|z|+C_2\ln|y|+C_3.$$

4. $\dfrac{\partial w}{\partial x}+f(x)F\left(by+\dfrac{\partial w}{\partial y}\right)+g(x)G\left(z^a\dfrac{\partial w}{\partial z}\right)=h(x).$

1°. Complete integral for $a\neq 1$:

$$w=-\int[F(C_2)f(x)+G(C_1)g(x)-h(x)]\,dx+\frac{C_1}{1-a}z^{1-a}-\frac{b}{2}y^2+C_2y+C_3.$$

2°. Complete integral for $a=1$:

$$w=\frac{1}{2}\int\left[-p(x)+\sqrt{p^2(x)-4F(C_2)f(x)-4G(C_1)g(x)+4h(x)}\right]dx+\frac{C_1z^{1-b}}{1-b}-\frac{a}{2}y^2+C_2y+C_3.$$

2°. Complete integral for $b=1$:

$$w=\frac{1}{2}\int\left[-p(x)+\sqrt{p^2(x)-4F(C_2)f(x)-4G(C_1)g(x)+4h(x)}\right]dx+C_1\ln|z|-\frac{a}{2}y^2+C_2y+C_3.$$

4.3.4. Nonlinear Equations of General Form

1. $\dfrac{\partial w}{\partial x} + F\left(x, \dfrac{\partial w}{\partial y}, \dfrac{\partial w}{\partial z}\right) = 0.$

Complete integral: $w = C_1 y + C_2 z + C_3 - \displaystyle\int F(x, C_1, C_2)\, dx.$

2. $\dfrac{\partial w}{\partial x} + F\left(x, \dfrac{\partial w}{\partial y}, \dfrac{\partial w}{\partial z}\right) = aw.$

Complete integral: $w = e^{ax}(C_1 y + C_2 z + C_3) - e^{ax} \displaystyle\int e^{-ax} F(x, C_1 e^{ax}, C_2 e^{ax})\, dx.$

3. $\dfrac{\partial w}{\partial x} + F\left(x, \dfrac{\partial w}{\partial y}, \dfrac{\partial w}{\partial z}\right) = g(x)w.$

Complete integral:

$$w = \varphi(x)(C_1 y + C_2 z + C_3) - \varphi(x) \int F\big(x, C_1\varphi(x), C_2\varphi(x)\big) \frac{dx}{\varphi(x)},$$

where $\varphi(x) = \exp\left[\displaystyle\int g(x)\, dx\right].$

4. $\dfrac{\partial w}{\partial x} + F\left(x, \dfrac{\partial w}{\partial y}, \dfrac{\partial w}{\partial z}\right) = g(x)w + h_1(x)y + h_2(x)z.$

Complete integral:

$$w = y\varphi(x) + z\psi(x) + \chi(x),$$

where

$$\varphi(x) = C_1 G(x) + G(x) \int \frac{h_1(x)}{G(x)}\, dx, \quad \psi(x) = C_2 G(x) + G(x) \int \frac{h_2(x)}{G(x)}\, dx,$$
$$\chi(x) = C_3 G(x) - G(x) \int F(x, \varphi, \psi) \frac{dx}{G(x)}, \quad G(x) = \exp\left[\int g(x)\, dx\right].$$

5. $\dfrac{\partial w}{\partial x} + \big[f_{12}(x)y + f_{11}(x)z + f_{10}(x)\big]\dfrac{\partial w}{\partial y} + \big[f_{22}(x)y + f_{21}(x)z + f_{20}(x)\big]\dfrac{\partial w}{\partial z}$
$+ F\left(x, \dfrac{\partial w}{\partial y}, \dfrac{\partial w}{\partial z}\right) = g(x)w + h_1(x)y + h_2(x)z.$

Complete integral:

$$w = y\varphi_1(x) + z\varphi_2(x) + \psi(x).$$

The functions $\varphi_1(x)$, $\varphi_2(x)$, and $\psi(x)$ are determined by solving the system of ordinary differential equations

$$\varphi_1' + (f_{12} - g)\varphi_1 + f_{22}\varphi_2 = h_1, \tag{1}$$
$$\varphi_2' + f_{11}\varphi_1 + (f_{21} - g)\varphi_2 = h_2, \tag{2}$$
$$\psi' - g\psi = -f_{10}\varphi_1 - f_{20}\varphi_2 - F(x, \varphi_1, \varphi_2), \tag{3}$$

where $f_{ij} = f_{ij}(x)$, $g = g(x)$, and $h_k = h_k(x)$; the prime denotes the derivative with respect to x.

Having found $\varphi_1 = \varphi_1(x)$ and $\varphi_2 = \varphi_2(x)$ from the linear system of equation (1) and (2), one can determine the solution of equation (3) according to the formula

$$\psi(x) = C_3 G - G\int \big[f_{10}\varphi_1 + f_{20}\varphi_2 + F(x,\varphi_1,\varphi_2)\big]\,\frac{dx}{G}, \qquad G = \exp\Big(\int g\,dx\Big).$$

2°. Consider the special case $h_1 \equiv 0$ and $h_2 \equiv 0$. In addition, assume that

$$f_{11} = a_1 f(x), \quad f_{12} = a_2 f(x) + g(x), \quad f_{21} = a_3 f(x) + g(x), \quad f_{22} = a_4 f(x), \tag{4}$$

where $f = f(x)$ and $g = g(x)$ are arbitrary functions and a_1, a_2, a_3, and a_4 are arbitrary numbers. With these assumptions, the general solution of the linear homogeneous system (1), (2) has the form

$$\begin{aligned}\varphi_1 &= C_1\exp\Big(\lambda_1\int f\,dx\Big) + C_2\exp\Big(\lambda_2\int f\,dx\Big),\\ \varphi_2 &= -\frac{a_2+\lambda_1}{a_4}C_1\exp\Big(\lambda_1\int f\,dx\Big) - \frac{a_2+\lambda_2}{a_4}C_2\exp\Big(\lambda_2\int f\,dx\Big),\end{aligned} \tag{5}$$

where λ_1 and λ_2 are the roots of the quadratic equation $(\lambda + a_2)(\lambda + a_3) - a_1 a_4 = 0$.

3°. Let $h_1 = h_1(x)$ and $h_2 = h_2(x)$ be arbitrary functions and let the $f_{ij} = f_{ij}(x)$ be defined by relations (4). In this case, the general solution of the linear nonhomogeneous system of equations (1), (2) can be obtained by variation of constants or with the aid of the Wronskian determinant [see, for example, Murphy (1960), Kamke (1977), and Zwillinger (1998)].

6. $$\frac{\partial w}{\partial x} + wF\Big(x, \frac{\partial w}{\partial y}, \frac{\partial w}{\partial z}\Big) + yG\Big(x, \frac{\partial w}{\partial y}, \frac{\partial w}{\partial z}\Big) + zH\Big(x, \frac{\partial w}{\partial y}, \frac{\partial w}{\partial z}\Big) + R\Big(x, \frac{\partial w}{\partial y}, \frac{\partial w}{\partial z}\Big) = 0.$$

A complete integral can be sought in the form $w = \varphi(x)y + \psi(x)z + \chi(x)$.

7. $$\frac{\partial w}{\partial x} + F\Big(x, \frac{\partial w}{\partial y} + az, \frac{\partial w}{\partial z} + ay\Big) = 0.$$

Complete integral: $w = -ayz + C_1 y + C_2 z - \int F\big(x, C_1, C_2\big)\,dx + C_3.$

8. $$\frac{\partial w}{\partial x} + F\Big(x, g_1(y)\frac{\partial w}{\partial y} + h_1(y), g_2(z)\frac{\partial w}{\partial z} + h_2(z)\Big) = 0.$$

Complete integral:

$$w = \int \frac{C_1 - h_1(y)}{g_1(y)}\,dy + \int \frac{C_2 - h_2(z)}{g_2(z)}\,dz - \int F(x, C_1, C_2)\,dx + C_3.$$

9. $$\Big(\frac{\partial w}{\partial x}\Big)^2 + \frac{\partial w}{\partial x}F\Big(x, \frac{\partial w}{\partial y}, \frac{\partial w}{\partial z}\Big) + G\Big(x, \frac{\partial w}{\partial y}, \frac{\partial w}{\partial z}\Big) = 0.$$

Complete integral:

$$w = C_1 y + C_2 z + C_3 + \frac{1}{2}\int\Big[-F(x, C_1, C_2) + \sqrt{F^2(x, C_1, C_2) - 4G(x, C_1, C_2)}\Big]\,dx.$$

10. $F\left(\dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}, \dfrac{\partial w}{\partial z}\right) = 0.$

Complete integral: $w = C_1x + C_2y + C_3z + C_4$, where the first three constants are related by the one constraint $F(C_1, C_2, C_3) = 0$.

⊙ Reference: E. Kamke (1965).

11. $F\left(\dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}, \dfrac{\partial w}{\partial z}\right) + x\dfrac{\partial w}{\partial x} + y\dfrac{\partial w}{\partial y} + z\dfrac{\partial w}{\partial z} = 0.$

Complete integral:

$$w = \varphi(\xi) + C_4, \quad \xi = C_1x + C_2y + C_3z,$$

where the function $\varphi = \varphi(\xi)$ is determined by the ordinary differential equation

$$F\left(C_1\varphi'_\xi, C_2\varphi'_\xi, C_3\varphi'_\xi\right) + \xi\varphi'_\xi = 0.$$

One of the constants C_1, C_2, or C_3 can be set equal to unity.

12. $F\left(\dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}, \dfrac{\partial w}{\partial z}\right) + x\dfrac{\partial w}{\partial x} + y\dfrac{\partial w}{\partial y} + z\dfrac{\partial w}{\partial z} = w.$

Clairaut's equation. Complete integral: $w = C_1x + C_2y + C_3z + F(C_1, C_2, C_3)$.

⊙ Reference: E. Kamke (1965).

13. $F\left(x, \dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}, \dfrac{\partial w}{\partial z}\right) + y\dfrac{\partial w}{\partial y} + z\dfrac{\partial w}{\partial z} = w.$

Complete integral: $w = C_2y + C_3z + \varphi(x)$, where the function $\varphi(x) = \varphi(x, C_1, C_2, C_3)$ is determined by the ordinary differential equation $F\left(x, \varphi'_x, C_2, C_3\right) = \varphi$.

14. $F\left(ax + by + cz, \dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}, \dfrac{\partial w}{\partial z}\right) = 0.$

Complete integral:

$$w = C_1x + C_2y + C_3 + \varphi(\xi, C_1, C_2), \qquad \xi = ax + by + cz,$$

where the function $\varphi = \varphi(\xi, C_1, C_2)$ is determined by the ordinary differential equation

$$F\left(\xi, a\varphi'_\xi + C_1, b\varphi'_\xi + C_2, c\varphi'_\xi\right) = 0.$$

15. $F\left(\dfrac{\partial w}{\partial x} + ayz, \dfrac{\partial w}{\partial y} + axz, \dfrac{\partial w}{\partial z} + axy\right) = 0.$

Complete integral: $w = -axyz + C_1y + C_2z + C_3z + C_4$, where $F(C_1, C_2, C_3) = 0$.

16. $F\left(ax + by + cz, \dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}, \dfrac{\partial w}{\partial z}\right) + x\dfrac{\partial w}{\partial x} + y\dfrac{\partial w}{\partial y} + z\dfrac{\partial w}{\partial z} = w.$

Complete integral:

$$w = C_1x + C_2y + C_3z + \varphi(\xi), \quad \xi = ax + by + cz,$$

where the function $\varphi = \varphi(\xi)$ is determined by the ordinary differential equation

$$F\left(\xi, a\varphi'_\xi + C_1, b\varphi'_\xi + C_2, c\varphi'_\xi + C_3\right) + \xi\varphi'_\xi = \varphi.$$

17. $F\left(w, \dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}, \dfrac{\partial w}{\partial z}\right) = 0.$

Complete integral:

$$w = \varphi(\xi), \quad \xi = C_1 x + C_2 y + C_3 z,$$

where the function $\varphi(\xi)$ is determined by solving the first-order autonomous ordinary differential equation $F\big(\varphi, C_1\varphi'_\xi, C_2\varphi'_\xi, C_3\varphi'_\xi\big) = 0$.

⊙ Reference: E. Kamke (1965).

18. $F\left(ax + by + cz + kw, \dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}, \dfrac{\partial w}{\partial z}\right) = 0.$

For $k = 0$, see equation 4.3.4.14. For $k \neq 0$, the substitution $ku = ax + by + cz + kw$ leads to an equation of the form 4.3.4.17: $F\Big(ku, \dfrac{\partial u}{\partial x} - \dfrac{a}{k}, \dfrac{\partial u}{\partial y} - \dfrac{b}{k}, \dfrac{\partial u}{\partial z} - \dfrac{c}{k}\Big) = 0.$

19. $F\left(x, \dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y} + az, \dfrac{\partial w}{\partial z} + ay\right) = 0.$

Complete integral: $w = -ayz + C_1 y + C_2 z + \varphi(x) + C_3$, where the function $\varphi(\xi)$ is determined by the first-order ordinary differential equation $F\big(x, \varphi'_x, C_1, C_2\big) = 0$.

20. $F\left(w, \dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}, \dfrac{\partial w}{\partial z}, x\dfrac{\partial w}{\partial x} + y\dfrac{\partial w}{\partial y} + z\dfrac{\partial w}{\partial z}\right) = 0.$

Complete integral:

$$w = \varphi(\xi), \quad \xi = C_1 x + C_2 y + C_3 z,$$

where the function $\varphi(\xi)$ is determined by the first-order ordinary differential equation

$$F\big(\varphi, C_1\varphi'_\xi, C_2\varphi'_\xi, C_3\varphi'_\xi, \xi\varphi'_\xi\big) = 0.$$

21. $F\left(x, \dfrac{\partial w}{\partial x}, G\left(y, \dfrac{\partial w}{\partial y}\right), H\left(z, \dfrac{\partial w}{\partial z}\right)\right) = 0.$

Complete integral:

$$w = \varphi(x, C_1, C_2) + \psi(y, C_1) + \chi(z, C_2) + C_3.$$

The functions φ, ψ, and χ are determined by the ordinary differential equations

$$F(x, \varphi'_x, C_1, C_2) = 0, \quad G(y, \psi'_y) = C_1, \quad H(z, \chi'_z) = C_2.$$

Solving these equations for the derivatives, we obtain linear separable equations, which are easy to integrate.

22. $F\left(G\left(H\left(x, \dfrac{\partial w}{\partial x}\right), y, \dfrac{\partial w}{\partial y}\right), z, \dfrac{\partial w}{\partial z}\right) = 0.$

Complete integral:

$$w = \varphi(x, C_1) + \psi(y, C_2, C_1) + \chi(z, C_2) + C_3.$$

The functions φ, ψ, and χ are determined by the ordinary differential equations

$$H\big(x, \varphi'_x\big) = C_1, \quad G\big(C_1, y, \psi'_y\big) = C_2, \quad F\big(C_2, z, \chi'_z\big) = 0.$$

Solving these equations for the derivatives, we obtain linear separable equations, which are easy to integrate.

4.4. Nonlinear Equations with Four Independent Variables

▷ *This section deals with specific nonlinear equations with four independent variables which contain arbitrary parameters. For nonlinear equations containing arbitrary functions, see Section 4.5 with* $n = 4$.

4.4.1. Equations Quadratic in Derivatives

1. $\dfrac{\partial w}{\partial x_1} + a\left(\dfrac{\partial w}{\partial x_2}\right)^2 + b\left(\dfrac{\partial w}{\partial x_3}\right)^2 + c\left(\dfrac{\partial w}{\partial x_4}\right)^2 = kx_1^n w + sx_1^m.$

Complete integral:

$$w = C_1 F(x_1) + (C_2 x_2 + C_3 x_3 + C_4 x_4) F(x_1) + F(x_1) \int \frac{s x_1^m - \lambda F^2(x_1)}{F(x_1)}\, dx_1,$$

where $F(x) = \exp\left(\dfrac{k}{n+1} x_1^{n+1}\right)$, $\lambda = aC_2^2 + bC_3^2 + cC_4^2$.

2. $\dfrac{\partial w}{\partial x_1} + a\left(\dfrac{\partial w}{\partial x_2}\right)^2 + b\left(\dfrac{\partial w}{\partial x_3}\right)^2 + c\left(\dfrac{\partial w}{\partial x_4}\right)^2 = kw^2 + sx_1^m w.$

This is a special case of equation 4.5.1.2.

3. $\dfrac{\partial w}{\partial x_1} + \dfrac{1}{2c}\left(\dfrac{\partial w}{\partial x_2}\right)^2 + \dfrac{1}{2a}\left(\dfrac{\partial w}{\partial x_3}\right)^2 + \dfrac{1}{2a \sin^2 x_3}\left(\dfrac{\partial w}{\partial x_4} - \cos x_3 \dfrac{\partial w}{\partial x_2}\right)^2 + k \cos x_3 = 0.$

This equation governs the motion of a rigid body with one fixed point in the Lagrange–Poisson case (x_1 is time; x_2, x_3, and x_4 are Eulerian angles; w is the Hamiltonian function; $a = b \neq c$ are mass moments of inertia; and k is the body weight times the distance from the center of mass to the fixed point). Complete integral:

$$w = -C_1 x_1 + C_2 x_2 + C_3 x_4 + C_4 \pm \int \sqrt{2aC_1 - 2ak \cos x_3 - \frac{a}{c} C_2^2 - \frac{(C_3 - C_2 \cos x_3)^2}{\sin^2 x_3}}\, dx_3.$$

⊙ Reference: E. N. Berezkin (1962).

4. $\dfrac{\partial w}{\partial x_1} + \dfrac{1}{2}\left(\dfrac{\partial w}{\partial x_2}\right)^2 + \dfrac{1}{2x_2^2}\left(\dfrac{\partial w}{\partial x_3}\right)^2 + \dfrac{1}{2x_2^2 \sin^2 x_3}\left(\dfrac{\partial w}{\partial x_4}\right)^2 - \dfrac{a}{x_2} = 0.$

This equation governs the motion of a planet in a central Newtonian gravitational field (x_1 is time, x_2 is the radial coordinate, x_3 and x_4 are the angular coordinates, and w is the Hamiltonian function). Complete integral:

$$w = -C_1 x_1 + C_2 x_4 + C_3 \pm \int \sqrt{2C_1 + \frac{2a}{x_2} - \frac{C_4^2}{x_2^2}}\, dx_2 \pm \int \sqrt{C_4^2 - \frac{C_2^2}{\sin^2 x_3}}\, dx_3.$$

⊙ Reference: P. Appell (1953) and E. N. Berezkin (1962).

5. $\dfrac{\partial w}{\partial x_1}+ax_1^k\left(\dfrac{\partial w}{\partial x_2}\right)^2+bx_1^n\left(\dfrac{\partial w}{\partial x_3}\right)^2+cx_1^m\left(\dfrac{\partial w}{\partial x_4}\right)^2=sx_1^qw.$

Complete integral:

$$w=\varphi(x_1)(C_1+C_2x_2+C_3x_3+C_4x_4)-\varphi(x_1)\int\varphi(x_1)\bigl(aC_2^2x_1^k+bC_3^2x_1^n+cC_4^2x_1^m\bigr)\,dx_1,$$

where $\varphi(x_1)=\exp\left(\dfrac{s}{q+1}x_1^{q+1}\right)$.

6. $\dfrac{\partial w}{\partial x_1}+a_2x_1^{k_2}\left(\dfrac{\partial w}{\partial x_2}\right)^2+a_3x_1^{k_3}\left(\dfrac{\partial w}{\partial x_3}\right)^2+a_4x_1^{k_4}\left(\dfrac{\partial w}{\partial x_4}\right)^2$
$=bx_1^nw+c_2x_1^{m_2}x_2+c_3x_1^{m_3}x_3+c_4x_1^{m_4}x_4.$

This is a special case of equation 4.6.1.5.

7. $\dfrac{\partial w}{\partial x_1}+a_2x_2^{k_2}\left(\dfrac{\partial w}{\partial x_2}\right)^2+a_3x_3^{k_3}\left(\dfrac{\partial w}{\partial x_3}\right)^2+a_4x_4^{k_4}\left(\dfrac{\partial w}{\partial x_4}\right)^2$
$=c_1x_1^{n_1}+c_2x_2^{n_2}+c_3x_3^{n_3}+c_4x_4^{n_4}.$

This is a special case of equation 4.2.2.6.

8. $\dfrac{\partial w}{\partial x_1}+a_1e^{\lambda_1x_1}\left(\dfrac{\partial w}{\partial x_2}\right)^2+a_2e^{\lambda_2x_1}\left(\dfrac{\partial w}{\partial x_3}\right)^2+a_3e^{\lambda_3x_1}\left(\dfrac{\partial w}{\partial x_4}\right)^2=be^{\beta x_1}w.$

Complete integral:

$$w=\varphi(x_1)(C_1+C_2x_2+C_3x_3+C_4x_4)-\varphi(x_1)\int\varphi(x_1)\bigl(a_1C_2^2e^{\lambda_1x_1}+a_2C_3^2e^{\lambda_2x_1}+a_3C_4^2e^{\lambda_3x_1}\bigr)dx_1,$$

where $\varphi(x_1)=\exp\left(\dfrac{b}{\beta}e^{\beta x_1}\right)$.

9. $\dfrac{\partial w}{\partial x_1}+a_2x_2^{k_2}w^{n_2}\left(\dfrac{\partial w}{\partial x_2}\right)^2+a_3x_3^{k_3}w^{n_3}\left(\dfrac{\partial w}{\partial x_3}\right)^2+a_4x_4^{k_4}w^{n_4}\left(\dfrac{\partial w}{\partial x_4}\right)^2=0.$

Complete integral:

$$C_1-x_1+\frac{2C_2}{2-k_2}x_2^{\frac{2-k_2}{2}}+\frac{2C_3}{2-k_3}x_3^{\frac{2-k_3}{2}}+\frac{2C_4}{2-k_4}x_4^{\frac{2-k_4}{2}}$$
$$=\frac{a_2C_2^2}{n_2+1}w^{n_2+1}+\frac{a_3C_3^2}{n_3+1}w^{n_3+1}+\frac{a_4C_4^2}{n_4+1}w^{n_4+1}.$$

10. $\dfrac{\partial w}{\partial x_1}+a_2x_2^{k_2}w^{n_2}\left(\dfrac{\partial w}{\partial x_2}\right)^2+a_3x_3^{k_3}w^{n_3}\left(\dfrac{\partial w}{\partial x_3}\right)^2+a_4x_4^{k_4}w^{n_4}\left(\dfrac{\partial w}{\partial x_4}\right)^2=bw^m.$

This is a special case of equation 4.6.1.15.

4.4.2. Equations Contain Power-Law Functions of Derivatives

1. $\dfrac{\partial w}{\partial x_1}+\sqrt{k+a\left(\dfrac{\partial w}{\partial x_2}\right)^2+b\left(\dfrac{\partial w}{\partial x_3}\right)^2+c\left(\dfrac{\partial w}{\partial x_4}\right)^2}=0.$

Complete integral:

$$w=-Ax_1+C_1x_2+C_2x_3+C_3x_4+C_4,\qquad A=\sqrt{k+aC_1^2+bC_2^2+cC_3^2}.$$

2. $\dfrac{\partial w}{\partial x_1}+a_1\sqrt{1+b_1\left(\dfrac{\partial w}{\partial x_2}\right)^2}+a_2\sqrt{1+b_2\left(\dfrac{\partial w}{\partial x_3}\right)^2}+a_3\sqrt{1+b_3\left(\dfrac{\partial w}{\partial x_4}\right)^2}=0.$

Complete integral:

$$w=-Ax_1+C_1x_2+C_2x_3+C_3x_4+C_4,$$

where $A=a_1\sqrt{1+b_1C_1^2}+a_2\sqrt{1+b_2C_2^2}+a_3\sqrt{1+b_3C_3^2}$.

3. $\dfrac{\partial w}{\partial x_1}\dfrac{\partial w}{\partial x_2}\dfrac{\partial w}{\partial x_3}\dfrac{\partial w}{\partial x_4}=ax_1^kx_2^nx_3^mx_4^s.$

Complete integral: $w=\dfrac{C_1}{k+1}x_1^{k+1}+\dfrac{C_2}{n+1}x_2^{n+1}+\dfrac{C_3}{m+1}x_3^{m+1}+\dfrac{a}{C_1C_2C_3(s+1)}x_4^{s+1}.$

4. $\dfrac{\partial w}{\partial x_1}+a_1\left(\dfrac{\partial w}{\partial x_2}+bx_3x_4\right)^{k_1}+a_2\left(\dfrac{\partial w}{\partial x_3}+bx_2x_4\right)^{k_2}+a_3\left(\dfrac{\partial w}{\partial x_4}+bx_2x_3\right)^{k_3}=cx_1^n.$

Complete integral:

$$w=-bx_2x_3x_4+C_1x_2+C_2x_3+C_3x_4-\left(a_1C_1^{k_1}+a_2C_2^{k_2}+a_3C_3^{k_3}\right)x_1+\frac{c}{n+1}x_1^{n+1}+C_4.$$

5. $a_1x_1^{k_1}\left(\dfrac{\partial w}{\partial x_1}\right)^{k_1}+a_2x_2^{k_2}\left(\dfrac{\partial w}{\partial x_2}\right)^{k_2}+a_3x_3^{k_3}\left(\dfrac{\partial w}{\partial x_3}\right)^{k_3}+a_4x_4^{k_4}\left(\dfrac{\partial w}{\partial x_4}\right)^{k_4}$
$=b_1x_1^{n_1}+b_2x_2^{n_2}+b_3x_3^{n_3}+b_4x_4^{n_4}.$

This is a special case of equation 4.6.2.6.

6. $a_1x_1^{k_1}\left(\dfrac{\partial w}{\partial x_1}\right)^{k_1}+a_2x_2^{k_2}\left(\dfrac{\partial w}{\partial x_2}\right)^{k_2}+a_3x_3^{k_3}\left(\dfrac{\partial w}{\partial x_3}\right)^{k_3}+a_4x_4^{k_4}\left(\dfrac{\partial w}{\partial x_4}\right)^{k_4}=bw^n.$

This is a special case of equation 4.6.2.7.

7. $a_1\left(\dfrac{\partial w}{\partial x_1}+bx_2\right)^{k_1}+a_2\left(\dfrac{\partial w}{\partial x_2}+bx_1\right)^{k_2}+a_3\left(\dfrac{\partial w}{\partial x_3}+cx_4\right)^{k_3}+a_4\left(\dfrac{\partial w}{\partial x_4}+cx_3\right)^{k_4}=s.$

Complete integral:

$$w=-bx_1x_2-cx_3x_4+C_1x_1+C_2x_2+C_3x_3+C_4x_4+C_5,$$

where $a_1C_1^{k_1}+a_2C_2^{k_2}+a_3C_3^{k_3}+a_4C_4^{k_4}=s$.

8. $a\left(\dfrac{\partial w}{\partial x_1}\right)^k\left(\dfrac{\partial w}{\partial x_2}\right)^n+b\left(\dfrac{\partial w}{\partial x_3}\right)^m\left(\dfrac{\partial w}{\partial x_4}\right)^s+x_1\dfrac{\partial w}{\partial x_1}+x_2\dfrac{\partial w}{\partial x_2}+x_3\dfrac{\partial w}{\partial x_3}+x_4\dfrac{\partial w}{\partial x_4}=w.$

Complete integral: $w = C_1x_1 + C_2x_2 + C_3x_3 + C_4x_4 + aC_1^kC_2^n + bC_3^mC_4^s.$

9. $a_1\left(\dfrac{\partial w}{\partial x_1}+bx_2\right)^{k_1}\left(\dfrac{\partial w}{\partial x_2}+bx_1\right)^{k_2}+a_2\left(\dfrac{\partial w}{\partial x_3}+cx_4\right)^{n_1}\left(\dfrac{\partial w}{\partial x_4}+cx_3\right)^{n_2}=s.$

Complete integral:

$$w = -bx_1x_2 - cx_3x_4 + C_1x_1 + C_2x_2 + C_3x_3 + C_4x_4 + C_5,$$

where $a_1C_1^{k_1}C_2^{k_2} + a_2C_3^{n_1}C_4^{n_2} = s.$

4.5. Nonlinear Equations with Arbitrary Number of Variables Containing Arbitrary Parameters

4.5.1. Equations Quadratic in Derivatives

1. $\dfrac{\partial w}{\partial x_1}+a_2\left(\dfrac{\partial w}{\partial x_2}\right)^2+\cdots+a_n\left(\dfrac{\partial w}{\partial x_n}\right)^2=bw+cx_1^k.$

This is a special case of equation 4.6.1.1 with $f(x_1)=b$ and $g(x_1)=cx_1^k$. Complete integral:

$$w=(C_1+C_2x_2+\cdots+C_nx_n)e^{bx_1}-\frac{1}{b}(a_2C_2^2+\cdots+a_nC_n^2)e^{2bx_1}+ce^{bx_1}\int e^{-bx_1}x_1^k\,dx_1.$$

2. $\dfrac{\partial w}{\partial x_1}+a_2\left(\dfrac{\partial w}{\partial x_2}\right)^2+\cdots+a_n\left(\dfrac{\partial w}{\partial x_n}\right)^2=bw^2+cx_1^kw.$

This is a special case of equation 4.6.1.2 with $f(x_1)=cx_1^k$ and $g(x_1)=0$. Complete integral:

$$w=\varphi(x_1)+C_1\psi(x_1)\exp(C_2x_2+\cdots+C_nx_n).$$

The arbitrary constants $C_2,\ldots,C_n$ are related by the one constraint $a_2C_2^2+\cdots+a_nC_n^2=b$. The function $\varphi(x)$ and $\psi(x)$ are given by

$$\varphi(x)=F(x)\left[C_{n+1}-b\int F(x)\,dx\right]^{-1},\quad F(x)=\exp\left(\frac{c}{k+1}x^{k+1}\right),$$
$$\psi(x)=\exp\left\{\int\left[2b\varphi(x)+cx^k\right]dx\right\}.$$

3. $\dfrac{\partial w}{\partial x_1}+a_2x_1^{k_2}\left(\dfrac{\partial w}{\partial x_2}\right)^2+\cdots+a_nx_1^{k_n}\left(\dfrac{\partial w}{\partial x_n}\right)^2=bw.$

Complete integral:

$$w=C_1e^{bx_1}+e^{bx_1}(C_2x_2+\cdots+C_nx_n)-e^{bx_1}\int e^{bx_1}\left(a_2C_2^2x_1^{k_2}+\cdots+a_nC_n^2x_1^{k_n}\right)dx_1.$$

4. $\dfrac{\partial w}{\partial x_1}+a_2x_1^{k_2}\left(\dfrac{\partial w}{\partial x_2}\right)^2+\cdots+a_nx_1^{k_n}\left(\dfrac{\partial w}{\partial x_n}\right)^2=bx_1^mw.$

This is a special case of equation 4.6.1.4 with $f_i(x_1)=a_ix_1^{k_i}$ and $g(x_1)=bx_1^m$. Complete integral:

$$w=\varphi(x_1)(C_1+C_2x_2+\cdots+C_nx_n)-\varphi(x_1)\int\varphi(x_1)\left(a_2C_2^2x_1^{k_2}+\cdots+a_nC_n^2x_1^{k_n}\right)dx_1,$$

where $\varphi(x_1)=\exp\left(\dfrac{b}{m+1}x_1^{m+1}\right)$.

5. $\dfrac{\partial w}{\partial x_1}+a_2x_1^{k_2}\left(\dfrac{\partial w}{\partial x_2}\right)^2+\cdots+a_nx_1^{k_n}\left(\dfrac{\partial w}{\partial x_n}\right)^2=\beta w+b_2x_1^{m_2}x_2+\cdots+b_nx_1^{m_n}x_n.$

This is a special case of equation 4.6.1.5 with $f_i(x_1)=a_ix_1^{k_i}$, $g(x_1)=\beta$, and $h_i(x_1)=b_ix_1^{m_i}$. Complete integral:

$$w=x_2\varphi_2(x_1)+\cdots+x_n\varphi_n(x_1)+\psi(x_1),$$

where the functions $\varphi_k(x_1)$ and $\psi(x_1)$ are given by

$$\varphi_k(x_1)=C_ke^{\beta x_1}+b_ke^{\beta x_1}\int e^{-\beta x_1}x_1^{m_k}\,dx_1,\qquad k=2,\ldots,n;$$

$$\psi(x_1)=C_1e^{\beta x_1}-e^{\beta x_1}\int e^{-\beta x_1}\left[a_2x_1^{k_2}\varphi_2^2(x_1)+\cdots+a_nx_1^{k_n}\varphi_n^2(x_1)\right]dx_1.$$

6. $\dfrac{\partial w}{\partial x_1}+a_2x_2^{k_2}\left(\dfrac{\partial w}{\partial x_2}\right)^2+\cdots+a_nx_n^{k_n}\left(\dfrac{\partial w}{\partial x_n}\right)^2=cx_1^{\beta}+b_2x_2^{m_2}+\cdots+b_nx_n^{m_n}.$

Complete integral:

$$w=C_1-(C_2+\cdots+C_n)x_1+\frac{c}{\beta+1}x_1^{\beta+1}+\int\sqrt{\frac{C_2+b_2x_2^{m_2}}{a_2x_2^{k_2}}}\,dx_2+\cdots+\int\sqrt{\frac{C_n+b_nx_n^{m_n}}{a_nx_n^{k_n}}}\,dx_n.$$

7. $\dfrac{\partial w}{\partial x_1}+a_2e^{\lambda_2x_1}\left(\dfrac{\partial w}{\partial x_2}\right)^2+\cdots+a_ne^{\lambda_nx_1}\left(\dfrac{\partial w}{\partial x_n}\right)^2=be^{\beta x_1}w.$

This is a special case of equation 4.6.1.4 with $f_i(x_1)=a_ie^{\lambda_ix_1}$ and $g(x_1)=be^{\beta x_1}$. Complete integral:

$$w=\varphi(x_1)(C_1+C_2x_2+\cdots+C_nx_n)-\varphi(x_1)\int\varphi(x_1)\left(a_2C_2^2e^{\lambda_2x_1}+\cdots+a_nC_n^2e^{\lambda_nx_1}\right)dx_1,$$

where $\varphi(x_1)=\exp\left(\dfrac{b}{\beta}e^{\beta x_1}\right)$.

8. $\dfrac{\partial w}{\partial x_1}+a_2e^{\lambda_2x_1}\left(\dfrac{\partial w}{\partial x_2}\right)^2+\cdots+a_ne^{\lambda_nx_1}\left(\dfrac{\partial w}{\partial x_n}\right)^2$
$=cw+b_2e^{\beta_2x_1}x_2+\cdots+b_ne^{\beta_nx_1}x_n.$

This is a special case of equation 4.6.1.5 with $f_i(x_1)=a_ie^{\lambda_ix_1}$, $g(x_1)=c$, and $h_i(x_1)=b_ie^{\beta_ix_1}$.

9. $\dfrac{\partial w}{\partial x_1}+\sum\limits_{k=2}^{n}\left(a_kx_1^{\beta_k}x_k^{m_k}+b_kx_1^{\gamma_k}x_k^{2m_k-2}\right)\left(\dfrac{\partial w}{\partial x_k}\right)^2=c_1x_1^{\mu_1}w+c_0x_1^{\mu_0}.$

This is a special case of equation 4.6.1.9 with $f_k(x_1)=a_kx_1^{\beta_k}$, $g_k(x_1)=b_kx_1^{\gamma_k}$, $a(x_1)=c_1x_1^{\mu_1}$, and $b(x_1)=c_0x_1^{\mu_0}$.

10. $\dfrac{\partial w}{\partial x_1}+\sum\limits_{k,m=2}^{n}a_{km}x_1^{\beta_{km}}\dfrac{\partial w}{\partial x_k}\dfrac{\partial w}{\partial x_m}=bw+\sum\limits_{k,m=2}^{n}c_{km}x_1^{\gamma_{km}}x_kx_m.$

This is a special case of equation 4.6.1.10.

11. $\dfrac{\partial w}{\partial x_1}+a_2x_1^{k_2}w^{\beta}\left(\dfrac{\partial w}{\partial x_2}\right)^2+\cdots+a_nx_1^{k_n}w^{\beta}\left(\dfrac{\partial w}{\partial x_n}\right)^2=bx_1^mw.$

The substitution $u=\dfrac{1}{\beta+1}w^{\beta+1}$ leads to an equation of the form 4.5.1.4:

$$\frac{\partial u}{\partial x_1}+a_2x_1^{k_2}\left(\frac{\partial u}{\partial x_2}\right)^2+\cdots+a_nx_1^{k_n}\left(\frac{\partial u}{\partial x_n}\right)^2=b(\beta+1)x_1^mu.$$

12. $\dfrac{\partial w}{\partial x_1}+a_2x_1^{m_2}w^{k}\left(\dfrac{\partial w}{\partial x_2}\right)^2+\cdots+a_nx_1^{m_n}w^{k}\left(\dfrac{\partial w}{\partial x_n}\right)^2=bw^{k+2}+cx_1^sw.$

This is a special case of equation 4.6.1.13 with $f_i(x_1)=a_ix_1^{m_i}$ and $h(x_1)=cx_1^s$.

13. $\dfrac{\partial w}{\partial x_1}+a_2x_2^{k_2}w^{m_2}\left(\dfrac{\partial w}{\partial x_2}\right)^2+\cdots+a_nx_n^{k_n}w^{m_n}\left(\dfrac{\partial w}{\partial x_n}\right)^2=0.$

This is a special case of equation 4.6.1.14 with $f_i(x_i)=a_ix_i^{k_i}$, $g_i(w)=w^{m_i}$. Complete integral for $k_i\neq 2$ and $m_i\neq -1$:

$$x_1+\frac{a_2(2-k_2)^2C_2^2}{m_2+1}w^{m_2+1}+\cdots+\frac{a_n(2-k_n)^2C_n^2}{m_n+1}w^{m_n+1}=C_1+2C_2x_2^{\frac{2-k_2}{2}}+\cdots+2C_nx_n^{\frac{2-k_n}{2}}.$$

14. $a_1\left(\dfrac{\partial w}{\partial x_1}\right)^2+a_2\left(\dfrac{\partial w}{\partial x_2}\right)^2+\cdots+a_n\left(\dfrac{\partial w}{\partial x_n}\right)^2=w.$

Complete integral: $w=\displaystyle\sum_{k=1}^{n}\frac{1}{4a_k}\left(x_k+C_k\right)^2.$

⊙ Reference: A. M. Vinogradov and I. S. Krasilshchik (1997).

15. $a_1x_1^{k_1}\left(\dfrac{\partial w}{\partial x_1}\right)^2+\cdots+a_nx_n^{k_n}\left(\dfrac{\partial w}{\partial x_n}\right)^2=b_1x_1^{m_1}+\cdots+b_nx_n^{m_n}.$

This is a special case of equation 4.6.1.16 with $f_i(x_i)=a_ix_i^{k_i}$ and $g_i(x_i)=b_ix_i^{m_i}$.

16. $a_1x_1^{k_1}\left(\dfrac{\partial w}{\partial x_1}\right)^2+\cdots+a_nx_n^{k_n}\left(\dfrac{\partial w}{\partial x_n}\right)^2=\left(b_1x_1^{m_1}+\cdots+b_nx_n^{m_n}\right)w^{\beta}.$

This is a special case of equation 4.6.1.18 with $f_i(x_i)=a_ix_i^{k_i}$, $g_i(x_i)=b_ix_i^{m_i}$, and $h(w)=w^{\beta}$.

17. $a_1e^{\lambda_1x_1}\left(\dfrac{\partial w}{\partial x_1}\right)^2+\cdots+a_ne^{\lambda_nx_n}\left(\dfrac{\partial w}{\partial x_n}\right)^2=b_1e^{\beta_1x_1}+\cdots+b_ne^{\beta_nx_n}.$

This is a special case of equation 4.6.1.16 with $f_k(x_k)=a_ke^{\lambda_kx_k}$ and $g_k(x_k)=b_ke^{\beta_kx_k}$.

18. $a_1e^{\lambda_1x_1}\left(\dfrac{\partial w}{\partial x_1}\right)^2+\cdots+a_ne^{\lambda_nx_n}\left(\dfrac{\partial w}{\partial x_n}\right)^2=\left(b_1e^{\beta_1x_1}+\cdots+b_ne^{\beta_nx_n}\right)e^{\gamma w}.$

This is a special case of equation 4.6.1.18 with $f_k(x_k)=a_ke^{\lambda_kx_k}$, $g_k(x_k)=b_ke^{\beta_kx_k}$, and $h(w)=e^{\gamma w}$.

4.5.2. Equations with Power-Law Nonlinearity in Derivatives

1. $\dfrac{\partial w}{\partial x_1}\dfrac{\partial w}{\partial x_2}\ldots\dfrac{\partial w}{\partial x_n} = x_1x_2\ldots x_n.$

Complete integrals:

$$\text{(a)}\qquad w = \tfrac{1}{2}\sum_{k=1}^{n-1} C_k x_k^2 + \tfrac{1}{2}Ax_n^2 + C_n, \qquad A = \frac{1}{C_1C_2\ldots C_{n-1}},$$

$$\text{(b)}\qquad (w - C_n)^n = \left(\frac{n}{2}\right)^n (x_n^2 - A)\prod_{k=1}^{n-1}(x_k^2 - C_k).$$

2. $\dfrac{\partial w}{\partial x_1}\dfrac{\partial w}{\partial x_2}\ldots\dfrac{\partial w}{\partial x_n} = ax_1^{k_1}x_2^{k_2}\ldots x_n^{k_n}w^m.$

Complete integral:

$$\frac{n}{n-m}w^{\frac{n-m}{n}} = \frac{C_1}{k_1+1}x^{k_1+1} + \cdots + \frac{C_{n-1}}{k_{n-1}+1}x^{k_{n-1}+1} + \frac{a}{(k_n+1)C_1C_2\ldots C_{n-1}}x^{k_n+1} + C_n.$$

3. $\dfrac{\partial w}{\partial x_1}\dfrac{\partial w}{\partial x_2}\ldots\dfrac{\partial w}{\partial x_n} = x_1\dfrac{\partial w}{\partial x_1} + x_2\dfrac{\partial w}{\partial x_2} + \cdots + x_n\dfrac{\partial w}{\partial x_n}.$

Complete integral:

$$w = \frac{n-1}{n}(C_1\ldots C_n)^{\frac{1}{1-n}}(C_1x_1 + \cdots + C_nx_n)^{\frac{n}{n-1}} + C_{n+1}.$$

One of the constants $C_1, \ldots, C_n$ can be set equal to unity.

4. $\dfrac{\partial w}{\partial x_1}\dfrac{\partial w}{\partial x_2}\ldots\dfrac{\partial w}{\partial x_n} = \left(a_1\dfrac{\partial w}{\partial x_1} - w\right)\left(a_2\dfrac{\partial w}{\partial x_2} - w\right)\ldots\left(a_n\dfrac{\partial w}{\partial x_n} - w\right).$

Complete integral: $\ln|w| = \sum\limits_{k=1}^{n} C_kx_k + C_{n+1}$, where the arbitrary constants $C_1, \ldots, C_n$ are related by the one constraint $C_1C_2\ldots C_n = (a_1C_1 - 1)(a_2C_2 - 1)\ldots(a_nC_n - 1)$.

5. $a_1x_1^{k_1}w^{m_1}\left(\dfrac{\partial w}{\partial x_1}\right)^{\beta} + \cdots + a_nx_n^{k_n}w^{m_n}\left(\dfrac{\partial w}{\partial x_n}\right)^{\beta} = bw^{\gamma}.$

This is a special case of equation 4.6.2.7.

6. $a_1\left(\dfrac{\partial w}{\partial x_1}\right)^{m_1} + a_2\left(\dfrac{\partial w}{\partial x_2}\right)^{m_2} + \cdots + a_n\left(\dfrac{\partial w}{\partial x_n}\right)^{m_n} = w.$

Complete integral:

$$w = \sum_{k=1}^{n} b_k\big(x_k + C_k\big)^{\frac{m_k}{m_k-1}}, \qquad \text{where} \quad b_k = a_k^{\frac{1}{1-m_k}}\left(\frac{m_k}{m_k-1}\right)^{\frac{m_k}{1-m_k}}.$$

7. $w = \sum_{k=1}^{n} x_k \dfrac{\partial w}{\partial x_k} + a\left(\dfrac{\partial w}{\partial x_1}\right)^{m_1}\left(\dfrac{\partial w}{\partial x_2}\right)^{m_2}\cdots\left(\dfrac{\partial w}{\partial x_n}\right)^{m_n}.$

Complete integral:

$$w = \sum_{k=1}^{n} C_k x_k + aC_1^{m_1}C_2^{m_2}\ldots C_n^{m_n}.$$

▷ *Complete integrals of some other equations containing arbitrary parameters can be obtained by utilizing the results of Section 4.6, where equations containing arbitrary functions are discussed.*

4.6. Nonlinear Equations with Arbitrary Number of Variables Containing Arbitrary Functions

4.6.1. Equations Quadratic in Derivatives

1. $\dfrac{\partial w}{\partial x_1} + a_2\left(\dfrac{\partial w}{\partial x_2}\right)^2 + \cdots + a_n\left(\dfrac{\partial w}{\partial x_n}\right)^2 = f(x_1)w + g(x_1).$

Complete integral:

$$w = C_1F(x_1) + (C_2x_2 + \cdots + C_nx_n)F(x_1) + F(x_1)\int \frac{g(x_1) - bF^2(x_1)}{F(x_1)}\,dx_1,$$

where $F(x) = \exp\left[\int f(x)\,dx\right]$, $b = a_2C_2^2 + \cdots + a_nC_n^2$.

2. $\dfrac{\partial w}{\partial x_1} + a_2\left(\dfrac{\partial w}{\partial x_2}\right)^2 + \cdots + a_n\left(\dfrac{\partial w}{\partial x_n}\right)^2 = bw^2 + f(x_1)w + g(x_1).$

1°. For $b = 0$, see equation 4.6.1.1. Complete integral for $b \neq 0$:

$$w = \varphi(x_1) + C_1\psi(x_1)\exp(C_2x_2 + \cdots + C_nx_n).$$

The arbitrary constants $C_2, \ldots, C_n$ are related by the one constraint $a_2C_2^2 + \cdots + a_nC_n^2 = b$. The function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$\varphi'_x = b\varphi^2 + f(x)\varphi + g(x), \tag{1}$$

and the function $\psi = \psi(x)$ is expressed via $\varphi(x)$ as

$$\psi(x) = \exp\left\{\int \left[2b\varphi(x) + f(x)\right]dx\right\}. \tag{2}$$

Riccati's equation (1) can be integrated by quadrature for many f and g; for details, see the books Kamke (1976) and Polyanin and Zaitsev (2003). Consider two special cases.

2°. For $g(x) \equiv 0$ and arbitrary $f(x)$, equation (1) has the general solution

$$\varphi(x) = F(x)\left[C_{n+1} - b\int F(x)\,dx\right]^{-1}, \qquad F(x) = \exp\left[\int f(x)\,dx\right].$$

3°. For $f(x) = f = \text{const}$ and $g(x) = g = \text{const}$, equation (1) is separable. Integrating yields

$$\int \frac{d\varphi}{b\varphi^2 + f\varphi + g} = x + C_{n+1}.$$

3. $\dfrac{\partial w}{\partial x_1} + f_2(x_1)\left(\dfrac{\partial w}{\partial x_2}\right)^2 + \cdots + f_n(x_1)\left(\dfrac{\partial w}{\partial x_n}\right)^2 = aw.$

Complete integral:

$$w = C_1 e^{ax_1} + e^{ax_1}(C_2x_2 + \cdots + C_nx_n) - e^{ax_1}\int e^{ax_1}\left[C_2^2 f_2(x_1) + \cdots + C_n^2 f_n(x_1)\right] dx_1.$$

4. $\dfrac{\partial w}{\partial x_1} + f_2(x_1)\left(\dfrac{\partial w}{\partial x_2}\right)^2 + \cdots + f_n(x_1)\left(\dfrac{\partial w}{\partial x_n}\right)^2 = g(x_1)w.$

Complete integral:

$$w = \varphi(x_1)(C_1 + C_2x_2 + \cdots + C_nx_n) - \varphi(x_1)\int \varphi(x_1)\left[C_2^2 f_2(x_1) + \cdots + C_n^2 f_n(x_1)\right] dx_1,$$

where $\varphi(x_1) = \exp\left[\int g(x_1)\,dx_1\right]$.

5. $\dfrac{\partial w}{\partial x_1} + f_2(x_1)\left(\dfrac{\partial w}{\partial x_2}\right)^2 + \cdots + f_n(x_1)\left(\dfrac{\partial w}{\partial x_n}\right)^2 = g(x_1)w + h_2(x_1)x_2 + \cdots + h_n(x_1)x_n.$

Complete integral:

$$w = x_2\varphi_2(x_1) + \cdots + x_n\varphi_n(x_1) + \psi(x_1),$$

where the functions $\varphi_k(x_1)$ and $\psi(x_1)$ are given by

$$\varphi_k(x_1) = C_kG(x_1) + G(x_1)\int \frac{h_k(x_1)}{G(x_1)}\,dx_1, \quad G(x_1) = \exp\left[\int g(x_1)\,dx_1\right], \quad k = 2, \ldots, n;$$

$$\psi(x_1) = C_1G(x_1) - G(x_1)\int \left[f_2(x_1)\varphi_2^2(x_1) + \cdots + f_n(x_1)\varphi_n^2(x_1)\right]\frac{dx_1}{G(x_1)}.$$

6. $\dfrac{\partial w}{\partial x_1} + f_2(x_2)\left(\dfrac{\partial w}{\partial x_2}\right)^2 + \cdots + f_n(x_n)\left(\dfrac{\partial w}{\partial x_n}\right)^2 = g(x_1) + h_2(x_2) + \cdots + h_n(x_n).$

Equations of this form are often encountered in mechanics; the variable x_1 plays the role of time, and $x_2, \ldots, x_n$ are generalized coordinates.

Complete integral:

$$w = C_1 - (C_2 + \cdots + C_n)x_1 + \int g(x_1)\,dx_1 + \int \sqrt{\frac{C_2 + h_2(x_2)}{f_2(x_2)}}\,dx_2 + \cdots + \int \sqrt{\frac{C_n + h_n(x_n)}{f_n(x_n)}}\,dx_n.$$

7. $\dfrac{\partial w}{\partial x_1} + f_2(x_2)\left(\dfrac{\partial w}{\partial x_2}\right)^2 + \cdots + f_n(x_n)\left(\dfrac{\partial w}{\partial x_n}\right)^2 = bw^2 + g(x_1)w + h(x_1).$

The transformation $\xi_k = \displaystyle\int \frac{dx_k}{\sqrt{|f_k(x_k)|}}$ $(k = 2, \ldots, n)$ leads to an equation of the form 4.6.1.2.

8. $\dfrac{\partial w}{\partial x_1}+\sum\limits_{k=2}^{n}\Big[f_k(x_1)x_k+g_k(x_1)\Big]\left(\dfrac{\partial w}{\partial x_k}\right)^2=a(x_1)w+b(x_1)+\sum\limits_{k=2}^{n}h_k(x_1)x_k.$

Complete integral:

$$w=\sum_{k=2}^{n}\varphi_k(x_1)x_k+\psi(x_1),$$

where the functions $\varphi_k(x_1)$ and $\psi(x_1)$ are determined by the ordinary differential equations

$$\varphi_k'+f_k(x_1)\varphi_k^2=a(x_1)\varphi_k+h_k(x_1),\qquad k=2,\ldots,n; \tag{1}$$

$$\psi'+\sum_{k=2}^{n}g_k(x_1)\varphi_k^2=a(x_1)\psi+b(x_1), \tag{2}$$

where the prime denotes the derivative with respect to x_1. Riccati's equation (1) can be integrated by quadrature for many $f_k(x_1)$, $h_k(x_1)$, and $a(x_1)$, in particular, for $h_k(x_1)=0$; see the books Kamke (1976), Polyanin and Zaitsev (2003). Equation (2) is linear with respect to ψ and can be readily integrated (for known φ_k).

9. $\dfrac{\partial w}{\partial x_1}+\sum\limits_{k=2}^{n}\Big[f_k(x_1)x_k^{m_k}+g_k(x_1)x_k^{2m_k-2}\Big]\left(\dfrac{\partial w}{\partial x_k}\right)^2=a(x_1)w+b(x_1).$

1°. If all $m_k\neq 2$, then the transformation $\xi_k=x_k^{2-m_k}$ $(k=2,\ldots,n)$ leads to an equation of the form 4.6.1.8:

$$\frac{\partial w}{\partial x_1}+\sum_{k=2}^{n}(2-m_k)^2\big[f_k(x_1)\xi_k+g_k(x_1)\big]\left(\frac{\partial w}{\partial \xi_k}\right)^2=a(x_1)w+b(x_1).$$

2°. If there is an $m_l=2$, then we introduce the new variable $\xi_l=\ln|x_l|$ instead of x_l and transform the other variables just as in item 1°. As a result, we obtain an equation of the form 4.6.1.8.

10. $\dfrac{\partial w}{\partial x_1}+\sum\limits_{k,m=2}^{n}f_{km}(x_1)\dfrac{\partial w}{\partial x_k}\dfrac{\partial w}{\partial x_m}+\sum\limits_{k=2}^{n}\left[\sum\limits_{m=2}^{n}g_{km}(x_1)x_m+g_k(x_1)\right]\dfrac{\partial w}{\partial x_k}$

$$=\psi(x_1)w+\sum_{k,m=2}^{n}h_{km}(x_1)x_kx_m+\sum_{k=2}^{n}h_k(x_1)x_k+h_0(x_1).$$

A complete integral can be sought in the form

$$w=\sum_{k,m=2}^{n}\varphi_{km}(x_1)x_kx_m+\sum_{k=2}^{n}\varphi_k(x_1)x_k+\varphi_0(x_1).$$

Substituting this expression into the original partial differential equation yields a system of ordinary differential equations for $\varphi_{km}(x_1)$, $\varphi_k(x_1)$, and $\varphi_0(x_1)$. If all $g_k(x_1)\equiv 0$, $h_k(x_1)\equiv 0$, and $h_0(x_1)\equiv 0$, then one may set $\varphi_k(x_1)\equiv 0$ and $\varphi_0(x_1)\equiv 0$.

11. $$\frac{\partial w}{\partial x_1}+\frac{1}{\sum\limits_{k=2}^{n} f_k(x_k)}\sum_{k=2}^{n}\left[g_k(x_k)\left(\frac{\partial w}{\partial x_k}\right)^2-h_k(x_k)\right]=0.$$

Liouville's equation. Complete integral:

$$w=-C_1x_1+\sum_{k=2}^{n}\int\sqrt{\frac{C_1f_k(x_k)+h_k(x_k)+C_k}{g_k(x_k)}}\,dx_k+C_{n+1},$$

where the arbitrary constants $C_2,\dots,C_n$ are related by the one constraint $C_2+\cdots+C_n=0$.

Note that the equation in question governs the motion of a mechanical system with ideal holonomic constraints in the case where the kinetic energy T and the force function U have the form

$$T=\frac{1}{4}\left[\sum_{k=2}^{n}f_k(x_k)\right]\left[\sum_{k=2}^{n}\frac{1}{g_k(x_k)}(x_k')^2\right],\quad U=\sum_{k=2}^{n}h_k(x_k)\Big/\sum_{k=2}^{n}f_k(x_k).$$

Here x_1 is time and $x_2,\dots,x_n$ are generalized coordinates.

12. $$\frac{\partial w}{\partial x_1}+w^kf_2(x_1)\left(\frac{\partial w}{\partial x_2}\right)^2+\cdots+w^kf_n(x_1)\left(\frac{\partial w}{\partial x_n}\right)^2=g(x_1)w.$$

The substitution $u=\dfrac{1}{k+1}w^{k+1}$ leads to an equation of the form 4.6.1.4:

$$\frac{\partial u}{\partial x_1}+f_2(x_1)\left(\frac{\partial u}{\partial x_2}\right)^2+\cdots+f_n(x_1)\left(\frac{\partial u}{\partial x_n}\right)^2=(k+1)g(x_1)u.$$

13. $$\frac{\partial w}{\partial x_1}+w^kf_2(x_2)\left(\frac{\partial w}{\partial x_2}\right)^2+\cdots+w^kf_n(x_n)\left(\frac{\partial w}{\partial x_n}\right)^2=aw^{k+2}+g(x_1)w.$$

The substitution $u=\dfrac{1}{k+1}w^{k+1}$ leads to an equation of the form 4.6.1.7 with $h(x_1)\equiv 0$:

$$\frac{\partial u}{\partial x_1}+f_2(x_2)\left(\frac{\partial u}{\partial x_2}\right)^2+\cdots+f_n(x_n)\left(\frac{\partial u}{\partial x_n}\right)^2=a(k+1)^2u^2+(k+1)g(x_1)u.$$

14. $$\frac{\partial w}{\partial x_1}+f_2(x_2)g_2(w)\left(\frac{\partial w}{\partial x_2}\right)^2+\cdots+f_n(x_n)g_n(w)\left(\frac{\partial w}{\partial x_n}\right)^2=0.$$

Complete integral:

$$x_1+\int\left[C_2^2g_2(w)+\cdots+C_n^2g_n(w)\right]dw=C_1+C_2\int\frac{dx_2}{\sqrt{f_2(x_2)}}+\cdots+C_n\int\frac{dx_n}{\sqrt{f_n(x_n)}}.$$

It has been assumed in the products f_kg_k that the f_k are all nonnegative and the g_k can have any sign.

15. $\dfrac{\partial w}{\partial x_1} + f_2(x_2)g_2(w)\left(\dfrac{\partial w}{\partial x_2}\right)^2 + \cdots + f_n(x_n)g_n(w)\left(\dfrac{\partial w}{\partial x_n}\right)^2 = h(w).$

Complete integral:

$$x_1 + C_2\int \frac{dx_2}{\sqrt{f_2(x_2)}} + \cdots + C_n\int \frac{dx_n}{\sqrt{f_n(x_n)}} + \int \frac{2\varphi(w)\,dw}{1+\sqrt{1+4h(w)\varphi(w)}} = C_1,$$

where $\varphi(w) = C_2^2 g_2(w) + \cdots + C_n^2 g_n(w)$.

16. $f_1(x_1)\left(\dfrac{\partial w}{\partial x_1}\right)^2 + \cdots + f_n(x_n)\left(\dfrac{\partial w}{\partial x_n}\right)^2 = g_1(x_1) + \cdots + g_n(x_n).$

Complete integral:

$$w = \pm\int \left[\frac{g_1(x_1)+C_1}{f_1(x_1)}\right]^{1/2} dx_1 \pm \cdots \pm \int \left[\frac{g_n(x_n)+C_n}{f_n(x_n)}\right]^{1/2} dx_n + C_{n+1},$$

where the arbitrary constants $C_1, \ldots, C_n$ are related by the one constraint $C_1 + \cdots + C_n = 0$.

17. $f_1(x_1)\left(\dfrac{\partial w}{\partial x_1}\right)^2 + \cdots + f_n(x_n)\left(\dfrac{\partial w}{\partial x_n}\right)^2 = aw + g_1(x_1) + \cdots + g_n(x_n).$

Complete integral:

$$w = \varphi_1(x_1, C_1) + \cdots + \varphi_n(x_n, C_n).$$

The functions $\varphi_k = \varphi_k(x_k, C_k)$ are determined by the ordinary differential equations $f_k(x_k)(\varphi_k')^2 - a\varphi_k - g_k(x_k) = 0$. By the substitutions $\psi_k = \sqrt{a\varphi_k - g_k(x_k)}$, these equations can be reduced to Abel's equations of the second kind for ψ_k [integrable cases of these equations can be found in Polyanin and Zaitsev (2003) and Zaitsev and Polyanin (1994)].

18. $f_1(x_1)\left(\dfrac{\partial w}{\partial x_1}\right)^2 + \cdots + f_n(x_n)\left(\dfrac{\partial w}{\partial x_n}\right)^2 = \big[g_1(x_1) + \cdots + g_n(x_n)\big]h(w).$

The substitution $u = \displaystyle\int \frac{dw}{\sqrt{h(w)}}$ leads to an equation of the form 4.6.1.16:

$$f_1(x_1)\left(\frac{\partial u}{\partial x_1}\right)^2 + \cdots + f_n(x_n)\left(\frac{\partial u}{\partial x_n}\right)^2 = g_1(x_1) + \cdots + g_n(x_n).$$

19. $f_1(x_1)g_1(w)\left(\dfrac{\partial w}{\partial x_1}\right)^2 + \cdots + f_n(x_n)g_n(w)\left(\dfrac{\partial w}{\partial x_n}\right)^2 = h(w).$

Complete integral:

$$\int \left[\frac{C_1^2 g_1(w) + \cdots + C_n^2 g_n(w)}{h(w)}\right]^{1/2} dw = C_1\int \frac{dx_1}{[f_1(x_1)]^{1/2}} + \cdots + C_n\int \frac{dx_n}{[f_n(x_n)]^{1/2}} + C_{n+1}.$$

One of the constants $C_1, \ldots, C_n$ can be set equal to unity.

4.6.2. Equations with Power-Law Nonlinearity in Derivatives

1. $\dfrac{\partial w}{\partial x_1}\dfrac{\partial w}{\partial x_2}\dots\dfrac{\partial w}{\partial x_n} = f_1(x_1)f_2(x_2)\dots f_n(x_n).$

Complete integral:

$$w = C_1\int f_1(x_1)\,dx_1 + \dots + C_{n-1}\int f_{n-1}(x_{n-1})\,dx_{n-1} + \frac{1}{C_1C_2\dots C_{n-1}}\int f_n(x_n)\,dx_n + C_n.$$

2. $\dfrac{\partial w}{\partial x_1}\dfrac{\partial w}{\partial x_2}\dots\dfrac{\partial w}{\partial x_n} = f_1(x_1)f_2(x_2)\dots f_n(x_n)\varphi(w).$

Complete integral:

$$\int\frac{dw}{\varphi^{1/n}(w)} = C_1\int f_1(x_1)\,dx_1 + \dots + C_{n-1}\int f_{n-1}(x_{n-1})\,dx_{n-1} + \frac{1}{C_1\dots C_{n-1}}\int f_n(x_n)\,dx_n + C_n.$$

3. $f_n(x_n)\left(\dfrac{\partial w}{\partial x_1}\dots\dfrac{\partial w}{\partial x_{n-1}}\right) + \dots + f_k(x_k)\left(\dfrac{\partial w}{\partial x_1}\dots\dfrac{\partial w}{\partial x_{k-1}}\dfrac{\partial w}{\partial x_{k+1}}\dots\dfrac{\partial w}{\partial x_n}\right) + \dots + f_1(x_1)\left(\dfrac{\partial w}{\partial x_2}\dots\dfrac{\partial w}{\partial x_n}\right) = 0.$

The large parentheses contain products of $n-1$ different partial derivatives. Complete integral:

$$w = \sum_{k=1}^{n} C_k\int f_k(x_k)\,dx_k + C_{n+1},$$

where the arbitrary constants $C_1,\dots,C_n$ are related by the one constraint

$$C_1\dots C_{n-1} + \dots + C_1\dots C_{k-1}C_{k+1}\dots C_n + \dots + C_2\dots C_n = 0.$$

4. $\left(\dfrac{\partial w}{\partial x_1}\right)^{k_1}\left(\dfrac{\partial w}{\partial x_2}\right)^{k_2}\dots\left(\dfrac{\partial w}{\partial x_n}\right)^{k_n} = f_1(x_1)f_2(x_2)\dots f_n(x_n)\varphi(w).$

Complete integral:

$$\int\big[\varphi(w)\big]^{-\frac{1}{k_1+\dots+k_n}}\,dw = C_1\int\big[f_1(x_1)\big]^{\frac{1}{k_1}}\,dx_1 + \dots + C_n\int\big[f_n(x_n)\big]^{\frac{1}{k_n}}\,dx_n + C_{n+1},$$

where $C_1^{k_1}\dots C_n^{k_n} = 1$.

5. $f_1(x_1)\left(\dfrac{\partial w}{\partial x_1}\right)^{k_1} + \dots + f_n(x_n)\left(\dfrac{\partial w}{\partial x_n}\right)^{k_n} = w.$

Complete integral:

$$w = \varphi_1(x_1) + \dots + \varphi_n(x_n), \quad \text{where} \quad \varphi_m(x_m) = \left[\frac{k_m-1}{k_m}\int f_m^{-\frac{1}{k_m}}(x_m)\,dx_m + C_m\right]^{\frac{k_m}{k_m-1}}.$$

6. $f_1(x_1)\left(\dfrac{\partial w}{\partial x_1}\right)^{k_1} + \cdots + f_n(x_n)\left(\dfrac{\partial w}{\partial x_n}\right)^{k_n} = g_1(x_1) + \cdots + g_n(x_n).$

Complete integral:

$$w = \int \left[\frac{g_1(x_1) + C_1}{f(x_1)}\right]^{1/k_1} dx_1 + \cdots + \int \left[\frac{g_n(x_n) + C_n}{f(x_n)}\right]^{1/k_n} dx_n + C_{n+1},$$

where the arbitrary constants $C_1, \ldots, C_n$ are related by the one constraint $C_1 + \cdots + C_n = 0$.

7. $f_1(x_1)g_1(w)\left(\dfrac{\partial w}{\partial x_1}\right)^{k} + \cdots + f_n(x_n)g_n(w)\left(\dfrac{\partial w}{\partial x_n}\right)^{k} = h(w).$

Complete integral:

$$\int \left[\frac{C_1^k g_1(w) + \cdots + C_n^k g_n(w)}{h(w)}\right]^{1/k} dw = C_1 \int \frac{dx_1}{[f_1(x_1)]^{1/k}} + \cdots + C_n \int \frac{dx_n}{[f_n(x_n)]^{1/k}} + C_{n+1}.$$

One of the constants $C_1, \ldots, C_n$ can be set equal to unity.

8. $\dfrac{\partial w}{\partial x_1} + f_2(x_2)g_2(w)\left(\dfrac{\partial w}{\partial x_2}\right)^{k} + \cdots + f_n(x_n)g_n(w)\left(\dfrac{\partial w}{\partial x_n}\right)^{k} = 0.$

Complete integral:

$$x_1 + C_1 + \int \left[C_2^k g_2(w) + \cdots + C_n^k g_n(w)\right]^{\frac{1}{k-1}} dw = C_2 \int \frac{dx_2}{[f_2(x_2)]^{1/k}} + \cdots + C_n \int \frac{dx_n}{[f_n(x_n)]^{1/k}}.$$

9. $\dfrac{\partial w}{\partial x_1} + \dfrac{1}{\sum\limits_{k=2}^{n} f_k(x_k)} \sum_{k=2}^{n} \left[g_k(x_k)\left(\dfrac{\partial w}{\partial x_k}\right)^{m_k} - h_k(x_k)\right] = 0.$

Complete integral:

$$w = -C_1 x_1 + \sum_{k=2}^{n} \int \left[\frac{C_1 f_k(x_k) + h_k(x_k) + C_k}{g_k(x_k)}\right]^{1/m_k} dx_k + C_{n+1},$$

where the arbitrary constants $C_2, \ldots, C_n$ are related by the one constraint $C_2 + \cdots + C_n = 0$.

4.6.3. Equations Contain Arbitrary Functions of Two Variables

1. $f_1\left(x_1, \dfrac{\partial w}{\partial x_1}\right) + f_2\left(x_2, \dfrac{\partial w}{\partial x_2}\right) + \ldots + f_n\left(x_n, \dfrac{\partial w}{\partial x_n}\right) = 0.$

Complete integral:

$w = \varphi_1(x_1, C_1) + \varphi_2(x_2, C_2) + \cdots + \varphi_n(x_n, C_n) + C_{n+1}$, where $C_n = -C_1 - \cdots - C_{n-1}$.

The functions $\varphi_k = \varphi_k(x_k, C_k)$ are determined by the ordinary differential equations

$$f_k\left(x_k, \frac{d\varphi_k}{dx_k}\right) = C_k \qquad (k = 1, \ldots, n).$$

Solving these equations for the derivatives, one obtains linear separable equations, which are easy to integrate.

⊙ Reference: E. Kamke (1965).

2. $f_1\left(x_1, \dfrac{\partial w}{\partial x_1}\right) f_2\left(x_2, \dfrac{\partial w}{\partial x_2}\right) \ldots f_n\left(x_n, \dfrac{\partial w}{\partial x_n}\right) = a, \qquad a \neq 0.$

Complete integral:

$$w = \varphi_1(x_1, C_1) + \varphi_2(x_2, C_2) + \cdots + \varphi_n(x_n, C_n) + C_{n+1}, \quad \text{where} \quad C_n = \frac{a}{C_1 C_2 \ldots C_{n-1}}.$$

The functions $\varphi_k = \varphi_k(x_k, C_k)$ are determined by the ordinary differential equations

$$f_k\left(x_k, \frac{d\varphi_k}{dx_k}\right) = C_k \qquad (k = 1, \ldots, n).$$

Solving these equations for the derivatives, one obtains linear separable equations, which are easy to integrate.

⊙ Reference: E. Kamke (1965).

3. $f_1\left(\dfrac{\partial w}{\partial x_1} + a_1 y_1, \dfrac{\partial w}{\partial y_1} + a_1 x_1\right) + \ldots + f_n\left(\dfrac{\partial w}{\partial x_n} + a_n y_n, \dfrac{\partial w}{\partial y_n} + a_n x_n\right) = 0.$

Complete integral:

$$w = -a_1 x_1 y_1 - \cdots - a_n x_n y_n + A_1 x_1 + \cdots + A_n x_n + B_1 y_1 + \cdots + B_n y_n,$$

where the arbitrary constants A_k and B_m are related by the one constraint

$$f_1(A_1, B_1) + \cdots + f_n(A_n, B_n) = 0.$$

4. $f_1\left(\dfrac{\partial w}{\partial x_1} + a_1 y_1, \dfrac{\partial w}{\partial y_1} + a_1 x_1\right) \ldots f_n\left(\dfrac{\partial w}{\partial x_n} + a_n y_n, \dfrac{\partial w}{\partial y_n} + a_n x_n\right) = b.$

The left-hand side of the equation consists of the product of n functions with complicated arguments. Complete integral:

$$w = -a_1 x_1 y_1 - \cdots - a_n x_n y_n + A_1 x_1 + \cdots + A_n x_n + B_1 y_1 + \cdots + B_n y_n,$$

where the arbitrary constants A_k and B_m are related by the one constraint

$$f_1(A_1, B_1) \ldots f_n(A_n, B_n) = b.$$

4.6.4. Nonlinear Equations of General Form

1. $\dfrac{\partial w}{\partial x_1} + F\left(x_1, \dfrac{\partial w}{\partial x_2}, \ldots, \dfrac{\partial w}{\partial x_n}\right) = 0.$

where the function $\varphi = \varphi(z)$ is determined by the ordinary differential equation

$$F\big(z, a_1\varphi'_z + C_1, \ldots, a_n\varphi'_z + C_n\big) = 0.$$

One of the constants $C_1, \ldots, C_n$ can be set equal to unity.

10. $F\left(\dfrac{\partial w}{\partial x_1}, \ldots, \dfrac{\partial w}{\partial x_n}\right) + x_1\dfrac{\partial w}{\partial x_1} + \cdots + x_n\dfrac{\partial w}{\partial x_n} = 0.$

Complete integral:

$$w = \varphi(z) + C_{n+1}, \qquad z = C_1x_1 + \cdots + C_nx_n,$$

where the function $\varphi = \varphi(z)$ is determined by the ordinary differential equation

$$F(C_1\varphi'_z, \ldots, C_n\varphi'_z) + z\varphi'_z = 0.$$

One of the constants $C_1, \ldots, C_n$ can be set equal to ± 1.

11. $F\left(\dfrac{\partial w}{\partial x_1}, \ldots, \dfrac{\partial w}{\partial x_n}\right) + x_{k+1}\dfrac{\partial w}{\partial x_{k+1}} + \cdots + x_n\dfrac{\partial w}{\partial x_n} = 0.$

Complete integral:

$$w = C_1x_1 + \ldots + C_kx_k + \varphi(z) + C_{n+1}, \qquad z = C_{k+1}x_{k+1} + \cdots + C_nx_n,$$

where the function $\varphi = \varphi(z)$ is determined by the ordinary differential equation

$$F(C_1, \ldots, C_k, C_{k+1}\varphi'_z, \ldots, C_n\varphi'_z) + z\varphi'_z = 0.$$

One of the constants $C_{k+1}, \ldots, C_n$ can be set equal to ± 1.

12. $\boldsymbol{F\left(\dfrac{\partial w}{\partial x_1}, \ldots, \dfrac{\partial w}{\partial x_n}\right) + x_1\dfrac{\partial w}{\partial x_1} + \cdots + x_n\dfrac{\partial w}{\partial x_n} = w.}$

Clairaut's equation. Complete integral: $w = C_1x_1 + \cdots + C_nx_n + F\left(C_1, \ldots, C_n\right)$.

⊙ References: E. Kamke (1965), A. M. Vinogradov and I. S. Krasilshchik (1997).

13. $\boldsymbol{F\left(x_1, \dfrac{\partial w}{\partial x_1}, \ldots, \dfrac{\partial w}{\partial x_n}\right) + x_2\dfrac{\partial w}{\partial x_2} + \cdots + x_n\dfrac{\partial w}{\partial x_n} = w.}$

Complete integral: $w = C_2x_2 + \cdots + C_nx_n + \varphi(x_1)$. The function $\varphi(x_1) = \varphi(x_1, C_1, \ldots, C_n)$ is determined by the ordinary differential equation $F\left(x_1, \varphi', C_2, \ldots, C_n\right) = \varphi$.

14. $\boldsymbol{F\left(a_1x_1 + \cdots + a_nx_n, \dfrac{\partial w}{\partial x_1}, \ldots, \dfrac{\partial w}{\partial x_n}\right) + x_1\dfrac{\partial w}{\partial x_1} + \cdots + x_n\dfrac{\partial w}{\partial x_n} = w.}$

Complete integral:

$$w = C_1x_1 + \cdots + C_nx_n + \varphi(z), \qquad z = a_1x_1 + \cdots + a_nx_n,$$

where the function $\varphi = \varphi(z)$ is determined by the ordinary differential equation

$$F\left(z, a_1\varphi'_z + C_1, \ldots, a_n\varphi'_z + C_n\right) + z\varphi'_z = \varphi.$$

15. $\boldsymbol{F\left(w, \dfrac{\partial w}{\partial x_1}, \ldots, \dfrac{\partial w}{\partial x_n}\right) = 0.}$

Complete integral:

$$w = \varphi(z), \quad z = C_1x_1 + \cdots + C_nx_n,$$

where the function $\varphi(z)$ is determined by the first-order autonomous ordinary differential equation

$$F\left(\varphi, C_1\varphi'_z, \ldots, C_n\varphi'_z\right) = 0.$$

⊙ Reference: E. Kamke (1965).

16. $\boldsymbol{F\left(w, \dfrac{\partial w}{\partial x_1}, \ldots, \dfrac{\partial w}{\partial x_n}\right) = G\left(x_1\dfrac{\partial w}{\partial x_1} + x_2\dfrac{\partial w}{\partial x_2} + \cdots + x_n\dfrac{\partial w}{\partial x_n}\right).}$

1°. Complete integral:

$$w = \varphi(z), \qquad z = C_1x_1 + \cdots + C_nx_n,$$

where the function $\varphi(z)$ is determined by the first-order ordinary differential equation

$$F\left(\varphi, C_1\varphi'_z, \ldots, C_n\varphi'_z\right) = G\left(z\varphi'_z\right).$$

2°. If the left-hand side of the equation does not explicitly depend on w and is a homogeneous function of degree k in the derivatives, i.e., $F(\lambda p_1, \ldots, \lambda p_n) = \lambda^k F(p_1, \ldots, p_n)$, and the function G is linear, $G(\xi) = a\xi$, then a complete integral of the original equation is given by [Kamke (1965)]:

$$w = \frac{k-1}{k}\left[\frac{a}{F(C_1, \ldots, C_n)}\left(\sum_{m=1}^{n} C_mx_m\right)^k\right]^{\frac{1}{k-1}} + C_{n+1}.$$

One of the constants $C_1, \ldots, C_n$ can be set equal to unity.

17. $\boldsymbol{F\left(a_1x_1+\cdots+a_nx_n+bw,\ \dfrac{\partial w}{\partial x_1},\ \ldots,\ \dfrac{\partial w}{\partial x_n}\right)=0.}$

For $b = 0$, see equation 4.6.4.14. For $b \neq 0$, the substitution $bu = a_1x_1 + \cdots + a_nx_n + bw$ leads to an equation of the form 4.6.4.15: $F\left(bu,\ \dfrac{\partial u}{\partial x_1}-\dfrac{a_1}{b},\ \ldots,\ \dfrac{\partial u}{\partial x_n}-\dfrac{a_n}{b}\right)=0.$

18. $\boldsymbol{F\big(\varphi_1(x_1,p_1),\ \varphi_2(x_2,p_2),\ \ldots,\ \varphi_n(x_n,p_n)\big)=0,\qquad p_k=\dfrac{\partial w}{\partial x_k}.}$

Here F is a composite function of the n functions $\varphi_1, \ldots, \varphi_n$ each of which depends on only one pair of Hamiltonian variables x_k, p_k ($k = 1, \ldots, n$).

Complete integral:

$$w = w_1(x_1, C_1) + w_2(x_2, C_2) + \cdots + w_n(x_n, C_n) + C_{n+1}.$$

The arbitrary constants $C_1, \ldots, C_n$ are linked by the one constraint $F(C_1, \ldots, C_n) = 0$ and the functions $w_k = w_k(x_k, C_k)$ are determined by the ordinary differential equations

$$\varphi_k\left(x_k,\ \frac{dw_k}{dx_k}\right)=C_k;\qquad k=1,\ 2,\ \ldots,\ n.$$

Solving these equations for the derivatives, one obtains linear separable equations, which are easy to integrate.

⊙ References: E. Kamke (1965), A. P. Markeev (1990).

19. $\boldsymbol{F\big(\varphi_1(x_1,\psi p_1),\ \varphi_2(x_2,\psi p_2),\ \ldots,\ \varphi_n(x_n,\psi p_n)\big)=0,}$

$$\boldsymbol{\psi=\psi(w),\quad p_1=\frac{\partial w}{\partial x_1},\ \ \ldots,\ \ p_n=\frac{\partial w}{\partial x_n}.}$$

The substitution $u = \int \psi(w)\,dw$ leads to an equation of the form 4.6.4.18:

$$F\big(\varphi_1(x_1,q_1),\varphi_2(x_2,q_2),\ldots,\varphi_n(x_n,q_n)\big)=0,\qquad \text{where}\quad q_k=\frac{\partial u}{\partial x_k}.$$

⊙ Reference: E. Kamke (1965).

20. $\boldsymbol{F_1(x_1,\ldots,x_k,p_1,\ldots,p_k)+F_2(x_{k+1},\ldots,x_n,p_{k+1},\ldots,p_n)=aw.}$

A complete integral can be represented as the sum of two functions,

$$w = w_1(x_1, \ldots, x_k) + w_2(x_{k+1}, \ldots, x_n),$$

which are determined by solving the two simpler equations

$$\begin{aligned} F_1(x_1,\ldots,x_k,q_1,\ldots,q_k)-aw_1&=C_1,\\ F_2(x_{k+1},\ldots,x_n,q_{k+1},\ldots,q_n)-aw_2&=-C_1,\end{aligned}\qquad q_m=\begin{cases}\dfrac{\partial w_1}{\partial x_m} & \text{for } m=1,\ldots,k,\\[2mm] \dfrac{\partial w_2}{\partial x_m} & \text{for } m=k+1,\ldots,n,\end{cases}$$

where C_1 is an arbitrary constant.

21. $\boldsymbol{F_1(x_1, \ldots, x_k, p_1, \ldots, p_k) + e^{\lambda w} F_2(x_{k+1}, \ldots, x_n, p_{k+1}, \ldots, p_n) = 0.}$

A complete integral can be represented as the sum of two functions,

$$w = w_1(x_1, \ldots, x_k) + w_2(x_{k+1}, \ldots, x_n),$$

which are determined by solving the two simpler equations

$$\begin{aligned} e^{-\lambda w_1} F_1(x_1, \ldots, x_k, q_1, \ldots, q_k) &= C_1, \\ e^{\lambda w_2} F_2(x_{k+1}, \ldots, x_n, q_{k+1}, \ldots, q_n) &= -C_1, \end{aligned} \qquad q_m = \begin{cases} \dfrac{\partial w_1}{\partial x_m} & \text{for } m = 1, \ldots, k, \\ \dfrac{\partial w_2}{\partial x_m} & \text{for } m = k+1, \ldots, n, \end{cases}$$

where C_1 is an arbitrary constant.

22. $\boldsymbol{F_n\big(\ldots F_3(F_2(F_1(x_1, p_1), x_2, p_2), x_3, p_3), \ldots, x_n, p_n\big) = 0,} \qquad \boldsymbol{p_k = \dfrac{\partial w}{\partial x_k}.}$

Complete integral:

$$w = w_1(x_1, C_1) + w_2(x_2, C_2, C_1) + \cdots + w_{n-1}(x_{n-1}, C_{n-1}, C_{n-2}) + w_n(x_n, C_{n-1}) + C_n.$$

The functions w_k are determined by the ordinary differential equations

$$\begin{aligned} F_1(x_1, w_1') &= C_1, \\ F_k(C_{k-1}, x_k, w_k') &= C_k, \quad k = 2, \ldots, n-1, \\ F_n(C_{n-1}, x_n, w_n') &= 0, \end{aligned}$$

where w_k' stands for the derivative of w_k with respect to x_k. Solving these equations for the derivatives, one obtains linear separable equations, which are easy to integrate.

Chapter 5
Second-Order Parabolic Equations with One Space Variable

5.1. Equations with Power-Law Nonlinearities

5.1.1. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bw + cw^2$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} - bw^2.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1^2 w(C_1 x + C_2, C_1^2 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Solutions:

$$w = \frac{a}{b}\frac{12(4-\sqrt{6})x^2 + 12(4-\sqrt{6})C_1 x + 120(12-5\sqrt{6})at + 12(2-\sqrt{6})C_2 + 6C_1^2}{\left[x^2 + C_1 x + 10(3-\sqrt{6})at + C_2\right]^2},$$

$$w = \frac{a}{b}\frac{12(4+\sqrt{6})x^2 + 12(4+\sqrt{6})C_1 x + 120(12+5\sqrt{6})at + 12(2+\sqrt{6})C_2 + 6C_1^2}{\left[x^2 + C_1 x + 10(3+\sqrt{6})at + C_2\right]^2},$$

where C_1 and C_2 are arbitrary constants.

3°. Traveling-wave solution (λ is an arbitrary constant):

$$w = w(z), \qquad z = x + \lambda t,$$

where the function $w(z)$ is determined by the autonomous ordinary differential equation

$$aw''_{zz} - \lambda w'_z - bw^2 = 0.$$

4°. Self-similar solution:

$$w = t^{-1}u(\xi), \qquad \xi = xt^{-1/2},$$

where the function $u(\xi)$ is determined by the ordinary differential equation

$$au''_{\xi\xi} + \tfrac{1}{2}\xi u'_\xi + u - bu^2 = 0$$

⊙ *References for equation* 5.1.1.1: T. Barannyk (2002), A. D. Polyanin and V. F. Zaitsev (2004, p. 1).

2. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + aw(1-w).$

Fisher equation. This equation arises in heat and mass transfer, combustion theory, biology, and ecology. For example, it describes the mass transfer in a two-component medium at rest with a volume chemical reaction of quasi-first order. The kinetic function $f(w) = aw(1-w)$ models also an autocatalytic chain reaction in combustion theory.

This is a special case of equation 5.1.3.2 with $m = 2$.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the functions

$$w_1 = w(\pm x + C_1, t + C_2),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Traveling-wave solutions (C is an arbitrary constant):

$$w(x,t) = \big[1 + C\exp\big(-\tfrac{5}{6}at \pm \tfrac{1}{6}\sqrt{6a}\,x\big)\big]^{-2},$$
$$w(x,t) = \big[-1 + C\exp\big(-\tfrac{5}{6}at \pm \tfrac{1}{6}\sqrt{6a}\,x\big)\big]^{-2},$$
$$w(x,t) = \frac{1 + 2C\exp\big(-\tfrac{5}{6}at \pm \tfrac{1}{6}\sqrt{-6a}\,x\big)}{\big[1 + C\exp\big(-\tfrac{5}{6}at \pm \tfrac{1}{6}\sqrt{-6a}\,x\big)\big]^2}.$$

3°. Traveling-wave solutions:

$$w(x,t) = \pm\xi^2\varphi(\xi), \qquad \xi = C_1\exp\big(\tfrac{1}{6}\sqrt{6a}\,x + \tfrac{5}{6}at\big),$$

where the function $\varphi(\xi)$ is defined implicitly by

$$\xi = \int \frac{d\varphi}{\sqrt{\pm(4\varphi^3 - 1)}} - C_2,$$

and C_1 and C_2 are arbitrary constants. For the upper sign, the inversion of this relation corresponds to the classical Weierstrass elliptic function, $\varphi(\xi) = \wp(\xi + C_3,\, 0,\, 1)$.

4°. The substitution $U = 1 - w$ leads to an equation of the similar form

$$\frac{\partial U}{\partial t} = \frac{\partial^2 U}{\partial x^2} - aU(1-U).$$

⊙ *References for equation* 5.1.1.2: R. A. Fisher (1937), M. J. Ablowitz and A. Zeppetella (1979), V. G. Danilov, V. P. Maslov, and K. A. Volosov (1995).

5.1.2. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b_0 + b_1 w + b_2 w^2 + b_3 w^3$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} - bw^3.$

This is a special case of equation 5.1.2.5 with $b_0 = b_1 = b_2 = 0$.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1 w(\pm C_1 x + C_2, C_1^2 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Solutions:

$$w(x,t) = \pm\sqrt{\frac{2a}{b}}\,\frac{2C_1x + C_2}{C_1x^2 + C_2x + 6aC_1t + C_3}.$$

3°. Traveling-wave solution (λ is an arbitrary constant):

$$w = w(z), \qquad z = x + \lambda t,$$

where the function $w(z)$ is determined by the autonomous ordinary differential equation

$$aw''_{zz} - \lambda w'_z - bw^3 = 0.$$

4°. Self-similar solution:

$$w = t^{-1/2}u(\xi), \qquad \xi = xt^{-1/2},$$

where the function $u(\xi)$ is determined by the ordinary differential equation

$$au''_{\xi\xi} + \tfrac{1}{2}\xi u'_\xi + \tfrac{1}{2}u - bu^3 = 0.$$

5°. Solution:

$$w = xU(\zeta), \qquad \zeta = t + \frac{1}{6a}x^2,$$

where the function $U(\zeta)$ is determined by the ordinary differential equation $U''_{\zeta\zeta} - 9abU^3 = 0$.

⊙ *References for equation* 5.1.2.1: P. A. Clarkson and E. L. Mansfield (1994), T. A. Barannyk and A. G. Nikitin (2004), G. Cicogna (2004).

2. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + aw - bw^3$.

This is a special case of equation 5.1.2.5 with $b_0 = b_2 = 0$.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the functions

$$w_1 = \pm w(\pm x + C_1, t + C_2),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation (the signs are chosen arbitrarily).

2°. Solutions with $a > 0$ and $b > 0$:

$$w = \sqrt{\frac{a}{b}}\,\frac{C_1\exp\left(\frac{1}{2}\sqrt{2a}\,x\right) - C_2\exp\left(-\frac{1}{2}\sqrt{2a}\,x\right)}{C_1\exp\left(\frac{1}{2}\sqrt{2a}\,x\right) + C_2\exp\left(-\frac{1}{2}\sqrt{2a}\,x\right) + C_3\exp\left(-\frac{3}{2}at\right)},$$

$$w = \sqrt{\frac{a}{b}}\left[\frac{2C_1\exp\left(\sqrt{2a}\,x\right) + C_2\exp\left(\frac{1}{2}\sqrt{2a}\,x - \frac{3}{2}at\right)}{C_1\exp\left(\sqrt{2a}\,x\right) + C_2\exp\left(\frac{1}{2}\sqrt{2a}\,x - \frac{3}{2}at\right) + C_3} - 1\right],$$

where C_1, C_2, and C_3 are arbitrary constants.

3°. Solution with $a < 0$ and $b > 0$:

$$w = \sqrt{\frac{|a|}{b}}\,\frac{\sin\left(\frac{1}{2}\sqrt{2|a|}\,x + C_1\right)}{\cos\left(\frac{1}{2}\sqrt{2|a|}\,x + C_1\right) + C_2\exp\left(-\frac{3}{2}at\right)},$$

where C_1 and C_2 are arbitrary constants.

4°. Solution with $a > 0$ (generalizes the first solution of Item 2°):

$$w = \big[C_1 \exp\big(\tfrac{1}{2}\sqrt{2a}\,x + \tfrac{3}{2}at\big) - C_2 \exp\big(-\tfrac{1}{2}\sqrt{2a}\,x + \tfrac{3}{2}at\big)\big]U(z),$$
$$z = C_1 \exp\big(\tfrac{1}{2}\sqrt{2a}\,x + \tfrac{3}{2}at\big) + C_2 \exp\big(-\tfrac{1}{2}\sqrt{2a}\,x + \tfrac{3}{2}at\big) + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants, and the function $U = U(z)$ is determined by the autonomous ordinary differential equation $aU''_{zz} = 2bU^3$ (whose solution can be written out in implicit form).

5°. Solution with $a < 0$ (generalizes the solution of Item 3°):

$$w = \exp\big(\tfrac{3}{2}at\big)\sin\big(\tfrac{1}{2}\sqrt{2|a|}\,x + C_1\big)V(\xi),$$
$$\xi = \exp\big(\tfrac{3}{2}at\big)\cos\big(\tfrac{1}{2}\sqrt{2|a|}\,x + C_1\big) + C_2,$$

where C_1 and C_2 are arbitrary constants, and the function $V = V(\xi)$ is determined by the autonomous ordinary differential equation $aV''_{\xi\xi} = -2bV^3$ (whose solution can be written out in implicit form).

6°. See also equation 5.1.3.2 with $m = 3$.

⊙ *References for equation* 5.1.2.2: F. Cariello and M. Tabor (1989), M. C. Nucci and P. A. Clarkson (1992), A. D. Polyanin and V. F. Zaitsev (2004, p. 3).

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} - bw^3 - cw^2.$

This is a special case of equation 5.1.2.5 with $b_1 = b_0 = 0$.

1°. Traveling-wave solutions:

$$w(x,t) = \left(ct \pm \sqrt{\frac{b}{2a}}\,x + C\right)^{-1},$$

where C is an arbitrary constant.

2°. Solutions:

$$w(x,t) = k\sqrt{\frac{2a}{b}}\,\frac{1}{F}\,\frac{\partial F}{\partial x},$$

where

$$F = C_1\left(x + kc\sqrt{\frac{2a}{b}}\,t\right) + C_2\exp\left(-\frac{kc}{\sqrt{2ab}}x + \frac{c^2}{2b}t\right) + C_3, \qquad k = \pm 1,$$

and C_1, C_2, and C_3 are arbitrary constants.

3°. Solutions:

$$w(x,t) = k\sqrt{\frac{2a}{b}}\,\frac{1}{F}\,\frac{\partial F}{\partial x} - \frac{c}{b},$$

where

$$F = C_1\exp\left(\frac{kc}{\sqrt{2ab}}x - \frac{c^2}{2b}t\right) + C_2\left(\frac{kc}{\sqrt{2ab}}x + \frac{c^2}{b}t\right)\exp\left(\frac{kc}{\sqrt{2ab}}x - \frac{c^2}{2b}t\right) + C_3, \qquad k = \pm 1.$$

4°. The transformation

$$t = \frac{b}{c^2}\tau, \quad x = \frac{\sqrt{2ab}}{c}z, \quad w = -\frac{c}{b}u$$

leads to the equation

$$\frac{\partial u}{\partial \tau} = \frac{1}{2}\frac{\partial^2 u}{\partial z^2} + u^2(1-u). \tag{1}$$

The *Volosov's solution* of Eq. (1) in implicit form:

$$z = F(u, \tau),$$

where the function $F = F(u, \tau)$ is determined by the system of first-order partial differential equations

$$\frac{\partial F}{\partial \tau} = \frac{1}{2} + \frac{3uR}{2(u^2 - u - R)}, \qquad \frac{\partial F}{\partial u} = \frac{1}{u^2 - u - R}, \tag{2}$$

where the function $R = R(u, \tau)$ is determined by the implicit formula

$$\frac{1-u}{R} + \ln\frac{u+R}{R} = \frac{3}{2}\tau. \tag{3}$$

Relation (3) is the consistency condition for system (2).

Remark. For overdetermined systems of two equations of the form (2) and their consistency condition, see Section 38.1.

⊙ *References for equation* 5.1.2.3: A. D. Polyanin and V. F. Zaitsev (2004, pp. 3–4), K. A. Volosov (2007, http://eqworld.ipmnet.ru/eqarchive/view.php?id=56).

4. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} - w(1-w)(a-w)$.

FitzHugh–Nagumo equation. This equation arises in population genetics and models the transmission of nerve impulses.

1°. There are three stationary solutions: $w = w_k$, where $w_1 = 0$, $w_2 = 1$, and $w_3 = a$. The linear stability analysis shows that

if $-1 \le a < 0$: the solutions $w = a$, $w = 1$ are stable, $w = 0$ is unstable;
if $0 < a < 1$: the solutions $w = 0$, $w = 1$ are stable, $w = a$ is unstable.

There is a stationary nonhomogeneous solution that can be represented in implicit form (A and B are arbitrary constants):

$$\int \frac{dw}{\sqrt{\frac{1}{4}w^4 - \frac{1}{3}(a+1)w^3 + \frac{1}{2}aw^2 + A}} = \pm x + B.$$

2°. Traveling-wave solutions (A is an arbitrary constant):

$$w(x,t) = \frac{1}{1 + A\exp\left[\pm\frac{1}{2}\sqrt{2}\,x + \frac{1}{2}(2a-1)t\right]},$$

$$w(x,t)=\frac{a}{1+A\exp\left[\pm\frac{1}{2}\sqrt{2}\,a\,x+\frac{1}{2}a(2-a)t\right]},$$

$$w(x,t)=\frac{A\exp\left[\pm\frac{1}{2}\sqrt{2}\,(1-a)x+\frac{1}{2}(1-a^2)t\right]+a}{A\exp\left[\pm\frac{1}{2}\sqrt{2}\,(1-a)x+\frac{1}{2}(1-a^2)t\right]+1},$$

$$w(x,t)=\tfrac{1}{2}+\tfrac{1}{2}\tanh\left[\pm\tfrac{1}{4}\sqrt{2}\,x+\tfrac{1}{4}(1-2a)t+A\right],$$

$$w(x,t)=\tfrac{1}{2}a+\tfrac{1}{2}a\tanh\left[\pm\tfrac{1}{4}\sqrt{2}\,ax+\tfrac{1}{4}a(a-2)t+A\right],$$

$$w(x,t)=\tfrac{1}{2}(1+a)+\tfrac{1}{2}(1-a)\tanh\left[\pm\tfrac{1}{4}\sqrt{2}\,(1-a)x+\tfrac{1}{4}(1-a^2)t+A\right],$$

$$w(x,t)=\frac{2a}{(1+a)-(1-a)\tanh\left[\pm\frac{1}{4}\sqrt{2}\,(1-a)x+\frac{1}{4}(1-a^2)t+A\right]},$$

$$w(x,t)=\tfrac{1}{2}+\tfrac{1}{2}\coth\left[\pm\tfrac{1}{4}\sqrt{2}\,x+\tfrac{1}{4}(1-2a)t+A\right],$$

$$w(x,t)=\tfrac{1}{2}a+\tfrac{1}{2}a\coth\left[\pm\tfrac{1}{4}\sqrt{2}\,ax+\tfrac{1}{4}a(a-2)t+A\right],$$

$$w(x,t)=\tfrac{1}{2}(1+a)+\tfrac{1}{2}(1-a)\coth\left[\pm\tfrac{1}{4}\sqrt{2}\,(1-a)x+\tfrac{1}{4}(1-a^2)t+A\right],$$

$$w(x,t)=\frac{2a}{(1+a)-(1-a)\coth\left[\pm\frac{1}{4}\sqrt{2}\,(1-a)x+\frac{1}{4}(1-a^2)t+A\right]}.$$

3°. "Two-phase" solution:

$$w(x,t)=\frac{A\exp(z_1)+aB\exp(z_2)}{A\exp(z_1)+B\exp(z_2)+C},$$

$$z_1=\pm\tfrac{\sqrt{2}}{2}\,x+\left(\tfrac{1}{2}-a\right)t,\quad z_2=\pm\tfrac{\sqrt{2}}{2}\,ax+a\left(\tfrac{1}{2}a-1\right)t,$$

where A, B, and C are arbitrary constants.

4°. The solutions of Item 2° are special cases of the traveling-wave solution

$$w(x,t)=w(\xi),\qquad \xi=x+\lambda t,$$

where λ is an arbitrary constant, and the function $w(\xi)$ is determined by the autonomous ordinary differential equation

$$w''_{\xi\xi}-\lambda w'_\xi=w(1-w)(a-w).$$

The substitution $w'_\xi=\lambda y(w)$ leads to an Abel equation of the second kind:

$$yy'_w-y=\lambda^{-2}\left[aw-(a+1)w^2+w^3\right].$$

The general solution of this equation with $a=-1$ and $\lambda=\pm\frac{3}{\sqrt{2}}$ can be found in Polyanin and Zaitsev (2003).

5°. Let us give two transformations that preserve the form of the original equation.

The substitution $u=1-w$ leads to an equation of the similar form with parameter $a_1=1-a$:

$$\frac{\partial u}{\partial t}=\frac{\partial^2 u}{\partial x^2}-u(1-u)(1-a-u).$$

The transformation

$$v(z,\tau) = 1 - \frac{1}{a}w(x,t), \quad \tau = a^2 t, \quad z = ax$$

leads to an equation of the similar form with parameter $a_2 = 1 - a^{-1}$:

$$\frac{\partial v}{\partial \tau} = \frac{\partial^2 v}{\partial z^2} - v(1-v)\left(1 - \frac{1}{a} - v\right).$$

Therefore, if $w = w(x,t;\, a)$ is a solution of the equation in question, then the functions

$$w_1 = 1 - w\big(x,t;\, 1-a\big),$$
$$w_2 = a - aw\big(ax, a^2 t;\, 1 - a^{-1}\big)$$

are also solutions of the equation. The aforesaid allows us to "multiply" exact solutions.

⊙ *References for equation* 5.1.2.4: T. Kawahara and M. Tanaka (1983), M. C. Nucci and P. A. Clarkson (1992), N. H. Ibragimov (1994, p. 142), V. F. Zaitsev and A. D. Polyanin (1996, p. 392).

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b_0 + b_1 w + b_2 w^2 + b_3 w^3.$

1°. Solutions are given by

$$w(x,t) = \frac{\beta}{F}\frac{\partial F}{\partial x} + \lambda, \quad \beta = \pm\sqrt{-\frac{2a}{b_3}}, \tag{1}$$

where λ is any of the roots of the cubic equation

$$b_3\lambda^3 + b_2\lambda^2 + b_1\lambda + b_0 = 0 \tag{2}$$

and the specific form of $F = F(x,t)$ depends on the equation coefficients.

Introduce the notation

$$p_1 = -3a, \quad p_2 = \beta(b_2 + 3b_3\lambda), \quad q_1 = -\frac{\beta}{2a}(b_2 + 3b_3\lambda), \quad q_2 = -\frac{1}{2a}(3b_3\lambda^2 + 2b_2\lambda + b_1). \tag{3}$$

Four cases are possible.

1.1. For $q_2 \neq 0$ and $q_1^2 \neq 4q_2$, we have

$$F(x,t) = C_1\exp(k_1 x + s_1 t) + C_2\exp(k_2 x + s_2 t) + C_3,$$
$$k_n = -\tfrac{1}{2}q_1 \pm \tfrac{1}{2}\sqrt{q_1^2 - 4q_2}, \quad s_n = -k_n^2 p_1 - k_n p_2, \tag{4}$$

where C_1, C_2, and C_3 are arbitrary constants; $n = 1,\ 2$.

1.2. For $q_2 \neq 0$ and $q_1^2 = 4q_2$, we have

$$F(x,t) = C_1\exp(kx + s_1 t) + C_2(kx + s_2 t)\exp(kx + s_1 t) + C_3,$$
$$k = -\tfrac{1}{2}q_1, \quad s_1 = -\tfrac{1}{4}p_1 q_1^2 + \tfrac{1}{2}p_2 q_1, \quad s_2 = -\tfrac{1}{2}p_1 q_1^2 + \tfrac{1}{2}p_2 q_1.$$

1.3. For $q_2 = 0$ and $q_1 \neq 0$,

$$F(x,t) = C_1(x - p_2 t) + C_2 \exp[-q_1 x + q_1(p_2 - p_1 q_1)t] + C_3.$$

1.4. For $q_2 = q_1 = 0$,

$$F(x,t) = C_1(x - p_2 t)^2 + C_2(x - p_2 t) - 2C_1 p_1 t + C_3.$$

Special case. Let

$$a = 1, \quad b_0 = 0, \quad b_1 w + b_2 w^2 + b_3 w^3 = -bw(w - \lambda_1)(w - \lambda_2).$$

By formulas (1)–(4) with $\lambda = 0$, one can obtain the solution

$$w(x,t) = \frac{C_1\lambda_1 \exp(z_1) + C_2\lambda_2 \exp(z_2)}{C_1 \exp(z_1) + C_2 \exp(z_2) + C_3},$$

where

$$z_1 = \pm\tfrac{1}{2}\sqrt{2b}\,\lambda_1 x + \tfrac{1}{2}b\lambda_1(\lambda_1 - 2\lambda_2)t,$$
$$z_2 = \pm\tfrac{1}{2}\sqrt{2b}\,\lambda_2 x + \tfrac{1}{2}b\lambda_2(\lambda_2 - 2\lambda_1)t.$$

2°. There is a traveling-wave solution, $w = w(x + \gamma t)$.

⊙ *References for equation* 5.1.2.5: V. G. Danilov and P. Yu. Sybochev (1991), N. A. Kudryashov (1993), P. A. Clarkson and E. L. Mansfield (1994).

5.1.3. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bw^k + cw^m + sw^n$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bw^k.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^2 w(\pm C_1^{k-1} x + C_2, C_1^{2k-2} t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Traveling-wave solution:

$$w = w(z), \qquad z = x + \lambda t,$$

where λ is an arbitrary constant and the function $w(z)$ is determined by the autonomous ordinary differential equation

$$aw''_{zz} - \lambda w'_z + bw^k = 0.$$

3°. Self-similar solution:

$$w = t^{\frac{1}{1-k}} u(\xi), \qquad \xi = \frac{x}{\sqrt{t}},$$

where the function $u(\xi)$ is determined by the ordinary differential equation

$$au''_{\xi\xi} + \frac{1}{2}\xi u'_\xi + \frac{1}{k-1}u + bu^k = 0.$$

4°. For $k = 2$ and $k = 3$, see equations 5.1.1.1 and 5.1.2.1, respectively, where other solutions can be found.

2. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + aw + bw^m.$

Kolmogorov–Petrovskii–Piskunov equation (a special case). This equation arises in heat and mass transfer, combustion theory, biology, and ecology.

1°. Traveling-wave solutions:

$$w(x,t) = \big[\beta + C\exp(\lambda t \pm \mu x)\big]^{\frac{2}{1-m}}, \tag{1}$$

$$w(x,t) = \big[-\beta + C\exp(\lambda t \pm \mu x)\big]^{\frac{2}{1-m}}, \tag{2}$$

where C is an arbitrary constant and the parameters λ, μ, and β are given by

$$\lambda = \frac{a(1-m)(m+3)}{2(m+1)}, \quad \mu = \sqrt{\frac{a(1-m)^2}{2(m+1)}}, \quad \beta = \sqrt{-\frac{b}{a}}.$$

2°. Solutions (1) and (2) are special cases of a wider class of solutions, the class of traveling-wave solutions:

$$w = w(z), \quad z = \pm\mu x + \lambda t.$$

These are determined by the autonomous equation

$$\mu^2 w''_{zz} - \lambda w'_z + aw + bw^m = 0. \tag{3}$$

For

$$\mu = \sqrt{\frac{a(m+3)^2}{2(m+1)}}, \quad \lambda = \mu^2 \qquad (m \neq \pm 1,\ m \neq -3)$$

the solution of equation (3) can be represented in parametric form as

$$z = \frac{m+3}{m-1}\ln f(\zeta), \quad w = \zeta\big[f(\zeta)\big]^{\frac{2}{m-1}},$$

where the function $f(\zeta)$ is given by

$$f(\zeta) = \pm\int\left[C_1 - \frac{4b}{a(m-1)^2}\zeta^{m+1}\right]^{-1/2} d\zeta + C_2,$$

and C_1 and C_2 are arbitrary constants.

3°. By the change of variable $U(w) = \mu^2\lambda^{-1}w'_z$, equation (3) can be reduced to an Abel equation of the second kind:

$$UU'_w - U = a_1 w + b_1 w^m, \qquad a_1 = -a\mu^2\lambda^{-2}, \quad b_1 = -b\mu^2\lambda^{-2}.$$

The books by Polyanin and Zaitsev (2003) and Zaitsev and Polyanin (1994) present exact solutions of this equation for some values of m and a_1 (b_1 is any).

⊙ *References for equation* 5.1.3.2: P. Kaliappan (1984), V. G. Danilov, V. P. Maslov, and K. A. Volosov (1995), V. F. Zaitsev and A. D. Polyanin (1996, p. 393).

3. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + aw + bw^m + cw^{2m-1}.$

This equation arises in heat and mass transfer, combustion theory, biology, and ecology. For $m = 2$, see Subsection 5.1.2.

1°. Traveling-wave solutions:

$$w(x,t) = \big[\beta + C\exp(\lambda t + \mu x)\big]^{\frac{1}{1-m}}, \tag{1}$$

where C is an arbitrary constant and the parameters β, λ, and μ are determined by the system of algebraic equations

$$a\beta^2 + b\beta + c = 0, \tag{2}$$

$$\mu^2 - (1-m)\lambda + a(1-m)^2 = 0, \tag{3}$$

$$\mu^2 - \lambda + (1-m)[2a + (b/\beta)\big] = 0. \tag{4}$$

The quadratic equation (2) for β can be solved independently. In the general case, system (2)–(4) gives four sets of the parameters, which generate four exact solutions of the original equation.

2°. Solution (1) is a special case of a wider class of traveling-wave solutions,

$$w = w(z), \quad z = x + \sigma t,$$

that are determined by the autonomous equation

$$w''_{zz} - \sigma w'_z + aw + bw^m + cw^{2m-1} = 0. \tag{5}$$

The substitution $U(w) = w'_z$ brings (5) to the Abel equation

$$UU'_w - \sigma U + aw + bw^m + cw^{2m-1} = 0,$$

whose general solutions for some m (no constraints are imposed on a, b, and c) can be found in the books by Polyanin and Zaitsev (1995, 2003).

3°. The substitution

$$u = w^{1-m}$$

leads to an equation with quadratic nonlinearity:

$$u\frac{\partial u}{\partial t} = u\frac{\partial^2 u}{\partial x^2} + \frac{m}{1-m}\left(\frac{\partial u}{\partial x}\right)^2 + a(1-m)u^2 + b(1-m)u + c(1-m). \tag{6}$$

Solution (1) corresponds to a particular solution of (6) that has the form $u = \beta + C\exp(\omega t + \mu x)$.

For $a = 0$, equation (6) has also other traveling-wave solutions:

$$u(x,t) = (1-m)\left(bt \pm \sqrt{-\frac{c}{m}}\,x\right) + C.$$

⊙ *Reference*: V. F. Zaitsev and A. D. Polyanin (1996, pp. 393–394).

4. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + aw^{m-1} + bmw^m - mb^2w^{2m-1}.$

Traveling-wave solution:

$$w = w(z), \quad z = x + \lambda t,$$

where λ is an arbitrary constant and the function $w(z)$ is determined by the autonomous ordinary differential equation

$$w''_{zz} - \lambda w'_z + aw^{m-1} + bmw^m - mb^2w^{2m-1} = 0. \tag{1}$$

For $\lambda = 1$, it can be shown that a one-parameter family of solutions to equation (1) satisfies the first-order equation

$$w'_z = w - bw^m + \frac{a}{mb}. \tag{2}$$

Integrating (2) yields a solution in implicit form (A is any):

$$\int \frac{dw}{a + mbw - mb^2w^m} = \frac{1}{mb}z + A. \tag{3}$$

In the special case $a = 0$, it follows from (3) that

$$w(z) = \left\{C\exp\left[(1-m)z\right] + b\right\}^{\frac{1}{1-m}},$$

where C is an arbitrary constant.

5.1.4. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(x, t, w)$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + s_1(bx + ct)^k + s_2w^n.$

This is a special case of equation 5.6.1.2 with $f(z, w) = s_1z^k + s_2w^n$.

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + s(w + bx + ct)^k.$

This is a special case of equation 5.6.1.2 with $f(z, w) = s(w + z)^k$.

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + s(bx + ct)^k w^n.$

This is a special case of equation 5.6.1.2 with $f(z, w) = sz^kw^n$.

4. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bt^n x^m w^k.$

1°. Suppose $w(x, t)$ is a solution of this equation. Then the function

$$w_1 = C^{2n+m+2}w(C^{k-1}x, C^{2k-2}t),$$

where C is an arbitrary constant, is also a solution of the equation.

2°. Self-similar solution:

$$w = t^{\frac{2n+m+2}{2(1-k)}}u(\xi), \quad \xi = \frac{x}{\sqrt{t}},$$

where the function $u = u(\xi)$ is determined by the ordinary differential equation

$$au''_{\xi\xi} + \frac{1}{2}\xi u'_\xi + \frac{2n + m + 2}{2(k-1)}u + b\xi^m u^k = 0.$$

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + se^{bx+ct}w^n.$

This is a special case of equation 5.6.1.2 with $f(z, w) = se^z w^n$.

5.1.5. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bw^k\dfrac{\partial w}{\partial x} + f(w)$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\dfrac{\partial w}{\partial x} + cw + k_1 w^{n_1} + k_2 w^{n_2}.$

This is a special case of equation 5.6.2.3 with $f(t) = b$. On passing from t, x to the new variables t, $z = x + bt$, one arrives at the simpler equation

$$\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial z^2} + cw + k_1 w^{n_1} + k_2 w^{n_2},$$

special cases of which are discussed in Subsections 5.1.1 to 5.1.3.

2. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + w\dfrac{\partial w}{\partial x}.$

Burgers equation. It is used for describing wave processes in gas dynamics, hydrodynamics, and acoustics.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w(C_1 x + C_1 C_2 t + C_3, C_1^2 t + C_4) + C_2,$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. Solutions:

$$w(x,t) = \frac{A - x}{B + t},$$

$$w(x,t) = \lambda + \frac{2}{x + \lambda t + A},$$

$$w(x,t) = \frac{4x + 2A}{x^2 + Ax + 2t + B},$$

$$w(x,t) = \frac{6(x^2 + 2t + A)}{x^3 + 6xt + 3Ax + B},$$

$$w(x,t) = \frac{2\lambda}{1 + A\exp(-\lambda^2 t - \lambda x)},$$

$$w(x,t) = -\lambda + A\frac{\exp\big[A(x - \lambda t)\big] - B}{\exp\big[A(x - \lambda t)\big] + B},$$

$$w(x,t) = -\lambda + 2A\tanh\big[A(x - \lambda t) + B\big],$$

$$w(x,t) = \frac{\lambda}{\lambda^2 t + A}\left[2\tanh\left(\frac{\lambda x + B}{\lambda^2 t + A}\right) - \lambda x - B\right],$$

$$w(x,t) = -\lambda + 2A\tan\big[A(\lambda t - x) + B\big],$$

$$w(x,t) = \frac{2\lambda\cos(\lambda x + A)}{B\exp(\lambda^2 t) + \sin(\lambda x + A)},$$

$$w(x,t) = \frac{2A}{\sqrt{\pi(t + \lambda)}}\exp\left[-\frac{(x + B)^2}{4(t + \lambda)}\right]\left[A\operatorname{erf}\left(\frac{x + B}{2\sqrt{t + \lambda}}\right) + C\right]^{-1},$$

where A, B, C, and λ are arbitrary constants, and $\operatorname{erf} z \equiv \dfrac{2}{\sqrt{\pi}} \displaystyle\int_0^z \exp(-\xi^2)\, d\xi$ is the error function (also called the probability integral).

3°. Other solutions can be obtained using the following formula (*Hopf–Cole transformation*):

$$w(x,t) = \frac{2}{u}\frac{\partial u}{\partial x}, \tag{1}$$

where $u = u(x,t)$ is a solution of the linear heat equation

$$\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}. \tag{2}$$

For details about this equation, see the books Tikhonov and Samarskii (1990) and Polyanin (2002).

4°. *Cauchy problem*. Initial condition:

$$w = f(x) \quad \text{at} \quad t = 0, \qquad -\infty < x < \infty.$$

Solution:

$$w(x,t) = 2\frac{\partial}{\partial x}\ln F(x,t),$$

where

$$F(x,t) = \frac{1}{\sqrt{4\pi t}} \int_{-\infty}^{\infty} \exp\left[-\frac{(x-\xi)^2}{4t} - \frac{1}{2}\int_0^{\xi} f(\xi')\, d\xi'\right] d\xi.$$

5°. The Burgers equation is connected with the linear heat equation (2) by the Bäcklund transformation

$$\frac{\partial u}{\partial x} - \frac{1}{2}uw = 0,$$
$$\frac{\partial u}{\partial t} - \frac{1}{2}\frac{\partial (uw)}{\partial x} = 0.$$

Remark 1. The equation $w_t + ww_x = w_{xx}$ is often call the Burgers equation; it is obtained from the original equation by substituting $-w$ for $-w$.

Remark 2. The Hopf–Cole transformation (1) and equation 5.6.3.2, which is a generalized Burgers equation, were encountered much earlier in Fortsyth (1906).

⊙ *References for equation* 5.1.5.2: E. Hopf (1950), J. Cole (1951), J. M. Burgers (1948), E. R. Benton and G. W. Platzman (1972), O. V. Rudenko and C. I. Soluyan (1975), N. H. Ibragimov (1994, pp. 180–182), V. F. Zaitsev and A. D. Polyanin (1996, pp. 395–396), M. Qin, F. Mei, and G. Fan (2007).

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bw\dfrac{\partial w}{\partial x}$.

Unnormalized Burgers equation. The scaling of the independent variables $x = \dfrac{a}{b}z$, $t = \dfrac{a}{b^2}\tau$ leads to an equation of the form 5.1.5.2:

$$\frac{\partial w}{\partial \tau} = \frac{\partial^2 w}{\partial z^2} + w\frac{\partial w}{\partial z}.$$

4. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bw\dfrac{\partial w}{\partial x} + c.$

The transformation

$$w = u(z,t) + ct, \qquad z = x + \tfrac{1}{2}bct^2,$$

leads to the Burgers equation 5.1.5.3:

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial z^2} + bu\frac{\partial u}{\partial z}.$$

5. $\dfrac{\partial w}{\partial t} + \sigma w\dfrac{\partial w}{\partial x} = a\dfrac{\partial^2 w}{\partial x^2} + bw.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = \pm w\big(\pm x - C_1\sigma e^{bt} + C_2,\ t + C_3\big) + Cbe^{bt},$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation (one takes either the upper or the lower signs).

2°. Traveling-wave solution:

$$w = w(z), \qquad z = x + \lambda t,$$

where λ is an arbitrary constant and the function $w(z)$ is determined by the autonomous ordinary differential equation

$$aw''_{zz} - \sigma w w'_z - \lambda w'_z + bw = 0.$$

3°. Degenerate solution:

$$w(x,t) = \frac{b(x + C_1)}{\sigma(1 + C_2 e^{-bt})}.$$

6. $\dfrac{\partial w}{\partial t} + \sigma w\dfrac{\partial w}{\partial x} = a\dfrac{\partial^2 w}{\partial x^2} + b_1 w + b_0.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w\big(x - C_1\sigma e^{b_1 t} + C_2,\ t + C_3\big) + Cb_1 e^{b_1 t},$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. The transformation

$$w = u(z,t) - \frac{b_0}{b_1}, \qquad z = x + \sigma\frac{b_0}{b_1}t,$$

leads to a simpler equation of the form 5.1.5.5:

$$\frac{\partial u}{\partial t} + \sigma u\frac{\partial u}{\partial z} = a\frac{\partial^2 u}{\partial z^2} + b_1 u.$$

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bw\dfrac{\partial w}{\partial x} + \dfrac{b^2}{9a}w(w-k)(w+k).$

Solution:

$$w = \frac{k(-1 + C_1 e^{4\lambda x})}{1 + C_1 e^{4\lambda x} + C_2 e^{2\lambda x + bk\lambda t}}, \qquad \lambda = \frac{bk}{12a},$$

where C_1 and C_2 are arbitrary constants.

⊙ *Private communication*: K. A. Volosov (2000).

8. $\dfrac{\partial w}{\partial t} + \sigma w\dfrac{\partial w}{\partial x} = a\dfrac{\partial^2 w}{\partial x^2} + b_0 + b_1 w + b_2 w^2 + b_3 w^3.$

For $b_0 = 0$, it is the *Burgers–Huxley equation*.

Exact solutions of the equation are given by

$$w(x,t) = \frac{\beta}{z}\frac{\partial z}{\partial x} + \lambda. \tag{1}$$

Here, β and λ are any of the roots of the respective quadratic and cubic equations

$$b_3\beta^2 + \sigma\beta + 2a = 0,$$
$$b_3\lambda^3 + b_2\lambda^2 + b_1\lambda + b_0 = 0,$$

and the specific form of $z = z(x,t)$ depends on the equation coefficients.

1°. *Case* $b_3 \neq 0$. Introduce the notation:

$$p_1 = -\beta\sigma - 3a, \qquad p_2 = \lambda\sigma + \beta b_2 + 3\beta\lambda b_3,$$
$$q_1 = -\frac{\beta b_2 + 3\beta\lambda b_3}{\beta\sigma + 2a}, \quad q_2 = -\frac{3b_3\lambda^2 + 2b_2\lambda + b_1}{\beta\sigma + 2a}.$$

Four cases are possible.

1.1. For $q_2 \neq 0$ and $q_1^2 \neq 4q_2$, we have

$$z(x,t) = C_1\exp(k_1 x + s_1 t) + C_2\exp(k_2 x + s_2 t) + C_3,$$
$$k_n = -\tfrac{1}{2}q_1 \pm \tfrac{1}{2}\sqrt{q_1^2 - 4q_2}, \quad s_n = -k_n^2 p_1 - k_n p_2,$$

where C_1, C_2, and C_3 are arbitrary constants; $n = 1, 2$.

1.2. For $q_2 \neq 0$ and $q_1^2 = 4q_2$,

$$z(x,t) = C_1\exp(kx + s_1 t) + C_2(kx + s_2 t)\exp(kx + s_1 t) + C_3,$$
$$k = -\tfrac{1}{2}q_1, \quad s_1 = -\tfrac{1}{4}p_1 q_1^2 + \tfrac{1}{2}p_2 q_1, \quad s_2 = -\tfrac{1}{2}p_1 q_1^2 + \tfrac{1}{2}p_2 q_1.$$

1.3. For $q_2 = 0$ and $q_1 \neq 0$,

$$z(x,t) = C_1(x - p_2 t) + C_2\exp[-q_1 x + q_1(p_2 - p_1 q_1)t] + C_3.$$

1.4. For $q_2 = q_1 = 0$,

$$z(x,t) = C_1(x - p_2 t)^2 + C_2(x - p_2 t) - 2C_1 p_1 t + C_3.$$

2°. *Case* $b_3 = 0$ *and* $b_2 \neq 0$. Solutions are given by (1) with

$$\beta = -\frac{2a}{\sigma}, \qquad z(x,t) = C_1 + C_2\exp\left[Ax + A\left(\frac{b_1\sigma}{2b_2} + \frac{2ab_2}{\sigma}\right)t\right], \qquad A = \frac{\sigma(b_1 + 2b_2\lambda)}{2ab_2},$$

where λ is a root of the quadratic equation $b_2\lambda^2 + b_1\lambda + b_0 = 0$.

3°. *Case* $b_3 = b_2 = 0$. See equations 5.1.5.4–5.1.5.6.

⊙ *References for equation* 5.1.5.8: P. G. Estevez and P. R. Gordoa (1990), N. A. Kudryashov (1993), P. G. Esteves (1994).

9. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bw^m\dfrac{\partial w}{\partial x}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w\big(C_1^m x + C_2,\ C_1^{2m} t + C_3\big),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solutions:

$$w(x,t) = \left[C\exp\left(-\frac{\lambda m}{a}z\right) + \frac{b}{\lambda(m+1)}\right]^{-1/m}, \qquad z = x + \lambda t;$$

$$w(x,t) = \left\{\frac{(m+1)\lambda}{2b}\left[1 + \tanh\left(\frac{m\lambda}{2a}z + C\right)\right]\right\}^{1/m}, \quad z = x + \lambda t,$$

where C and λ are arbitrary constants. A wider family of traveling-wave solutions is presented in 5.6.3.8 for $f(w) = bw^m$.

3°. There is a self-similar solution of the form

$$w(\xi,t) = |t|^{-\frac{1}{2m}}\varphi(\xi), \qquad \xi = x|t|^{-\frac{1}{2}}.$$

⊙ *References for equation* 5.1.5.9: A. D. Polyanin and V. F. Zaitsev (2004, p. 13), L. Zhang (2011).

5.1.6. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(x,t,w)\dfrac{\partial w}{\partial x} + g(x,t,w)$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + (bx + c)\dfrac{\partial w}{\partial x} + sw^k.$

This is a special case of equation 5.6.2.1 with $f(w) = sw^k$.

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x + C_1 e^{-bt}, t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Generalized traveling-wave solution:

$$w = w(z), \qquad z = x + C_1 e^{-bt},$$

where the function $w(z)$ is determined by the ordinary differential equation

$$aw''_{zz} + bzw'_z + sw^k = 0.$$

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bt^n\dfrac{\partial w}{\partial x} + cw + k_1 w^{m_1} + k_2 w^{m_2}.$

This is a special case of equation 5.6.2.3 with $f(t) = bt^n$. On passing from t, x to the new variables t, $z = x + \dfrac{b}{n+1}t^{n+1}$, one arrives at the simpler equation

$$\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial z^2} + cw + k_1 w^{m_1} + k_2 w^{m_2},$$

special cases of which are discussed in Subsections 5.1.1 to 5.1.3.

3. $\dfrac{\partial w}{\partial t} + \dfrac{k}{t}w + bw\dfrac{\partial w}{\partial x} = a\dfrac{\partial^2 w}{\partial x^2}.$

Modified Burgers equation.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the functions

$$\begin{aligned} w_1 &= C_1 w(C_1 x + C_2, C_1^2 t), \\ w_2 &= w(x - bC_3 t^{1-k}, t) + C_3(1-k)t^{-k} \quad \text{if } k \neq 1, \\ w_3 &= w(x - bC_3 \ln|t|, t) + C_3 t^{-1} \quad \text{if } k = 1, \end{aligned}$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Degenerate solution linear in x:

$$\begin{aligned} w(x,t) &= \frac{(1-k)x + C_1}{C_2 t^k + bt} \quad \text{if } k \neq 1, \\ w(x,t) &= \frac{x + C_1}{t(C_2 + b\ln|t|)} \quad \text{if } k = 1, \end{aligned}$$

where C_1 and C_2 are arbitrary constants.

3°. Self-similar solution:

$$w(x,t) = u(z)t^{-1/2}, \quad z = xt^{-1/2},$$

where the function $u = u(z)$ is determined by the ordinary differential equation

$$au''_{zz} + \left(\tfrac{1}{2}z - bu\right)u'_z + \left(\tfrac{1}{2} - k\right)u = 0.$$

⊙ *Reference for equation* 5.1.6.3: A. D. Polyanin and V. F. Zaitsev (2002, p. 17).

4. $\dfrac{\partial w}{\partial t} + bw\dfrac{\partial w}{\partial x} = a\left[\dfrac{1}{x}\dfrac{\partial}{\partial x}\left(x\dfrac{\partial w}{\partial x}\right) - \dfrac{w}{x^2}\right].$

Cylindrical Burgers equation. The variable x plays the role of the radial coordinate.

Solution:

$$w(x,t) = -\frac{2a}{b}\frac{1}{\theta}\frac{\partial \theta}{\partial x},$$

where the function $\theta = \theta(x,t)$ satisfies the linear heat equation with axial symmetry

$$\frac{\partial \theta}{\partial t} = \frac{a}{x}\frac{\partial}{\partial x}\left(x\frac{\partial \theta}{\partial x}\right).$$

⊙ *Reference*: S. Nerney, E. J. Schmahl, and Z. E. Musielak (1996).

5. $\dfrac{\partial w}{\partial t} + bw\dfrac{\partial w}{\partial x} = a\dfrac{\partial^2 w}{\partial x^2} + cx^k\dfrac{\partial w}{\partial x} + ckx^{k-1}w.$

Solution:

$$w(x,t) = -\frac{2a}{b}\frac{1}{\theta}\frac{\partial \theta}{\partial x},$$

where the function $\theta = \theta(x,t)$ satisfies the linear equation

$$\frac{\partial \theta}{\partial t} = a\frac{\partial^2 \theta}{\partial x^2} + cx^k\frac{\partial \theta}{\partial x}.$$

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bw\dfrac{\partial w}{\partial x} + c(x+st)^k.$

This is a special case of equation 5.6.3.2 with $f(x,t) = c(x+st)^k$.

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bw\dfrac{\partial w}{\partial x} + cx^k + st^n.$

This is a special case of equation 5.6.3.2 with $f(x,t) = cx^k + st^n$.

8. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + (bx + cw^k)\dfrac{\partial w}{\partial x}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x + C_1 e^{-bt}, t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Generalized traveling-wave solution:

$$w = w(z), \qquad z = x + C_1 e^{-bt},$$

where the function $w(z)$ is determined by the ordinary differential equation

$$aw''_{zz} + (bz + cw^k)w'_z = 0.$$

⊙ *Reference for equation* 5.1.6.8: A. D. Polyanin and V. F. Zaitsev (2004, p. 14).

9. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + (bw^m + ct + s)\dfrac{\partial w}{\partial x}.$

This is a special case of equation 5.6.3.12 with $f(w) = bw^m$, $g(t) = ct + s$, and $h(w) = 0$.

On passing from t, x to the new variables t, $z = x + \frac{1}{2}ct^2 + st$, we obtain an equation of the form 5.1.5.9:

$$\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial z^2} + bw^m\frac{\partial w}{\partial z}.$$

10. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + (bw^m + ct^k)\dfrac{\partial w}{\partial x}.$

This is a special case of equation 5.6.3.12 with $f(w) = bw^m$, $g(t) = ct^k$, and $h(w) = 0$.

On passing from t, x to the new variables t, $z = x + \dfrac{c}{k+1}t^{k+1}$, we obtain an equation of the form 5.1.5.9:

$$\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial z^2} + bw^m\frac{\partial w}{\partial z}.$$

11. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + s_1(bx + ct)^k w^n\dfrac{\partial w}{\partial x} + s_2(bx + ct)^p w^q.$

This is a special case of equation 5.6.3.14 with $f(z,w) = s_1 z^k w^n$ and $g(z,w) = s_2 z^p w^q$.

5.1.7. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + f(x,t,w)$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2.$

1°. Solutions:

$$w(x) = \frac{a}{b}\ln|Ax+B| + C,$$
$$w(x,t) = A^2bt \pm Ax + B,$$
$$w(x,t) = -\frac{(x+A)^2}{4bt} - \frac{a}{2b}\ln t + B,$$
$$w(x,t) = \frac{a}{b}\ln|x^2 + 2at + Ax + B| + C,$$
$$w(x,t) = \frac{a}{b}\ln|x^3 + 6axt + Ax + B| + C,$$
$$w(x,t) = \frac{a}{b}\ln|x^4 + 12ax^2t + 12a^2t^2 + A| + B,$$
$$w(x,t) = -\frac{a^2\lambda^2}{b}t + \frac{a}{b}\ln|\cos(\lambda x + A)| + B,$$

where A, B, C, and λ are arbitrary constants.

2°. The substitution

$$w(x,t) = \frac{a}{b}\ln|u(x,t)|$$

leads to the linear heat equation

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial x^2}.$$

For details about this equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + c.$

The substitution

$$w(x,t) = \frac{a}{b}\ln|u(x,t)| + ct$$

leads to the linear heat equation

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial x^2}.$$

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + cw + s.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm x + C_1, t + C_2) + C_3e^{ct},$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Generalized separable solution quadratic in x:

$$w(x,t) = \frac{c(x+C_2)^2}{C_1e^{-ct} - 4b} - \frac{2a}{C_1}e^{ct}\ln|C_1e^{-ct} - 4b| + C_3e^{ct} - \frac{s}{c}.$$

4. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + \left(\dfrac{\partial w}{\partial x}\right)^2 + aw^2.$

1°. Solutions for $a < 0$:

$$w(x,t) = C_1 \exp\bigl(-at \pm x\sqrt{-a}\,\bigr),$$
$$w(x,t) = \frac{1}{C_1 - at} + \frac{C_2}{(C_1 - at)^2} \exp\bigl(-at \pm x\sqrt{-a}\,\bigr),$$

where C_1 and C_2 are arbitrary constants. The first formula represents a multiplicative separable solution and the second one, a generalized separable solution.

2°. Generalized separable solution for $a < 0$:

$$w(x,t) = \varphi(t) + \psi(t)\bigl[A \exp\bigl(x\sqrt{-a}\,\bigr) + B \exp\bigl(-x\sqrt{-a}\,\bigr)\bigr],$$

where A and B are arbitrary constants, and the functions $\varphi(t)$ and $\psi(t)$ are determined by the autonomous system of first-order ordinary differential equations

$$\varphi'_t = a\bigl(\varphi^2 + 4AB\psi^2\bigr), \tag{1}$$
$$\psi'_t = a(2\varphi - 1)\psi. \tag{2}$$

Dividing equation (1) by (2) termwise yields the first-order equation $(2\varphi - 1)\psi\varphi'_\psi = \varphi^2 + 4AB\psi^2$.

3°. Generalized separable solution for $a > 0$:

$$w(x,t) = \varphi(t) + \psi(t)\cos\bigl(x\sqrt{a} + C\bigr),$$

where C is an arbitrary constant, and the functions $\varphi(t)$ and $\psi(t)$ are determined by the autonomous system of first-order ordinary differential equations

$$\varphi'_t = a\bigl(\varphi^2 + \psi^2\bigr), \tag{3}$$
$$\psi'_t = a(2\varphi - 1)\psi. \tag{4}$$

Dividing equation (3) by (4) termwise yields a first-order equation.

⊙ *References for equation* 5.1.7.4: V. A. Galaktionov and S. A. Posashkov (1989), V. F. Zaitsev and A. D. Polyanin (1996, p. 399).

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + bcw^2 + sw + k.$

1°. Generalized separable solution for $c < 0$:

$$w(x,t) = \varphi(t) + \psi(t)\exp\bigl(\pm x\sqrt{-c}\,\bigr), \tag{1}$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the autonomous system of first-order ordinary differential equations

$$\varphi'_t = bc\varphi^2 + s\varphi + k, \tag{2}$$
$$\psi'_t = (2bc\varphi + s - ac)\psi. \tag{3}$$

The solution of system (2), (3) is given by

$$\varphi(t) = \lambda + \frac{2bc\lambda + s}{C_1 \exp\big[-(2bc\lambda + s)t\big] - bc},$$
$$\psi(t) = \frac{C_1 C_2 \exp\big[-(2bc\lambda + s + ac)t\big]}{\big\{C_1 \exp\big[-(2bc\lambda + s)t\big] - bc\big\}^2},$$

where C_1 and C_2 are arbitrary constants and $\lambda = \lambda_1$ and $\lambda = \lambda_2$ are roots of the quadratic equation

$$bc\lambda^2 + s\lambda + k = 0.$$

2°. For more complicated generalized separable solutions that involve hyperbolic and trigonometric functions of x, see equation 5.6.6.2 with f, g, h = const.

⊙ *References for equation* 5.1.7.5: V. A. Galaktionov and S. A. Posashkov (1989), V. F. Zaitsev and A. D. Polyanin (1996, p. 399).

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + cw^2 + st^n w + kt^m.$

This is a special case of equation 5.6.6.2 with f = const, $g = st^n$, and $h = kt^m$.

5.1.8. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f\left(x, t, w, \dfrac{\partial w}{\partial x}\right)$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + a\left(\dfrac{\partial w}{\partial x}\right)^2 + b\dfrac{\partial w}{\partial x} + c.$

The substitution $u = e^w$ leads to the constant coefficient linear equation

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial x^2} + b\frac{\partial u}{\partial x} + cu,$$

which can be reduced to the linear heat equation [see Polyanin (2002, p. 93)].

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + a\left(\dfrac{\partial w}{\partial x}\right)^2 + bt^n\dfrac{\partial w}{\partial x} + ct^m.$

This is a special case of equation 5.6.5.4 with $f(x,t) = bt^n$ and $g(x,t) = ct^m$.

The substitution $u = e^w$ leads to the linear equation

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial x^2} + bt^n\frac{\partial u}{\partial x} + ct^m u.$$

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bt^n\left(\dfrac{\partial w}{\partial x}\right)^2 + ct^m w + st^k.$

This is a special case of equation 5.6.6.1 with $f(t) = bt^n$, $g(t) = ct^m$, and $h(t) = st^k$.

4. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + be^{\lambda t}\left(\dfrac{\partial w}{\partial x}\right)^2 + ce^{\mu t}w + se^{\nu t}.$

This is a special case of equation 5.6.6.1 with $f(t) = be^{\lambda t}$, $g(t) = ce^{\mu t}$, and $h(t) = se^{\nu t}$.

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bw\left(\dfrac{\partial w}{\partial x}\right)^2 + cw^3 + sw.$

1°. Traveling-wave solutions with $bc < 0$:

$$w = C\exp\left[\pm\sqrt{-\frac{c}{b}}\,x + \left(s - \frac{ac}{b}\right)t\right],$$

where C is an arbitrary constant.

Remark. The more general equation

$$w_t = aw_{xx} + f(w)\big(bw_x^2 + cw^2\big) + sw,$$

where $f(w)$ is an arbitrary function, has the same solution.

2°. Generalized separable solution with $bc < 0$ (generalizes the solutions of Item 1°):

$$w = \varphi(t)\exp\big(x\sqrt{|c/b|}\,\big) + \psi(t)\exp\big(-x\sqrt{|c/b|}\,\big),$$

where the functions $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are determined by the autonomous system of ordinary differential equations

$$\varphi_t' = \left(s - \frac{ac}{b}\right)\varphi + 4c\varphi^2\psi,$$
$$\psi_t' = \left(s - \frac{ac}{b}\right)\psi + 4c\varphi\psi^2.$$

Integrating this system, we get the multiplicative separable solution

$$w = \left[C_1\exp\big(x\sqrt{|c/b|}\,\big) + C_2\exp\big(-x\sqrt{|c/b|}\,\big)\right]\left[C_3\exp\left(\frac{2(ac-bs)}{b}t\right) + \frac{4bcC_1C_2}{ac-bs}\right]^{-1/2},$$

where C_1, C_2, and C_3 are arbitrary constants. By setting $C_1 = 0$ or $C_2 = 0$, we get the solutions of Item 1°.

3°. Generalized separable solution with $bc > 0$:

$$w = \varphi(t)\cos\big(x\sqrt{c/b}\,\big) + \psi(t)\sin\big(x\sqrt{c/b}\,\big),$$

where the functions $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are determined by the autonomous system of ordinary differential equations

$$\varphi_t' = \left(s - \frac{ac}{b}\right)\varphi + c(\varphi^2 + \psi^2)\varphi,$$
$$\psi_t' = \left(s - \frac{ac}{b}\right)\psi + c(\varphi^2 + \psi^2)\psi.$$

Integrating this system, we get the multiplicative separable solution

$$w = \left[C_1\cos\big(x\sqrt{c/b}\,\big) + C_2\sin\big(x\sqrt{c/b}\,\big)\right]\left[C_3\exp\left(\frac{2(ac-bs)}{b}t\right) + \frac{bc(C_1^2 + C_2^2)}{ac-bs}\right]^{-1/2},$$

where C_1, C_2, and C_3 are arbitrary constants.

⊙ *References for equation* 5.1.8.5: A. D. Polyanin and V. F. Zaitsev (2002, p. 381; 2004, p. 699).

6. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + \dfrac{a}{w}\left(\dfrac{\partial w}{\partial x}\right)^2.$

This is a special case of equation 5.6.6.8 with $f(w) = a/w$.

The substitution

$$u = \begin{cases} \dfrac{1}{a+1} w^{a+1} & \text{if } a \neq -1, \\ \ln|w| & \text{if } a = -1 \end{cases}$$

leads to the constant coefficient linear equation $\partial_t u = \partial_{xx} u$.

7. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + a w^k \left(\dfrac{\partial w}{\partial x}\right)^2.$

This is a special case of equation 5.6.6.8 with $f(w) = aw^k$. For $k = 0$, see equation 5.1.7.1, and for $k = -1$, see equation 5.1.8.6.

The substitution

$$u = \int \exp\left(\frac{a}{k+1} w^{k+1}\right) dw$$

leads to the constant coefficient linear equation $\partial_t u = \partial_{xx} u$.

8. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + a w^m \left(\dfrac{\partial w}{\partial x}\right)^2 + (bx + ct + s)\dfrac{\partial w}{\partial x}.$

This is a special case of equation 5.6.6.10 with $f(w) = aw^m$, $g(t) = b$, and $h(t) = ct + s$.

5.1.9. Equations of the Form $\dfrac{\partial w}{\partial t} = a w^k \dfrac{\partial^2 w}{\partial x^2} + f\left(x, t, w, \dfrac{\partial w}{\partial x}\right)$

1. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2}.$

1°. Suppose $w(x, t)$ is a solution of this equation. Then the function

$$w_1 = C_1^{-2} C_2 w(C_1 x + C_3, C_2 t + C_4),$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. Multiplicative separable solution:

$$w(x, t) = \frac{x^2 + Ax + B}{C - 2at},$$

where A, B, and C are arbitrary constants.

3°. Traveling-wave solution in implicit form:

$$ak^2 \int \frac{dw}{\lambda \ln|w| + C_1} = kx + \lambda t + C_2,$$

where C_1, C_2, k, and λ are arbitrary constants.

4°. For other exact solutions, see equation 5.1.9.26 with $m = 1$, Items 5° to 8°.

2. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + b.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1^{-1} w(C_1 x + C_2, C_1 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Solutions:

$$w(x,t) = Ax + B + bt,$$
$$w(x,t) = \frac{x^2 + Ax + B}{C - 2at} - \frac{b}{4a}(C - 2at),$$

where A, B, and C are arbitrary constants. The first solution is degenerate and the second one is a generalized separable solution.

3°. Traveling-wave solution:

$$w = w(z), \qquad z = kx + \lambda t,$$

where k and λ are arbitrary constants, and the function $w(z)$ is determined by the autonomous ordinary differential equation

$$ak^2 w w''_{zz} - \lambda w'_z + b = 0.$$

4°. Self-similar solution:

$$w = tU(\xi), \qquad \xi = x/t,$$

where the function $U(\xi)$ is determined by the autonomous ordinary differential equation

$$aUU''_{\xi\xi} + \xi U'_\xi - U + b = 0.$$

3. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + bw + c.$

1°. Generalized separable solutions:

$$w(x,t) = Ae^{bt}x + Be^{bt} - \frac{c}{b},$$
$$w(x,t) = \frac{b(x + A)^2 - Bce^{-bt} - 2act + C}{Bbe^{-bt} - 2a},$$

where A, B, and C are arbitrary constants (the first solution is degenerate).

2°. Traveling-wave solution:

$$w = w(z), \qquad z = kx + \lambda t,$$

where k and λ are arbitrary constants, and the function $w(z)$ is determined by the autonomous ordinary differential equation

$$ak^2 w w''_{zz} - \lambda w'_z + bw + c = 0.$$

4. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + cw^2 + kw + s.$

This is a special case of equation 5.1.9.10 with $b = 0$.

⊙ *Reference*: V. A. Galaktionov and S. A. Posashkov (1989).

5. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + bw^2 + (ct + d)w + st + k.$

This is a special case of equation 5.6.9.3 with $f(t) = ct + d$ and $g(t) = st + k$.

6. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + b\dfrac{\partial w}{\partial x} + (ct + d)w + pt + k.$

This is a special case of equation 5.6.10.2 with $f(t)\equiv 0$, $g(t)=b$, $h(t)=ct+d$, and $s(t)=pt+k$.

7. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} - \dfrac{2}{3}a\left(\dfrac{\partial w}{\partial x}\right)^2 + b.$

Generalized separable solution:

$$w(x,t) = \frac{1}{a}\big[3Ax^3 + f_2(t)x^2 + f_1(t)x + f_0(t)\big],$$

where A is an arbitrary constant and the functions $f_2(t)$, $f_1(t)$, and $f_0(t)$ are determined by the system of ordinary differential equations

$$\begin{aligned} f_2' &= 6Af_1 - \tfrac{2}{3}f_2^2, \\ f_1' &= 18Af_0 - \tfrac{2}{3}f_1f_2, \\ f_0' &= 2f_0f_2 - \tfrac{2}{3}f_1^2 + ab. \end{aligned}$$

The general solution of this system with $A \neq 0$ has the form

$$f_2(t) = 3\int \varphi(t)\,dt + 3B, \quad f_1(t) = \frac{1}{A}\left[\int \varphi(t)\,dt + B\right]^2 + \frac{1}{2A}\varphi(t),$$
$$f_0(t) = \frac{1}{9A^2}\left[\int \varphi(t)\,dt + B\right]^3 + \frac{1}{6A^2}\varphi(t)\left[\int \varphi(t)\,dt + B\right] + \frac{1}{36A^2}\varphi_t'(t),$$

where the function $\varphi(t)$ is determined by the autonomous ordinary differential equation

$$\varphi_{tt}'' + 12\varphi^2 - 36A^2ab = 0.$$

The solution of the last equation is defined implicitly by

$$\int (C_1 + 72A^2ab\varphi - 8\varphi^3)^{-1/2}\,d\varphi = \pm t + C_2,$$

and B, C_1, and C_2 are arbitrary constants.

⊙ *Reference*: J. R. King (1993), V. A. Galaktionov (1995), A. D. Polyanin and V. F. Zaitsev (2004, p. 20).

8. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} - a\left(\dfrac{\partial w}{\partial x}\right)^2 - b.$

1°. Generalized separable solution quadratic in x:

$$w = \frac{(x + C_1)^2}{2at} + C_2 t - bt \ln|t|,$$

where C_1 and C_2 are arbitrary constants (one more arbitrary constant can be added by a translation in t).

2°. Generalized separable solution:

$$w = \varphi(t) + \psi(t)(C_1 e^{\lambda x} + C_2 e^{-\lambda x}),$$

where C_1, C_2, and λ are arbitrary constants and the functions $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are determined by the system of ordinary differential equations

$$\varphi'_t = 4aC_1C_2\lambda^2\psi^2 - b,$$
$$\psi'_t = a\lambda^2\varphi\psi.$$

3°. Generalized separable solution:

$$w = \varphi(t) + \psi(t)\sin(\lambda x + C),$$

where C and λ are arbitrary constants and the functions $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are determined by the system of ordinary differential equations

$$\varphi'_t = -a\lambda^2\psi^2 - b,$$
$$\psi'_t = -a\lambda^2\varphi\psi.$$

4°. Generalized separable solution:

$$w = C_1 x + C_2 - (aC_1^2 + b)t + C_3 t^\beta \exp\left(-\frac{x}{aC_1 t} - \frac{C_2}{aC_1^2 t}\right), \qquad \beta = 1 - \frac{b}{aC_1^2},$$

where C_1, C_2, and C_3 are arbitrary constants ($C_1 \neq 0$).

⊙ *Reference for equation* 5.1.11.8: V. A. Galaktionov and S. R. Svirshchevskii (2007, pp. 37–38).

9. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + c\dfrac{\partial w}{\partial x} + pw + q.$

This is a special case of equation 5.6.10.2 with $f(t) = b$, $g(t) = c$, $h(t) = p$, and $s(t) = q$.

10. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + cw^2 + kw + s.$

1°. Generalized separable solutions involving an exponential of x:

$$w(x,t) = \varphi(t) + \psi(t)\exp(\pm\lambda x), \quad \lambda = \left(\frac{-c}{a+b}\right)^{1/2}, \tag{1}$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of first-order ordinary differential equations

$$\varphi'_t = c\varphi^2 + k\varphi + s, \tag{2}$$

$$\psi'_t = (a\lambda^2\varphi + 2c\varphi + k)\psi. \tag{3}$$

Integrating (2) yields

$$\int \frac{d\varphi}{c\varphi^2 + k\varphi + s} = t + C_1.$$

On computing the integral, one can find $\varphi = \varphi(t)$ in explicit form. The solution of equation (3) is expressed in terms of $\varphi(t)$ as

$$\psi(t) = C_2 \exp\left[\int (a\lambda^2\varphi + 2c\varphi + k)\, dt\right],$$

where C_1 and C_2 are arbitrary constants.

2°. There are also generalized separable solutions that involve hyperbolic and trigonometric functions (A is an arbitrary constant):

$$w(x,t) = \varphi(t) + \psi(t)\cosh(\lambda x + A), \quad \lambda = \left(\frac{-c}{a+b}\right)^{1/2};$$

$$w(x,t) = \varphi(t) + \psi(t)\sinh(\lambda x + A), \quad \lambda = \left(\frac{-c}{a+b}\right)^{1/2};$$

$$w(x,t) = \varphi(t) + \psi(t)\cos(\lambda x + A), \quad \lambda = \left(\frac{c}{a+b}\right)^{1/2}.$$

The functions $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are determined by autonomous systems of first-order ordinary differential equations (these systems can be reduced to a single first-order equation each).

For details about these solutions, see Items 2° to 4° of equation 5.6.10.1 with $f(t) = k$ and $g(t) = s$.

⊙ *References for equation* 5.1.9.10: V. A. Galaktionov and S. A. Posashkov (1989), A. D. Polyanin and V. F. Zaitsev (2002, p. 21).

11. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} - \dfrac{3}{4}a\left(\dfrac{\partial w}{\partial x}\right)^2 + cw^2 + kw + s.$

This is a special case of equation 5.1.9.10 with $b = -\frac{3}{4}a$.

1°. Solution with $ac > 0$:

$$w = \varphi_1(t) + \varphi_2(t)\cos(\lambda x) + \varphi_3(t)\sin(\lambda x) + \varphi_4(t)\cos(2\lambda x) + \varphi_5(t)\sin(2\lambda x), \quad \lambda = \sqrt{c/a},$$

where the functions $\varphi_n(t)$ are determined by the autonomous system of first-order ordinary differential equations

$$\begin{aligned}
\varphi'_1 &= c[\varphi_1^2 - \tfrac{3}{8}(\varphi_2^2 + \varphi_3^2) - 3(\varphi_4^2 + \varphi_5^2)] + k\varphi_1 + s,\\
\varphi'_2 &= c[\varphi_1\varphi_2 - 3(\varphi_2\varphi_4 + \varphi_3\varphi_5)] + k\varphi_2,\\
\varphi'_3 &= c[\varphi_1\varphi_3 + 3(\varphi_3\varphi_4 - \varphi_2\varphi_5)] + k\varphi_3,\\
\varphi'_4 &= c[-2\varphi_1\varphi_4 + \tfrac{3}{8}(\varphi_2^2 - \varphi_3^2)] + k\varphi_4,\\
\varphi'_5 &= c(-2\varphi_1\varphi_5 + \tfrac{3}{4}\varphi_2\varphi_3) + k\varphi_5.
\end{aligned}$$

2°. Solution with $ac < 0$:

$$w = \varphi_1(t) + \varphi_2(t)\cosh(\lambda x) + \varphi_3(t)\sinh(\lambda x) + \varphi_4(t)\cosh(2\lambda x) + \varphi_5(t)\sinh(2\lambda x), \quad \lambda = \sqrt{-c/a},$$

where the functions $\varphi_n(t)$ are determined by the autonomous system of first-order ordinary differential equations

$$\begin{aligned}
\varphi_1' &= c[\varphi_1^2 + \tfrac{3}{8}(\varphi_3^2 - \varphi_2^2) + 3(\varphi_5^2 - \varphi_4^2)] + k\varphi_1 + s,\\
\varphi_2' &= c[\varphi_1\varphi_2 + 3(\varphi_3\varphi_5 - \varphi_2\varphi_4)] + k\varphi_2,\\
\varphi_3' &= c[\varphi_1\varphi_3 + 3(\varphi_3\varphi_4 - \varphi_2\varphi_5)] + k\varphi_3,\\
\varphi_4' &= c[-2\varphi_1\varphi_4 + \tfrac{3}{8}(\varphi_2^2 + \varphi_3^2)] + k\varphi_4,\\
\varphi_5' &= c(-2\varphi_1\varphi_5 + \tfrac{3}{4}\varphi_2\varphi_3) + k\varphi_5.
\end{aligned}$$

3°. Solution with $c = 0$:

$$w = \varphi_1(t) + \varphi_2(t)x + \varphi_3(t)x^2 + \varphi_4(t)x^3 + \varphi_5(t)x^4,$$

where the functions $\varphi_n(t)$ are determined by the autonomous system of first-order ordinary differential equations

$$\begin{aligned}
\varphi_1' &= a(2\varphi_1\varphi_3 - \tfrac{3}{4}\varphi_2^2) + k\varphi_1 + s,\\
\varphi_2' &= a(6\varphi_1\varphi_4 - \varphi_2\varphi_3) + k\varphi_2,\\
\varphi_3' &= a(5\varphi_3^2 + \tfrac{3}{2}\varphi_2\varphi_4) + k\varphi_3,\\
\varphi_4' &= a(6\varphi_2\varphi_5 - \varphi_3\varphi_4) + k\varphi_4,\\
\varphi_5' &= a(2\varphi_3\varphi_5 - \tfrac{3}{4}\varphi_4^2) + k\varphi_5.
\end{aligned}$$

Remark. In the original equation, the parameters k and s can be replaced by arbitrary functions $k = k(t)$ and $s = s(t)$.

12. $$\frac{\partial w}{\partial t} = w\frac{\partial^2 w}{\partial x^2} - 2\left(\frac{\partial w}{\partial x}\right)^2 + bw\frac{\partial w}{\partial x} + cw^2 + sw^3.$$

This is a special case of equation 5.1.9.30 with $m = 1$. The substitution

$$w = 1/f$$

leads to the equation

$$f\frac{\partial f}{\partial t} = \frac{\partial^2 f}{\partial x^2} + b\frac{\partial f}{\partial x} - cf - s.$$

This equation has a generalized separable solution of the form

$$u = f(x)t + g(x),$$

where the functions $f = f(x)$ and $g = g(x)$ are determined by the autonomous system of ordinary differential equations

$$\begin{aligned}
f_{xx}'' + bf_x' - cf &= f^2,\\
g_{xx}'' + bg_x' - cg &= fg + s.
\end{aligned}$$

Remark. In the original equation, the parameters b, c, and s can be replaced by arbitrary functions $b = b(x)$, $c = c(x)$, and $s = s(x)$.

13. $\dfrac{\partial w}{\partial t} = aw^2\dfrac{\partial^2 w}{\partial x^2}.$

The substitution $w = 1/v$ leads to an equation of the form 5.1.10.3:

$$\frac{\partial v}{\partial t} = a\frac{\partial}{\partial x}\left(\frac{1}{v^2}\frac{\partial v}{\partial x}\right).$$

Therefore the solutions of the original equation are expressed via solutions of the linear heat equation

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial y^2}$$

by the relations

$$w = \frac{\partial u}{\partial y}, \quad x = u.$$

The variable y should be eliminated to obtain $w = w(x, t)$ in explicit form.

⊙ *Reference*: N. H. Ibragimov (1985).

14. $\dfrac{\partial w}{\partial t} = aw^2\dfrac{\partial^2 w}{\partial x^2} + bw^2.$

1°. Suppose $w(x, t)$ is a solution of this equation. Then the function

$$w_1 = C_1^2 w(C_1^{-1}x + C_2, C_1^2 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. The transformation $w = 1/u$, $\tau = at$ leads to an equation of the form 5.1.11.2:

$$\frac{\partial u}{\partial t} = \frac{\partial}{\partial x}\left(\frac{1}{u^2}\frac{\partial u}{\partial x}\right) - \frac{b}{a}.$$

15. $\dfrac{\partial w}{\partial t} = aw^2\dfrac{\partial^2 w}{\partial x^2} + bw^{-1}.$

This is a special case of equation 5.1.9.27 with $m = 2$ and $b = -1$.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^{-1} w(\pm C_1^2 x + C_2, C_1^2 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Functional separable solutions:

$$w(x, t) = \pm\left[C_1(x + C_2)^2 + C_3\exp(2aC_1 t) - \frac{b}{aC_1}\right]^{1/2},$$

where C_1, C_2, and C_3 are arbitrary constants.

16. $\dfrac{\partial w}{\partial t} = aw^2\dfrac{\partial^2 w}{\partial x^2} + bw + cw^{-1}.$

Functional separable solutions:

$$w(x,t) = \pm\left[bC_1e^{2bt}(x+C_2)^2 + C_3F(t) + 2cF(t)\int\frac{dt}{F(t)}\right]^{1/2}, \qquad F(t) = \exp\bigl(aC_1e^{2bt} + 2bt\bigr),$$

where C_1, C_2, and C_3 are arbitrary constants.

17. $\dfrac{\partial w}{\partial t} = w^2\dfrac{\partial^2 w}{\partial x^2} - \dfrac{1}{2}w\left(\dfrac{\partial w}{\partial x}\right)^2.$

Multiplicative separable solution:

$$w = \frac{C_2x^2 + C_1x + C_0}{\sqrt{(C_1^2 - 4C_0C_2)t + C_3}},$$

where C_0, C_1, C_2, and C_3 are arbitrary constants.

18. $\dfrac{\partial w}{\partial t} = w^2\dfrac{\partial^2 w}{\partial x^2} - \dfrac{1}{2}w\left(\dfrac{\partial w}{\partial x}\right)^2 + aw + b.$

Generalized separable solution

$$w = \varphi_2(t)x^2 + \varphi_1(t)x + \varphi_0(t),$$

where the functions $\varphi_n(t)$ are determined by the system of ordinary differential equations

$$\begin{aligned}
\varphi_2' &= \varphi_2\bigl(2\varphi_0\varphi_2 - \tfrac{1}{2}\varphi_1^2\bigr) + a\varphi_2,\\
\varphi_1' &= \varphi_1\bigl(2\varphi_0\varphi_2 - \tfrac{1}{2}\varphi_1^2\bigr) + a\varphi_1,\\
\varphi_0' &= \varphi_0\bigl(2\varphi_0\varphi_2 - \tfrac{1}{2}\varphi_1^2\bigr) + a\varphi_0 + b.
\end{aligned}$$

Remark. In the original equation, the parameters a and b can be replaced by arbitrary functions $a = a(t)$ and $b = b(t)$.

⊙ *Reference*: V. A. Galaktionov, S. A. Posashkov (1995).

19. $\dfrac{\partial w}{\partial t} = w^2\dfrac{\partial^2 w}{\partial x^2} - \dfrac{1}{2}w\left(\dfrac{\partial w}{\partial x}\right)^2 + \dfrac{1}{2}w^3 + aw + b.$

Functional separable solution:

$$w = \varphi_1(t) + \varphi_2(t)\cos x + \varphi_3(t)\sin x,$$

where the functions $\varphi_n = \varphi_n(t)$ are determined by the system of ordinary differential equations

$$\begin{aligned}
\varphi_1' &= \tfrac{1}{2}\varphi_1(\varphi_1^2 - \varphi_2^2 - \varphi_3^2) + a\varphi_1 + b,\\
\varphi_2' &= \tfrac{1}{2}\varphi_2(\varphi_1^2 - \varphi_2^2 - \varphi_3^2) + a\varphi_2,\\
\varphi_3' &= \tfrac{1}{2}\varphi_3(\varphi_1^2 - \varphi_2^2 - \varphi_3^2) + a\varphi_3.
\end{aligned}$$

It follows from the last two equations that $\varphi_3 = C\varphi_2$, where C is an arbitrary constant.

Remark. The parameters of the equation can be arbitrary functions of time, $a = a(t)$ and $b = b(t)$.

⊙ *Reference*: V. A. Galaktionov and S. R. Svirshchevskii (2007, p. 32).

20. $\dfrac{\partial w}{\partial t} = w^2\dfrac{\partial^2 w}{\partial x^2} - 3w\left(\dfrac{\partial w}{\partial x}\right)^2 + bw^2\dfrac{\partial w}{\partial x} + cw^3 + sw^5.$

This is a special case of equation 5.1.9.30 with $m = 2$. The substitution

$$w = f^{-1/2}$$

leads to the equation

$$f\frac{\partial f}{\partial t} = \frac{\partial^2 f}{\partial x^2} + b\frac{\partial f}{\partial x} - 2cf - 2s.$$

This equation has a generalized separable solution of the form

$$u = f(x)t + g(x),$$

where the functions $f = f(x)$ and $g = g(x)$ are determined by the autonomous system of ordinary differential equations

$$f''_{xx} + bf'_x - 2cf = f^2,$$
$$g''_{xx} + bg'_x - 2cg = fg + 2s.$$

Remark. In the original equation, the parameters b, c, and s can be replaced by arbitrary functions $b = b(x)$, $c = c(x)$, and $s = s(x)$.

21. $\dfrac{\partial w}{\partial t} = aw^3\dfrac{\partial^2 w}{\partial x^2}.$

This is a special case of equation 5.1.9.20 with $m = 3$.

Functional separable solution:

$$w(x,t) = a^{-1/3}\left[3Ax^3 + f_2(t)x^2 + f_1(t)x + f_0(t)\right]^{1/3}.$$

Here,

$$f_2(t) = 3\int \varphi(t)\,dt + 3B, \quad f_1(t) = \frac{1}{A}\left[\int \varphi(t)\,dt + B\right]^2 + \frac{1}{2A}\varphi(t),$$
$$f_0(t) = \frac{1}{9A^2}\left[\int \varphi(t)\,dt + B\right]^3 + \frac{1}{6A^2}\varphi(t)\left[\int \varphi(t)\,dt + B\right] + \frac{1}{36A^2}\varphi'_t(t),$$

where the function $\varphi(t)$ is defined implicitly by

$$\int (C_1 - 8\varphi^3)^{-1/2}\,d\varphi = \pm t + C_2,$$

and A, B, C_1, and C_2 are arbitrary constants. Setting $C_1 = 0$ in the last relation, one obtains the function φ in explicit form: $\varphi = -\frac{1}{2}(t + C_2)^{-2}$.

⊙ *Reference*: G. A. Rudykh and E. I. Semenov (1998).

22. $\dfrac{\partial w}{\partial t} = aw^3\dfrac{\partial^2 w}{\partial x^2} + bw^{-2}.$

This is a special case of equation 5.1.9.21 with $m = 3$ and $b = -2$.

The substitution $w = u^{1/3}$ leads to an equation of the form 5.1.9.7:

$$\frac{\partial u}{\partial t} = au\frac{\partial^2 u}{\partial x^2} - \frac{2}{3}a\left(\frac{\partial u}{\partial x}\right)^2 + 3b.$$

Therefore the equation in question has a generalized separable solution of the form

$$w(x,t) = a^{-1/3}\big[3Ax^3 + f_2(t)x^2 + f_1(t)x + f_0(t)\big]^{1/3}.$$

23. $\dfrac{\partial w}{\partial t} = w^3\dfrac{\partial^2 w}{\partial x^2} - 4w^2\left(\dfrac{\partial w}{\partial x}\right)^2 + bw^3\dfrac{\partial w}{\partial x} + cw^4 + sw^7.$

This is a special case of equation 5.1.9.30 with $m = 3$. The substitution

$$w = f^{-1/3}$$

leads to the equation

$$f\frac{\partial f}{\partial t} = \frac{\partial^2 f}{\partial x^2} + b\frac{\partial f}{\partial x} - 3cf - 3s.$$

This equation has a generalized separable solution of the form

$$u = f(x)t + g(x),$$

where the functions $f = f(x)$ and $g = g(x)$ are determined by the autonomous system of ordinary differential equations

$$f''_{xx} + bf'_x - 3cf = f^2,$$
$$g''_{xx} + bg'_x - 3cg = fg + 3s.$$

Remark. In the original equation, the parameters b, c, and s can be replaced by arbitrary functions $b = b(x)$, $c = c(x)$, and $s = s(x)$.

24. $\dfrac{\partial w}{\partial t} = aw^4\dfrac{\partial^2 w}{\partial x^2} + bw + cw^{-1}.$

Functional separable solutions:

$$w(x,t) = \pm\sqrt{\varphi(t)x^2 + \psi(t)x + \chi(t)},$$

where the functions $\varphi(t)$, $\psi(t)$, and $\chi(t)$ are determined by the system of first-order ordinary differential equations

$$\varphi'_t = \tfrac{1}{2}a\varphi(4\varphi\chi - \psi^2) + 2b\varphi,$$
$$\psi'_t = \tfrac{1}{2}a\psi(4\varphi\chi - \psi^2) + 2b\psi,$$
$$\chi'_t = \tfrac{1}{2}a\chi(4\varphi\chi - \psi^2) + 2b\chi + 2c.$$

It follows from the first two equations that $\varphi = C\psi$, where C is an arbitrary constant.

Remark. In the original equation, the parameters a, b, and c can be replaced by arbitrary function s $a = a(t)$, $b = b(t)$, and $c = c(t)$.

⊙ *Reference*: V. A. Galaktionov, S. A. Posashkov, and S. R. Svirshchevskii (1995).

25. $\dfrac{\partial w}{\partial t} = aw^4\dfrac{\partial^2 w}{\partial x^2} + bx^k w^5.$

This is a special case of equation 5.6.11.4 with $m = 4$ and $f(x) = bx^k$.

26. $\dfrac{\partial w}{\partial t} = aw^m\dfrac{\partial^2 w}{\partial x^2}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-2/m}C_2^{1/m}w(\pm C_1 x + C_3, C_2 t + C_4),$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation.

2°. Solutions:

$$w(x) = Ax + B,$$

$$w(x,t) = (\pm\beta x + \beta\lambda t + A)^{1/m}, \quad \beta = \frac{m\lambda}{a(1-m)},$$

$$w(x,t) = \left[\frac{m(x-A)^2}{2a(2-m)(B-t)}\right]^{1/m},$$

$$w(x,t) = \left[A|t+B|^{\frac{m}{m-2}} + \frac{m}{2a(m-2)}\frac{(x+C)^2}{t+B}\right]^{1/m},$$

$$w(x,t) = \left[\frac{(x+A)^2}{\varphi(t)} + B(x+A)^m|\varphi(t)|^{\frac{m(m-3)}{2}}\right]^{1/m}, \quad \varphi(t) = C + \frac{2a(m-2)}{m}t,$$

where A, B, C, and λ are arbitrary constants (the first solution is degenerate).

3°. Traveling-wave solution in implicit form:

$$\int \frac{dw}{\lambda w^{1-m} + C_1} = \frac{\beta x + \lambda t + C_2}{a\beta^2(1-m)},$$

where C_1, C_2, β, and λ are arbitrary constants. To $\lambda = 0$ there corresponds a stationary solution, and to $C_1 = 0$ there corresponds the second solution in Item 2°.

4°. Multiplicative separable solution:

$$w(x,t) = (\lambda t + A)^{-1/m} f(x),$$

where λ is an arbitrary constant, and the function $f = f(x)$ is determined by the autonomous ordinary differential equation $amf''_{xx} + \lambda f^{1-m} = 0$ (its solution can be written out in implicit form).

5°. Self-similar solution:

$$w = w(z), \quad z = \frac{x}{\sqrt{t}},$$

where the function $w(z)$ is determined by the ordinary differential equation $2aw^m w''_{zz} + zw'_z = 0$.

6°. Self-similar solution of a more general form:

$$w = t^{\beta}U(\zeta), \quad \zeta = xt^{-\frac{m\beta+1}{2}},$$

where β is an arbitrary constant, and the function $U = U(\zeta)$ is determined by the ordinary differential equation

$$aU^m U''_{\zeta\zeta} = \beta U - \tfrac{1}{2}(m\beta + 1)\zeta U'_{\zeta}.$$

This equation is generalized homogeneous, and, hence, its order can be reduced.

7°. Generalized self-similar solution:

$$w = e^{-2\lambda t}\varphi(\xi), \quad \xi = xe^{\lambda m t},$$

where λ is an arbitrary constant, and the function $\varphi = \varphi(\xi)$ is determined by the ordinary differential equation

$$a\varphi^m \varphi''_{\xi\xi} = \lambda m \xi \varphi'_{\xi} - 2\lambda\varphi.$$

This equation is generalized homogeneous, and, hence, its order can be reduced.

8°. Solution:

$$w = (At + B)^{-1/m}\psi(u), \quad u = x + k\ln(At + B),$$

where A, B, and k are arbitrary constants, and the function $\psi = \psi(u)$ is determined by the autonomous ordinary differential equation

$$a\psi^m \psi''_{uu} = Ak\psi'_u - \frac{A}{m}\psi.$$

9°. The substitution $u = w^{1-m}$ leads to the equation

$$\frac{\partial u}{\partial t} = a\frac{\partial}{\partial x}\left(u^{\frac{m}{1-m}}\frac{\partial u}{\partial x}\right),$$

which is considered in Subsection 5.1.10.

27. $\dfrac{\partial w}{\partial t} = aw^m \dfrac{\partial^2 w}{\partial x^2} + bw^k.$

1°. Suppose $w(x, t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^2 w(\pm C_1^{k-m-1}x + C_2, C_1^{2k-2}t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Traveling-wave solutions:

$$w = w(z), \quad z = kx + \lambda t,$$

where k and λ are arbitrary constants, and the function $w(z)$ is determined by the autonomous ordinary differential equation

$$aw^m w''_{zz} - \lambda w'_z + bw^k = 0.$$

3°. Self-similar solution for $k \neq 1$:

$$w = t^{\frac{1}{1-k}}u(\xi), \quad \xi = xt^{\frac{k-m-1}{2(1-k)}},$$

where the function $u(\xi)$ is determined by the ordinary differential equation

$$au^m u''_{\xi\xi} + \frac{m-k+1}{2(1-k)}\xi u'_{\xi} + bu^k - \frac{1}{1-k}u = 0.$$

4°. For $m \neq 1$, the substitution $u = w^{1-m}$ leads to the equation

$$\frac{\partial u}{\partial t} = a\frac{\partial}{\partial x}\left(u^{\frac{m}{1-m}}\frac{\partial u}{\partial x}\right) + b(1-m)u^{\frac{k-m}{1-m}},$$

which is considered in Subsection 5.1.11.

5°. For $k = 1$, the transformation

$$w(x,t) = e^{bt}U(x,\tau), \quad \tau = \frac{1}{bm}e^{bmt} + \text{const},$$

leads to an equation of the form 5.1.9.26:

$$\frac{\partial U}{\partial \tau} = aU^m \frac{\partial^2 U}{\partial x^2}.$$

28. $\dfrac{\partial w}{\partial t} = aw^m \dfrac{\partial^2 w}{\partial x^2} + bxt^n \dfrac{\partial w}{\partial x} + ct^k w.$

This is a special case of equation 5.6.11.5 with $f(t) = bt^n$ and $g(t) = ct^k$.

29. $\dfrac{\partial w}{\partial t} = w^{2m} \dfrac{\partial^2 w}{\partial x^2} + (m-1)w^{2m-1}\left(\dfrac{\partial w}{\partial x}\right)^2 + aw^{m+1}.$

The substitution $w = u^{-1/m}$ leads to an equation of the form 5.1.11.3:

$$\frac{\partial u}{\partial t} = \frac{\partial}{\partial x}\left(\frac{1}{u^2}\frac{\partial u}{\partial x}\right) - am,$$

that can be linearized.

30. $\dfrac{\partial w}{\partial t} = w^m \dfrac{\partial^2 w}{\partial x^2} - (m+1)w^{m-1}\left(\dfrac{\partial w}{\partial x}\right)^2 + aw^m \dfrac{\partial w}{\partial x} + bw^{m+1} + cw^{2m+1}.$

For $m \neq 0$, the substitution

$$w = f^{-1/m}$$

leads to the equation

$$f\frac{\partial f}{\partial t} = \frac{\partial^2 f}{\partial x^2} + a\frac{\partial f}{\partial x} - bmf - cm.$$

This equation has a generalized separable solution of the form

$$u = f(x)t + g(x),$$

where the functions $f = f(x)$ and $g = g(x)$ are determined by the autonomous system of ordinary differential equations

$$f''_{xx} + af'_x - bmf = f^2,$$
$$g''_{xx} + ag'_x - bmg = fg + cm.$$

Remark. In the original equation, the parameters a, b, and c can be replaced by arbitrary functions $a = a(x)$, $b = b(x)$, and $c = c(x)$.

5.1.10. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m \dfrac{\partial w}{\partial x}\right)$

▷ *Equations of this form admit traveling-wave solutions* $w = w(kx + \lambda t)$.

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right)$.

This is a special case of equation 5.1.10.8 with $m = 1$. It is a quadratic *porous medium equation*, which describes unsteady flow of groundwater with the presence of a free surface (J. Boussinesq, 1904), where w is the groundwater pressure.

1°. Solutions:

$$w(x,t) = C_1 x + aC_1^2 t + C_2,$$
$$w(x,t) = -\frac{(x+C_1)^2}{6a(t+C_2)} + \frac{C_3}{|t+C_2|^{1/3}},$$
$$w(x,t) = \frac{(x+C_1)^2}{C_2 - 6at} + C_3|x+C_1|^{1/2}|C_2 - 6at|^{-5/8},$$

where C_1, C_2, and C_3 are arbitrary constants.

2°. Traveling-wave solution in implicit form:

$$w - C_2 \ln|w + C_2| = C_1 x + aC_1^2 t + C_3.$$

3°. Solution in parametric form:

$$x = (6at + C_1)\xi + C_2\xi^2 + C_3,$$
$$w = -(6at + C_1)\xi^2 - 2C_2\xi^3.$$

4°. Solution in parametric form:

$$x = tf(\xi) + g(\xi),$$
$$w = tf'_\xi(\xi) + g'_\xi(\xi),$$

where the functions $f = f(\xi)$ and $g(\xi)$ are determined by the system of ordinary differential equations

$$(f'_\xi)^2 - ff''_{\xi\xi} = af'''_{\xi\xi\xi}, \tag{1}$$
$$f'_\xi g'_\xi - fg''_{\xi\xi} = ag'''_{\xi\xi\xi}. \tag{2}$$

The order of equation (1) can be reduced by two. Suppose a solution of equation (1) is known. Equation (2) is linear in g and has two linearly independent particular solutions

$$g_1 = 1, \quad g_2 = f(\xi).$$

The second particular solution follows from the comparison of (1) and (2). The general solution of equation (1) can be represented in the form (see Polyanin and Zaitsev, 2003):

$$g(\xi) = C_1 + C_2 f + C_3\left(f\int \psi\, d\xi - \int f\psi\, d\xi\right),$$
$$f = f(\xi), \quad \psi = \frac{1}{(f'_\xi)^2}\exp\left(-\frac{1}{a}\int f\, d\xi\right). \tag{3}$$

It is not difficult to verify that equation (1) has the following particular solutions:

$$f(\xi) = 6a(\xi + C)^{-1},$$
$$f(\xi) = Ce^{\lambda\xi} - a\lambda, \tag{4}$$

where C and λ are arbitrary constants. One can see, taking into account (1) and (3), that the first solution in (4) leads to the solution of Item 3°. Substituting the second relation of (4) into (1), we obtain another solution.

Remark. The above solution was obtained, with the help of the Mises transformation, from a solution of the hydrodynamic boundary layer equation (see 13.3.1.1, Items 5° and 7°).

5°. For other solutions, see Items 4° to 9° of equation 5.1.10.8 with $m = 1$.

⊙ *References for equation* 5.1.10.1: G. I. Barenblatt and Ya. B. Zel'dovich (1957), D. Zwillinger (1989, p. 311), A. D. Polyanin and V. F. Zaitsev (2002, pp. 22–23; 2004, p. 25).

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(\dfrac{1}{w}\dfrac{\partial w}{\partial x}\right)$.

Fast diffusion equation. This is a special case of equation 5.1.10.8 with $m = -1$.

Solutions:

$$w(x,t) = (C_1x - aC_1^2t + C_2)^{-1},$$
$$w(x,t) = (2at + C_1)(x + C_2)^{-2},$$
$$w(x,t) = \frac{2a(t + C_1)}{(x + C_2)^2 + C_3(t + C_1)^2},$$
$$w(x,t) = \frac{C_1^2}{C_2 + C_3\exp(aC_2t - C_1x)},$$
$$w(x,t) = \frac{C_1^2}{at + C_2}\left[C_3\exp\left(-\frac{C_1x}{at + C_2}\right) - 1 + \frac{C_1x}{at + C_2}\right]^{-1},$$
$$w(x,t) = \frac{2aC_1^2t + C_2}{\sinh^2(C_1x + C_3)},$$
$$w(x,t) = \frac{C_2 - 2aC_1^2t}{\cosh^2(C_1x + C_3)},$$
$$w(x,t) = \frac{2aC_1^2t + C_2}{\cos^2(C_1x + C_3)},$$
$$w(x,t) = \frac{2\sin(2at + C_1)}{\cos(2at + C_1) - \cos(2x + C_2)},$$
$$w(x,t) = \frac{2\sinh(2at + C_1)}{\cosh(2x + C_2) - \cosh(2at + C_1)},$$
$$w(x,t) = \frac{2\cosh(2at + C_1)}{\sinh(2x + C_2) - \sinh(2at + C_1)},$$
$$w(x,t) = -\frac{2\sinh(2at + C_1)}{\cosh(2x + C_2) + \cosh(2at + C_1)},$$
$$w(x,t) = \frac{2\sin(2at + C_1)}{\cosh(2x + C_2) - \cos(2at + C_1)},$$
$$w(x,t) = \frac{2\sinh(2at + C_1)}{\cosh(2at + C_1) - \cos(2x + C_2)},$$

where C_1, C_2, and C_3 are arbitrary constants.

⊙ *References*: O. V. Voinov (1994), V. V. Pukhnachov (1987), S. N. Aristov (1999), A. D. Polyanin and V. F. Zaitsev (2002, p. 23), R. O. Popovich, O. O. Vaneeva, and N. M. Ivanova (2007), N. M. Ivanova (2008).

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{-2}\dfrac{\partial w}{\partial x}\right)$.

Fujita–Storm equation. This is a special case of equation 5.1.10.8 with $m = -2$.

1°. Solutions:

$$w(x,t) = \pm(2C_1x - 2aC_1^2t + C_2)^{-1/2},$$

$$w(x,t) = \pm\frac{\sqrt{2at}}{x}\left[\ln\left(\frac{C_1}{x^2t}\right)\right]^{-1/2},$$

$$w(x,t) = \pm\left[\frac{C_1(x+C_2)^2}{2a} + C_3\exp(C_1t)\right]^{-1/2},$$

$$w(x,t) = \frac{\pm1}{f(\tau)\sqrt{4 - e^{8\tau}\left[ce^{-\tau} \pm f(\tau)\right]^2}}, \qquad \tau = at, \quad f(\tau) = \sqrt{c^2e^{-2\tau} + 2e^{-8\tau} + 2e^{-4\tau}x},$$

$$w(x,t) = \frac{\pm1}{f(-\tau)\sqrt{e^{-8\tau}\left[ce^{-\tau} \pm f(\tau)\right]^2 - 4}}, \quad \tau = at, \quad f(\tau) = \sqrt{c^2e^{-2\tau} + 2e^{-8\tau} + 2e^{-4\tau}x},$$

where C_1, C_2, C_3, and c are arbitrary constants. The first solution is of the traveling-wave type, the second is self-similar, and the third is a functional separable solution. In the last two equations, the plus or minus signs can be selected arbitrarily.

2°. Introduce a new unknown $z = z(x,t)$ by $w = \dfrac{\partial z}{\partial x}$ and then integrate the resulting equation with respect to x to obtain

$$\frac{\partial z}{\partial t} = a\left(\frac{\partial z}{\partial x}\right)^{-2}\frac{\partial^2 z}{\partial x^2}. \tag{1}$$

By the hodograph transformation

$$x = u, \quad z = y, \tag{2}$$

equation (1) can be reduced to a linear heat equation for $u = u(y,t)$:

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial y^2}. \tag{3}$$

Transformation (2) means that the dependent variable z is taken to be the independent variable, and the independent variable x, the dependent one.

Solutions $w = w(x,t)$ of the original equation are expressed via solutions $u = u(y,t)$ of the linear equation (3) according to

$$w = \left(\frac{\partial u}{\partial y}\right)^{-1}, \quad x = u(y,t). \tag{4}$$

The variable y should be eliminated from (4) to obtain $w = w(x,t)$ in explicit form.

3°. The transformation

$$\bar{x}=\int_{x_0}^{x} w(y,t)\,dy+a\int_{t_0}^{t}\left[w^{-2}(x,\tau)\frac{\partial w}{\partial x}(x,\tau)\right]_{x=x_0} d\tau,\quad \bar{t}=t-t_0,\quad \bar{w}(\bar{x},\bar{t})=\frac{1}{w(x,t)},\quad (5)$$

where x_0 and t_0 are any numbers, leads to the linear equation

$$\frac{\partial \bar{w}}{\partial \bar{t}}=a\frac{\partial^2 \bar{w}}{\partial \bar{x}^2}.$$

The inversion of transformation (5) is given by

$$x=\int_{\bar{x}_0}^{\bar{x}} \bar{w}(x',\bar{t})\,dx'+\int_{\bar{t}_0}^{\bar{t}}\left(\frac{\partial \bar{w}(\bar{x},t')}{\partial \bar{x}}\right)_{\bar{x}=\bar{x}_0} dt',\quad t=\bar{t}-\bar{t}_0,\quad w(x,t)=\frac{1}{\bar{w}(\bar{x},\bar{t})}.$$

4°. Suppose $w=w(x,t)$ is a solution of the equation in question. Then the function

$$w_1=w-\frac{2tw_t+xw_x+w}{at(w_x-\frac{1}{2}w^2)+\frac{1}{2}xw}$$

is also a solution of the equation.

⊙ *References for equation* 5.1.10.3: M. L. Storm (1951), G. W. Bluman and S. Kumei (1980), A. Munier, J. R. Burgan, J. Gutierres, E. Fijalkow, and M. R. Feix (1981), N. H. Ibragimov (1985), V. Tychynin, O. Petrova, and O. Tertyshnyk (2007), N. M. Ivanova (2008).

4. $\dfrac{\partial w}{\partial t}=a\dfrac{\partial}{\partial x}\left(w^{-4/3}\dfrac{\partial w}{\partial x}\right)$.

This is a special case of equation 5.1.10.8 with $m=-4/3$ (the equation admits more invariant solutions than for $m\neq -4/3$).

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1=\frac{|A_1B_2-A_2B_1|^{3/2}C_1^{-3/4}}{(A_2x+B_2)^3}\,w\left(\frac{A_1x+B_1}{A_2x+B_2},\,C_1t+C_2\right),$$

where A_1, A_2, B_1, B_2, C_1, and C_2 are arbitrary constants ($A_1B_2-A_2B_1\neq 0$), is also a solution of the equation.

2°. Solutions:

$$w(x,t)=(\pm 2C_1x-3aC_1^2t+C_2)^{-3/4},$$
$$w(x,t)=(at+C_1)^{3/4}[(x+C_2)(C_3x+C_2C_3+1)]^{-3/2},$$
$$w(x,t)=(\pm 2C_1x^3+C_2x^4-3aC_1^2x^4t)^{-3/4},$$
$$w(x,t)=\left[\frac{(x+C_1)^2}{a(t+C_2)}+C_3(t+C_2)^2\right]^{-3/4},$$
$$w(x,t)=\left[\frac{(x+C_1)^2}{a(t+C_2)}+C_3(t+C_2)^2(x+C_1)^4\right]^{-3/4},$$

where C_1, C_2, and C_3 are arbitrary constants. The first solution is of the traveling-wave type, the second is a solution in multiplicative separable form, and the others are functional separable solutions.

3°. Functional separable solution:

$$w(x,t) = \big[\varphi_4(t)x^4 + \varphi_3(t)x^3 + \varphi_2(t)x^2 + \varphi_1(t)x + \varphi_0(t)\big]^{-3/4},$$

where the functions $\varphi_k = \varphi_k(t)$ are determined by the system of ordinary differential equations

$$\begin{aligned}
\varphi_0' &= -a\tfrac{3}{4}\varphi_1^2 + 2a\varphi_0\varphi_2,\\
\varphi_1' &= -a\varphi_1\varphi_2 + 6a\varphi_0\varphi_3,\\
\varphi_2' &= -a\varphi_2^2 + \tfrac{3}{2}a\varphi_1\varphi_3 + 12a\varphi_0\varphi_4,\\
\varphi_3' &= -a\varphi_2\varphi_3 + 6a\varphi_1\varphi_4,\\
\varphi_4' &= -\tfrac{3}{4}a\varphi_3^2 + 2a\varphi_2\varphi_4.
\end{aligned}$$

The prime denotes a derivative with respect to t.

4°. There are exact solutions of the following forms:

$$w(x,t) = x^{-3}F(y), \quad y = t - \frac{1}{x};$$

$$w(x,t) = x^{-3}G(z), \quad z = \frac{tx^2}{(x+1)^2}.$$

5°. For other solutions, see equation 5.1.10.8 with $m = -4/3$.

⊙ *References for equation* 5.1.10.4: L. V. Ovsiannikov (1959, 1982), J. R. King (1991), N. H. Ibragimov (1994, pp. 120, 128), V. A. Galaktionov (1995), G. A. Rudykh and E. I. Semenov (1998).

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{-2/3}\dfrac{\partial w}{\partial x}\right).$

This is a special case of equation 5.1.10.8 with $m = -2/3$.

1°. Solution:

$$w = (C - 4at)^{3/2}\big[(C - 4at)^{3/2} - x^2\big]^{-3/2}.$$

2°. The transformation

$$t = \tau, \quad x = v, \quad w = 1/u,$$

where $\frac{\partial v}{\partial \xi} = u$, leads to an equation of the form 5.1.10.4:

$$\frac{\partial u}{\partial \tau} = a\frac{\partial}{\partial \xi}\left(u^{-4/3}\frac{\partial u}{\partial \xi}\right).$$

⊙ *References for equation* 5.1.10.5: A. Munier, J. R. Burgan, J. Gutierres, E. Fijalkow, and M. R. Feix (1981), J. R. Burgan, A. Munier, M. R. Feix, and E. Fijalkow (1984), I. Sh. Akhatov, R. K. Gazizov, and N. H. Ibragimov (1989), J. R. King (1991), N. H. Ibragimov (1994, pp. 127–128).

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{-3/2}\dfrac{\partial w}{\partial x}\right).$

This is a special case of equation 5.1.10.8 with $m = -3/2$.

1°. Functional separable solution:

$$w(x,t) = a^{2/3}\left[3Ax^3 + f_2(t)x^2 + f_1(t)x + f_0(t)\right]^{-2/3},$$

where A is an arbitrary constant and the functions $f_2(t)$, $f_1(t)$, and $f_0(t)$ are determined by the system of ordinary differential equations

$$\begin{aligned} f_2' &= 6Af_1 - \tfrac{2}{3}f_2^2, \\ f_1' &= 18Af_0 - \tfrac{2}{3}f_1f_2, \\ f_0' &= 2f_0f_2 - \tfrac{2}{3}f_1^2. \end{aligned}$$

The general solution of this system with $A \neq 0$ has the form

$$f_2(t) = 3\int \varphi(t)\,dt + 3B, \quad f_1(t) = \frac{1}{A}\left[\int \varphi(t)\,dt + B\right]^2 + \frac{1}{2A}\varphi(t),$$
$$f_0(t) = \frac{1}{9A^2}\left[\int \varphi(t)\,dt + B\right]^3 + \frac{1}{6A^2}\varphi(t)\left[\int \varphi(t)\,dt + B\right] + \frac{1}{36A^2}\varphi_t'(t),$$

where the function $\varphi(t)$ is determined by the autonomous ordinary differential equation

$$\varphi_{tt}'' + 12\varphi^2 = 0.$$

The solution of the last equation is given implicitly by

$$\int (C_1 - 8\varphi^3)^{-1/2}\,d\varphi = \pm t + C_2,$$

and A, B, C_1, and C_2 are arbitrary constants. Setting $C_1 = 0$ in this relation, we find φ in explicit form: $\varphi = -\frac{1}{2}(t + C_2)^{-2}$.

2°. For other solutions, see equation 5.1.10.8 with $m = -3/2$.

⊙ *References for equation* 5.1.10.6: J. R. King (1993), A. D. Polyanin and V. F. Zaitsev (2004, p. 28).

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{-1/2}\dfrac{\partial w}{\partial x}\right)$.

This is a special case of equation 5.1.10.8 with $m = -1/2$.

Functional separable solution:

$$w = [\varphi(x)t + \psi(x)]^2,$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(x)$ are determined by the system of ordinary differential equations

$$a\varphi_{xx}'' = \varphi^2, \quad a\psi_{xx}'' = \varphi\psi.$$

A particular solution of this system is

$$\varphi = \frac{6a}{(x + C_1)^2}, \quad \psi = C_2(x + C_1)^3 + \frac{C_3}{(x + C_1)^2},$$

where C_1, C_2, and C_3 are arbitrary constants.

⊙ *References*: T. K. Amerov (1990), J. R. King (1992).

8. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right)$.

This equation often occurs in nonlinear problems of heat and mass transfer, combustion theory, and flows in porous media. For example, it describes unsteady heat transfer in a quiescent medium with the heat diffusivity being a power-law function of temperature. For $m = 1, -1, -2, -4/3, -2/3, -3/2, -1/2$, see also equations 5.1.10.1 to 5.1.10.7.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w(C_2 x + C_3, C_1^m C_2^2 t + C_4),$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. Solutions:*

$$w(x) = (Ax + B)^{\frac{1}{m+1}},$$

$$w(x,t) = (\pm kx + k\lambda t + A)^{1/m}, \quad k = \lambda m/a,$$

$$w(x,t) = \left[\frac{m(x-A)^2}{2a(m+2)(B-t)}\right]^{\frac{1}{m}},$$

$$w(x,t) = \left[A|t+B|^{-\frac{m}{m+2}} - \frac{m}{2a(m+2)}\frac{(x+C)^2}{t+B}\right]^{\frac{1}{m}},$$

$$w(x,t) = \left[\frac{m(x+A)^2}{\varphi(t)} + B|x+A|^{\frac{m}{m+1}}|\varphi(t)|^{-\frac{m(2m+3)}{2(m+1)^2}}\right]^{\frac{1}{m}}, \quad \varphi(t) = C - 2a(m+2)t,$$

where A, B, C, and λ are arbitrary constants. The third solution for $B > 0$ and the fourth solution for $B < 0$ correspond to *blow-up regimes* (the solution increases without bound on a finite time interval).

Special case. A solution satisfying the initial and boundary conditions

$$w = 0 \quad \text{at} \quad t = 0 \quad (x > 0),$$
$$w = kt^{1/m} \quad \text{at} \quad x = 0 \quad (t > 0),$$

is given by

$$w(x,t) = \begin{cases} k(t - x/\lambda)^{1/m} & \text{for } 0 \le x \le \lambda t, \\ 0 & \text{for } x > \lambda t, \end{cases}$$

where $\lambda = \sqrt{ak^m/m}$.

3°. Traveling-wave solutions:

$$w = w(z), \quad z = \pm x + \lambda t,$$

where the function $w(z)$ is defined implicitly by

$$a\int \frac{w^m\,dw}{\lambda w + C_1} = C_2 + z,$$

and λ, C_1, and C_2 are arbitrary constants. To $\lambda = 0$ there corresponds a stationary solution, and to $C_1 = 0$ there corresponds the second solution in Item 2°.

* For the sake of brevity, here and henceforth, exact solutions of nonlinear equations are given only for the domain of their spatial localization, where $w \not\equiv 0$.

4°. Multiplicative separable solution:

$$w(x,t) = (\lambda t + A)^{-1/m} f(x), \tag{1}$$

where the function $f = f(x)$ is defined implicitly by

$$\int \frac{f^m\,df}{\sqrt{C_1 - bf^{m+2}}} = \pm x + C_2, \qquad b = \frac{2\lambda}{am(m+2)},$$

and λ, C_1, and C_2 are arbitrary constants.

5°. Self-similar solution:

$$w = w(z), \quad z = \frac{x}{\sqrt{t}} \qquad (0 \le x < \infty),$$

where the function $w(z)$ is determined by the ordinary differential equation

$$2a\big(w^m w_z'\big)_z' + zw_z' = 0. \tag{2}$$

Solutions of this sort usually describe situations where the unknown function assumes constant values at the initial and boundary conditions.

To the particular solution of equation (2) with $w(z) = k_2 z^{2/m}$ there corresponds the third solution in Item 2°.

Fujita (1952) obtained the general solution of equation (2) for $m = -1$ and $m = -2$; see also the book by Lykov (1967).

With the boundary conditions

$$w = 1 \quad \text{at} \quad z = 0, \qquad w = 0 \quad \text{at} \quad z = \infty$$

the solution of equation (2) is localized and has the structure

$$w = \begin{cases} (1-Z)^{1/m}\dfrac{P(1-Z,\,m)}{P(1,\,m)} & \text{for } 0 \le Z \le 1, \\ 0 & \text{for } 1 \le Z < \infty, \end{cases}$$

where

$$Z = \frac{z}{z_0}, \quad z_0^2 = \frac{2a}{mP(1,\,m)}, \quad P(\xi,\,m) = \sum_{k=0}^{\infty} b_k \xi^k,$$

$b_0 = 1$, $b_1 = -\frac{1}{2}[m(m+1)]^{-1}$, . . . ; see Samarskii and Sobol' (1963).

6°. Self-similar solution:

$$w = t^{-\frac{1}{m+2}} F(\xi), \quad \xi = xt^{-\frac{1}{m+2}} \qquad (0 \le x < \infty).$$

Here, the function $F = F(\xi)$ is determined by the first-order ordinary differential equation

$$a(m+2)F^m F_\xi' + \xi F = C, \tag{3}$$

where C is an arbitrary constant.

To $C = 0$ in (3) there corresponds the fourth solution in Item 2°, which describes the propagation of a thermal wave coming from a plane source. For details, see the book by Zel'dovich and Raiser (1966).

Performing the change of variable $\varphi = F^m$ in equation (3), one obtains

$$\varphi_\xi' = \alpha\varphi^{-1/m} - \beta\xi, \tag{4}$$

where $\alpha = \frac{mC}{a(m+2)}$ and $\beta = \frac{m}{a(m+2)}$. The books by Polyanin and Zaitsev (1995, 2003) present general solutions of equation (4) for $m = -1$ and $m = 1$.

7°. Self-similar solution of a more general form:

$$w = t^{\beta} g(\zeta), \quad \zeta = x t^{-\frac{m\beta+1}{2}}, \qquad \beta \text{ is any.}$$

Here, the function $g = g(\zeta)$ is determined by the ordinary differential equation

$$G''_{\zeta\zeta} = A_1 \zeta G^{-\frac{m}{m+1}} G'_{\zeta} + A_2 G^{\frac{1}{m+1}}, \qquad G = g^{m+1}, \tag{5}$$

where $A_1 = -(m\beta + 1)/(2a)$ and $A_2 = \beta(m + 1)/a$. This equation is homogeneous, and, therefore, its order can be reduced (and then it can be transformed to an Abel equation of the second kind). Exact analytical solutions of equation (5) for various values of m can be found in Polyanin and Zaitsev (2003).

8°. Generalized self-similar solution:

$$w = e^{-2\lambda t}\varphi(u), \quad u = x e^{\lambda m t}, \qquad \lambda \text{ is any,}$$

where the function $\varphi = \varphi(u)$ is determined by the ordinary differential equation

$$a(\varphi^m \varphi'_u)'_u = \lambda m u \varphi'_u - 2\lambda\varphi. \tag{6}$$

This equation is homogeneous, and, hence, its order can be reduced (and then it can be transformed to an Abel equation of the second kind). The substitution $\Phi = \varphi^{m+1}$ brings (6) to an equation that coincides, up to notation, with (5).

9°. Solution:

$$w = (t + A)^{-1/m}\psi(u), \quad u = x + b\ln(t + A), \qquad A,\ b \text{ are any,}$$

where the function $\psi = \psi(u)$ is determined by the autonomous ordinary differential equation

$$a(\psi^m \psi'_u)'_u = b\psi'_u - \psi/m. \tag{7}$$

Introduce the new dependent variable $p(\psi) = \dfrac{a}{b}\psi^m \psi'_u$. Taking into account the identity $\dfrac{d}{du} = \dfrac{b}{a}\psi^{-m} p \dfrac{d}{d\psi}$, we arrive at an Abel equation of the second kind:

$$pp'_{\psi} = p - s\psi^{m+1}, \quad s = a/(mb^2).$$

The general solutions of this equation with $m = -3, -2, -\frac{3}{2}, -1$ can be found in Polyanin and Zaitsev (2003).

10°. Unsteady point source solution with $a = 1$:

$$w(x,t) = \begin{cases} A t^{-1/(m+2)} \left(\eta_0^2 - \dfrac{x^2}{t^{2/(m+2)}} \right)^{1/m} & \text{for } |x| \le \eta_0 t^{1/(m+2)}, \\ 0 & \text{for } |x| > \eta_0 t^{1/(m+2)}, \end{cases}$$

where

$$A = \left[\frac{m}{2(m+2)} \right]^{1/m}, \quad \eta_0 = \left[\frac{\Gamma(1/m + 3/2)}{A\sqrt{\pi}\,\Gamma(1/m + 1)} E_0 \right]^{m/(m+2)}, \quad \Gamma(z) = \int_0^{\infty} e^{-\xi} \xi^{z-1}\, d\xi,$$

with $\Gamma(z)$ being the gamma function.

The above solution satisfies the initial condition

$$w(x,0) = E_0\delta(x),$$

where $\delta(x)$ is the Dirac delta function, and the condition of conservation of energy

$$\int_{-\infty}^{\infty} w(x,t)\,dx = E_0 > 0.$$

11°. The transformation

$$\widetilde{t} = t - t_0, \quad \widetilde{x} = \int_{x_0}^{x} w(y,t)\,dy + a\int_{t_0}^{t}\left[w^m(x,\tau)\frac{\partial w}{\partial x}(x,\tau)\right]_{x=x_0} d\tau, \quad \widetilde{w}(\widetilde{x},\widetilde{t}) = \frac{1}{w(x,t)}$$

takes a nonzero solution $w(x,t)$ of the original equation to a solution $\widetilde{w}(\widetilde{x},\widetilde{t})$ of a similar equation

$$\frac{\partial \widetilde{w}}{\partial \widetilde{t}} = a\frac{\partial}{\partial \widetilde{x}}\left(\widetilde{w}^{-m-2}\frac{\partial \widetilde{w}}{\partial \widetilde{x}}\right).$$

Samarskii, V. A. Galaktionov, S. P. Kurdyumov, and A. P. Mikhailov (1995), G. A. Rudykh and E. I. Semenov (1998), R. Z. Zhdanov and V. I. Lahno (1998).

5.1.11. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + bw^k$

▷ *Equations of this form admit traveling-wave solutions* $w = w(kx + \lambda t)$.

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) + b.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-1}w(\pm C_1 x + C_2, C_1 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Generalized separable solutions linear and quadratic in x:

$$w(x,t) = C_1 x + (aC_1^2 + b)t + C_2,$$
$$w(x,t) = -\frac{(x+C_2)^2}{6a(t+C_1)} + C_3|t+C_1|^{-1/3} + \frac{3}{4}b(t+C_1),$$

where C_1, C_2, and C_3 are arbitrary constants. The first solution is degenerate.

3°. Traveling-wave solution in implicit form:

$$a\int \frac{u\,du}{au^2 - C_1 u + b} = -\ln|\pm x + C_1 t + C_2| + C_3, \qquad u = \frac{w}{\pm x + C_1 t + C_2}.$$

4°. For other solutions, see equation 5.1.11.14 with $m = 1$ and $k = 0$.

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) + bw.$

This is a special case of equation 5.1.11.10 with $m = 1$.

1°. Additive separable solution:

$$w = -\frac{b}{6a}(x + C_1)^2 + C_2 \exp\left(\tfrac{2}{3}bt\right),$$

where C_1 and C_2 are arbitrary constants.

2°. Generalized separable solution:

$$w = -be^{bt}(6ae^{bt} + C_1)^{-1}(x + C_3)^2 + C_2e^{bt}(6ae^{bt} + C_1)^{-1/3},$$

where C_1, C_2, and C_3 are arbitrary constants.

3°. Generalized separable solution:

$$w = -be^{bt}(6ae^{bt} + C_1)^{-1}(x + C_3)^2 + C_2e^{bt}(6ae^{bt} + C_1)^{-5/8}(x + C_3)^{1/2},$$

where C_1, C_2, and C_3 are arbitrary constants.

3. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(w^{-2}\dfrac{\partial w}{\partial x}\right) + b.$

1°. Suppose $w(x, t)$ is a solution of this equation. Then the functions

$$w_1 = C_1w(\pm C_1x + C_2, C_1^{-1}t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. The transformation

$$x = -\frac{2}{bu}\frac{\partial u}{\partial y}, \quad w(x, t) = -\frac{b}{2}\left[\frac{\partial}{\partial y}\left(\frac{1}{u}\frac{\partial u}{\partial y}\right)\right]^{-1} \tag{1}$$

leads to the equation

$$\frac{\partial}{\partial y}\left(\Phi\frac{\partial \Psi}{\partial y}\right) = 0, \quad \text{where} \quad \Phi = \left[\frac{\partial}{\partial y}\left(\frac{1}{u}\frac{\partial u}{\partial y}\right)\right]^{-1}, \quad \Psi = \frac{1}{u}\left(\frac{\partial u}{\partial t} - \frac{\partial^2 u}{\partial y^2}\right).$$

It follows that any solution $u = u(x, t)$ of the linear heat equation

$$\frac{\partial u}{\partial t} - \frac{\partial^2 u}{\partial y^2} = 0 \tag{2}$$

generates a solution (1) of the original nonlinear equation.

⊙ *References for equation* 5.1.11.3: V. A. Dorodnitsyn and S. R. Svirshchevskii (1983), S. I. Svinolupov (1985).

4. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{-2}\dfrac{\partial w}{\partial x}\right) - bw^3.$

Functional separable solutions:

$$w(x,t) = \pm\left[C_1(x+C_2)^2 + C_3\exp(2aC_1t) - \frac{b}{aC_1}\right]^{-1/2},$$

where C_1, C_2, and C_3 are arbitrary constants.

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{-1}\dfrac{\partial w}{\partial x}\right) + bw^2.$

1°. Generalized separable solution:

$$w = \left[\frac{(x+C_1)^2}{2at} + C_2t - bt\ln|t|\right]^{-1},$$

where C_1 and C_2 are arbitrary constants (one more arbitrary constant can be added using a translation in t).

2°. Functional separable solution:

$$w = \frac{1}{\varphi(t) + \psi(t)(C_1e^{\lambda x} + C_2e^{-\lambda x})},$$

where C_1, C_2, and λ are arbitrary constants and the functions $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are determined by the system of ordinary differential equations

$$\varphi'_t = 4aC_1C_2\lambda^2\psi^2 - b,$$
$$\psi'_t = a\lambda^2\varphi\psi.$$

3°. Functional separable solution:

$$w = \frac{1}{\varphi(t) + \psi(t)\sin(\lambda x + C)},$$

where C and λ are arbitrary constants and the functions $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are determined by the system of ordinary differential equations

$$\varphi'_t = -a\lambda^2\psi^2 - b,$$
$$\psi'_t = -a\lambda^2\varphi\psi.$$

4°. Functional separable solution:

$$w = \left[C_1x + C_2 - (aC_1^2 + b)t + C_3t^\beta\exp\left(-\frac{x}{aC_1t} - \frac{C_2}{aC_1^2t}\right)\right]^{-1}, \qquad \beta = 1 - \frac{b}{aC_1^2},$$

where C_1, C_2, and C_3 are arbitrary constants ($C_1 \neq 0$).

⊙ *Reference for equation* 5.1.11.5: V. A. Galaktionov and S. R. Svirshchevskii (2007, pp. 37–38).

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{-4/3}\dfrac{\partial w}{\partial x}\right) + bw^{-1/3}.$

1°. For $ab > 0$, the transformation

$$w(x,t) = \exp(\pm 3\lambda x)z(\xi,t), \quad \xi = \frac{1}{2\lambda}\exp(\pm 2\lambda x), \qquad \lambda = \left(\frac{b}{3a}\right)^{1/2},$$

leads to a simpler equation of the form 5.1.10.4:

$$\frac{\partial z}{\partial t} = a\frac{\partial}{\partial \xi}\left(z^{-4/3}\frac{\partial z}{\partial \xi}\right). \tag{1}$$

2°. For $ab < 0$, the transformation

$$w(x,t) = \frac{z(\xi,t)}{\cos^3(\lambda x)}, \quad \xi = \frac{1}{\lambda}\tan(\lambda x), \qquad \lambda = \left(-\frac{b}{3a}\right)^{1/2},$$

also leads to simpler equation (1) (for its solutions, see equation 5.1.10.4).

3°. Multiplicative separable solution:

$$w(x,t) = (t+C)^{3/4}u(x),$$

where C is an arbitrary constant, and the function $u = u(x)$ is determined by the autonomous ordinary differential equation

$$a(u^{-4/3}u'_x)'_x + bu^{-1/3} - \tfrac{3}{4}u = 0.$$

4°. The substitution $u = w^{-4/3}$ leads to an equation with quadratic nonlinearity of the form 5.1.9.11 with $c = -\frac{4}{3}b$ and $k = s = 0$:

$$\frac{\partial u}{\partial t} = au\frac{\partial^2 u}{\partial x^2} - \frac{3}{4}a\left(\frac{\partial u}{\partial x}\right)^2 - \frac{4}{3}bu^2. \tag{2}$$

For $a = -b$, equation (2) has a solution of the form

$$u = \varphi_1(t) + \varphi_2(t)\cos(kx) + \varphi_3(t)\sin(kx) + \varphi_4(t)\cos(2kx) + \varphi_5(t)\sin(2kx), \quad k = \tfrac{2}{\sqrt{3}},$$

where the functions $\varphi_n = \varphi_n(t)$ are determined by the system of first-order ordinary differential equations (not written out here).

For $a = b$, equation (2) has a solution of the form

$$u = \varphi_1(t) + \varphi_2(t)\cosh(kx) + \varphi_3(t)\sinh(kx) + \varphi_4(t)\cosh(2kx) + \varphi_5(t)\sinh(2kx), \quad k = \tfrac{2}{\sqrt{3}}.$$

⊙ *References for equation* 5.1.11.6: N. H. Ibragimov (1994, pp. 134, 136), V. A. Galaktionov (1995), A. A. Samarskii, V. A. Galaktionov, S. P. Kurdyumov, and A. P. Mikhailov (1995), A. D. Polyanin and V. F. Zaitsev (2002, pp. 27–28).

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{-3/2}\dfrac{\partial w}{\partial x}\right) + bw^{5/2}.$

1°. Functional separable solution:

$$w(x,t) = a^{2/3}\left[3Ax^3 + f_2(t)x^2 + f_1(t)x + f_0(t)\right]^{-2/3}.$$

Here,

$$f_2(t) = 3\int \varphi(t)\,dt + 3B, \quad f_1(t) = \frac{1}{A}\left[\int \varphi(t)\,dt + B\right]^2 + \frac{1}{2A}\varphi(t),$$
$$f_0(t) = \frac{1}{9A^2}\left[\int \varphi(t)\,dt + B\right]^3 + \frac{1}{6A^2}\varphi(t)\left[\int \varphi(t)\,dt + B\right] + \frac{1}{36A^2}\varphi_t'(t),$$

where the function $\varphi(t)$ is defined implicitly by

$$\int (C_1 - 108A^2ab\varphi - 8\varphi^3)^{-1/2}\,d\varphi = t + C_2,$$

and A, B, C_1, and C_2 are arbitrary constants.

2°. For other solutions, see equations 5.1.11.12 with $m = -3/2$ and 5.1.11.14 with $m = -3/2$ and $k = 5/2$.

3°. The substitution $w = u^{-2/3}$ leads to an equation of the form 5.1.9.7:

$$\frac{\partial u}{\partial t} = au\frac{\partial^2 u}{\partial x^2} - \frac{2}{3}a\left(\frac{\partial u}{\partial x}\right)^2 - \frac{3}{2}b.$$

8. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{-4/3}\dfrac{\partial w}{\partial x}\right) + cw^{7/3}.$

This is a special case of equation 5.1.12.5 with $b = 0$. See also equation 5.1.11.14 with $m = -4/3$ and $k = 7/3$.

9. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(\dfrac{1}{\sqrt{w}}\dfrac{\partial w}{\partial x}\right) + b\sqrt{w}.$

This is a special case of equation 5.1.11.8 with $m = -\frac{1}{2}$. This equation with $a = \frac{1}{2}$ and $b = -1$ arises in plasma physics; it describes energy diffusion in a strong magnetic field in the presence of energy sinks due to plasma radiation.

Generalized separable solution:

$$w = \varphi^2(x)\left(C\int \frac{dx}{\varphi^2(x)} - t\right)^2,$$

where C is an arbitrary constant and the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$2a\varphi_{xx}'' + b\varphi + 2\varphi^2 = 0.$$

⊙ *Reference*: A. Oron and P. Rosenau (1986).

10. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + bw.$

1°. Solutions:

$$w(x,t) = e^{bt}(Ax+B)^{\frac{1}{m+1}},$$

$$w(x,t) = e^{bt}\left(\pm\frac{\lambda m}{a}x + \frac{\lambda^2}{ab}e^{bmt} + A\right)^{\frac{1}{m}},$$

$$w(x,t) = e^{bt}\left[\frac{bm^2(x-A)^2}{2a(m+2)(B-e^{bmt})}\right]^{\frac{1}{m}},$$

$$w(x,t) = \left[A\exp\left(\frac{2bmt}{m+2}\right) - \frac{bm^2(x+B)^2}{2a(m+2)}\right]^{\frac{1}{m}},$$

$$w(x,t) = e^{bt}\left[A|e^{bmt}+B|^{-\frac{m}{m+2}} - \frac{bm^2}{2a(m+2)}\frac{(x+C)^2}{e^{bmt}+B}\right]^{\frac{1}{m}},$$

where A, B, C, and λ are arbitrary constants.

2°. By the transformation

$$w(x,t) = e^{bt}v(x,\tau), \quad \tau = \frac{1}{bm}e^{bmt} + \text{const}$$

the original equation can be reduced to an equation of the form 5.1.10.8:

$$\frac{\partial v}{\partial \tau} = a\frac{\partial}{\partial x}\left(v^m\frac{\partial v}{\partial x}\right).$$

3°. See also equation 5.1.11.14 with $k = 1$.

⊙ *References for equation* 5.1.11.10: L. K. Martinson and K. B. Pavlov (1972), A. D. Polyanin and V. F. Zaitsev (2002, pp. 28–31).

11. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + bw^{m+1}.$

1°. Multiplicative separable solution ($a = b = 1$, $m > 0$):

$$w(x,t) = \begin{cases} \left[\dfrac{2(m+1)}{m(m+2)}\dfrac{\cos^2(\pi x/L)}{(t_0-t)}\right]^{1/m} & \text{for } |x| \le \dfrac{L}{2}, \\ 0 & \text{for } |x| > \dfrac{L}{2}, \end{cases} \tag{1}$$

where $L = 2\pi(m+1)^{1/2}/m$. Solution (1) describes a blow-up regime that exists on a limited time interval $t \in [0,\, t_0)$. The solution is localized in the interval $|x| < L/2$.

2°. Multiplicative separable solution:

$$w(x,t) = \left(\frac{Ae^{\mu x} + Be^{-\mu x} + D}{m\lambda t + C}\right)^{1/m},$$

$$B = \frac{\lambda^2(m+1)^2}{4b^2A(m+2)^2}, \quad D = -\frac{\lambda(m+1)}{b(m+2)}, \quad \mu = m\sqrt{-\frac{b}{a(m+1)}},$$

where A, C, and λ are arbitrary constants, $ab(m+1) < 0$.

3°. Multiplicative separable solution (C and λ are arbitrary constants):

$$w(x,t) = (m\lambda t + C)^{-1/m}\varphi(x),$$

where the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$a(\varphi^m \varphi'_x)'_x + b\varphi^{m+1} + \lambda\varphi = 0. \tag{2}$$

Equation (2) has the following solution in implicit form:

$$\int \varphi^m \left[A - \frac{2\lambda}{a(m+2)}\varphi^{m+2} - \frac{b}{a(m+1)}\varphi^{2m+2}\right]^{-1/2} d\varphi = \pm x + B,$$

where A and B are arbitrary constants.

4°. Functional separable solutions [it is assumed that $ab(m+1) < 0$]:

$$w(x,t) = \left[f(t) + g(t)e^{\lambda x}\right]^{1/m}, \qquad \lambda = \pm m\sqrt{\frac{-b}{a(m+1)}},$$

where the functions $f = f(t)$ and $g = g(t)$ are determined by the autonomous system of ordinary differential equations

$$f'_t = bmf^2, \qquad g'_t = \frac{bm(m+2)}{m+1}fg.$$

Integrating yields

$$f(t) = (C_1 - bmt)^{-1}, \quad g(t) = C_2(C_1 - bmt)^{-\frac{m+2}{m+1}},$$

where C_1 and C_2 are arbitrary constants.

5°. Functional separable solution (A and B are arbitrary constants):

$$w(x,t) = \left[f(t) + g(t)(Ae^{\lambda x} + Be^{-\lambda x})\right]^{1/m}, \qquad \lambda = m\sqrt{\frac{-b}{a(m+1)}}, \tag{3}$$

where the functions $f = f(t)$ and $g = g(t)$ are determined by the autonomous system of ordinary differential equations

$$f'_t = bmf^2 + \frac{4bmAB}{m+1}g^2, \quad g'_t = \frac{bm(m+2)}{m+1}fg. \tag{4}$$

On eliminating t from this system, one obtains a homogeneous first-order equation:

$$f'_g = \frac{m+1}{m+2}\frac{f}{g} + \frac{4AB}{m+2}\frac{g}{f}. \tag{5}$$

The substitution $\zeta = f/g$ leads to a separable equation. Integrating yields the solution of equation (5) in the form

$$f = \pm g\left(4AB + C_1 g^{-\frac{2}{m+2}}\right)^{\frac{1}{2}}, \qquad C_1 \text{ is any.}$$

Substituting this expression into the second equation of system (4), one obtains a separable equation for $g = g(t)$.

6°. The functional separable solutions

$$w(x,t) = \big[f(t) + g(t)\cosh(\lambda x)\big]^{1/m},$$
$$w(x,t) = \big[f(t) + g(t)\sinh(\lambda x)\big]^{1/m}$$

are special cases of formula (3) with $A = \frac{1}{2}$, $B = \frac{1}{2}$ and $A = \frac{1}{2}$, $B = -\frac{1}{2}$, respectively.

7°. Functional separable solution [it is assumed that $ab(m+1) > 0$]:

$$w(x,t) = \big[f(t) + g(t)\cos(\lambda x + C)\big]^{1/m}, \qquad \lambda = m\sqrt{\frac{b}{a(m+1)}},$$

where the functions $f = f(t)$ and $g = g(t)$ are determined by the autonomous system of ordinary differential equations

$$f'_t = bmf^2 + \frac{bm}{m+1}g^2, \quad g'_t = \frac{bm(m+2)}{m+1}fg,$$

which coincides with system (4) for $AB = \frac{1}{4}$.

⊙ *References for equation* 5.1.11.11: N. V. Zmitrenko, S. P. Kurdyumov, A. P. Mikhailov, and A. A. Samarskii (1976), M. Bertsch, R. Kersner, and L. A. Peletier (1985), V. A. Galaktionov and S. A. Posashkov (1989), A. A. Samarskii, V. A. Galaktionov, S. P. Kurdyumov, and A. P. Mikhailov (1995), V. F. Zaitsev and A. D. Polyanin (1996, pp. 407–408).

12. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + bw^{1-m}.$

This is a special case of equation 5.1.11.14 with $k = 1 - m$, where some solutions are also given.

Functional separable solution for $m \neq -1$ and $m \neq -2$:

$$w(x,t) = \left[\frac{1}{F}(x+A)^2 + B|F|^{-\frac{m}{m+2}} - \frac{bm^2}{4a(m+1)}F\right]^{1/m},$$
$$F = F(t) = C - \frac{2a(m+2)}{m}t,$$

where A, B, and C are arbitrary constants.

For $m = -2$ see also equation 5.1.11.4 and for $m = -1$ see equation 5.1.11.5.

⊙ *References*: R. Kersner (1978 *a, b*).

13. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{2n}\dfrac{\partial w}{\partial x}\right) + bw^{1-n}.$

This is a special case of equation 5.1.11.14 with $m = 2n$ and $k = 1 - n$.

Generalized traveling-wave solution:

$$w(x,t) = \left[\pm\frac{x + C_1}{\sqrt{C_2 - kt}} - \frac{bn^2}{3a(n+1)}(C_2 - kt)\right]^{1/n}, \qquad k = \frac{2a(n+1)}{n},$$

where C_1 and C_2 are arbitrary constants.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2004, p. 36).

14. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + bw^k.$

This is a special case of equation 5.6.15.2 with $f(w) = aw^m$ and $g(w) = bw^k$. For $b = 0$, see Subsection 5.1.10.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^2 w(\pm C_1^{k-m-1}x + C_2, C_1^{2k-2}t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. A space-homogeneous solution and a stationary solution are given by (the latter is written out in implicit form):

$$w(t) = \begin{cases} \big[(1-k)bt + C\big]^{\frac{1}{1-k}} & \text{if } k \neq 1, \\ Ce^{bt} & \text{if } k = 1, \end{cases}$$

$$\int w^m\left[A - \frac{2b}{a(m+k+1)}w^{m+k+1}\right]^{-1/2} dw = \pm x + B,$$

where A, B, and C are arbitrary constants.

3°. Traveling-wave solutions:

$$w = w(z), \quad z = \pm x + \lambda t,$$

where the function $w(z)$ is determined by the autonomous ordinary differential equation

$$a(w^m w_z')_z' - \lambda w_z' + bw^k = 0. \tag{1}$$

The substitution

$$u(w) = \frac{a}{\lambda}w^m w_z'$$

brings (1) to the Abel equation

$$uu_w' - u = -ab\lambda^{-2}w^{m+k}. \tag{2}$$

The book by Polyanin and Zaitsev (2003) presents exact solutions of equation (2) with $m + k = -2, -1, -\frac{1}{2}, 0, 1$.

4°. Self-similar solution for $k \neq 1$:

$$w = t^{\frac{1}{1-k}}u(\xi), \quad \xi = xt^{\frac{k-m-1}{2(1-k)}},$$

where the function $u(\xi)$ is determined by the ordinary differential equation

$$a(u^m u_\xi')_\xi' + \frac{m-k+1}{2(1-k)}\xi u_\xi' + bu^k - \frac{1}{1-k}u = 0.$$

⊙ *Reference for equation* 5.1.11.14: V. A. Dorodnitsyn (1982).

5.1.12. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + bw + c_1w^{k_1} + c_2w^{k_2} + c_3w^{k_3}$

▷ *Equations of this form admit traveling-wave solutions* $w = w(kx + \lambda t)$.

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) + bw + c.$

For $b = 0$, see equation 5.1.11.1 and for $c = 0$, see equation 5.1.11.2.

Generalized separable solutions linear and quadratic in x:

$$w(x,t) = C_1xe^{bt} + C_2e^{bt} + \frac{aC_1^2}{b}e^{2bt} - \frac{c}{b},$$

$$w(x,t) = \frac{be^{bt}(x+C_2)^2}{\varphi(t)} + C_3\frac{e^{bt}}{\varphi^{1/3}(t)} + \frac{ce^{bt}}{\varphi^{1/3}(t)}\int e^{-bt}\varphi^{1/3}(t)dt, \qquad \varphi(t) = C_1 - 6ae^{bt},$$

where C_1, C_2, and C_3 are arbitrary constants. The first solution is degenerate.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2004, p. 37).

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) + bw + cw^2.$

This is a special case of equation 5.6.10.1.

There are generalized separable solutions of the forms:

$$w = f(t) + g(t)[a\cosh(kx) + b\sinh(kx)],$$
$$w = f(t) + g(t)[a\cos(kx) + b\sin(kx)],$$

where a and b are arbitrary constants, and the functions $f(t)$ and $g(t)$ and the constant k are determined by substituting these solutions into the original equation.

⊙ *References*: W. I. Newman (1980), V. A. Galaktionov (1995), V. F. Zaitsev and A. D. Polyanin (1996, pp. 425–427).

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(\dfrac{1}{\sqrt{w}}\dfrac{\partial w}{\partial x}\right) + b + c\sqrt{w}.$

This is a special case of equation 5.1.12.12 with $m = -1/2$.

Functional separable solution:

$$w = [\varphi(x) + \psi(x)t]^2,$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(x)$ are determined by the system of ordinary differential equations

$$a\varphi''_{xx} - \varphi\psi + \tfrac{1}{2}c\varphi + \tfrac{1}{2}b = 0,$$
$$a\psi''_{xx} - \psi^2 + \tfrac{1}{2}c\psi = 0.$$

This system can be easily integrated by starting from the latter equation. In particular, by setting $\psi = \text{const}$, one arrives at the special solution

$$w = \left(\frac{1}{2}ct - \frac{b}{4a}x^2 + C_1x + C_2\right)^2,$$

where C_1 and C_2 are arbitrary constants.

⊙ *Reference*: V. A. Galaktionov and S. R. Svirshchevskii (2007, pp. 280–281).

4. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(\dfrac{1}{\sqrt{w}}\dfrac{\partial w}{\partial x}\right) + b + cw + d\sqrt{w}.$

Generalized separable solution:

$$w = \left[f(x)\exp\left(\tfrac{1}{2}ct\right) + g(x)\right]^2,$$

where the functions $f = f(x)$ and $g = g(x)$ are determined by the system of ordinary differential equations

$$2af''_{xx} + cfg + df = 0,$$
$$2ag''_{xx} + cg^2 + dg + b = 0.$$

The latter equation has two constant special solutions: $g = k_{1,2} = \text{const}$. In both these cases, the former equation is a linear equation with constant coefficients, which is easily integrable and has solutions that are expressed in terms of exponentials or sines and cosines.

Remark. The constants a, b, and d in the above equation can be replaced by arbitrary functions $a = a(x)$, $b = b(x)$, and $d = d(x)$.

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{-2}\dfrac{\partial w}{\partial x}\right) - bw - cw^3.$

Functional separable solutions for $b \neq 0$:

$$w(x,t) = \pm\left[bC_1e^{2bt}(x+C_2)^2 + C_3F(t) + 2cF(t)\int\frac{dt}{F(t)}\right]^{-1/2}, \qquad F(t) = \exp\left(aC_1e^{2bt} + 2bt\right),$$

where C_1, C_2, and C_3 are arbitrary constants.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2004, p. 37).

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{-4/3}\dfrac{\partial w}{\partial x}\right) + bw^{-1/3} + cw.$

1°. Multiplicative separable solutions:

$$w(x,t) = e^{ct}\left(Ae^{kx} + Be^{-kx}\right)^{-3} \qquad \text{if} \quad b/(3a) = k^2 > 0,$$
$$w(x,t) = e^{ct}\left[A\cos(kx) + B\sin(kx)\right]^{-3} \qquad \text{if} \quad b/(3a) = -k^2 < 0,$$

where A and B are arbitrary constants.

2°. The transformation

$$w = e^{ct}u(x,\tau), \qquad \tau = -\frac{3}{4c}e^{-\frac{4}{3}ct} + \text{const}$$

leads to a simpler equation of the form 5.1.11.6:

$$\frac{\partial u}{\partial \tau} = a\frac{\partial}{\partial x}\left(u^{-4/3}\frac{\partial u}{\partial x}\right) + bu^{-1/3}.$$

3°. See also equation 5.1.12.10.

⊙ *Reference for equation* 5.1.12.6: A. D. Polyanin and V. F. Zaitsev (2004, p. 38).

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{-4/3}\dfrac{\partial w}{\partial x}\right) + bw + cw^{5/3}.$

Functional separable solution:

$$w(x,t) = \left[\varphi(t)x^2 + \psi(t)x + \chi(t)\right]^{-3/2},$$

where the functions $\varphi(t)$, $\psi(t)$, and $\chi(t)$ are determined by the system of first-order ordinary differential equations

$$\begin{aligned}
\varphi_t' &= \tfrac{1}{2}a\varphi(4\varphi\chi - \psi^2) - \tfrac{2}{3}b\varphi,\\
\psi_t' &= \tfrac{1}{2}a\psi(4\varphi\chi - \psi^2) - \tfrac{2}{3}b\psi,\\
\chi_t' &= \tfrac{1}{2}a\chi(4\varphi\chi - \psi^2) - \tfrac{2}{3}b\chi - \tfrac{2}{3}c.
\end{aligned}$$

It follows from the first two equations that $\varphi = C\psi$, where C is an arbitrary constant.

Remark. In the original equation, the constants a, b, and c can be replaced by arbitrary functions $a = a(t)$, $b = b(t)$, and $c = c(t)$.

⊙ *Reference*: V. A. Galaktionov, S. A. Posashkov, and S. R. Svirshchevskii (1995).

8. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{-4/3}\dfrac{\partial w}{\partial x}\right) + bw + cw^{7/3}.$

Functional separable solution:

$$w(x,t) = \left[\varphi_4(t)x^4 + \varphi_3(t)x^3 + \varphi_2(t)x^2 + \varphi_1(t)x + \varphi_0(t)\right]^{-3/4},$$

where the functions $\varphi_k = \varphi_k(t)$ are determined by the system of ordinary differential equations

$$\begin{aligned}
\varphi_0' &= -\tfrac{3}{4}a\varphi_1^2 + 2a\varphi_0\varphi_2 - \tfrac{4}{3}b\varphi_0 - \tfrac{4}{3}c,\\
\varphi_1' &= -a\varphi_1\varphi_2 + 6a\varphi_0\varphi_3 - \tfrac{4}{3}b\varphi_1,\\
\varphi_2' &= -a\varphi_2^2 + \tfrac{3}{2}a\varphi_1\varphi_3 + 12a\varphi_0\varphi_4 - \tfrac{4}{3}b\varphi_2,\\
\varphi_3' &= -a\varphi_2\varphi_3 + 6a\varphi_1\varphi_4 - \tfrac{4}{3}b\varphi_3,\\
\varphi_4' &= -\tfrac{3}{4}a\varphi_3^2 + 2a\varphi_2\varphi_4 - \tfrac{4}{3}b\varphi_4.
\end{aligned}$$

The prime denotes a derivative with respect to t.

Remark. In the original equation, the constants a, b, and c can be replaced by arbitrary functions $a = a(t)$, $b = b(t)$, and $c = c(t)$.

⊙ *Reference*: V. A. Galaktionov (1995).

9. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(w^{-4/3}\dfrac{\partial w}{\partial x}\right) - \dfrac{3}{4}w^{-1/3} + bw^{5/3} + cw.$

Functional separable solution:

$$w = [\varphi_1(t) + \varphi_2(t)\cos x + \varphi_3(t)\sin x]^{-3/2},$$

where the functions $\varphi_n = \varphi_n(t)$ are determined by the system of ordinary differential equations

$$\begin{aligned}
\varphi_1' &= \tfrac{1}{2}\varphi_1(\varphi_1^2 - \varphi_2^2 - \varphi_3^2) - \tfrac{2}{3}c\varphi_1 - \tfrac{2}{3}b,\\
\varphi_2' &= \tfrac{1}{2}\varphi_2(\varphi_1^2 - \varphi_2^2 - \varphi_3^2) - \tfrac{2}{3}c\varphi_2,\\
\varphi_3' &= \tfrac{1}{2}\varphi_3(\varphi_1^2 - \varphi_2^2 - \varphi_3^2) - \tfrac{2}{3}c\varphi_3.
\end{aligned}$$

It follows from the last two equations that $\varphi_3 = C\varphi_2$, where C is an arbitrary constant.

Remark. In the original equation, the constants b and c can be replaced by arbitrary functions $b = b(t)$ and $c = c(t)$.

⊙ *Reference*: V. A. Galaktionov and S. R. Svirshchevskii (2007, p. 32).

10. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(w^{-4/3}\dfrac{\partial w}{\partial x}\right) - aw^{-1/3} + bw^{7/3} + cw.$

The substitution $u = w^{-4/3}$ leads to an equation with quadratic nonlinearity:

$$\frac{\partial u}{\partial t} = u\frac{\partial^2 u}{\partial x^2} - \frac{3}{4}\left(\frac{\partial u}{\partial x}\right)^2 + \frac{4}{3}\left(au^2 - cu - b\right).$$

1°. For $a = 1$, there is a solution of the form

$$u = \varphi_1(t) + \varphi_2(t)\cos(kx) + \varphi_3(t)\sin(kx) + \varphi_4(t)\cos(2kx) + \varphi_5(t)\sin(2kx), \quad k = 2\times 3^{-1/2},$$

where the functions $\varphi_n = \varphi_n(t)$ are determined by the system of first-order ordinary differential equations (not written out here).

2°. For $a = -1$, there is a solution of the form

$$u=\varphi_1(t)+\varphi_2(t)\cosh(kx)+\varphi_3(t)\sinh(kx)+\varphi_4(t)\cosh(2kx)+\varphi_5(t)\sinh(2kx), \quad k=2\times 3^{-1/2}.$$

⊙ *Reference for equation* 5.1.12.10: V. A. Galaktionov (1995).

11. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + bw^{m+1} + cw.$

1°. Multiplicative separable solutions:

$$w(x,t) = e^{ct}\left[A\cos(kx) + B\sin(kx)\right]^{\frac{1}{m+1}} \quad \text{if} \quad b(m+1)/a = k^2 > 0,$$
$$w(x,t) = e^{ct}\left[A\exp(kx) + B\exp(-kx)\right]^{\frac{1}{m+1}} \quad \text{if} \quad b(m+1)/a = -k^2 < 0,$$

where A and B are arbitrary constants.

2°. The transformation

$$w = e^{ct}u(x,\tau), \quad \tau = \frac{1}{cm}e^{cmt} + \text{const}$$

leads to a simpler equation of the form 5.1.11.11:

$$\frac{\partial u}{\partial \tau} = a\frac{\partial}{\partial x}\left(u^m\frac{\partial u}{\partial x}\right) + bu^{m+1}.$$

Special case. Multiplicative separable solution for $m = -1$:

$$w = A\exp\left(ct - \frac{b}{2a}x^2 + Bx\right),$$

where A and B are arbitrary constants.

12. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + b + cw^{-m}.$

Functional separable solution:

$$w = \left[c(m+1)t - \frac{b(m+1)}{2a}x^2 + C_1x + C_2\right]^{\frac{1}{m+1}},$$

where C_1 and C_2 are arbitrary constants.

13. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + bw + cw^{1-m}.$

1°. Generalized traveling-wave solution:

$$w(x,t) = \left(C_1e^{bmt}x + \frac{a}{bm^2}e^{2bmt} + C_2e^{bmt} - \frac{c}{b}\right)^{1/m},$$

where C_1 and C_2 are arbitrary constants.

2°. For a more complicated solution, see 5.6.13.6 with $f(t) = b$ and $g(t) = c$.

⊙ *Reference for equation* 5.1.12.13: V. A. Galaktionov and S. A. Posashkov (1989).

14. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + bw^{1+m} + cw + sw^{1-m}.$

This is a special case of equation 5.6.13.7 with $f(t) = c$ and $g(t) = s$.

The substitution $u = w^m$ leads to an equation of the form 5.1.9.10:

$$\frac{\partial u}{\partial t} = au\frac{\partial^2 u}{\partial x^2} + \frac{a}{m}\left(\frac{\partial u}{\partial x}\right)^2 + bmu^2 + cmu + sm.$$

⊙ *Reference*: V. A. Galaktionov and S. A. Posashkov (1989).

15. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{2n}\dfrac{\partial w}{\partial x}\right) + bw + cw^{1-n}.$

Generalized traveling-wave solutions:

$$w(x,t) = \left[\varphi(t)(\pm x + C_1) + cn\varphi(t)\int\frac{dt}{\varphi(t)}\right]^{1/n}, \qquad \varphi(t) = \left[C_2e^{-2bnt} - \frac{a(n+1)}{bn^2}\right]^{-1/2},$$

where C_1 and C_2 are arbitrary constants.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2004, p. 40).

16. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + bw + ck + bkw^{n+1} + cw^{-n}.$

Functional separable solutions:

$$w(x,t) = \left\{\exp\big[b(n+1)t\big]\big[C_1\cos\big(x\sqrt{\lambda}\,\big) + C_2\sin\big(x\sqrt{\lambda}\,\big)\big] - \frac{c}{b}\right\}^{\frac{1}{n+1}} \qquad \text{if } \lambda > 0,$$

$$w(x,t) = \left\{\exp\big[b(n+1)t\big]\big[C_1\cosh\big(x\sqrt{|\lambda|}\,\big) + C_2\sinh\big(x\sqrt{|\lambda|}\,\big)\big] - \frac{c}{b}\right\}^{\frac{1}{n+1}} \qquad \text{if } \lambda < 0,$$

where C_1 and C_2 are arbitrary constants and $\lambda = \dfrac{bk}{a}(n+1)$.

⊙ *Reference*: V. A. Galaktionov (1994).

5.1.13. Equations of the Form $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + g(w)$

▷ *Equations of this form admit traveling-wave solutions* $w = w(kx + \lambda t)$.

1. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[(aw^2 + bw)\dfrac{\partial w}{\partial x}\right]$.

This is a special case of equation 5.6.15.1 with $f(w) = aw^2 + bw$ and a special case of equation 5.1.13.4 with n=1.

Solutions:

$$w(x,t) = \pm\sqrt{2C_1x + 2aC_1^2t + C_2} - \frac{b}{a},$$
$$w(x,t) = \pm\frac{x + C_1}{\sqrt{C_2 - 4at}} - \frac{b}{2a},$$

where C_1 and C_2 are arbitrary constants. The first solution is of the traveling-wave type and the second one is self-similar.

2. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(\dfrac{a}{w^2 + b^2}\dfrac{\partial w}{\partial x}\right)$.

This is a special case of equation 5.6.15.1 with $f(w) = a(w^2 + b^2)^{-1}$.

1°. Solutions (A and B are arbitrary constants):

$$w(x) = b\tan(Ax + B),$$
$$w(x,t) = \pm bx\left(A - 2ab^{-2}t - x^2\right)^{-1/2},$$
$$w(x,t) = Ab\exp(ab^{-2}t - x)\left\{1 - A^2\exp\left[2(ab^{-2}t - x)\right]\right\}^{-1/2}.$$

2°. Traveling-wave solution in implicit form:

$$\lambda(kx + \lambda t) + B = \frac{ak^2}{A^2 + b^2}\left[\ln|w + A| - \frac{1}{2}\ln(w^2 + b^2) + \frac{A}{b}\arctan\frac{w}{b}\right],$$

where A, B, k, and λ are arbitrary constants.

3°. The substitution

$$w = \frac{bu}{\sqrt{1 - u^2}} \tag{1}$$

leads to the equation

$$\frac{\partial u}{\partial t} = \frac{a}{b^2}\left[(1 - u^2)\frac{\partial^2 u}{\partial x^2} + u\left(\frac{\partial u}{\partial x}\right)^2\right], \tag{2}$$

which is a special case of 12.1.2.12 with $F(t,\xi,\eta) = ab^{-2}(\xi - \eta)$. Equation (2) has multiplicative separable solutions

$$u = \frac{Ae^{\lambda x} + Be^{-\lambda x}}{\sqrt{4AB + Ce^{-kt}}}, \qquad k = \frac{2a\lambda^2}{b^2};$$
$$u = \frac{A\sin(\lambda x) + B\cos(\lambda x)}{\sqrt{A^2 + B^2 + Ce^{kt}}}, \quad k = \frac{2a\lambda^2}{b^2}, \tag{3}$$

where A, B, C, and λ are arbitrary constants. Formulas (1) and (3) provide two solutions of the original equation.

4°. Solution:

$$w = b\tan\left(\pm\frac{1}{2}z \pm \frac{a}{b^2}t + C\right),$$
$$z = x^2\cos^{-2}\left(\pm\frac{1}{2}z - \arctan\big(\psi(z)\big) \pm \frac{a}{b^2}t + C\right),$$

where C is an arbitrary constant and the function $\psi = \psi(z)$ is determined by the ordinary differential equation

$$\psi'_z = \frac{1}{2}(1+\psi^2)\left(\pm 1 - \frac{\psi}{z}\right).$$

Here the function $z = z(x,t)$ is defined implicitly.

5°. Solution:

$$w = b\tan\left(\varphi(z) + \arctan\big(\psi(z)\big) + \frac{C}{2}\ln\frac{at}{b^2}\right),$$
$$z = \frac{b^2x^2}{at}\cos^{-2}\left(\varphi(z) + \frac{C}{2}\ln\frac{at}{b^2}\right),$$

where C is an arbitrary constant and the functions $\varphi(z)$ and $\psi(z)$ are determined by the system of ordinary differential equations

$$\varphi'_z = \frac{\psi}{2z}, \quad \psi'_z = \frac{1}{2}(1+\psi^2)\left(\frac{C}{2} - \frac{\psi}{2} - \frac{\psi}{z}\right).$$

Here the function $z = z(x,t)$ is defined implicitly.

⊙ *References for equation* 5.1.13.2: I. Sh. Akhatov, R. K. Gazizov, and N. H. Ibragimov (1989), N. H. Ibragimov (1994, pp. 125–126), P. W. Doyle and P. J. Vassiliou (1998).

3. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(\dfrac{a}{1-w^2}\dfrac{\partial w}{\partial x}\right)$.

Solutions:

$$w = \pm\frac{x + C_1}{\sqrt{(x+C_1)^2 + 2at + C_2}},$$
$$w = \pm\frac{e^{at-x}}{C\sqrt{1 + C^2e^{2(x-at)}}},$$
$$w = \pm\frac{\sinh(x+C_1)}{\sqrt{\cosh^2(x+C_1) - C_2e^{-2at}}},$$
$$w = \pm\frac{\cosh(x+C_1)}{\sqrt{\sinh^2(x+C_1) + C_2e^{-2at}}},$$
$$w = \pm\frac{\sin(x+C_1)}{\sqrt{C_2e^{2at} - \cos^2(x+C_1)}},$$

where C_1 and C_2 are arbitrary constants.

⊙ *Reference*: P. W. Doyle and P. J. Vassiliou (1998).

4. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[(aw^{2n} + bw^n)\dfrac{\partial w}{\partial x}\right].$

This is a special case of equation 5.6.15.1 with $f(w) = aw^{2n} + bw^n$.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1 = w(C_1 x + C_2, C_1^2 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solution:

$$w(x,t) = \left(\pm\sqrt{2C_1 nx + 2aC_1^2 nt + C_2} - \frac{b}{a}\right)^{1/n},$$

where C_1 and C_2 are arbitrary constants.

3°. Self-similar solution:

$$w(x,t) = \left[\pm\frac{x + C_1}{\sqrt{C_2 - kt}} - \frac{b}{a(n+1)}\right]^{1/n}, \qquad k = \frac{2a(n+1)}{n}.$$

⊙ *Reference for equation* 5.1.13.4: A. D. Polyanin and V. F. Zaitsev (2004, pp. 41–42).

5. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[(aw^{2n} + bw^n)\dfrac{\partial w}{\partial x}\right] + cw^{1-n}.$

Generalized traveling-wave solution:

$$w(x,t) = \left[\pm\frac{x + C_1}{\sqrt{C_2 - kt}} - \frac{cn^2}{3a(n+1)}(C_2 - kt) - \frac{b}{a(n+1)}\right]^{1/n}, \qquad k = \frac{2a(n+1)}{n},$$

where C_1 and C_2 are arbitrary constants.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2004, p. 42).

6. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[(aw^{2n} + bw^n)\dfrac{\partial w}{\partial x}\right] + cw + sw^{1-n}.$

Generalized traveling-wave solutions:

$$w(x,t) = \left[\varphi(t)(\pm x + C_1) + \frac{b}{n}\varphi(t)\int \varphi(t)\,dt + sn\varphi(t)\int \frac{dt}{\varphi(t)}\right]^{1/n},$$
$$\varphi(t) = \left[C_2 e^{-2cnt} - \frac{a(n+1)}{cn^2}\right]^{-1/2},$$

where C_1 and C_2 are arbitrary constants.

5.1.14. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m \dfrac{\partial w}{\partial x}\right) + f(x,t,w)$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{-4/3}\dfrac{\partial w}{\partial x}\right) + bx^m w^{-1/3}.$

For $m = 0$, see equation 5.1.11.6. For $m \neq 0$, the original equation can be reduced to a simpler equation 5.1.10.4 that corresponds to the case $b = 0$ [see equation 5.6.13.1 with $f(x) = bx^m$].

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m \dfrac{\partial w}{\partial x}\right) + bt^n w.$

This is a special case of equation 5.6.13.4 with $f(t) = bt^n$.

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m \dfrac{\partial w}{\partial x}\right) + be^{\lambda t} w.$

This is a special case of equation 5.6.13.4 with $f(t) = be^{\lambda t}$.

4. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m \dfrac{\partial w}{\partial x}\right) + bt^n w^{1-m}.$

This is a special case of equation 5.6.13.5 with $f(t) = bt^n$.

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m \dfrac{\partial w}{\partial x}\right) + be^{\lambda t} w^{1-m}.$

This is a special case of equation 5.6.13.5 with $f(t) = be^{\lambda t}$.

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m \dfrac{\partial w}{\partial x}\right) + bt^n w + ct^k w^{1-m}.$

This is a special case of equation 5.6.13.6 with $f(t) = bt^n$ and $g(t) = ct^k$.

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m \dfrac{\partial w}{\partial x}\right) + be^{\lambda t} w + ce^{\mu t} w^{1-m}.$

This is a special case of equation 5.6.13.6 with $f(t) = be^{\lambda t}$ and $g(t) = ce^{\mu t}$.

8. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m \dfrac{\partial w}{\partial x}\right) + bw^{1+m} + ct^n w + st^k w^{1-m}.$

This is a special case of equation 5.6.13.7 with $f(t) = ct^n$ and $g(t) = st^k$.

9. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m \dfrac{\partial w}{\partial x}\right) + bx^n w^{1+m}.$

This is a special case of equation 5.6.13.8 with $f(x) = bx^n$.

5.1.15. Equations of the Form $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + g(w)\dfrac{\partial w}{\partial x}$

1. $\dfrac{\partial w}{\partial t} + aw\dfrac{\partial w}{\partial x} = b\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right).$

This is a special case of equation 5.1.15.8 with $n = 1$.

Degenerate solution linear in x:

$$w(x,t) = \frac{ax + b\ln|t + C_1| + C_2}{a^2(t + C_1)},$$

where C_1 and C_2 are arbitrary constants.

2. $\dfrac{\partial w}{\partial t} + aw\dfrac{\partial w}{\partial x} = b\dfrac{\partial}{\partial x}\left(w^2\dfrac{\partial w}{\partial x}\right).$

This is a special case of equation 5.1.15.8 with $n = 2$.

1°. Traveling-wave solution in implicit form:

$$2b\int \frac{w^2\,dw}{aw^2 + 2\lambda w + C_1} = x + \lambda t + C_2,$$

where C_1, C_2, and λ are arbitrary constants.

2°. Degenerate solution linear in x:

$$w(x,t) = (x + C_1)f(t).$$

Here, C_1 is an arbitrary constant, and the function $f = f(t)$ is determined by the ordinary differential equation

$$f'_t + af^2 = 2bf^3,$$

whose solution can be represented in implicit form:

$$\frac{1}{af} + \frac{2b}{a^2}\ln\left|\frac{2bf - a}{f}\right| = t + C_2.$$

3. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(w^{-2}\dfrac{\partial w}{\partial x}\right) + aw^{-2}\dfrac{\partial w}{\partial x}.$

Fokas–Yortsos equation.

1°. This equation can be linearized; see equation 5.6.15.5 (the special case in Item 2°) and equation 5.6.13.3 with $f(x) = a$.

2°. Traveling-wave solution in implicit form:

$$\int \frac{dw}{w(\lambda w^2 + C_1 w + a)} = x + \lambda t + C_2,$$

where C_1, C_2, and λ are arbitrary constants (the integral can be calculated explicitly).

3°. Multiplicative separable solution:

$$w(x,t) = f(x)\sqrt{C_1 t + C_2},$$

where C_1 and C_2 are arbitrary constants, and the function $f = f(x)$ is determined by the autonomous ordinary differential equation

$$(f^{-2}f'_x)'_x + af^{-2}f'_x = \tfrac{1}{2}C_1 f.$$

4°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1 = \frac{aw^2}{aw - w_x}$$

is also a solution of the equation.

⊙ *References for equation* 5.1.15.3: A. S. Fokas and Y. C. Yortsos (1982), V. Tychynin and O. Rasin (2004), N. M. Ivanova (2008).

4. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[\dfrac{a}{(w+b)^2}\dfrac{\partial w}{\partial x}\right] + c\dfrac{\partial w}{\partial x}.$

The transformation

$$u(z,t) = w(x,t) + b, \qquad z = x + ct$$

leads to an equation of the form 5.1.10.3:

$$\frac{\partial u}{\partial t} = a\frac{\partial}{\partial z}\left(u^{-2}\frac{\partial u}{\partial z}\right).$$

5. $\dfrac{\partial w}{\partial t} + aw\dfrac{\partial w}{\partial x} = \dfrac{\partial}{\partial x}\left[(bw^2 + cw)\dfrac{\partial w}{\partial x}\right].$

1°. Degenerate solution linear in x:

$$w(x,t) = f(t)x + g(t),$$

where the functions $f = f(t)$ and $g = g(t)$ are determined by the system of ordinary differential equations

$$f'_t + af^2 = 2bf^3,$$
$$g'_t + afg = 2bf^2 g + cf^2.$$

The solution of the first equation can be found in 5.1.15.2, Item 2°. The second equation is easy to integrate, since it is linear in g.

2°. Traveling-wave solution in implicit form:

$$2\int \frac{bw^2 + cw}{aw^2 + 2\lambda w + C_1}\,dw = x + \lambda t + C_2,$$

where C_1, C_2, and λ are arbitrary constants.

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + b\,\operatorname{sign} x\dfrac{\partial w}{\partial x}.$

This equation arises in biology.

By changing from t and x to the new variables t and $z = |x| + bt$, we arrive at a simpler equation of the form 5.1.10.8:

$$\frac{\partial w}{\partial t} = a\frac{\partial}{\partial z}\left(w^m\frac{\partial w}{\partial z}\right).$$

⊙ *References*: J. D. Murray (1989), N. Shigesada, K. Kawasaki, and E. Teramoto (1979).

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + b\dfrac{\partial w}{\partial x}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = Aw\big(Bx + b(B - A^nB^2)t + C_1, A^nB^2t + C_2\big),$$

where A, B, C_1, and C_2 are arbitrary constants, are also solutions of the equation.

2°. The transformation

$$w = U(z,t), \qquad z = x + bt,$$

leads to a simpler equation of the form 5.1.10.8:

$$\frac{\partial U}{\partial t} = a\frac{\partial}{\partial z}\left(U^n\frac{\partial U}{\partial z}\right).$$

8. $\dfrac{\partial w}{\partial t} + aw\dfrac{\partial w}{\partial x} = b\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1w(C_1^{1-n}x + C_2, C_1^{2-n}t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solution in implicit form:

$$2b\int\frac{w^n\,dw}{aw^2 + 2\lambda w + C_1} = x + \lambda t + C_2,$$

where C_1, C_2, and λ are arbitrary constants.

3°. Self-similar solution for $n \neq 2$:

$$w(x,t) = u(z)t^{1/(n-2)}, \qquad z = xt^{-(n-1)/(n-2)},$$

where the function $u = u(z)$ is determined by the ordinary differential equation

$$bu^nu''_{zz} + 2bnu^{n-1}(u'_z)^2 - \left(au - \frac{n-1}{n-2}z\right)u'_z - \frac{1}{n-2}u = 0.$$

9. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + (bw^n + c)\dfrac{\partial w}{\partial x}.$

Generalized traveling-wave solution:

$$w(x,t) = \left[\frac{C_2 - x}{b(t+C_1)} + \frac{a\ln|t+C_1|}{b^2 n(t+C_1)} - \frac{c}{b}\right]^{1/n},$$

where C_1 and C_2 are arbitrary constants.

10. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{2n}\dfrac{\partial w}{\partial x}\right) + bw^n\dfrac{\partial w}{\partial x}.$

This is a special case of equation 5.1.15.11 with $k = 2n$ and is a special case of equation 5.1.15.12 with $b = s = 0$.

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(C_1^{-n}x + C_2, t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solution in implicit form:

$$a\int \frac{w^{2n}\,dw}{C_1 w + C_2 - \frac{b}{n+1}w^{n+1}} = x + C_1 t + C_3 \quad \text{if} \quad n \neq -1,$$
$$a\int \frac{dw}{w^2(C_1 w + C_2 - b\ln|x|)} = x + C_1 t + C_3 \quad \text{if} \quad n = -1,$$

where C_1, C_2, and C_3 are arbitrary constants.

3°. Multiplicative separable solution:

$$w = (x + C_1)^{1/n}\varphi(t),$$

where C_1 is an arbitrary constant and the function $\varphi = \varphi(t)$ is determined by the separable first-order ordinary differential equation

$$\varphi_t' = a\frac{n+1}{n^2}\varphi^{2n+1} + \frac{b}{n}\varphi^{n+1}.$$

Integrating yields the general solution in implicit form

$$\varphi^{-n} - \frac{a(n+1)}{bn}\ln\left[\varphi^{-n} + \frac{a(n+1)}{bn}\right] = -bt + C_2,$$

where C_2 is an arbitrary constant.

⊙ *References for equation* 5.1.15.10: C. M. Yung, K. Verburg, and P. Baveye (1994), A. D. Polyanin and V. F. Zaitsev (2004, p. 46), N. M. Ivanova (2008).

11. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^k\dfrac{\partial w}{\partial x}\right) + bw^n\dfrac{\partial w}{\partial x}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(C_1^{n-k}x + C_2, C_1^{2n-k}t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solution in implicit form:

$$a\int \frac{w^k\,dw}{C_1 w + C_2 - \frac{b}{n+1}w^{n+1}} = x + C_1 t + C_3 \quad \text{if} \quad n \neq -1,$$

$$a\int \frac{w^k\,dw}{C_1 w + C_2 - b\ln|x|} = x + C_1 t + C_3 \quad \text{if} \quad n = -1,$$

where C_1, C_2, and C_3 are arbitrary constants.

3°. Self-similar solution:

$$w = t^{\frac{1}{k-2n}}U(z), \qquad z = xt^{\frac{n-k}{k-2n}},$$

where the function $U = U(z)$ is determined by the ordinary differential equation

$$\frac{1}{k-2n}\big[U + (n-k)zU_z'\big] = a(U^kU_z')_z' + bU^nU_z'.$$

Special case. For $k = n$, there is the generalized traveling-wave solution

$$w = \left\{\frac{C_2 - x}{b(t+C_1)} + \frac{a\ln|t+C_1|}{b^2n(t+C_1)}\right\}^{1/n},$$

where C_1 and C_2 are arbitrary constants (this solution is a special case of the one given in equation 5.1.15.12).

⊙ *References for equation* 5.1.15.11: C. M. Yung, K. Verburg, and P. Baveye (1994), N. M. Ivanova (2008).

12. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[\left(aw^{2n} + bw^n\right)\dfrac{\partial w}{\partial x}\right] + \left(cw^n + s\right)\dfrac{\partial w}{\partial x}.$

Generalized traveling-wave solution:

$$w(x,t) = \left[\varphi(t)x + (st + C_1)\varphi(t) + \frac{b}{n}\varphi(t)\int \varphi(t)\,dt\right]^{1/n},$$

where C_1 is an arbitrary constant and the function $\varphi(t)$ is determined by the first-order separable ordinary differential equation

$$\varphi_t' = \frac{a(n+1)}{n}\varphi^3 + c\varphi^2.$$

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2004, p. 46).

5.1.16. Equations of the Form $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + g\left(x, t, w, \dfrac{\partial w}{\partial x}\right)$

1. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(w^{-1}\dfrac{\partial w}{\partial x}\right) + bx\dfrac{\partial w}{\partial x}.$

This is a special case of equation 5.1.16.4 with $n = -1$.

Solutions:

$$w(x,t) = C_1 \exp\left(C_2 x e^{bt}\right),$$

$$w(x,t) = \frac{2b}{2bxe^{bt} - e^{2bt} + C_1},$$

$$w(x,t) = \frac{4be^{2bt}}{4b^2(xe^{bt} + C_1)^2 + C_2 e^{4bt}},$$

$$w(x,t) = \frac{C_1 C_2^2 \exp(2bt + C_2 x e^{bt})}{b[1 - C_1 \exp(C_2 x e^{bt})]^2},$$

$$w(x,t) = \frac{C_1}{2bC_2 + C_3 \exp(C_1 x e^{bt} + C_1 C_2 e^{2bt})},$$

$$w(x,t) = \frac{C_1^2 e^{2bt}}{b\cos^2(C_1 x e^{bt} + C_2)},$$

where C_1, C_2, and C_3 are arbitrary constants.

⊙ *Reference*: N. M. Ivanova (2008).

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{-2}\dfrac{\partial w}{\partial x}\right) + b\dfrac{\partial w}{\partial x} + cw.$

This is a special case of equation 5.6.13.10 with $m = -2$, $f(t) = b$, and $g(t) = c$.

The transformation (A and B are arbitrary constants)

$$w(x,t) = e^{ct}u(z,\tau), \quad z = x + bt + A, \quad \tau = B - \frac{1}{2c}e^{-2ct}$$

leads to an equation of the form 5.1.10.3:

$$\frac{\partial u}{\partial \tau} = a\frac{\partial}{\partial z}\left(u^{-2}\frac{\partial u}{\partial z}\right).$$

⊙ *Reference*: V. A. Dorodnitsyn and S. R. Svirshchevskii (1983); the case $b = 0$ was treated.

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{-2}\dfrac{\partial w}{\partial x}\right) + (bx + c)\dfrac{\partial w}{\partial x} + sw.$

This is a special case of equation 5.6.13.12 with $m = -2$, $f(t) = b$, $g(t) = c$, and $h(t) = s$.

1°. For $b = 0$, see equation 5.1.16.2.

2°. Let $b \neq 0$ and $b \neq s$. The transformation

$$w(x,t) = e^{st}u(z,\tau), \quad z = e^{bt}\left(x + \frac{c}{b}\right), \quad \tau = \frac{1}{2(b-s)}e^{2(b-s)t}$$

leads to a simpler equation of the form 5.1.10.3:

$$\frac{\partial u}{\partial \tau} = a\frac{\partial}{\partial z}\left(u^{-2}\frac{\partial u}{\partial z}\right).$$

3°. Let $b \neq 0$ and $b = s$. The transformation

$$w(x,t) = e^{bt}u(z,t), \quad z = e^{bt}\left(x + \frac{c}{b}\right)$$

leads to a simpler equation of the form 5.1.10.3:

$$\frac{\partial u}{\partial t} = a\frac{\partial}{\partial z}\left(u^{-2}\frac{\partial u}{\partial z}\right).$$

⊙ *References for equation* 5.1.16.3: S. I. Svinolupov (1985), V. F. Zaitsev and A. D. Polyanin (1996, pp. 434–435).

4. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) - bx\dfrac{\partial w}{\partial x}$.

This is a special case of equation 5.1.16.5 with $c = s = 0$.

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-2}w(\pm C_1^n x + C_2 e^{bt}, t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Generalized traveling-wave solutions:

$$w(x,t) = \left(\pm x + C_1 e^{bt}\right)^{2/n}\left[C_2 e^{2bt} + \frac{a(n+2)}{bn}\right]^{-1/n},$$

where C_1 and C_2 are arbitrary constants.

3°. Generalized traveling-wave solutions:

$$w = w(z), \quad z = \pm x + Ce^{bt},$$

where C is an arbitrary constant and the function $w(z)$ is determined by the ordinary differential equation

$$a(w^n w_z')_z' - bzw_z' = 0.$$

4°. The transformation

$$w(x,t) = u(z,\tau), \quad z = e^{-bt}x, \quad \tau = C - \frac{1}{2b}e^{-2bt},$$

where C is an arbitrary constant, leads to a simpler equation of the form 5.1.10.8:

$$\frac{\partial u}{\partial \tau} = a\frac{\partial}{\partial z}\left(u^n\frac{\partial u}{\partial z}\right).$$

If $n = -1$ or $n = -2$, see 5.1.10.2 or 5.1.10.3 for solutions of this equation.

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + (bx + c)\dfrac{\partial w}{\partial x} + sw.$

This is a special case of equation 5.6.13.12.

The transformation

$$w(x,t) = e^{st}u(z,\tau), \quad z = e^{bt}\left(x + \frac{c}{b}\right), \quad \tau = \frac{1}{2b + sn}e^{(2b+sn)t},$$

leads to a simpler equation of the form 5.1.10.8:

$$\frac{\partial u}{\partial \tau} = a\frac{\partial}{\partial z}\left(u^n\frac{\partial u}{\partial z}\right).$$

If $n = -1$ or $n = -2$, see 5.1.10.2 or 5.1.10.3 for solutions of this equation.

⊙ *Reference*: V. F. Zaitsev and A. D. Polyanin (1996, pp. 434–435).

6. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + aw^n\dfrac{\partial^2 w}{\partial x^2} + bw^{n-1}\left(\dfrac{\partial w}{\partial x}\right)^2.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(C_2 x + C_3, C_1^n C_2^2 t + C_4),$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. Functional separable solution for $b = \frac{1}{3}n(a-2) - a - 1$:

$$w(x,t) = \left[n\sum_{k=0}^{3}\varphi_k(t)x^k\right]^{1/n}.$$

Here,

$$\varphi_3(t) = A, \quad \varphi_2(t) = \int \psi(t)\,dt + B, \quad \varphi_1(t) = \frac{1}{3A}\left[\int \psi(t)\,dt + B\right]^2 + \frac{1}{2A\beta n}\psi(t),$$

$$\varphi_0(t) = \frac{1}{27A^2}\left[\int \psi(t)\,dt + B\right]^3 + \frac{1}{6A^2\beta n}\psi(t)\left[\int \psi(t)\,dt + B\right] + \frac{1}{12A^2\beta^2 n^2}\psi_t'(t),$$

where the function $\psi = \psi(t)$ is defined implicitly by

$$\int \left(C_1 - \tfrac{8}{3}\beta n\psi^3\right)^{-1/2} d\psi = C_2 + t,$$

A, B, C_1, and C_2 are arbitrary constants, $\beta = a + 1$; $A \neq 0$, $n \neq 0$, $a > -1$.

3°. Functional separable solution for $b = \frac{1}{4}n(a-3) - a - 1$:

$$w(x,t) = \left[n\sum_{k=0}^{4}\varphi_k(t)x^k\right]^{1/n}.$$

Here, the functions $\varphi_k = \varphi_k(t)$ are determined by the system of ordinary differential equations

$$\begin{aligned}
\varphi_0' &= -\tfrac{3}{4}\beta\varphi_1^2 + 2\beta\varphi_2\varphi_0,\\
\varphi_1' &= -\beta\varphi_1\varphi_2 + 6\beta\varphi_3\varphi_0,\\
\varphi_2' &= -\beta\varphi_2^2 + \tfrac{3}{2}\beta\varphi_1\varphi_3 + 12\beta\varphi_4\varphi_0,\\
\varphi_3' &= -\beta\varphi_2\varphi_3 + 6\beta\varphi_1\varphi_4,\\
\varphi_4' &= -\tfrac{3}{4}\beta\varphi_3^2 + 2\beta\varphi_2\varphi_4,
\end{aligned}$$

where $\beta = n(a+1)$; the prime denotes a derivative with respect to t.

4°. There are exact solutions of the following forms:

$$w(x,t) = F(z), \quad z = Ax + Bt;$$
$$w(x,t) = (At + B)^{-1/n} G(x);$$
$$w(x,t) = t^{\beta} H(\xi), \quad \xi = xt^{-\frac{\beta n+1}{2}};$$
$$w(x,t) = e^{-2t} U(\eta), \quad \eta = xe^{nt};$$
$$w(x,t) = (At + B)^{-1/n} V(\zeta), \quad \zeta = x + C\ln(At + B),$$

where A, B, C, and β are arbitrary constants. The first solution is of the traveling-wave type, the second is a solution in multiplicative separable form, and the third is self-similar.

⊙ *Reference for equation* 5.1.16.6: G. A. Rudykh and E. I. Semenov (1998).

5.1.17. Other Equations

1. $$\boldsymbol{w\frac{\partial w}{\partial t} = w\frac{\partial^2 w}{\partial x^2} - \left(\frac{\partial w}{\partial x}\right)^2 + aw\frac{\partial w}{\partial x} + bw^2.}$$

The substitution $w = e^u$ leads to the linear equation

$$\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2} + a\frac{\partial u}{\partial x} + b.$$

Remark. In the original equation, the parameters a and b can be replaced by arbitrary functions $a = a(x,t)$ and $b = b(x,t)$.

2. $$\boldsymbol{w\frac{\partial w}{\partial t} = aw\frac{\partial^2 w}{\partial x^2} + b\left(\frac{\partial w}{\partial x}\right)^2 + cw\frac{\partial w}{\partial x} + sw^2.}$$

1°. For $a \neq -b$, the substitution

$$w = f^{\frac{a}{a+b}}$$

leads to the linear equation

$$\frac{\partial f}{\partial t} = a\frac{\partial^2 f}{\partial x^2} + c\frac{\partial f}{\partial x} + \frac{s(a+b)}{a}f.$$

2°. For $a = -b$, the substitution $\tau = at$ leads to an equation of the form 5.1.17.1.

Remark. In the original equation, the parameters c and s can be replaced by arbitrary functions $c = c(x,t)$ and $s = s(x,t)$.

3. $$\boldsymbol{w\frac{\partial w}{\partial t} = w\frac{\partial^2 w}{\partial x^2} + a\left(\frac{\partial w}{\partial x}\right)^2 + bw\frac{\partial w}{\partial x} + cw^2 + sw^{1-a}.}$$

1°. For $a \neq -1$, the substitution

$$w = f^{\frac{1}{1+a}}$$

leads to the linear equation

$$\frac{\partial f}{\partial t} = \frac{\partial^2 f}{\partial x^2} + b\frac{\partial f}{\partial x} + c(a+1)f + s(a+1).$$

Remark. In the original equation, the parameters b, c, and s can be replaced by arbitrary functions $b = b(x)$, $c = c(x)$, and $s = s(x)$.

4. $\dfrac{\partial w}{\partial t} = w\dfrac{\partial^2 w}{\partial x^2} + (k-1)\left(\dfrac{\partial w}{\partial x}\right)^2 + aw^{k+1}\dfrac{\partial w}{\partial x}.$

The substitution $w = u^{1/k}$ leads to an unnormalized Burgers equation

$$\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2} + au\frac{\partial u}{\partial x},$$

that can be linearized (see equation 5.1.5.3).

5. $\dfrac{\partial w}{\partial t} = (aw^2 + bw^4)\dfrac{\partial^2 w}{\partial x^2}.$

This is a special case of equation 5.6.16.3 with $f(w) = aw^2 + bw^4$.

1°. Self-similar solutions:

$$w(x,t) = \pm\left[\frac{(x+C_1)^2}{2a(t+C_2)} - \frac{a}{b}\right]^{1/2},$$

where C_1 and C_2 are arbitrary constants.

2°. Functional separable solutions:

$$w(x,t) = \pm\left[\varphi(t)(x^2 + C_1x + C_2) - \frac{a}{b}\right]^{1/2},$$

where C_1 and C_2 are arbitrary constants, and the function $\varphi(t)$ is determined by the first-order separable equation

$$\varphi'_t = -2a\varphi^2 + \tfrac{1}{2}b(4C_2 - C_1^2)\varphi^3,$$

whose solution can be written out in implicit form.

6. $\dfrac{\partial w}{\partial t} = (aw^2 + bw^4)\dfrac{\partial^2 w}{\partial x^2} + cw + kw^{-1}.$

Functional separable solutions:

$$w(x,t) = \pm\sqrt{\varphi(t)x^2 + \psi(t)x + \chi(t)},$$

where the functions $\varphi(t)$, $\psi(t)$, and $\chi(t)$ are determined by the system of first-order ordinary differential equations

$$\begin{aligned}
\varphi'_t &= \tfrac{1}{2}b\varphi(4\varphi\chi - \psi^2) + 2c\varphi,\\
\psi'_t &= \tfrac{1}{2}b\psi(4\varphi\chi - \psi^2) + 2c\psi,\\
\chi'_t &= \tfrac{1}{2}(b\chi + a)(4\varphi\chi - \psi^2) + 2c\chi + 2k.
\end{aligned}$$

It follows from the first two equations that $\varphi = C\psi$, where C is an arbitrary constant.

Remark. The above remains true if the equation coefficients are arbitrary functions of time: $a = a(t)$, $b = b(t)$, $c = c(t)$, and $k = k(t)$.

7. $\dfrac{\partial w}{\partial t} = ax^{4-k}w^k\dfrac{\partial^2 w}{\partial x^2}.$

This is a special case of equation 5.6.16.4 with $f(u) = au^k$.

The transformation

$$w(x,t) = xu(z,t), \quad z = 1/x$$

leads to a simpler equation of the form 5.1.9.26:

$$\frac{\partial u}{\partial t} = au^k\frac{\partial^2 u}{\partial z^2}.$$

8. $\dfrac{\partial w}{\partial t} = ax^n w^k\dfrac{\partial^2 w}{\partial x^2}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(C_2 x, C_1^k C_2^{2-n} t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. The substitution $u = w^{1-k}$ leads to an equation of the form 5.1.17.10:

$$\frac{\partial u}{\partial t} = ax^n\frac{\partial}{\partial x}\left(u^{\frac{k}{1-k}}\frac{\partial u}{\partial x}\right).$$

3°. The transformation

$$w(x,t) = xu(z,t), \quad z = 1/x$$

leads to an equation of the similar form

$$\frac{\partial u}{\partial t} = az^{4-n-k}u^k\frac{\partial^2 u}{\partial z^2}.$$

9. $\dfrac{\partial w}{\partial t} = ax^{\frac{3m+4}{m+1}}\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right).$

This is a special case of equation 5.1.17.10.

The transformation

$$w(x,t) = x^{\frac{1}{m+1}}u(z,t), \quad z = \frac{1}{x}$$

leads to a simpler equation of the form 5.1.10.8:

$$\frac{\partial u}{\partial t} = a\frac{\partial}{\partial z}\left(u^m\frac{\partial u}{\partial z}\right).$$

10. $\dfrac{\partial w}{\partial t} = ax^n\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right).$

This equation occurs in nonlinear problems of heat and mass transfer and is a special case of equation 5.6.17.16 with $f(w) = aw^m$. For $n = 0$, see equation 5.1.10.8.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w(C_2 x, C_1^m C_2^{2-n} t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Solutions:

$$w(x) = (Ax + B)^{\frac{1}{m+1}},$$

$$w(x,t) = k(\lambda t + A)^{-\frac{1}{m}} x^{\frac{2-n}{m}}, \quad k = \left[\frac{m\lambda}{a(n-2)(2+m-n-nm)}\right]^{\frac{1}{m}},$$

$$w(x,t) = t^{(1-n)\beta}\left[\frac{m\beta}{a(2-n)}\left(xt^{\beta}\right)^{2-n} + A\right]^{\frac{1}{m}}, \quad \beta = \frac{1}{nm+n-m-2},$$

$$w(x,t) = \exp(-\lambda t)\left[\frac{\lambda}{a}(m+1)^2 x^{\frac{m}{m+1}} \exp(\lambda m t) + A\right]^{\frac{1}{m}}, \quad n = \frac{m+2}{m+1},$$

where A, B, and λ are arbitrary constants.

3°. Multiplicative separable solution:

$$w(x,t) = (\lambda t + A)^{-1/m} f(x),$$

where the function $f = f(x)$ is expressed via solutions to the Emden–Fowler equation

$$F''_{xx} + \frac{\lambda(m+1)}{am} x^{-n} F^{\frac{1}{m+1}} = 0, \qquad F = f^{m+1}. \tag{1}$$

To the power-law particular solution of this equation there corresponds the second solution of the original equation in Item 2°.

The order of equation (1) can be reduced; the equation is analyzed in detail in Polyanin and Zaitsev (2003), where its exact solutions for 26 different pairs of values of the parameters n and m are presented.

4°. Self-similar solution for $n \neq -2$:

$$w = w(z), \quad z = xt^{\frac{1}{n-2}},$$

where the function $w(z)$ is determined by the ordinary differential equation

$$a(2-n)\left(w^m w'_z\right)'_z + z^{1-n} w'_z = 0. \tag{2}$$

The book by Zaitsev and Polyanin (1993) presents the general solution of equation (2) for $m = -1$ and any n.

5°. Self-similar solution:

$$w = t^{\alpha} g(\zeta), \quad \zeta = xt^{\beta}, \qquad \beta = \frac{m\alpha + 1}{n-2}, \quad \alpha \text{ is any},$$

where the function $g(\zeta)$ is determined by the ordinary differential equation

$$a\zeta^n \left(g^m g'_\zeta\right)'_\zeta = \beta\zeta g'_\zeta + \alpha g. \tag{3}$$

This equation is homogeneous, and, hence, its order can be reduced (thereafter it can be transformed to an Abel equation of the second kind).

In the special case

$$\alpha = \frac{1-n}{nm+n-m-2}, \quad \beta = \frac{1}{nm+n-m-2},$$

a first integral of equation (3) is given by

$$ag^m g'_\zeta = \beta\zeta^{1-n} g + C. \tag{4}$$

To $C = 0$ in (4) there corresponds the third solution in Item 2°.

In the general case, the change of variable $G = g^{m+1}$ brings (3) to the equation

$$G''_{\zeta\zeta} = A_1\zeta^{1-n} G^{-\frac{m}{m+1}} G'_\zeta + A_2\zeta^{-n} G^{\frac{1}{m+1}}, \tag{5}$$

where $A_1 = \beta/a$ and $A_2 = \alpha(m+1)/a$. Exact analytical solutions of equation (5) for various values of the parameters n and m can be found in the books by Polyanin and Zaitsev (1995, 2003).

6°. Generalized self-similar solution:

$$w = e^{\lambda(n-2)t}\varphi(u), \quad u = xe^{\lambda mt}, \qquad \lambda \text{ is any},$$

where the function $\varphi(u)$ is determined by the ordinary differential equation

$$au^n(\varphi^m\varphi'_u)'_u = \lambda mu\varphi'_u + \lambda(n-2)\varphi. \tag{6}$$

This equation is homogeneous, so its order can be reduced (thereafter it can be transformed to an Abel equation of the second kind).

In the special case $n = \dfrac{m+2}{m+1}$, equation (6) has the first integral

$$a\varphi^m\varphi'_u = \lambda mu^{-\frac{1}{m+1}}\varphi + C.$$

To $C = 0$ there corresponds the last solution in Item 2°.

In the general case, the change of variable $\Phi = \varphi^{m+1}$ brings (6) to an equation that coincides, up to notation, with (5).

7°. For $n = 2$, there are solutions of the form

$$w = w(\xi), \quad \xi = \ln|x| - \lambda t,$$

which are defined implicitly by

$$a(m+1)\int \frac{w^m\,dw}{aw^{m+1} - \lambda(m+1)w + C_1} = \xi + C_2,$$

where λ, C_1, and C_2 are arbitrary constants. To the special case $C_1 = 0$ there corresponds the solution

$$w(x,t) = \left[\frac{\lambda(m+1)}{a} + C|x|^{\frac{m}{m+1}}\exp\left(-\frac{m\lambda}{m+1}t\right)\right]^{\frac{1}{m}},$$

where C is an arbitrary constant.

8°. The transformation

$$w(x,t) = x^{\frac{1}{m+1}}u(z,t), \quad z = \frac{1}{x}$$

leads to an equation of the similar form

$$\frac{\partial u}{\partial t} = az^{\frac{4+3m-n-nm}{m+1}}\frac{\partial}{\partial z}\left(u^m\frac{\partial u}{\partial z}\right).$$

⊙ *Reference for equation* 5.1.17.10: V. F. Zaitsev and A. D. Polyanin (1996, pp. 410–412).

11. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[\left(\dfrac{ax+b}{cw+k}\right)^2 \dfrac{\partial w}{\partial x}\right].$

The substitution $u = \dfrac{cw+k}{ax+b}$ $(c \neq 0)$ leads to an equation of the form 5.1.10.3:

$$\frac{\partial u}{\partial t} = \frac{\partial}{\partial x}\left(u^{-2}\frac{\partial u}{\partial x}\right).$$

⊙ *Reference*: A. Munier, J. R. Burgan, J. Gutierres, E. Fijalkow, and M. R. Feix (1981).

12. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(x^n w^m \dfrac{\partial w}{\partial x}\right).$

This is a special case of equation 5.6.17.5 with $f(x) = ax^n$.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w(C_2 x, C_1^m C_2^{2-n} t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Let $m \neq -1$ and $2m - 2n - nm + 3 \neq 0$. The transformation

$$w(x,t) = x^{\frac{1-n}{m+1}} u(\xi, t), \quad \xi = x^{\frac{2m-2n-nm+3}{m+1}}$$

leads to an equation of the similar form

$$\frac{\partial u}{\partial t} = A\frac{\partial}{\partial \xi}\left(\xi^{\frac{3m-3n-2nm+4}{2m-2n-nm+3}} u^m \frac{\partial u}{\partial \xi}\right), \tag{1}$$

where $A = a\left(\dfrac{2m-2n-nm+3}{m+1}\right)^2$.

3°. In the special case $n = \dfrac{3m+4}{2m+3}$, the transformed equation is very simple and coincides, up to notation, with equation 5.1.10.8:

$$\frac{\partial u}{\partial t} = A\frac{\partial}{\partial \xi}\left(u^m \frac{\partial u}{\partial \xi}\right).$$

4°. In the special case of $n = 2$ and $m = -2$, the transformed equation becomes

$$\frac{\partial u}{\partial t} = A\frac{\partial}{\partial \xi}\left(u^{-2}\frac{\partial u}{\partial \xi}\right),$$

so it coincides with equation 5.1.10.3 (which can further be reduced to the linear heat equation).

⊙ *Reference for equation* 5.1.17.12: V. F. Zaitsev and A. D. Polyanin (1996, pp. 412–413).

13. $\dfrac{\partial w}{\partial t} = \dfrac{a}{x^n}\dfrac{\partial}{\partial x}\left(x^n w^m \dfrac{\partial w}{\partial x}\right).$

This equation occurs in nonlinear problems of heat and mass transfer and other applications. For $n = 0$, see equation 5.1.10.8. To $n = 1$ there correspond two-dimensional problems with axial symmetry, and to $n = 2$ there correspond three-dimensional spherically symmetric problems. Equation with $n = 5$ are encountered in the theory of static turbulence. To $m > 0$ there corresponds *slow diffusion* and to $m < 0$, *fast diffusion*.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w(C_2 x, C_1^m C_2^2 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Solutions:

$$w(x) = \left(Ax^{1-n} + B\right)^{\frac{1}{m+1}},$$

$$w(x,t) = \left(\frac{mx^2}{A - kt}\right)^{\frac{1}{m}}, \quad k = 2a(nm + m + 2),$$

$$w(x,t) = \left(A|kt + B|^{-\frac{m(n+1)}{nm+m+2}} - \frac{mx^2}{kt + B}\right)^{\frac{1}{m}}, \quad k = 2a(nm + m + 2),$$

$$w(x,t) = \left[A\exp\left(-\frac{4a\lambda}{m}t\right) + \lambda x^2\right]^{\frac{1}{m}}, \quad n = -\frac{m+2}{m},$$

where A, B, and λ are arbitrary constants.

3°. Solutions with $m = -\dfrac{2}{n+1}$:

$$w(x,t) = e^{-a\lambda(n+1)t}\left[\frac{\lambda}{n+1}\left(C + x^2 e^{-2a\lambda t}\right)\right]^{-\frac{n+1}{2}},$$

$$w(x,t) = t^{\frac{1+n}{1-n}}\left(\frac{\xi^2}{n-1}\ln\frac{\xi}{C}\right)^{-\frac{n+1}{2}}, \quad \xi = xt^{\frac{1+n}{2(1-n)}},$$

where C and λ are arbitrary constants.

4°. Some other solutions with $m = -1$, $m = -\dfrac{1}{2}$, $m = -\dfrac{2}{n+1}$, and $m = \dfrac{n-3}{2}$ can be found in King (1990 *c*) and Ivanova (2008).

⊙ *References for equation* 5.1.17.13: Ya. B. Zel'dovich and A. S. Kompaneets (1950), G. I. Barenblatt (1952, 1989), R. E. Pattle (1959), Ya. B. Zel'dovich and Yu. P. Raiser (1966), J. R. King (1990 *c*), L. I. Sedov (1993), A. A. Samarskii, V. A. Galaktionov, S. P. Kurdyumov, and A. P. Mikhailov (1995), V. F. Zaitsev and A. D. Polyanin (1996, p. 413), N. M. Ivanova (2008).

14. $\dfrac{\partial w}{\partial t} = k(ax^2 + bx + c)^m w^{4-2m}\dfrac{\partial^2 w}{\partial x^2}.$

This is a special case of equation 5.6.16.5 with $f(u) = ku^{-2m}$.

1°. The transformation

$$w(x,t) = u(z,t)\sqrt{ax^2+bx+c}, \qquad z = \int \frac{dx}{ax^2+bx+c} \tag{1}$$

leads to the equation

$$\frac{\partial u}{\partial t} = ku^{4-2m}\frac{\partial^2 u}{\partial z^2} + k(ac-\tfrac{1}{4}b^2)u^{5-2m}, \tag{2}$$

which has a traveling-wave solution $u = u(z+\lambda t)$ and a multiplicative separable solution $u = f(t)g(z)$.

Using the change of variable $\varphi = u^{2m-3}$, one obtains from (2) an equation of the form 5.1.11.11,

$$\frac{\partial \varphi}{\partial t} = k\frac{\partial}{\partial z}\left(\varphi^n \frac{\partial \varphi}{\partial z}\right) + p\varphi^{n+1},$$
$$n = \frac{4-2m}{2m-3}, \qquad p = k(2m-3)(ac-\tfrac{1}{4}b^2),$$

which admits a wide class of exact solutions.

2°. By the transformation

$$w(x,t) = \big[v(\xi,t)\big]^{\frac{1}{2m+3}}, \qquad \xi = \int \frac{dx}{(ax^2+bx+c)^m}, \tag{3}$$

the original equation can be reduced to equation 5.6.17.5:

$$\frac{\partial v}{\partial t} = \frac{\partial}{\partial \xi}\left[F(\xi)v^{\frac{4-2m}{2m-3}}\frac{\partial v}{\partial \xi}\right], \tag{4}$$

where the function $F(\xi)$ is defined parametrically by

$$F(\xi) = \frac{k}{(ax^2+bx+c)^m}, \qquad \xi = \int \frac{dx}{(ax^2+bx+c)^m}. \tag{5}$$

Note some special cases of equation (4) where the function $F = F(\xi)$ can be written out in explicit form:

$$\frac{\partial v}{\partial t} = k\frac{\partial}{\partial \xi}\left(\frac{\cos^2\xi}{v^2}\frac{\partial v}{\partial \xi}\right), \qquad m=1, \quad a=1, \quad b=0, \quad c=1;$$
$$\frac{\partial v}{\partial t} = k\frac{\partial}{\partial \xi}\left(\frac{\cosh^2\xi}{v^2}\frac{\partial v}{\partial \xi}\right), \qquad m=1, \quad a=-1, \quad b=0, \quad c=1;$$
$$\frac{\partial v}{\partial t} = k\frac{\partial}{\partial \xi}\left(\frac{v^{-3/2}}{\cos\xi}\frac{\partial v}{\partial \xi}\right), \qquad m=\frac{1}{2}, \quad a=-1, \quad b=0, \quad c=1.$$

⊙ *Reference for equation* 5.1.17.14: V. F. Zaitsev and A. D. Polyanin (1996, pp. 413–414).

15. $\dfrac{\partial w}{\partial t} = ae^{\lambda x}\dfrac{\partial}{\partial x}\left(w^{-1}\dfrac{\partial w}{\partial x}\right) + b\dfrac{\partial w}{\partial x}.$

For exact solutions to this equations, see Ivanova (2008).

16. $\dfrac{\partial f(t)w}{\partial t} = \dfrac{k}{x^4}\dfrac{\partial}{\partial x}x^5\left[\sqrt{f(t)(1-w)}\,\dfrac{\partial f(t)w}{\partial x}\right].$

Closed von *Kármán–Howarth equation*. It is used for the statistical description of decaying isotropic turbulence in the limit of large Reynolds numbers (see von Kármán and Howarth (1938) and Oberlack and Peters (1993)). Here w is the normalized double correlation function and $f(t) = \overline{u'^2}(t)$ is the turbulence intensity, and $B_{LL} = f(t)w$ is the longitudinal correlation function.

1°. Self-similar solution for $f(t) = t^{-2(\sigma+1)/(\sigma+3)}$ (σ is an arbitrary constant):

$$w = w(\xi), \qquad \xi = xt^{-2/(\sigma+3)}$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$\frac{k}{\xi^4}\frac{d}{d\xi}\left(\xi^5\sqrt{1-w}\,\frac{dw}{d\xi}\right) + \frac{2}{\sigma+3}\xi\frac{dw}{d\xi} + 2\frac{\sigma+1}{\sigma+3}w = 0$$

subject to the boundary conditions

$$w(\xi) = 1 \quad \text{at} \quad \xi = 0, \qquad w(\xi) \to 0 \quad \text{as} \quad \xi \to \infty.$$

Special case. For *Loitsianskii's decay law*, which corresponds to $\sigma = 4$, we have a solution in implicit form

$$\xi = \frac{7}{2}k\left[\ln\left(\frac{1+\sqrt{1-w}}{1-\sqrt{1-w}}\right) - 2\sqrt{1-w}\right].$$

Geometric interpretation: in the new variables $x = \xi/(7k)$, $y = \sqrt{w}$ this solution is transformed to the *tractrix equation*

$$x = -\sqrt{1-y^2} + \frac{1}{2}\ln\left(\frac{1+\sqrt{1-y^2}}{1-\sqrt{1-y^2}}\right),$$

arising in the differential geometry. The curve $x = x(y)$ is the element of Beltarmi surface.

⊙ *Reference*: V. N. Grebenev and M. Oberlack (2009).

2°. The substitution $u = f(t)(1-w)$ leads to the simpler equation

$$\frac{\partial u}{\partial t} = \frac{k}{x^4}\frac{\partial}{\partial x}\left(x^5\sqrt{u}\,\frac{\partial u}{\partial x}\right) + f_t'(t). \tag{1}$$

3°. For a linear function $f(t) = at + b$, equation (1) admits a stationary solution

$$u = \left(C_1x^{-4} + C_2 - \frac{3a}{10k}x\right)^{2/3},$$

where C_1 and C_2 are arbitrary constants. The corresponding nonstationary solution of the original equation is expressed as

$$w = 1 - \frac{1}{at+b}\left(C_1x^{-4} + C_2 - \frac{3a}{10k}x\right)^{2/3}. \tag{2}$$

4°. For a suitable $f(t)$, equation (1) admits a generalized separable solution of the form

$$u = [\varphi(t)x + \psi(t)]^2.$$

5.2. Equations with Exponential Nonlinearities

5.2.1. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b_0 + b_1 e^{\lambda w} + b_2 e^{2\lambda w}$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + be^{\lambda w}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1^{\lambda} x + C_2, C_1^{2\lambda} t + C_3) + 2\ln|C_1|,$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Traveling-wave solution (k and β are arbitrary constants):

$$w = w(z), \qquad z = kx + \beta t,$$

where the function $w(z)$ is determined by the autonomous ordinary differential equation

$$ak^2 w''_{zz} - \beta w'_z + be^{\lambda w} = 0.$$

3°. Solution:

$$w = u(\xi) - \frac{1}{\lambda}\ln t, \qquad \xi = \frac{x}{\sqrt{t}},$$

where the function $u(\xi)$ is determined by the ordinary differential equation

$$au''_{\xi\xi} + \frac{1}{2}\xi u'_\xi + \frac{1}{\lambda} + be^{\lambda u} = 0.$$

⊙ *Reference for equation* 5.2.1.1: N. H. Ibragimov (1994, p. 135), A. A. Samarskii, V. A. Galaktionov, S. P. Kurdyumov, and A. P. Mikhailov (1995).

2. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + a + be^{\lambda w}.$

This equation occurs in heat and mass transfer and combustion theory.

1°. Traveling-wave solutions:

$$w(x,t) = -\frac{2}{\lambda}\ln\big[\beta + C\exp\big(\pm\mu x - \tfrac{1}{2}a\lambda t\big)\big],$$
$$w(x,t) = -\frac{2}{\lambda}\ln\big[-\beta + C\exp\big(\pm\mu x - \tfrac{1}{2}a\lambda t\big)\big], \qquad \beta = \sqrt{-\frac{b}{a}},\ \mu = \sqrt{\frac{a\lambda}{2}},$$

where C is an arbitrary constant.

2°. The solutions of Item 1° are special cases of the traveling-wave solutions

$$w = w(z), \qquad z = \pm\mu x + \sigma t,$$

that satisfy the autonomous equation

$$\mu^2 w''_{zz} - \sigma w'_z + a + be^{\lambda w} = 0. \tag{1}$$

For

$$\mu = \sqrt{\tfrac{1}{2}a\lambda}, \qquad \sigma = \mu^2,$$

the general solution of equation (1) can be written out in parametric form as

$$z = 2\int \frac{f'_\tau(\tau)\,d\tau}{f(\tau)\big[\lambda\tau f(\tau) + 2\big]} + C_1, \qquad w = \frac{2}{\lambda}\ln|f(\tau)|,$$

where the function $f(\tau)$ is defined by

$$f(\tau) = \frac{C_2 - 2\ln\big|\tau + \sqrt{\tau^2 + k}\big|}{\lambda\sqrt{\tau^2 + k}}, \qquad k = \frac{4b}{a\lambda^2},$$

and C_1 and C_2 are arbitrary constants.

⊙ *Reference for equation* 5.2.1.2: V. F. Zaitsev and A. D. Polyanin (1996, p. 414).

3. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + a + be^{\lambda w} + ce^{2\lambda w}$.

Equations of this form are encountered in problems of heat and mass transfer and combustion theory.

1°. Traveling-wave solutions for $a \neq 0$:

$$w(x,t) = -\frac{1}{\lambda}\ln\big[\beta + C\exp(\pm\mu x - a\lambda t)\big], \qquad \mu = \frac{1}{\beta}\sqrt{-c\lambda}, \tag{1}$$

where C is an arbitrary constant and the parameter β is determined by solving the quadratic equation

$$a\beta^2 + b\beta + c = 0.$$

2°. Traveling-wave solutions for $a = 0$:

$$w(x,t) = -\frac{1}{\lambda}\ln\big(\pm\sqrt{-c\lambda}\,x - b\lambda t + C\big). \tag{2}$$

3°. The substitution $u = e^{-\lambda w}$ leads to an equation with quadratic nonlinearity:

$$u\frac{\partial u}{\partial t} = u\frac{\partial^2 u}{\partial x^2} - \left(\frac{\partial u}{\partial x}\right)^2 - a\lambda u^2 - b\lambda u - c\lambda.$$

The particular solution $u = \beta + C\exp(\lambda t + \mu x)$ of this equation generates a solution (1).

4°. Solutions (1) and (2) are special cases of a wider class of traveling-wave solutions $w = w(x + \sigma t)$.

⊙ *Reference for equation* 5.2.1.3: V. F. Zaitsev and A. D. Polyanin (1996, p. 415).

5.2.2. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + f(w)$

▷ *Equations of this form admit traveling-wave solutions* $w = w(kx + \lambda t)$.

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right)$.

This equation governs unsteady heat transfer in a quiescent medium in the case where the thermal diffusivity is exponentially dependent on temperature.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the function

$$w_1 = w(C_1 x + C_2, C_3 t + C_4) + \frac{1}{\lambda}\ln\frac{C_3}{C_1^2},$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. Solutions:

$$w(x,t) = \frac{2}{\lambda}\ln\left(\frac{\pm x + A}{\sqrt{B - 2at}}\right),$$
$$w(x,t) = -\frac{1}{\lambda}\ln\big(C - 2a\lambda\mu t\big) + \frac{1}{\lambda}\ln\big(\lambda\mu x^2 + Ax + B\big),$$

where A, B, C, and μ are arbitrary constants. The first solution is self-similar and the second one is an additive separable solution.

3°. Traveling-wave solution in implicit form:

$$x + \beta t + C_1 = a\int \frac{e^{\lambda w}\,dw}{\beta w + C_2}.$$

4°. Self-similar solution:

$$w = w(y), \qquad y = x/\sqrt{t},$$

where the function $w(y)$ is determined by the ordinary differential equation

$$a(e^{\lambda w}w_y')_y' + \tfrac{1}{2}yw_y' = 0.$$

5°. Solution:

$$w(x,t) = U(\xi) + 2kt, \quad \xi = xe^{-k\lambda t},$$

where k is an arbitrary constant, and the function $U = U(\xi)$ is determined by the ordinary differential equation

$$2k - k\lambda\xi U_\xi' = a(e^{\lambda U}U_\xi')_\xi'.$$

6°. Solution:

$$w(x,t) = F(\zeta) - \frac{1}{\lambda}\ln t, \quad \zeta = x + \beta\ln t,$$

where β is an arbitrary constant, and the function $F = F(\zeta)$ is determined by the first-order ordinary differential equation (C is an arbitrary constant)

$$-\zeta + \beta\lambda F = a\lambda e^{\lambda F}F_\zeta' + C.$$

7°. Solution:

$$w(x,t) = G(\theta) - \frac{2b+1}{\lambda}\ln t, \quad \theta = xt^b,$$

where b is an arbitrary constant, and the function $G = G(\theta)$ is determined by the ordinary differential equation

$$-\frac{2b+1}{\lambda} + b\theta G'_\theta = (ae^{\lambda G}G'_\theta)'_\theta.$$

8°. The substitution $\varphi = e^{\lambda w}$ leads to an equation of the form 5.1.9.1:

$$\frac{\partial \varphi}{\partial t} = a\varphi\frac{\partial^2 \varphi}{\partial x^2}.$$

⊙ *References for equation* 5.2.2.1: L. V. Ovsiannikov (1959, 1982), N. H. Ibragimov (1994, pp. 110, 119), A. A. Samarskii, V. A. Galaktionov, S. P. Kurdyumov, and A. P. Mikhailov (1995).

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^w\dfrac{\partial w}{\partial x}\right) + b.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(C_1x + C_2, t + C_3) - 2\ln|C_1|,$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Additive separable solutions:

$$w(x,t) = \ln|C_1x + C_2| + bt + C_3,$$
$$w(x,t) = 2\ln|\pm x + C_1| - \ln\left(C_2e^{-bt} - \frac{2a}{b}\right).$$

The first solution is degenerate.

3°. The transformation

$$w = bt + u(x,\tau), \quad \tau = \frac{1}{b}e^{bt} + \text{const}$$

leads to an equation of the form 5.2.2.1:

$$\frac{\partial u}{\partial \tau} = a\frac{\partial}{\partial x}\left(e^u\frac{\partial u}{\partial x}\right).$$

⊙ *Reference for equation* 5.2.2.2: A. D. Polyanin and V. F. Zaitsev (2002, p. 41).

3. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(e^w\dfrac{\partial w}{\partial x}\right) - a^2e^w.$

Solutions:

$$w(x,t) = \ln\left|\frac{\pm A\exp[2(\pm ax + B)] + 2\exp(\pm ax + B) + D}{2a^2(t + C)}\right| \mp ax - B,$$

where A, B, C, and D are arbitrary constants (either the upper or the lower signs must be taken).

4. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{w}\dfrac{\partial w}{\partial x}\right) - be^{w}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm x + C_1, C_2 t + C_3) + \ln C_2,$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Additive separable solution:

$$w(x,t) = u(x) - \ln(aC_1 t + C_2),$$

where C_1 and C_2 are arbitrary constants, and the function $u = u(x)$ is determined by the ordinary differential equation

$$u''_{xx} + (u'_x)^2 + C_1 e^{-u} - \frac{b}{a} = 0.$$

Integrating yields the general solution in implicit form:

$$\int \left(C_3 e^{-2u} - 2C_1 e^{-u} + \frac{b}{a}\right)^{-1/2} du = \pm x + C_4.$$

The integral is computable, so the solution can be rewritten in explicit form (if $a = 1$ and $b > 0$, see 5.2.2.3 for a solution).

3°. The substitution $u = e^{w}$ leads to an equation of the form 5.1.9.10:

$$\frac{\partial u}{\partial t} = au\frac{\partial^2 u}{\partial x^2} - bu^2.$$

5. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(e^{w}\dfrac{\partial w}{\partial x}\right) + ae^{w} + b, \qquad a \neq 0, \quad b \neq 0.$

1°. Additive separable solution for $a = k^2 > 0$:

$$w(x,t) = \ln\left[C_1\cos(kx) + C_2\sin(kx)\right] + bt + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants.

2°. Additive separable solution for $a = -k^2 < 0$:

$$w(x,t) = \ln\left[C_1\cosh(kx) + C_2\sinh(kx)\right] + bt + C_3.$$

3°. The transformation

$$w = bt + u(x,\tau), \quad \tau = \frac{1}{b}e^{bt} + \text{const}$$

leads to an equation of the form 5.2.2.4:

$$\frac{\partial u}{\partial \tau} = \frac{\partial}{\partial x}\left(e^{u}\frac{\partial u}{\partial x}\right) + ae^{u}.$$

⊙ *Reference for equation* 5.2.2.5: A. D. Polyanin and V. F. Zaitsev (2002, pp. 41–42).

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{w}\dfrac{\partial w}{\partial x}\right) + be^{\lambda w}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1^{\lambda-1}x + C_2, C_1^{2\lambda}t + C_3) + 2\ln|C_1|,$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Solution for $\lambda \neq 0$:

$$w(x,t) = u(z) - \frac{1}{\lambda}\ln t, \qquad z = 2\ln|x| + \frac{1-\lambda}{\lambda}\ln t,$$

where the function $u = u(z)$ is determined by the ordinary differential equation

$$2a\lambda e^{-z}\left[2(e^{u}u_z')_z' - e^{u}u_z'\right] + b\lambda e^{\lambda u} = (1-\lambda)u_z' - 1.$$

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + b + ce^{-\lambda w}.$

Functional separable solution:

$$w = \frac{1}{\lambda}\ln\left(c\lambda t - \frac{b\lambda}{2a}x^2 + C_1 x + C_2\right),$$

where C_1 and C_2 are arbitrary constants.

8. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + be^{\lambda w} + c + se^{-\lambda w}.$

This is a special case of equation 5.6.14.4 with $f(t) = c$ and $g(t) = s$.

Functional separable solutions:

$$w = \frac{1}{\lambda}\ln\left\{e^{\alpha t}\left[C_1\cos(x\sqrt{\beta}) + C_2\sin(x\sqrt{\beta})\right] + \gamma\right\} \qquad \text{if } ab\lambda > 0,$$

$$w = \frac{1}{\lambda}\ln\left\{e^{\alpha t}\left[C_1\cosh(x\sqrt{-\beta}) + C_2\sinh(x\sqrt{-\beta})\right] + \gamma\right\} \qquad \text{if } ab\lambda < 0.$$

Here, C_1 and C_2 are arbitrary constants and

$$\alpha = \lambda(b\gamma + c), \qquad \beta = b\lambda/a,$$

where $\gamma = \gamma_{1,2}$ are roots of the quadratic equation $b\gamma^2 + c\gamma + s = 0$.

5.2.3. Equations of the Form $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + g(w)$

▷ *Equations of this form admit traveling-wave solutions* $w = w(kx + \lambda t)$.

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(we^{\lambda w}\dfrac{\partial w}{\partial x}\right).$

Traveling-wave solution:

$$w(x,t) = \frac{1}{\lambda}\ln\left(C_1 x + \frac{a}{\lambda}C_1^2 t + C_2\right),$$

where C_1 and C_2 are arbitrary constants.

⊙ *Reference*: A. A. Samarskii, V. A. Galaktionov, S. P. Kurdyumov, and A. P. Mikhailov (1995).

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(we^{\lambda w}\dfrac{\partial w}{\partial x}\right) + b.$

Generalized traveling-wave solution:

$$w(x,t) = \frac{1}{\lambda}\ln\left(C_1 e^{b\lambda t}x + \frac{aC_1^2}{b\lambda^2}e^{2b\lambda t} + C_2 e^{b\lambda t}\right),$$

where C_1 and C_2 are arbitrary constants.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2004, p. 56).

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(we^{w}\dfrac{\partial w}{\partial x}\right) + b(w+2).$

Functional separable solution:

$$w(x,t) = \ln\left[C_1 e^{2bt} - \frac{b}{2a}(x+C_2)^2\right],$$

where C_1 and C_2 are arbitrary constants.

4. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(we^{\lambda w}\dfrac{\partial w}{\partial x}\right) + be^{-\lambda w}.$

Traveling-wave solution:

$$w(x,t) = \frac{1}{\lambda}\ln\left[C_1 x + \left(\frac{aC_1^2}{\lambda} + b\lambda\right)t + C_2\right],$$

where C_1 and C_2 are arbitrary constants.

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(we^{\lambda w}\dfrac{\partial w}{\partial x}\right) + b + ce^{-\lambda w}.$

Generalized traveling-wave solution:

$$w(x,t) = \frac{1}{\lambda}\ln\left(C_1 e^{b\lambda t}x + \frac{aC_1^2}{b\lambda^2}e^{2b\lambda t} + C_2 e^{b\lambda t} - \frac{c}{b}\right),$$

where C_1 and C_2 are arbitrary constants.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2004, p. 57).

6. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[\left(awe^{\lambda w} + be^{\lambda w}\right)\dfrac{\partial w}{\partial x}\right] + b + ce^{-\lambda w}.$

The substitution $w = u - b/a$ leads to an equation of the form 5.2.3.5:

$$\frac{\partial u}{\partial t} = ae^{-b\lambda/a}\frac{\partial}{\partial x}\left(ue^{\lambda u}\frac{\partial u}{\partial x}\right) + b + ce^{b\lambda/a}e^{-\lambda u}.$$

7. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[\left(ae^{2\lambda w} + bwe^{\lambda w}\right)\dfrac{\partial w}{\partial x}\right].$

Self-similar solutions:

$$w(x,t) = \frac{1}{\lambda}\ln\left(\frac{\pm x + C_1}{\sqrt{C_2 - 2at}} - \frac{b}{a\lambda}\right),$$

where C_1 and C_2 are arbitrary constants.

8. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[\left(ae^{2\lambda w} + bwe^{\lambda w}\right)\dfrac{\partial w}{\partial x}\right] + c.$

Generalized traveling-wave solutions:

$$w(x,t) = \frac{1}{\lambda}\ln\left[\pm\varphi(t)x + C_1\varphi(t) + \frac{b}{\lambda}\varphi(t)\int\varphi(t)\,dt\right], \qquad \varphi(t) = \left(C_2e^{-2c\lambda t} - \frac{a}{c\lambda}\right)^{-1/2},$$

where C_1 and C_2 are arbitrary constants.

9. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left[w^n\exp\left(\lambda w^n\right)\dfrac{\partial w}{\partial x}\right] + bw^{1-n}.$

Generalized traveling-wave solutions:

$$w(x,t) = \left(\frac{1}{\lambda}\ln z\right)^{1/n}, \qquad z = C_1e^{bn\lambda t}x + \frac{aC_1^2}{bn^2\lambda^2}e^{2bn\lambda t} + C_2e^{bn\lambda t},$$

where C_1 and C_2 are arbitrary constants.

10. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{-2}e^{1/w}\dfrac{\partial w}{\partial x}\right).$

Solution:

$$w = \frac{z^2 + c}{2at},$$

where

$$z = \frac{x}{\ln\frac{x^2+c}{2e^2at} + \frac{2\sqrt{c}}{x}\arctan\frac{x}{\sqrt{c}} + \frac{b}{x}} \quad \text{if} \quad c > 0,$$

$$z = \frac{x}{\ln\frac{x^2+c}{2e^2at} + \frac{2\sqrt{-c}}{x}\ln\frac{x-\sqrt{-c}}{x+\sqrt{-c}} + \frac{b}{x}} \quad \text{if} \quad c < 0,$$

where b and c are arbitrary constants.

⊙ *References*: I. Tsyfra, A. Messina, A. Napoli, and V. Tretynyk (2004), N. M. Ivanova (2008).

5.2.4. Other Equations Explicitly Independent of x and t

1. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + \beta\dfrac{\partial w}{\partial x} + a + be^{\lambda w} + ce^{2\lambda w}.$

On passing from t, x to the new variables t, $z = x + \beta t$, one arrives at a simpler equation of the form 5.2.1.3:

$$\frac{\partial w}{\partial t} = \frac{\partial^2 w}{\partial z^2} + a + be^{\lambda w} + ce^{2\lambda w}.$$

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + be^{\lambda w}\dfrac{\partial w}{\partial x}.$

This is a special case of equation 5.6.3.8 with $f(w) = be^{\lambda w}$.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the function

$$w_1 = w(C_1 x + C_2, C_1^2 t + C_3) + \frac{1}{\lambda}\ln C_1,$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Apart from the traveling wave $w = w(x + \lambda t)$, there is also an exact solution of the form

$$w = \varphi(\xi) - \frac{1}{2\lambda}\ln t, \qquad \xi = \frac{x}{\sqrt{t}}.$$

3. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + ae^{\lambda w}\left(\dfrac{\partial w}{\partial x}\right)^2.$

This is a special case of equation 5.6.6.8 with $f(w) = ae^{\lambda w}$.

The substitution

$$u = \int \exp\left(\frac{a}{\lambda}e^{\lambda w}\right) dw$$

leads to the linear heat equation $\partial_t u = \partial_{xx} u$.

4. $\dfrac{\partial w}{\partial t} = ae^{\lambda w}\dfrac{\partial^2 w}{\partial x^2}.$

1°. Suppose $w(x, t)$ is a solution of this equation. Then the function

$$w_1 = w(C_1 x + C_2, C_3 t + C_4) + \frac{1}{\lambda}\ln\frac{C_3}{C_1^2},$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solution:

$$w(x, t) = \frac{1}{\lambda}\ln\left[C_2\exp\left(\frac{C_1}{ak^2}z\right) + \frac{\beta}{C_1}\right], \qquad z = kx + \beta t,$$

where C_1, C_2, k, and β are arbitrary constants.

3°. Additive separable solutions:

$$w(x,t)=\frac{1}{\lambda}\ln\left[\frac{\cos^2(C_2x+C_3)}{2C_2^2(at+C_1)}\right],$$
$$w(x,t)=\frac{1}{\lambda}\ln\left[\frac{\sinh^2(C_2x+C_3)}{2C_2^2(at+C_1)}\right],$$
$$w(x,t)=\frac{1}{\lambda}\ln\left[\frac{\cosh^2(C_2x+C_3)}{2C_2^2(C_1-at)}\right],$$

where C_1, C_2, and C_3 are arbitrary constants; note that $\ln(A/B)=\ln|A|-\ln|B|$ for $AB>0$.

4°. Self-similar solution:

$$w=w(y),\qquad y=x/\sqrt{t},$$

where the function $w(y)$ is determined by the ordinary differential equation

$$ae^{\lambda w}w''_{yy}+\tfrac{1}{2}yw'_y=0.$$

5°. Solution:

$$w(x,t)=U(\xi)+2kt,\quad \xi=xe^{-k\lambda t},$$

where k is an arbitrary constant, and the function $U=U(\xi)$ is determined by the ordinary differential equation

$$2k-k\lambda\xi U'_\xi=ae^{\lambda U}U''_{\xi\xi}.$$

6°. Solution:

$$w(x,t)=F(\zeta)-\frac{1}{\lambda}\ln t,\quad \zeta=x+\beta\ln t,$$

where β is an arbitrary constant, and the function $F=F(\zeta)$ is determined by the autonomous ordinary differential equation

$$\beta\lambda F'_\zeta-1=a\lambda e^{\lambda F}F''_{\zeta\zeta}.$$

7°. Solution:

$$w(x,t)=G(\theta)-\frac{2b+1}{\lambda}\ln t,\quad \theta=xt^b,$$

where b is an arbitrary constant, and the function $G=G(\theta)$ is determined by the ordinary differential equation

$$-\frac{2b+1}{\lambda}+b\theta G'_\theta=ae^{\lambda G}G''_{\theta\theta}.$$

5. $\dfrac{\partial w}{\partial t}=ae^{w}\dfrac{\partial^2 w}{\partial x^2}+be^{\lambda w}$.

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1=w(\pm C_1^{\lambda-1}x+C_2,C_1^{2\lambda}t+C_3)+2\ln|C_1|,$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Traveling-wave solution:

$$w = w(\xi), \qquad \xi = kx + \beta t,$$

where k and β are arbitrary constants, and the function $w(\xi)$ is determined by the autonomous ordinary differential equation

$$ak^2 e^w w''_{\xi\xi} - \beta w'_\xi + be^{\lambda w} = 0.$$

3°. Solution for $\lambda \neq 0$:

$$w(x,t) = u(z) - \frac{1}{\lambda}\ln t, \qquad z = 2\ln x + \frac{1-\lambda}{\lambda}\ln t,$$

where the function $u = u(z)$ is determined by the ordinary differential equation

$$2a\lambda e^{u-z}\left(2u''_{zz} - u'_z\right) + b\lambda e^{\lambda u} = (1-\lambda)u'_z - 1.$$

4°. Additive separable solution for $\lambda = 1$:

$$w(x,t) = -\ln(kt + C) + \varphi(x),$$

where the function $\varphi(x)$ is determined by the autonomous ordinary differential equation

$$a\varphi''_{xx} + b + ke^{-\varphi} = 0.$$

5°. Additive separable solutions for $\lambda = 0$:

$$w(x,t) = \ln\left[\frac{b}{2C_2^2}\frac{\cos^2(C_2x + C_3)}{a - C_1e^{-bt}}\right],$$

$$w(x,t) = \ln\left[\frac{b}{2C_2^2}\frac{\sinh^2(C_2x + C_3)}{a - C_1e^{-bt}}\right],$$

$$w(x,t) = \ln\left[\frac{b}{2C_2^2}\frac{\cosh^2(C_2x + C_3)}{C_1e^{-bt} - a}\right],$$

where C_1, C_2, and C_3 are arbitrary constants; note that $\ln(A/B) = \ln|A| - \ln|B|$ for $AB > 0$.

6. $\dfrac{\partial w}{\partial t} + aw\dfrac{\partial w}{\partial x} = b\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right)$.

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w\left(e^{C_1}x + \frac{a}{\lambda}C_1e^{C_1}t + C_2, e^{C_1}t + C_3\right) - \frac{1}{\lambda}C_1,$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solution in implicit form:

$$2b\int \frac{e^{\lambda w}\,dw}{aw^2 + 2\beta w + C_1} = x + \beta t + C_2,$$

where C_1, C_2, and β are arbitrary constants.

3°. Solution:

$$w(x,t) = u(z) + \frac{1}{\lambda}\ln t, \qquad z = \frac{x}{t} - \frac{a}{\lambda}\ln t,$$

where the function $u = u(z)$ is determined by the ordinary differential equation

$$\left(au - z - \frac{a}{\lambda}\right)u'_z + \frac{1}{\lambda} = b(e^\lambda uu'_z)'_z.$$

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + be^{\beta w}\dfrac{\partial w}{\partial x}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w\big(e^{(\beta-\lambda)k}x + A, e^{(2\beta-\lambda)k}t + B\big) + k,$$

where A, B, and k are arbitrary constants, are also solutions of the equation.

2°. Traveling-wave solution in implicit form:

$$a\int \frac{e^{\lambda w}dw}{C_1 w + C_2 - (b/\beta)e^{\beta w}} = x + C_1 t + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants.

3°. Solution with $\lambda \neq 2\beta$:

$$w = U(\zeta) + \frac{1}{\lambda - 2\beta}\ln t, \qquad \zeta = xt^{\frac{\beta-\lambda}{\lambda-2\beta}},$$

where the function $U = U(\zeta)$ is determined by the ordinary differential equation

$$\frac{1}{\lambda-2\beta}\big[(\beta-\lambda)\zeta U'_\zeta + 1\big] = a(e^{\lambda U}U'_\zeta)'_\zeta + be^{\beta U}U'_\zeta.$$

4°. Additive separable solution with $\lambda = 2\beta$:

$$w = \varphi(t) + \frac{1}{\beta}\ln x,$$

where the function $\varphi = \varphi(t)$ is determined by the separable first-order ordinary differential equation

$$\beta\varphi'_t = ae^{2\beta\varphi} + be^{\beta\varphi}.$$

⊙ *References for equation* 5.2.4.7: M. P. Edwards (1994), N. M. Ivanova (2008).

8. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[\big(ae^{2w} + ce^{w}\big)\dfrac{\partial w}{\partial x}\right] + \big(ke^{w} + s\big)\dfrac{\partial w}{\partial x}.$

This is a special case of equation 5.2.4.10 with $b = 0$ and $\lambda = 1$.

9. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[\big(ae^{2w} + bwe^{w}\big)\dfrac{\partial w}{\partial x}\right] + \big(ke^{w} + s\big)\dfrac{\partial w}{\partial x}.$

This is a special case of equation 5.2.4.10 with $c = 0$ and $\lambda = 1$.

Generalized traveling-wave solution:

$$w(x,t) = \ln\left[\varphi(t)x + (st + C_1)\varphi(t) + b\varphi(t)\int \varphi(t)\,dt\right],$$

where C_1 is an arbitrary constant, and the function $\varphi(t)$ is determined by the first-order separable ordinary differential equation

$$\varphi'_t = a\varphi^3 + k\varphi^2,$$

whose general solution can be written out in implicit form

$$-\frac{1}{k\varphi}+\frac{a}{k^2}\ln\left|\frac{a\varphi+k}{\varphi}\right|+C_2=t.$$

Here C_2 is an arbitrary constant and $k\neq 0$.

In special cases, we have

$$\varphi(t)=(C_2-2at)^{-1/2} \quad \text{if } k=0,$$
$$\varphi(t)=(C_2-kt)^{-1} \quad \text{if } a=0.$$

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2004, p. 60).

10. $\dfrac{\partial w}{\partial t}=\dfrac{\partial}{\partial x}\left[\left(ae^{2\lambda w}+bwe^{\lambda w}+ce^{\lambda w}\right)\dfrac{\partial w}{\partial x}\right]+\left(ke^{\lambda w}+s\right)\dfrac{\partial w}{\partial x}.$

Generalized traveling-wave solution:

$$w=\frac{1}{\lambda}\ln\left[\varphi(t)x+(st+C_1)\varphi(t)+\frac{b}{\lambda}\varphi(t)\int\varphi(t)\,dt\right],$$

where C_1 is an arbitrary constant, and the function $\varphi=\varphi(t)$ is determined by the first-order separable ordinary differential equation

$$\varphi_t'=a\varphi^3+k\varphi^2.$$

For solutions to this equation, see the previous equation 5.2.4.9.

5.2.5. Equations Explicitly Dependent on x and/or t

1. $\dfrac{\partial w}{\partial t}=a\dfrac{\partial^2 w}{\partial x^2}+ce^{\lambda w+bx+ct}.$

This is a special case of equation 5.6.1.2 with $f(z,w)=ce^{z+\lambda w}$.

2. $\dfrac{\partial w}{\partial t}=a\dfrac{\partial^2 w}{\partial x^2}+a\lambda\left(\dfrac{\partial w}{\partial x}\right)^2+be^{\beta x+\mu t-\lambda w}.$

This is a special case of equation 5.6.4.9 with $f(x,t)\equiv 0$ and $g(x,t)=be^{\beta x+\mu t}$.

3. $\dfrac{\partial w}{\partial t}=a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right)+bt^n.$

This is a special case of equation 5.6.14.1 with $f(t)=bt^n$.

4. $\dfrac{\partial w}{\partial t}=a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right)+be^{\mu t}.$

This is a special case of equation 5.6.14.1 with $f(t)=be^{\mu t}$.

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + be^{\lambda w} + ce^{\mu t}.$

This is a special case of equation 5.6.14.4 with $f(t) = ce^{\mu t}$ and $g(t) = 0$.

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + bt^n e^{-\lambda w}.$

This is a special case of equation 5.6.14.2 with $f(t) = 0$ and $g(t) = bt^n$.

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + be^{-\lambda w+\mu t}.$

This is a special case of equation 5.6.14.2 with $f(t) = 0$ and $g(t) = be^{\mu t}$.

8. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + be^{\mu t} + ce^{-\lambda w+\nu t}.$

This is a special case of equation 5.6.14.2 with $f(t) = be^{\mu t}$ and $g(t) = ce^{\nu t}$.

9. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + (bx + c)e^{\lambda w}.$

Additive separable solution:

$$w = -\frac{1}{\lambda}\ln(\lambda t + C) + \varphi(x),$$

where C is an arbitrary constant and the function $\varphi(x)$ is determined by the second-order linear ordinary differential equation

$$a\psi''_{xx} + \lambda(bx + c)\psi + \lambda = 0, \qquad \psi = e^{\lambda\varphi}.$$

10. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + be^{\lambda w+\mu x}.$

Additive separable solution:

$$w = -\frac{1}{\lambda}\ln(\lambda t + C) + \varphi(x),$$

where C is an arbitrary constant and the function $\varphi(x)$ is determined by the second-order linear ordinary differential equation

$$a\psi''_{xx} + \lambda be^{\mu x}\psi + \lambda = 0, \qquad \psi = e^{\lambda\varphi}.$$

11. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(x^n e^{\lambda w}\dfrac{\partial w}{\partial x}\right).$

This is a special case of equation 5.6.17.12 with $f(x) = ax^n$.

12. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w+\mu x}\dfrac{\partial w}{\partial x}\right).$

This is a special case of equation 5.6.17.12 with $f(x) = ae^{\mu x}$.

5.3. Equations with Hyperbolic Nonlinearities

5.3.1. Equations Involving Hyperbolic Cosine

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\cosh^k(\lambda w).$

This is a special case of equation 5.6.1.1 with $f(w) = b\cosh^k(\lambda w)$.

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + \beta\cosh^k(\lambda w + bx + ct).$

This is a special case of equation 5.6.1.2 with $f(z, w) = \beta\cosh^k(z + \lambda w)$.

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + (bx + c)\dfrac{\partial w}{\partial x} + s\cosh^k(\lambda w).$

This is a special case of equation 5.6.2.1 with $f(w) = s\cosh^k(\lambda w)$.

4. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + b\cosh^k(\lambda w)\left(\dfrac{\partial w}{\partial x}\right)^2.$

This is a special case of equation 5.6.6.8 with $f(w) = b\cosh^k(\lambda w)$.

5. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + b\cosh^k(\lambda w)\left(\dfrac{\partial w}{\partial x}\right)^2 + c\cosh^k(\beta t)\dfrac{\partial w}{\partial x}.$

This is a special case of equation 5.6.6.10 with $f(w) = b\cosh^k(\lambda w)$, $g(t) = 0$, and $h(t) = c\cosh^k(\beta t)$.

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + 2b\cosh(\lambda w) + c\cosh^k(\beta t).$

This is a special case of equation 5.6.14.4 with $f(t) = c\cosh^k(\beta t)$ and $g(t) = b$.

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left[\cosh^2(\beta w)\dfrac{\partial w}{\partial x}\right].$

This is a special case of equation 5.6.15.1 with $f(w) = a\cosh^2(\beta w)$.

Self-similar solutions:

$$w(x, t) = \frac{1}{\beta}\operatorname{arcsinh}\left(\frac{\pm x + C_1}{\sqrt{C_2 - 2at}}\right),$$

where C_1 and C_2 are arbitrary constants.

8. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left[\cosh^k(\beta w)\dfrac{\partial w}{\partial x}\right].$

This is a special case of equation 5.6.15.1 with $f(w) = a\cosh^k(\beta w)$.

5.3.2. Equations Involving Hyperbolic Sine

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\sinh^k(\lambda w).$

This is a special case of equation 5.6.1.1 with $f(w) = b\sinh^k(\lambda w)$.

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + \beta\sinh^k(\lambda w + bx + ct).$

This is a special case of equation 5.6.1.2 with $f(z, w) = \beta\sinh^k(z + \lambda w)$.

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + (bx + c)\dfrac{\partial w}{\partial x} + s\sinh^k(\lambda w).$

This is a special case of equation 5.6.2.1 with $f(w) = s\sinh^k(\lambda w)$.

4. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + b\sinh^k(\lambda w)\left(\dfrac{\partial w}{\partial x}\right)^2.$

This is a special case of equation 5.6.6.8 with $f(w) = b\sinh^k(\lambda w)$.

5. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + b\sinh^k(\lambda w)\left(\dfrac{\partial w}{\partial x}\right)^2 + c\sinh^k(\beta t)\dfrac{\partial w}{\partial x}.$

This is a special case of equation 5.6.6.10 with $f(w) = b\sinh^k(\lambda w)$, $g(t) = 0$, and $h(t) = c\sinh^k(\beta t)$.

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + 2b\sinh(\lambda w) + c\sinh^k(\beta t).$

This is a special case of equation 5.6.14.4 with $f(t) = c\sinh^k(\beta t)$ and $g(t) = -b$.

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left[\sinh^2(\beta w)\dfrac{\partial w}{\partial x}\right].$

This is a special case of equation 5.6.15.1 with $f(w) = a\sinh^2(\beta w)$.

Self-similar solutions:

$$w(x, t) = \frac{1}{\beta}\operatorname{arccosh}\left(\frac{\pm x + C_1}{\sqrt{C_2 - 2at}}\right),$$

where C_1 and C_2 are arbitrary constants.

8. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left[\sinh^k(\beta w)\dfrac{\partial w}{\partial x}\right].$

This is a special case of equation 5.6.15.1 with $f(w) = a\sinh^k(\beta w)$.

5.3.3. Equations Involving Hyperbolic Tangent

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\tanh^k(\lambda w).$

This is a special case of equation 5.6.1.1 with $f(w) = b\tanh^k(\lambda w)$.

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + \beta\tanh^k(\lambda w + bx + ct).$

This is a special case of equation 5.6.1.2 with $f(z, w) = \beta\tanh^k(z + \lambda w)$.

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + (bx + c)\dfrac{\partial w}{\partial x} + s\tanh^k(\lambda w).$

This is a special case of equation 5.6.2.1 with $f(w) = s\tanh^k(\lambda w)$.

4. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + b\tanh^k(\lambda w)\left(\dfrac{\partial w}{\partial x}\right)^2.$

This is a special case of equation 5.6.6.8 with $f(w) = b\tanh^k(\lambda w)$.

5. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + b\tanh^k(\lambda w)\left(\dfrac{\partial w}{\partial x}\right)^2 + c\tanh^k(\beta t)\dfrac{\partial w}{\partial x}.$

This is a special case of equation 5.6.6.10 with $f(w) = b\tanh^k(\lambda w)$, $g(t) = 0$, and $h(t) = c\tanh^k(\beta t)$.

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left[\tanh^k(\beta w)\dfrac{\partial w}{\partial x}\right].$

This is a special case of equation 5.6.15.1 with $f(w) = a\tanh^k(\beta w)$.

5.3.4. Equations Involving Hyperbolic Cotangent

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\coth^k(\lambda w).$

This is a special case of equation 5.6.1.1 with $f(w) = b\coth^k(\lambda w)$.

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + \beta\coth^k(\lambda w + bx + ct).$

This is a special case of equation 5.6.1.2 with $f(z, w) = \beta\coth^k(z + \lambda w)$.

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + (bx + c)\dfrac{\partial w}{\partial x} + s\coth^k(\lambda w).$

This is a special case of equation 5.6.2.1 with $f(w) = s\coth^k(\lambda w)$.

4. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + b\coth^k(\lambda w)\left(\dfrac{\partial w}{\partial x}\right)^2.$

This is a special case of equation 5.6.6.8 with $f(w) = b\coth^k(\lambda w)$.

5. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + b\coth^k(\lambda w)\left(\dfrac{\partial w}{\partial x}\right)^2 + c\coth^k(\beta t)\dfrac{\partial w}{\partial x}.$

This is a special case of equation 5.6.6.10 with $f(w) = b\coth^k(\lambda w)$, $g(t) = 0$, and $h(t) = c\coth^k(\beta t)$.

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left[\coth^k(\beta w)\dfrac{\partial w}{\partial x}\right].$

This is a special case of equation 5.6.15.1 with $f(w) = a\coth^k(\beta w)$.

5.4. Equations with Logarithmic Nonlinearities

5.4.1. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(x, t, w)$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\ln w.$

This is a special case of equation 5.6.1.1 with $f(w) = b\ln w$.

2. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + aw\ln w.$

This is a special case of equation 5.6.1.1 with $f(w) = aw\ln w$.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the functions

$$w_1 = \exp(C_1 e^{at})w(\pm x + C_2, t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Functional separable solutions:

$$w(x, t) = \exp\left(Ae^{at}x + \frac{A^2}{a}e^{2at} + Be^{at}\right),$$
$$w(x, t) = \exp\left[\tfrac{1}{2} - \tfrac{1}{4}a(x + A)^2 + Be^{at}\right],$$
$$w(x, t) = \exp\left[-\frac{a(x + A)^2}{4(1 + Be^{-at})} + \frac{1}{2B}e^{at}\ln(1 + Be^{-at}) + Ce^{at}\right],$$

where A, B, and C are arbitrary constants.

3°. Multiplicative separable solution:

$$w(x, t) = \exp\left[Ae^{at} + f(x)\right], \tag{1}$$

where the function $f(x)$ is defined implicitly by

$$\int \left(Be^{-2f} - af + \tfrac{1}{2}a\right)^{-1/2} df = \pm x + C. \tag{2}$$

Relations (1) and (2) involve three arbitrary constants, A, B, and C.

4°. There are more complicated solutions of the form

$$w(x, t) = \exp\left[Ae^{at} + f(x + bt)\right],$$

where the function $f(\xi)$ is determined by the autonomous ordinary differential equation

$$f''_{\xi\xi} + (f'_\xi)^2 - bf'_\xi + af = 0.$$

⊙ *References for equation* 5.4.1.2: V. A. Dorodnitsyn (1979, 1982), A. A. Samarskii, V. A. Galaktionov, S. P. Kurdyumov, and A. P. Mikhailov (1995), A. D. Polyanin and V. F. Zaitsev (2002, p. 46).

3. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + aw\ln w + bw.$

The substitution $w = e^{-b/a}u$ leads to an equation of the form 5.4.1.2:

$$\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2} + au\ln u.$$

4. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + aw\ln w + (bx + c)w.$

This is a special case of equations 5.6.1.5 and 5.6.1.7.

5. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + aw\ln w + (bx + ct + k)w.$

This is a special case of equation 5.6.1.7.

6. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + aw\ln w + (bx^2 + cx + k)w.$

This is a special case of equation 5.6.1.9.

7. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + a(w + b)\ln^2(w + b).$

1°. The substitution $w = e^u - b$ leads to an equation of the form 5.1.7.4:

$$\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2} + \left(\frac{\partial u}{\partial x}\right)^2 + au^2. \tag{1}$$

2°. Solutions of equation (1) for $a < 0$:

$$u(x,t) = C_1\exp\bigl(-at \pm x\sqrt{-a}\,\bigr),$$
$$u(x,t) = \frac{1}{C_1 - at} + \frac{C_2}{(C_1 - at)^2}\exp\bigl(-at \pm x\sqrt{-a}\,\bigr),$$

where C_1 and C_2 are arbitrary constants. The first solution is a traveling-wave solution and the second one is a generalized separable solution.

3°. Equation (1) has also generalized separable solutions of the following forms:

$$u(x,t) = \varphi(t) + \psi(t)\bigl[A\exp(x\sqrt{-a}\,) + B\exp(x\sqrt{-a}\,)\bigr] \quad \text{if} \quad a < 0,$$
$$u(x,t) = \varphi(t) + \psi(t)\bigl[A\sin(x\sqrt{a}\,) + B\cos(x\sqrt{a}\,)\bigr] \quad \text{if} \quad a > 0.$$

For details, see 5.1.7.4.

⊙ *References for equation* 5.4.1.7: V. A. Galaktionov and S. A. Posashkov (1989), A. D. Polyanin and V. F. Zaitsev (2002, p. 47).

8. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + (1 + kw)\bigl[a\ln^2(1 + kw) + b\ln(1 + kw) + c\bigr].$

This is a special case of equation 5.6.1.10.

⊙ *Reference*: V. A. Galaktionov and S. A. Posashkov (1989).

5.4.2. Other Equations

1. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + a\dfrac{\partial w}{\partial x} + bw\ln w.$

On passing from t, x to the new variables t, $z = x + at$, one obtains a simpler solution of the form 5.4.1.2:

$$\frac{\partial w}{\partial t} = \frac{\partial^2 w}{\partial z^2} + bw\ln w.$$

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bt\dfrac{\partial w}{\partial x} + cw\ln w.$

This is a special case of equation 5.6.2.6 with $f(t) = 0$, $g(t) = bt$, $h(t) = c$, and $p(t) = s(t) = 0$.

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bx\dfrac{\partial w}{\partial x} + cw\ln w.$

This is a special case of equation 5.6.2.6 with $f(t) = b$, $g(t) = 0$, $h(t) = c$, and $p(t) = s(t) = 0$.

4. $\dfrac{\partial w}{\partial t} = \dfrac{a}{x^k}\dfrac{\partial}{\partial x}\left(x^k\dfrac{\partial w}{\partial x}\right) + bw\ln w.$

The values $k = 1$ and $k = 2$ correspond to problems with axial and central symmetry, respectively.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the functions

$$w_1 = \exp(C_1 e^{bt})\, w(\pm x, t + C_2),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Functional separable solution:

$$w(x,t) = \exp\left[-\frac{bx^2}{4a(1 + Ae^{-bt})} + Be^{bt} + \frac{1}{2A}(k+1)e^{bt}\ln(1 + Ae^{-bt})\right],$$

where A and B are arbitrary constants.

3°. Multiplicative separable solution:

$$w(x,t) = \exp\left(Ae^{bt}\right)\theta(x),$$

where A is an arbitrary constant and the function $\theta(x)$ is determined by the second-order ordinary differential equation

$$\frac{a}{x^k}\frac{d}{dx}\left(x^k\frac{d\theta}{dx}\right) + b\theta\ln\theta = 0.$$

⊙ *References for equation* 5.4.2.4: A. A. Samarskii, V. A. Galaktionov, S. P. Kurdyumov, and A. P. Mikhailov (1995), A. D. Polyanin and V. F. Zaitsev (2002, pp. 47–48).

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + (b\ln w + c)\dfrac{\partial w}{\partial x}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = e^{C_1} w(x + bC_1 t + C_2, t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solution:

$$w(x,t) = \exp\left[C_1 \exp\left(-\frac{b}{a}x + b^2 C_2 t\right) + 1 - aC_2 - \frac{c}{b}\right],$$

where C_1 and C_2 are arbitrary constants.

3°. Generalized traveling-wave solution:

$$w(x,t) = \exp\left[\frac{C_1 - x}{b(t + C_2)} + \frac{a}{b^2}\frac{\ln|t + C_2|}{t + C_2} - \frac{c}{b}\right].$$

4°. Solution:

$$w(x,t) = e^{\lambda t} u(z), \qquad z = x + \tfrac{1}{2}b\lambda t^2 + kt,$$

where k and λ are arbitrary constants, and the function $u(z)$ is determined by the autonomous ordinary differential equation

$$a u''_{zz} + (b\ln u + c - k)u'_z - \lambda u = 0.$$

To $\lambda = 0$, there corresponds a traveling-wave solution.

⊙ *Reference for equation* 5.4.2.5: A. D. Polyanin and V. F. Zaitsev (2004, p. 67).

6. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + a\ln^k(bw)\left(\dfrac{\partial w}{\partial x}\right)^2.$

This is a special case of equation 5.6.6.8 with $f(w) = a\ln^k(bw)$.

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + (b\ln w + c)\dfrac{\partial w}{\partial x}.$

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1 = Aw(A^{-n}x + bA^{-n}\ln A\, t + B, A^{-n}t + C),$$

where A, B, and C are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solution in implicit form:

$$a\int \frac{w^n\, dw}{bw\ln w + (c - b + C_1)w + C_2} = -x + C_1 t + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants.

3°. Solution:

$$w = t^{1/n}U(z), \qquad z = \frac{x}{t} + \frac{b}{n}\ln t,$$

where the function $U = U(z)$ is determined by the ordinary differential equation

$$a(U^n U'_z)'_z + \left(b\ln U + z + c - \frac{b}{n}\right)U'_z - \frac{1}{n}U = 0.$$

⊙ *References for equation* 5.4.2.7: C. M. Yung, K. Verburg, and P. Baveye (1994), N. M. Ivanova (2008).

8. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[(a\ln w + b)\dfrac{\partial w}{\partial x}\right].$

This is a special case of equation 5.6.15.1 with $f(w) = a\ln w + b$.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1 = w(C_1 x + C_2, C_1^2 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Solutions:

$$w(x,t) = \exp\left(\pm\sqrt{2C_1 x + 2aC_1^2 t + C_2} - \frac{b}{a}\right),$$

$$w(x,t) = \exp\left(\frac{C_2 \pm x}{\sqrt{C_1 - 2at}} - \frac{a+b}{a}\right),$$

where C_1 and C_2 are arbitrary constants. The first solution represents a traveling wave and the second one is self-similar.

9. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[(a\ln w + b)\dfrac{\partial w}{\partial x}\right] + cw.$

Generalized traveling-wave solution:

$$w(x,t) = \exp\left[\frac{C_2 \pm x}{\sqrt{C_1 - 2at}} - \frac{c}{3a}(C_1 - 2at) - \frac{a+b}{a}\right],$$

where C_1 and C_2 are arbitrary constants.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2004, p. 68).

10. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[(a\ln w + b)\dfrac{\partial w}{\partial x}\right] + cw\ln w + sw.$

Generalized traveling-wave solution:

$$w(x,t) = \exp\left[\varphi(t)(C_1 \pm x) + (a+b)\varphi(t)\int \varphi(t)\,dt + s\varphi(t)\int \frac{dt}{\varphi(t)}\right],$$

$$\varphi(t) = \left(C_2 e^{-2ct} - \frac{a}{c}\right)^{-1/2},$$

where C_1 and C_2 are arbitrary constants.

11. $w\dfrac{\partial w}{\partial t} = w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2 + aw\dfrac{\partial w}{\partial x} + bw^2 + cw^2\ln w.$

The substitution $w = e^u$ leads to the linear equation

$$\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2} + a\frac{\partial u}{\partial x} + cu + b.$$

Remark. In the original equation, the parameters a, b, and c can be replaced by arbitrary functions $a = a(x)$, $b = b(x)$, and $c = c(x)$.

5.5. Equations with Trigonometric Nonlinearities

5.5.1. Equations Involving Cosine

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\cos^k(\lambda w).$

This is a special case of equation 5.6.1.1 with $f(w) = b\cos^k(\lambda w)$.

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + \beta\cos^k(\lambda w + bx + ct).$

This is a special case of equation 5.6.1.2 with $f(z, w) = \beta\cos^k(z + \lambda w)$.

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + (bx + c)\dfrac{\partial w}{\partial x} + s\cos^k(\lambda w).$

This is a special case of equation 5.6.2.1 with $f(w) = s\cos^k(\lambda w)$.

4. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + b\cos^k(\lambda w)\left(\dfrac{\partial w}{\partial x}\right)^2.$

This is a special case of equation 5.6.6.8 with $f(w) = b\cos^k(\lambda w)$.

5. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + b\cos^k(\lambda w)\left(\dfrac{\partial w}{\partial x}\right)^2 + c\cos^k(\beta t)\dfrac{\partial w}{\partial x}.$

This is a special case of equation 5.6.6.10 with $f(w) = b\cos^k(\lambda w)$, $g(t) = 0$, and $h(t) = c\cos^k(\beta t)$.

6. $\dfrac{\partial w}{\partial t} = a\cos^2(\lambda w + \beta)\dfrac{\partial^2 w}{\partial x^2}.$

The substitution $u = \tan(\lambda w + \beta)$ leads to an equation of the form 5.1.13.2:

$$\frac{\partial u}{\partial t} = a\frac{\partial}{\partial x}\left(\frac{1}{u^2 + 1}\frac{\partial u}{\partial x}\right).$$

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left[\cos^2(\beta w)\dfrac{\partial w}{\partial x}\right].$

This is a special case of equation 5.6.15.1 with $f(w) = a\cos^2(\beta w)$.

Self-similar solutions:

$$w(x, t) = \frac{1}{\beta}\arcsin\frac{\pm x + C_1}{\sqrt{2at + C_2}},$$

where C_1 and C_2 are arbitrary constants.

8. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left[\cos^k(\beta w)\dfrac{\partial w}{\partial x}\right].$

This is a special case of equation 5.6.15.1 with $f(w) = a\cos^k(\beta w)$.

5.5.2. Equations Involving Sine

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\sin^k(\lambda w).$

This is a special case of equation 5.6.1.1 with $f(w) = b\sin^k(\lambda w)$.

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + \beta\sin^k(\lambda w + bx + ct).$

This is a special case of equation 5.6.1.2 with $f(z, w) = \beta\sin^k(z + \lambda w)$.

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + (bx + c)\dfrac{\partial w}{\partial x} + s\sin^k(\lambda w).$

This is a special case of equation 5.6.2.1 with $f(w) = s\sin^k(\lambda w)$.

4. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + b\sin^k(\lambda w)\left(\dfrac{\partial w}{\partial x}\right)^2.$

This is a special case of equation 5.6.6.8 with $f(w) = b\sin^k(\lambda w)$.

5. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + b\sin^k(\lambda w)\left(\dfrac{\partial w}{\partial x}\right)^2 + c\sin^k(\beta t)\dfrac{\partial w}{\partial x}.$

This is a special case of equation 5.6.6.10 with $f(w) = b\sin^k(\lambda w)$, $g(t) = 0$, and $h(t) = c\sin^k(\beta t)$.

6. $\dfrac{\partial w}{\partial t} = a\sin^2(\lambda w)\dfrac{\partial^2 w}{\partial x^2}.$

The substitution $u = \cot(\lambda w)$ leads to an equation of the form 5.1.13.2:

$$\frac{\partial u}{\partial t} = a\frac{\partial}{\partial x}\left(\frac{1}{u^2+1}\frac{\partial u}{\partial x}\right).$$

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left[\sin^2(\beta w)\dfrac{\partial w}{\partial x}\right].$

This is a special case of equation 5.6.15.1 with $f(w) = a\sin^2(\beta w)$.

Self-similar solutions:

$$w(x,t) = \frac{1}{\beta}\arccos\frac{\pm x + C_1}{\sqrt{2at + C_2}},$$

where C_1 and C_2 are arbitrary constants.

8. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left[\sin^k(\beta w)\dfrac{\partial w}{\partial x}\right].$

This is a special case of equation 5.6.15.1 with $f(w) = a\sin^k(\beta w)$.

5.5.3. Equations Involving Tangent

1. $$\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + b\tan^k(\lambda w).$$

This is a special case of equation 5.6.1.1 with $f(w) = b\tan^k(\lambda w)$.

2. $$\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + \beta\tan^k(\lambda w + bx + ct).$$

This is a special case of equation 5.6.1.2 with $f(z, w) = \beta\tan^k(z + \lambda w)$.

3. $$\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + (bx + c)\frac{\partial w}{\partial x} + s\tan^k(\lambda w).$$

This is a special case of equation 5.6.2.1 with $f(w) = s\tan^k(\lambda w)$.

4. $$\frac{\partial w}{\partial t} = \frac{\partial^2 w}{\partial x^2} + b\tan^k(\lambda w)\left(\frac{\partial w}{\partial x}\right)^2.$$

This is a special case of equation 5.6.6.8 with $f(w) = b\tan^k(\lambda w)$.

5. $$\frac{\partial w}{\partial t} = \frac{\partial^2 w}{\partial x^2} + b\tan^k(\lambda w)\left(\frac{\partial w}{\partial x}\right)^2 + c\tan^k(\beta t)\frac{\partial w}{\partial x}.$$

This is a special case of equation 5.6.6.10 with $f(w) = b\tan^k(\lambda w)$, $g(t) = 0$, and $h(t) = c\tan^k(\beta t)$.

6. $$\frac{\partial w}{\partial t} = a\frac{\partial}{\partial x}\left[\tan^k(\beta w)\frac{\partial w}{\partial x}\right].$$

This is a special case of equation 5.6.15.1 with $f(w) = a\tan^k(\beta w)$.

5.5.4. Equations Involving Cotangent

1. $$\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + b\cot^k(\lambda w).$$

This is a special case of equation 5.6.1.1 with $f(w) = b\cot^k(\lambda w)$.

2. $$\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + \beta\cot^k(\lambda w + bx + ct).$$

This is a special case of equation 5.6.1.2 with $f(z, w) = \beta\cot^k(z + \lambda w)$.

3. $$\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + (bx + c)\frac{\partial w}{\partial x} + s\cot^k(\lambda w).$$

This is a special case of equation 5.6.2.1 with $f(w) = s\cot^k(\lambda w)$.

4. $$\frac{\partial w}{\partial t} = \frac{\partial^2 w}{\partial x^2} + b\cot^k(\lambda w)\left(\frac{\partial w}{\partial x}\right)^2.$$

This is a special case of equation 5.6.6.8 with $f(w) = b\cot^k(\lambda w)$.

5. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + b\cot^k(\lambda w)\left(\dfrac{\partial w}{\partial x}\right)^2 + c\cot^k(\beta t)\dfrac{\partial w}{\partial x}.$

This is a special case of equation 5.6.6.10 with $f(w) = b\cot^k(\lambda w)$, $g(t) = 0$, and $h(t) = c\cot^k(\beta t)$.

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left[\cot^k(\beta w)\dfrac{\partial w}{\partial x}\right].$

This is a special case of equation 5.6.15.1 with $f(w) = a\cot^k(\beta w)$.

5.5.5. Equations Involving Inverse Trigonometric Functions

1. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(\dfrac{e^{\lambda \arctan w}}{1+w^2}\dfrac{\partial w}{\partial x}\right).$

Solution in parametric form:

$$w = \tan\left(\varphi(z) + \arctan\left(2z\varphi'_z\right) - \frac{1}{\lambda}\ln t\right),$$
$$x^2 = z\cos^2\left(\varphi(z) + \frac{1}{\lambda}\ln t\right),$$

where z is the parameter and the function $\varphi = \varphi(z)$ is determined by the first-order ordinary differential equation (C is an arbitrary constant)

$$\varphi'_z = \frac{1}{2z}\tan\left(\frac{1}{\lambda}\ln\frac{C-z}{2} - \varphi\right) - \frac{1}{\lambda(C-z)}.$$

⊙ *Reference*: I. Sh. Akhatov, R. K. Gazizov, and N. H. Ibragimov (1989, pp. 29–30).

2. $\dfrac{\partial w}{\partial t} = \left[\left(\dfrac{\partial w}{\partial x}\right)^2 + 1\right]^{-1}\exp\left[k\arctan\left(\dfrac{\partial w}{\partial x}\right)\right]\dfrac{\partial^2 w}{\partial x^2}, \qquad k \neq 0.$

Solution:

$$w^2 = u(z) - x^2, \qquad z = t\exp\left[-k\arctan(x/w)\right],$$

where the function $u(z)$ is determined by the ordinary differential equation

$$2k^2z^2uu''_{zz} - k^2z(3zu'_z - 2u)u'_z - 4u^2 - \tfrac{1}{2}(k^2z^2u'^2_z + 4u^2)u'_z\exp\left[k\arctan\left(\tfrac{1}{2}kzu^{-1}u'_z\right)\right] = 0.$$

⊙ *Reference*: I. Sh. Akhatov, R. K. Gazizov, and N. H. Ibragimov (1989, pp. 29–33).

5.6. Equations Involving Arbitrary Functions

5.6.1. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(x,t,w)$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(w).$

Kolmogorov–Petrovskii–Piskunov equation. Equations of this form are often encountered in various problems of heat and mass transfer (with f being the rate of a volume chemical reaction), combustion theory, biology, and ecology. For $f = f(w)$ having power-law, exponential, or logarithmic form, see Subsections 5.1.1 to 5.1.3, equations 5.2.1.1 to 5.2.1.3, or equations 5.4.1.2, 5.4.1.3, 5.4.1.7, and 5.4.1.8, respectively.

1°. The equation has an implicit nonstationary solution independent of the space variable:

$$\int \frac{dw}{f(w)} = t + C, \qquad C \text{ is an arbitrary constant.}$$

2°. Stationary solution in implicit form:

$$\int \left[C_1 - \frac{2}{a} \int f(w)\, dw \right]^{-1/2} dw = C_2 \pm x.$$

3°. Traveling-wave solutions:

$$w = w(z), \quad z = \pm x + \lambda t,$$

where λ is an arbitrary constant. The function $w = w(z)$ is determined by the autonomous ordinary differential equation

$$a w''_{zz} - \lambda w'_z + f(w) = 0. \tag{1}$$

The transformation

$$\xi = (\lambda/a)z, \quad U(w) = w'_\xi$$

brings (1) to the Abel equation

$$U U'_w - U + a\lambda^{-2} f(w) = 0. \tag{2}$$

The book by Polyanin and Zaitsev (2003) presents a considerable number of solutions to equation (2) for various $f = f(w)$.

⊙ *References for equation* 5.6.1.1: A. N. Kolmogorov, I. G. Petrovskii, and I. S. Piskunov (1937), Ya. B. Zel'dovich, G. I. Barenblatt, V. B. Librovich, and G. M. Makhviladze (1985).

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(bx + ct, w).$

Solution:

$$w = w(\xi), \quad \xi = bx + ct,$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$ab^2 w''_{\xi\xi} - c w'_\xi + f(\xi, w) = 0.$$

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + \dfrac{1}{t} f\left(\dfrac{x}{\sqrt{t}}, w\right).$

1°. Suppose $w(x, t)$ is a solution of this equation. Then the function

$$w_1 = w(Cx, C^2 t),$$

where C is an arbitrary constant, is also a solution of the equation.

2°. The transformation

$$\tau = \ln t, \quad \xi = \frac{x}{\sqrt{t}}$$

leads to the equation

$$\frac{\partial w}{\partial \tau} = a\frac{\partial^2 w}{\partial \xi^2} + \frac{1}{2}\xi\frac{\partial w}{\partial \xi} + f(\xi, w),$$

which admits exact solutions of the form $w = w(\xi)$.

4. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bw\ln w + f(t)w.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = \exp\bigl(C_1 e^{bt}\bigr)\,w\bigl(\pm x + C_2, t\bigr),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Generalized traveling-wave solution:

$$w(x,t) = \exp\left[Ae^{bt}x + Be^{bt} + \frac{a}{b}A^2e^{2bt} + e^{bt}\int e^{-bt}f(t)\,dt\right],$$

where A and B are arbitrary constants.

3°. Functional separable solution:

$$w(x,t) = \exp\bigl[\varphi(t)x^2 + \psi(t)\bigr].$$

Here, the functions $\varphi(t)$ and $\psi(t)$ are given by

$$\varphi(t) = \frac{be^{bt}}{A - 4ae^{bt}}, \quad \psi(t) = Be^{bt} + e^{bt}\int e^{-bt}\bigl[2a\varphi(t) + f(t)\bigr]\,dt,$$

where A and B are arbitrary constants.

4°. There are also functional separable solutions of the more general form

$$w(x,t) = \exp\bigl[\varphi_2(t)x^2 + \varphi_1(t)x + \varphi_0(t)\bigr],$$

where the functions $\varphi_2(t)$, $\varphi_1(t)$, and $\varphi_0(t)$ are determined by a system of ordinary differential equations (see equation 5.6.1.9) that can be integrated.

5°. Solution:

$$w(x,t) = \exp\left[Ae^{bt} + e^{bt}\int e^{-bt}f(t)\,dt + \Phi(x+\lambda t)\right],$$

where A and λ are arbitrary constants, and the function $\Phi = \Phi(z)$ is determined by the autonomous ordinary differential equation

$$a\Phi''_{zz} + a(\Phi'_z)^2 - \lambda\Phi'_z + b\Phi = 0,$$

the order of which can be reduced by one.

6°. The substitution

$$w(x,t) = \exp\left[e^{bt}\int e^{-bt}f(t)\,dt\right]u(x,t)$$

leads to a simpler equation of the form 5.4.1.2:

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial x^2} + bu\ln u.$$

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bw\ln w + \big[f(x) + g(t)\big]w.$

1°. Multiplicative separable solution:

$$w(x,t) = \exp\left[Ce^{bt} + e^{bt}\int e^{-bt}g(t)\,dt\right]\varphi(x),$$

where C is an arbitrary constant, and the function $\varphi(t)$ is determined by the ordinary differential equation

$$a\varphi''_{xx} + b\varphi\ln\varphi + f(x)\varphi = 0.$$

2°. With the substitution

$$w(x,t) = \exp\left[e^{bt}\int e^{-bt}g(t)\,dt\right]u(x,t)$$

one arrives at the simpler equation

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial x^2} + bu\ln u + f(x)u.$$

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(t)w\ln w + g(t)w.$

1°. Generalized traveling-wave solution:

$$w(x,t) = \exp\big[\Phi(t)x + \Psi(t)\big],$$

where the functions $\Phi(t)$ and $\Psi(t)$ are given by

$$\Phi(t) = Ae^F, \quad \Psi(t) = Be^F + e^F\int e^{-F}(aA^2e^{2F} + g)\,dt, \qquad F = \int f\,dt,$$

and A and B are arbitrary constants.

2°. Functional separable solution:

$$w(x,t) = \exp\big[\varphi(t)x^2 + \psi(t)\big],$$

where the functions $\varphi(t)$ and $\psi(t)$ are given by

$$\varphi(t) = e^F\left(A - 4a\int e^F dt\right)^{-1}, \quad F = \int f\,dt,$$
$$\psi(t) = Be^F + e^F\int e^{-F}(2a\varphi + g)\,dt,$$

and A and B are arbitrary constants.

3°. There are also functional separable solutions of the more general form

$$w(x,t) = \exp\big[\varphi_2(t)x^2 + \varphi_1(t)x + \varphi_0(t)\big],$$

where the functions $\varphi_2(t)$, $\varphi_1(t)$, and $\varphi_0(t)$ are determined by a system of ordinary differential equations (see equation 5.6.1.9), which can be integrated.

⊙ *Reference for equation* 5.6.1.6: V. F. Zaitsev and A. D. Polyanin (1996, pp. 419–420).

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(t)w\ln w + \big[g(t)x + h(t)\big]w.$

1°. Generalized traveling-wave solution:

$$w(x,t) = \exp\big[\varphi(t)x + \psi(t)\big],$$

where the functions $\varphi(t)$ and $\psi(t)$ are given by

$$\varphi(t) = Ae^F + e^F\int e^{-F}g\,dt, \quad F = \int f\,dt,$$

$$\psi(t) = Be^F + e^F\int e^{-F}(a\varphi^2 + h)\,dt,$$

and A and B are arbitrary constants.

2°. There are also functional separable solutions of the form

$$w(x,t) = \exp\big[\varphi_2(t)x^2 + \varphi_1(t)x + \varphi_0(t)\big],$$

where the functions $\varphi_2(t)$, $\varphi_1(t)$, and $\varphi_0(t)$ are determined by a system of ordinary differential equations (see equation 5.6.1.9), which can be integrated.

⊙ *Reference for equation* 5.6.1.7: V. F. Zaitsev and A. D. Polyanin (1996, p. 420).

8. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(x)w\ln w + \big[bf(x)t + g(x)\big]w.$

Multiplicative separable solution:

$$w(x,t) = e^{-bt}\exp\big[\varphi(x)\big],$$

where the function $\varphi(x)$ is determined by the ordinary differential equation

$$a\varphi''_{xx} + a(\varphi'_x)^2 + f(x)\varphi + g(x) + b = 0.$$

For f, g = const, this equation can be reduced by the substitution $u(\varphi) = (\varphi'_x)^2$ to a first-order linear equation.

⊙ *Reference*: V. F. Zaitsev and A. D. Polyanin (1996, pp. 420–421).

9. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(t)w\ln w + \big[g(t)x^2 + h(t)x + s(t)\big]w.$

Functional separable solution:

$$w(x,t) = \exp\big[\varphi_2(t)x^2 + \varphi_1(t)x + \varphi_0(t)\big],$$

where the functions $\varphi_n(t)$ $(n = 1,\ 2,\ 3)$ are determined by the system of first-order ordinary differential equations with variable coefficients

$$\varphi'_2 = 4a\varphi_2^2 + f\varphi_2 + g, \tag{1}$$

$$\varphi'_1 = 4a\varphi_2\varphi_1 + f\varphi_1 + h, \tag{2}$$

$$\varphi'_0 = f\varphi_0 + a\varphi_1^2 + 2a\varphi_2 + s. \tag{3}$$

Here, the arguments of the functions f, g, h, and s are not specified, and the prime denotes a derivative with respect to t.

Equation (1) for $\varphi_2 = \varphi_2(t)$ is a Riccati equation, so it can be reduced to a second-order linear equation. The books by Kamke (1977), Polyanin and Zaitsev (2003) present a large number of solutions to this equation for various f and g.

Given a solution of equation (1), the solutions of equations (2) and (3) can be constructed successively, due to the linearity of each of them in the unknown.

⊙ *Reference*: V. F. Zaitsev and A. D. Polyanin (1996, p. 421).

10. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + (bw + c)\left[k\ln^2(bw + c) + f(t)\ln(bw + c) + g(t)\right].$

The substitution

$$bw + c = \exp u, \quad u = u(x, t)$$

leads to an equation of the form 5.6.6.2:

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial x^2} + a\left(\frac{\partial u}{\partial x}\right)^2 + bku^2 + bf(t)u + bg(t),$$

which has exponential and sinusoidal solutions with respect to x.

5.6.2. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(x, t)\dfrac{\partial w}{\partial x} + g(x, t, w)$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + (bx + c)\dfrac{\partial w}{\partial x} + f(w).$

This equation governs unsteady mass transfer with a volume chemical reaction in an inhomogeneous fluid flow.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the function

$$w_1 = w(x + C_1e^{-bt}, t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Generalized traveling-wave solution:

$$w = w(z), \quad z = x + C_1e^{-bt},$$

where the function $w(z)$ is determined by the ordinary differential equation

$$aw''_{zz} + (bz + c)w'_z + f(w) = 0.$$

⊙ *Reference for equation* 5.6.2.1: A. D. Polyanin and V. F. Zaitsev (2002, p. 56).

2. $\dfrac{\partial w}{\partial t} = \dfrac{a}{x^n}\dfrac{\partial}{\partial x}\left(x^n\dfrac{\partial w}{\partial x}\right) + f(t)w\ln w.$

This equation can be rewritten as

$$\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + \frac{an}{x}\frac{\partial w}{\partial x} + f(t)w\ln w.$$

Functional separable solution:

$$w(x, t) = \exp\left[\varphi(t)x^2 + \psi(t)\right],$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of first-order ordinary differential equations with variable coefficients

$$\varphi'_t = 4a\varphi^2 + f\varphi,$$
$$\psi'_t = 2a(n + 1)\varphi + f\psi;$$

the arguments of the functions f and g are not specified. Integrating the first equation and then the second, we obtain

$$\varphi(t) = e^F\left(A - 4a\int e^F dt\right)^{-1}, \quad F = \int f\,dt,$$

$$\psi(t) = Be^F + 2a(n + 1)e^F\int \varphi e^{-F} dt,$$

where A and B are arbitrary constants.

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(t)\dfrac{\partial w}{\partial x} + g(w).$

On passing from t, x to the new variables $t, z = x + \int f(t)\,dt$, one obtains a simpler equation

$$\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial z^2} + g(w),$$

which has a traveling-wave solution $w = w(kz + \lambda t)$.

4. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(t)\dfrac{\partial w}{\partial x} + g(t, w).$

On passing from t, x to the new variables $t, z = x + \int f(t)\,dt$, one obtains a simpler equation

$$\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial z^2} + g(t, w).$$

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(x)\dfrac{\partial w}{\partial x} + bw\ln w + \big[g(x) + h(t)\big]w.$

Multiplicative separable solution:

$$w(x, t) = \exp\left[Ce^{bt} + e^{bt}\int e^{-bt}h(t)\,dt\right]\varphi(x),$$

where C is an arbitrary constant, and the function $\varphi(t)$ is determined by the ordinary differential equation

$$a\varphi''_{xx} + f(x)\varphi'_x + b\varphi\ln\varphi + g(x)\varphi = 0.$$

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + \big[xf(t) + g(t)\big]\dfrac{\partial w}{\partial x} + h(t)w\ln w + \big[xp(t) + s(t)\big]w.$

1°. Generalized traveling-wave solution:

$$w(x, t) = \exp\big[x\varphi(t) + \psi(t)\big],$$

where the functions $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are determined by the system of first-order ordinary differential equations with variable coefficients

$$\varphi'_t = \big[f(t) + h(t)\big]\varphi + p(t), \tag{1}$$

$$\psi'_t = h(t)\psi + a\varphi^2 + g(t)\varphi + s(t). \tag{2}$$

Integrating (1) and then (2), we obtain (C_1 and C_2 are arbitrary constants)

$$\varphi(t) = C_1E(t) + E(t)\int\frac{p(t)}{E(t)}\,dt, \qquad E(t) = \exp\left[\int f(t)\,dt + \int h(t)\,dt\right],$$

$$\psi(t) = C_2H(t) + H(t)\int\frac{a\varphi^2(t) + g(t)\varphi(t) + s(t)}{H(t)}\,dt, \qquad H(t) = \exp\left[\int h(t)\,dt\right].$$

2°. See equation 5.6.2.7 with $r(t) = 0$.

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + \big[xf(t) + g(t)\big]\dfrac{\partial w}{\partial x} + h(t)w\ln w + \big[x^2 r(t) + xp(t) + s(t)\big]w.$

Functional separable solution:

$$w(x,t) = \exp\big[x^2\varphi(t) + x\psi(t) + \chi(t)\big],$$

where the functions $\varphi = \varphi(t)$, $\psi = \psi(t)$, and $\chi = \chi(t)$ are determined by the system of first-order ordinary differential equations with variable coefficients

$$\varphi_t' = 4a\varphi^2 + (2f + h)\varphi + r, \tag{1}$$
$$\psi_t' = (4a\varphi + f + h)\psi + 2g\varphi + p, \tag{2}$$
$$\chi_t' = h\chi + 2a\varphi + a\psi^2 + g\psi + s. \tag{3}$$

For $r \equiv 0$, equation (1) is a Bernoulli equation, so it is easy to integrate. In the general case, equation (1) for $\varphi = \varphi(t)$ is a Riccati equation, so it can be reduced to a second-order linear equation. The books by Kamke (1977) and Polyanin and Zaitsev (2003) present a large number of solutions to the Riccati equation for various f, h, and r. With equation (1) solved, the solutions of equations (2) and (3) can be obtained with ease, since these are linear in their unknowns $\psi = \psi(t)$ and $\chi = \chi(t)$.

8. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + \left[xf(t) + \dfrac{g(t)}{x}\right]\dfrac{\partial w}{\partial x} + h(t)w\ln w + \big[x^2 p(t) + s(t)\big]w.$

Functional separable solution:

$$w(x,t) = \exp\big[\varphi(t)x^2 + \psi(t)\big],$$

where the functions $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are determined by the system of first-order ordinary differential equations with variable coefficients

$$\varphi_t' = 4a\varphi^2 + (2f + h)\varphi + p, \tag{1}$$
$$\psi_t' = h\psi + 2(a + g)\varphi + s. \tag{2}$$

For $p \equiv 0$, equation (1) is a Bernoulli equation, so it is easy to integrate. In the general case, equation (1) for $\varphi = \varphi(t)$ is a Riccati equation, so it can be reduced to a second-order linear equation. The books by Kamke (1977) and Polyanin and Zaitsev (2003) present a large number of solutions to the Riccati equation for various f, h, and r. With equation (1) solved, the solution of the linear equation (2) can be obtained with ease.

5.6.3. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(x,t,w)\dfrac{\partial w}{\partial x} + g(x,t,w)$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bw\dfrac{\partial w}{\partial x} + f(t).$

The transformation

$$w = u(z,t) + \int_{t_0}^{t} f(\tau)\,d\tau, \qquad z = x + b\int_{t_0}^{t}(t-\tau)f(\tau)\,d\tau,$$

where t_0 is any number, leads to the Burgers equation 5.1.5.3:

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial x^2} + bu\frac{\partial u}{\partial x}.$$

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bw\dfrac{\partial w}{\partial x} + f(x,t).$

This is a special case of equation 5.6.3.4.

Let us substitute

$$w = \frac{\partial u}{\partial x}$$

and then integrate the resulting equation with respect to x to arrive at an equation of the form 5.6.4.3:

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial x^2} + \frac{b}{2}\left(\frac{\partial u}{\partial x}\right)^2 + F(x,t),$$

where $F(x,t) = \int f(x,t)\,dx + g(t)$ with $g(t)$ being an arbitrary function.

⊙ *Reference*: A. R. Fortsyth (1906).

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bw\dfrac{\partial w}{\partial x} + \dfrac{\partial}{\partial x}\Big[f(x,t)w\Big].$

This is a special case of equation 5.6.3.4.

Solution:

$$w(x,t) = \frac{2a}{b}\frac{1}{\theta}\frac{\partial \theta}{\partial x},$$

where the function $\theta = \theta(x,t)$ satisfies the linear equation

$$\frac{\partial \theta}{\partial t} = a\frac{\partial^2 \theta}{\partial x^2} + f(x,t)\frac{\partial \theta}{\partial x}.$$

4. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bw\dfrac{\partial w}{\partial x} + \dfrac{\partial}{\partial x}\Big[f(x,t)w\Big] + g(x,t).$

The Bäcklund transformation

$$\frac{\partial Z}{\partial t} = \frac{b}{2a}Z\left[a\frac{\partial w}{\partial x} + \frac{1}{2}bw^2 + f(x,t)w + \int g(x,t)\,dx\right],$$
$$\frac{\partial Z}{\partial x} = \frac{b}{2a}Zw,$$

links the equation in question with the linear equation

$$\frac{\partial Z}{\partial t} = a\frac{\partial^2 Z}{\partial x^2} + f(x,t)\frac{\partial Z}{\partial x} + \frac{b}{2a}Z\int g(x,t)\,dx.$$

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + \big[bw + f(t)\big]\dfrac{\partial w}{\partial x} + g(t).$

The transformation

$$w = u(z,t) + \int_{t_0}^{t} g(\tau)\,d\tau, \qquad z = x + \int_{t_0}^{t} f(\tau)\,d\tau + b\int_{t_0}^{t}(t-\tau)g(\tau)\,d\tau,$$

where t_0 is any number, leads to the Burgers equation 5.1.5.3:

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial x^2} + bu\frac{\partial u}{\partial x}.$$

6. $\dfrac{\partial w}{\partial t} + f(t)w\dfrac{\partial w}{\partial x} = a\dfrac{\partial^2 w}{\partial x^2} + g(t)w + h(t).$

Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w\big(x + \psi(t),\, t\big) + \varphi(t), \quad \varphi(t) = C\exp\left[\int g(t)\,dt\right], \quad \psi(t) = -\int f(t)\varphi(t)\,dt,$$

where C is an arbitrary constant, is also a solution of the equation.

Remark. This remains true if the equation coefficient a is an arbitrary function of time, $a = a(t)$.

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + \big[f(t)\ln w + g(t)\big]\dfrac{\partial w}{\partial x}.$

Generalized traveling-wave solution:

$$w(x,t) = \exp\left\{\varphi(t)(x + C_1) + \varphi(t)\int\big[a\varphi(t) + g(t)\big]\,dt\right\}, \quad \varphi(t) = -\left[\int f(t)\,dt + C_2\right]^{-1},$$

where C_1 and C_2 are arbitrary constants.

8. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(w)\dfrac{\partial w}{\partial x}.$

Generalized Burgers equation.

1°. Traveling-wave solution:

$$w = w(z), \quad z = x + \lambda t$$

are defined implicitly by

$$a\int\frac{dw}{\lambda w - F(w) + A} = z + B, \qquad F(w) = \int f(w)\,dw,$$

where A and B are arbitrary constants.

2°. For the special forms of the function $f(w) = bw$, $f(w) = bw^m$, $f(w) = be^{\lambda w}$, and $f(w) = b\ln w + c$, see equations 5.1.5.3, 5.1.5.9, 5.2.4.2, and 5.4.2.5, respectively, where other solutions are also given.

9. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(w)\dfrac{\partial w}{\partial x} + g(w).$

Traveling-wave solution:

$$w = w(z), \quad z = x + \lambda t,$$

where the function $w = w(z)$ is determined by the second-order autonomous ordinary differential equation

$$aw''_{zz} + \big[f(w) - \lambda\big]w'_z + g(w) = 0,$$

which can be reduced with the change of variable $w'_z = u(w)$ to a first-order equation. For exact solutions of the above ordinary differential equation with various $f(w)$ and $g(w)$, see Polyanin and Zaitsev (2003).

10. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + \big[f(w) + bx\big]\dfrac{\partial w}{\partial x} + g(w).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x + C_1 e^{-bt}, t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Generalized traveling-wave solution:

$$w = w(z), \qquad z = x + C_1 e^{-bt},$$

where the function $w(z)$ is determined by the ordinary differential equation

$$aw''_{zz} + \big[f(w) + bz\big]w'_z + g(w) = 0.$$

⊙ *Reference for equation* 5.6.3.10: A. D. Polyanin and V. F. Zaitsev (2002, p. 56).

11. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + \big[f(w) + g(t)\big]\dfrac{\partial w}{\partial x}.$

On passing from t, x to the new variables t, $z = x + \int g(t)\,dt$, one obtains an equation of the form 5.6.3.8:

$$\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial z^2} + f(w)\frac{\partial w}{\partial z}.$$

12. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + \big[f(w) + g(t)\big]\dfrac{\partial w}{\partial x} + h(w).$

On passing from t, x to the new variables t, $z = x + \int g(t)\,dt$, one obtains a simpler equation of the form 5.6.3.9:

$$\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial z^2} + f(w)\frac{\partial w}{\partial z} + h(w).$$

13. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + \big[f(w) + g(t) + bx\big]\dfrac{\partial w}{\partial x} + h(w).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x + Ce^{-bt}, t),$$

where C is an arbitrary constant, is also a solution of the equation.

2°. Generalized traveling-wave solution:

$$w = w(z), \qquad z = x + Ce^{-bt} + e^{-bt}\int e^{bt} g(t)\,dt,$$

where the function $w(z)$ is determined by the ordinary differential equation

$$aw''_{zz} + \big[f(w) + bz\big]w'_z + h(w) = 0.$$

14. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(bx + ct, w)\dfrac{\partial w}{\partial x} + g(bx + ct, w).$

Solution:

$$w = w(\xi), \qquad \xi = bx + ct,$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$ab^2 w''_{\xi\xi} + \big[bf(\xi, w) - c\big]w'_\xi + g(\xi, w) = 0.$$

5.6.4. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + f(x,t,w)$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + f(x) + g(t).$

This is a special case of equation 5.6.4.3.

Additive separable solution:

$$w(x,t) = At + B + \int g(t)\,dt + \varphi(x).$$

Here, A and B are arbitrary constants, and the function $\varphi(x)$ is determined by the ordinary differential equation

$$a\varphi''_{xx} + b(\varphi'_x)^2 + f(x) - A = 0,$$

which can be reduced, with the change of variable $\varphi'_x = \dfrac{a}{b}\dfrac{\psi'_x}{\psi}$, to a second-order linear equation:

$$\psi''_{xx} + ba^{-2}\big[f(x) - A\big]\psi = 0.$$

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + f(t)x^2 + g(t)x + h(t).$

This is a special case of equation 5.6.4.3.

Generalized separable solution quadratic in x:

$$w(x,t) = \varphi(t)x^2 + \psi(t)x + \chi(t),$$

where the functions $\varphi(t)$, $\psi(t)$, and $\chi(t)$ are determined by the system of first-order ordinary differential equations with variable coefficients

$$\varphi'_t = 4b\varphi^2 + f, \tag{1}$$
$$\psi'_t = 4b\varphi\psi + g, \tag{2}$$
$$\chi'_t = 2a\varphi + b\psi^2 + h. \tag{3}$$

Equation (1) for φ is a Riccati equation. In the special case $f = \text{const}$, it can be easily integrated by separation of variables. Having determined φ, one finds the solutions of equation (2) and then (3), which are linear in the unknowns ψ and χ, respectively.

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + f(x,t).$

The substitution $u = \exp\left(\dfrac{b}{a}w\right)$ leads to a linear equation for $u = u(x,t)$:

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial x^2} + \frac{b}{a}f(x,t)u.$$

4. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + cw + f(t).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm x + C_1, t) + C_2 e^{ct},$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Generalized separable solution quadratic in x:

$$w(x,t) = \frac{c(x+C_2)^2}{C_1 e^{-ct} - 4b} - \frac{2a}{C_1} e^{ct} \ln|C_1 e^{-ct} - 4b| + C_3 e^{ct} + e^{ct} \int e^{-ct} f(t)\,dt.$$

3°. Solution:

$$w(x,t) = Ae^{ct} + e^{ct} \int e^{-ct} f(t)\,dt + \Theta(\xi), \quad \xi = x + \lambda t,$$

where A and λ are arbitrary constants, and the function $\Theta(\xi)$ is determined by the autonomous ordinary differential equation

$$a\Theta''_{\xi\xi} + b\left(\Theta'_\xi\right)^2 - \lambda\Theta'_\xi + c\Theta = 0.$$

4°. The substitution

$$w = U(x,t) + e^{ct} \int e^{-ct} f(t)\,dt$$

leads to the simpler equation

$$\frac{\partial U}{\partial t} = a\frac{\partial^2 U}{\partial x^2} + b\left(\frac{\partial U}{\partial x}\right)^2 + cU.$$

⊙ *Reference for equation* 5.6.4.4: A. D. Polyanin and V. F. Zaitsev (2002, p. 57).

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + cw + f(x).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x, t + C_1) + C_2 e^{ct},$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = Ae^{ct} + \varphi(x),$$

where A is an arbitrary constant and the function $\varphi(x)$ is determined by the ordinary differential equation

$$a\varphi''_{xx} + b(\varphi'_x)^2 + c\varphi + f(x) = 0.$$

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + cw + f(x) + g(t).$

Additive separable solution:

$$w(x,t) = \varphi(x) + Ae^{ct} + e^{ct}\int e^{-ct}g(t)\,dt,$$

where A is an arbitrary constant and the function $\varphi(x)$ is determined by the ordinary differential equation

$$a\varphi''_{xx} + b(\varphi'_x)^2 + c\varphi + f(x) = 0.$$

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + g(t)w + h(t).$

This is a special case of equation 5.6.6.1 with $f(t) = b$.

8. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + cw^2 + f(t)w + g(t).$

This is a special case of equation 5.6.6.2.

9. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + a\lambda\left(\dfrac{\partial w}{\partial x}\right)^2 + f(x,t) + g(x,t)e^{-\lambda w}.$

The substitution $u = \exp(\lambda w)$ leads to the linear equation

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial x^2} + \lambda f(x,t)u + \lambda g(x,t).$$

10. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + \dfrac{1}{t}f\left(\dfrac{x}{\sqrt{t}},\ w\right).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(Cx, C^2t),$$

where C is an arbitrary constant, is also a solution of the equation.

2°. The transformation $\tau = \ln t$, $\xi = xt^{-1/2}$ leads to the equation

$$\frac{\partial w}{\partial \tau} = a\frac{\partial^2 w}{\partial \xi^2} + b\left(\frac{\partial w}{\partial \xi}\right)^2 + \frac{1}{2}\xi\frac{\partial w}{\partial \xi} + f(\xi, w),$$

which admits an exact solution of the form $w = w(\xi)$.

3°. In the special case $f = f(\xi)$, there is also a exact solution of the form $w = C\tau + \varphi(\xi)$, where C is an arbitrary constant, and the function $\varphi(\xi)$ is determined by the ordinary differential equation

$$a\varphi''_{\xi\xi} + b(\varphi'_\xi)^2 + \tfrac{1}{2}\xi\varphi'_\xi + f(\xi) - C = 0.$$

5.6.5. Equations of the Form

$$\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + b\left(\frac{\partial w}{\partial x}\right)^2 + f(x,t,w)\frac{\partial w}{\partial x} + g(x,t,w)$$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + f(x)\dfrac{\partial w}{\partial x} + kw + g(x) + h(t).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x,t) + Ce^{kt},$$

where C is an arbitrary constant, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = \varphi(x) + Ce^{kt} + e^{kt}\int e^{-kt}h(t)\,dt,$$

where the function $\varphi(x)$ is determined by the ordinary differential equation

$$a\varphi''_{xx} + b(\varphi'_x)^2 + f(x)\varphi'_x + k\varphi + g(x) = 0.$$

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + f(t)\dfrac{\partial w}{\partial x} + cw^2 + g(t)w + h(t).$

This is a special case of equation 5.6.6.5.

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + cw\dfrac{\partial w}{\partial x} + kw^2 + f(t)w + g(t).$

There are generalized separable solutions of the form

$$w(x,t) = \varphi(t) + \psi(t)\exp(\lambda x),$$

where $\lambda = \lambda_{1,2}$ are roots of the quadratic equation $b\lambda^2 + c\lambda + k = 0$.

4. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + f(x,t)\dfrac{\partial w}{\partial x} + g(x,t).$

The substitution $u = \exp\left(\dfrac{b}{a}w\right)$ leads to the linear equation

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial x^2} + f(x,t)\frac{\partial u}{\partial x} + \frac{b}{a}g(x,t)u.$$

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + a\lambda\left(\dfrac{\partial w}{\partial x}\right)^2 + f(x,t)\dfrac{\partial w}{\partial x} + g(x,t) + h(x,t)e^{-\lambda w}.$

The substitution $u = \exp(\lambda w)$ leads to the linear equation

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial x^2} + f(x,t)\frac{\partial u}{\partial x} + \lambda g(x,t)u + \lambda h(x,t).$$

5.6.6. Equations of the Form

$$\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + f(x,t,w)\left(\frac{\partial w}{\partial x}\right)^2 + g(x,t,w)\frac{\partial w}{\partial x} + h(x,t,w)$$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(t)\left(\dfrac{\partial w}{\partial x}\right)^2 + g(t)w + h(t).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm x + C_1, t) + C_2 \exp\left[\int g(t)\,dt\right],$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Generalized separable solution quadratic in x:

$$w(x,t) = \varphi(t)x^2 + \psi(t)x + \chi(t),$$

where the functions $\varphi(t)$, $\psi(t)$, and $\chi(t)$ are determined by the system of first-order ordinary differential equations with variable coefficients

$$\varphi_t' = 4f\varphi^2 + g\varphi, \tag{1}$$
$$\psi_t' = (4f\varphi + g)\psi, \tag{2}$$
$$\chi_t' = g\chi + 2a\varphi + f\psi^2 + h. \tag{3}$$

Equation (1) is a Bernoulli equation for φ, so it can be readily integrated. Having determined φ, we can obtain the solutions of equation (2) and then (3), which are linear in the unknowns ψ and χ, respectively. Finally, we have

$$\begin{aligned}
&\varphi = e^G\left(A_1 - 4\int e^G f\,dt\right)^{-1}, \quad G = \int g\,dt,\\
&\psi = A_2 \exp\left[\int (4f\varphi + g)\,dt\right],\\
&\chi = A_3 e^G + e^G \int e^{-G}(2a\varphi + f\psi^2 + h)\,dt,
\end{aligned} \tag{4}$$

where A_1, A_2, and A_3 are arbitrary constants.

To the limit passage $A_1 \to \infty$ in (4) there corresponds a degenerate solution with $\varphi \equiv 0$.

⊙ *Reference for equation* 5.6.6.1: V. F. Zaitsev and A. D. Polyanin (1996, p. 422).

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(t)\left(\dfrac{\partial w}{\partial x}\right)^2 + bf(t)w^2 + g(t)w + h(t).$

1°. Generalized separable solutions:

$$w(x,t) = \varphi(t) + \psi(t)\exp\left(\pm x\sqrt{-b}\right), \qquad b < 0, \tag{1}$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of first-order ordinary differential equations with variable coefficients (the arguments of f, g, and h are not indicated)

$$\varphi_t' = bf\varphi^2 + g\varphi + h, \tag{2}$$
$$\psi_t' = (2bf\varphi + g - ab)\psi. \tag{3}$$

Equation (2) is a Riccati equation for $\varphi = \varphi(t)$, so it can be reduced to a second-order linear equation. The books by Kamke (1977) and Polyanin and Zaitsev (2003) present a large number of solutions to this equation for various f, g, and h.

Given a solution of (2), one can solve the linear equation (3) for $\psi = \psi(t)$ to obtain

$$\psi(t) = C\exp\left[-abt + \int (2bf\varphi + g)\,dt\right], \tag{4}$$

where C is an arbitrary constant.

Note two special integrable cases of equation (2).

Solution of equation (2) with $h \equiv 0$:

$$\varphi(t) = e^G\left(C_1 - b\int fe^G\,dt\right)^{-1}, \quad G = \int g\,dt,$$

where C_1 is an arbitrary constant.

If the functions f, g, and h are proportional,

$$g = \alpha f, \quad h = \beta f \qquad (\alpha,\ \beta = \text{const}),$$

then the solution of (2) is given by

$$\int \frac{d\varphi}{b\varphi^2 + \alpha\varphi + \beta} = \int f\,dt + C_2, \tag{5}$$

where C_2 is an arbitrary constant. On integrating the left-hand side of equation (5) and solving for φ, one can find $\varphi = \varphi(t)$ in explicit form.

2°. Generalized separable solution of a more general form:

$$w(x,t) = \varphi(t) + \psi(t)\left[A\exp\left(x\sqrt{-b}\right) + B\exp\left(-x\sqrt{-b}\right)\right], \qquad b < 0, \tag{6}$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of first-order ordinary differential equations with variable coefficients

$$\varphi'_t = bf\left(\varphi^2 + 4AB\psi^2\right) + g\varphi + h, \tag{7}$$

$$\psi'_t = 2bf\varphi\psi + g\psi - ab\psi. \tag{8}$$

Solving (8) for φ to express it in terms of ψ and then substituting the resulting expression into (7), one arrives at a second-order nonlinear equation for ψ (if f, g, h = const, this equation is autonomous and, hence, its order can be reduced).

Note two special cases of solution (6) where the exponentials combine to form hyperbolic functions:

$$w(x,t) = \varphi(t) + \psi(t)\cosh\left(x\sqrt{-b}\right), \qquad A = \tfrac{1}{2}, \quad B = \tfrac{1}{2},$$

$$w(x,t) = \varphi(t) + \psi(t)\sinh\left(x\sqrt{-b}\right), \qquad A = \tfrac{1}{2}, \quad B = -\tfrac{1}{2}.$$

3°. Generalized separable solution (c is an arbitrary constant):

$$w(x,t) = \varphi(t) + \psi(t)\cos\left(x\sqrt{b} + c\right), \qquad b > 0, \tag{9}$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of first-order ordinary differential equations with variable coefficients

$$\varphi'_t = bf\left(\varphi^2 + \psi^2\right) + g\varphi + h, \tag{10}$$

$$\psi'_t = 2bf\varphi\psi + g\psi - ab\psi. \tag{11}$$

Solving (11) for φ to express it in terms of ψ and then substituting the resulting expression into (10), one arrives at a second-order nonlinear equation for ψ (if f, g, h = const, this equation is autonomous and, hence, its order can be reduced).

⊙ *References for equation* 5.6.6.2: V. A. Galaktionov and S. A. Posashkov (1989, the case f, g, h = const was considered), V. F. Zaitsev and A. D. Polyanin (1996, pp. 422–423).

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(t)\left(\dfrac{\partial w}{\partial x}\right)^2 + bf(t)w\dfrac{\partial w}{\partial x} + cf(t)w^2 + g(t)w + h(t).$

There are generalized separable solutions of the form

$$w(x,t) = \varphi(t) + \psi(t)\exp(\lambda x),$$

where $\lambda = \lambda_{1,2}$ are roots of the quadratic equation $\lambda^2 + b\lambda + c = 0$.

4. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(x)\left(\dfrac{\partial w}{\partial x}\right)^2 + g(x)\dfrac{\partial w}{\partial x} + bw + h(x) + p(t).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x,t) + Ce^{bt},$$

where C is an arbitrary constant, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = \varphi(x) + Ce^{bt} + e^{bt}\int e^{-bt}p(t)\,dt,$$

where the function $\varphi(x)$ is determined by the ordinary differential equation

$$a\varphi''_{xx} + f(x)(\varphi'_x)^2 + g(x)\varphi'_x + b\varphi + h(x) = 0.$$

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(t)\left(\dfrac{\partial w}{\partial x}\right)^2 + g(t)\dfrac{\partial w}{\partial x} + bf(t)w^2 + h(t)w + p(t).$

On passing from t, x to the new variables t, $z = x + \int g(t)\,dt$, one arrives at an equation of the form 5.6.6.2:

$$\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial z^2} + f(t)\left(\frac{\partial w}{\partial z}\right)^2 + bf(t)w^2 + h(t)w + p(t).$$

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(t)\left(\dfrac{\partial w}{\partial x}\right)^2 + \big[g_1(t)x + g_0(t)\big]\dfrac{\partial w}{\partial x} + h(t)w + p(t)x^2 + q(t)x + s(t).$

Generalized separable solution quadratic in x:

$$w(x,t) = \varphi(t)x^2 + \psi(t)x + \chi(t),$$

where the functions $\varphi(t)$, $\psi(t)$, and $\chi(t)$ are determined by the system of first-order ordinary differential equations with variable coefficients

$$\varphi'_t = 4f\varphi^2 + (2g_1 + h)\varphi + p, \tag{1}$$

$$\psi'_t = (4f\varphi + g_1 + h)\psi + 2g_0\varphi + q, \tag{2}$$

$$\chi'_t = h\chi + 2a\varphi + f\psi^2 + g_0\psi + s. \tag{3}$$

Equation (1) is a Riccati equation for $\varphi = \varphi(t)$ and, hence, can be reduced to a second-order linear equation. For solution of such equations, see Kamke (1977) and Polyanin and Zaitsev (2003). In the special case $p \equiv 0$, (1) is a Bernoulli equation, so it can be readily integrated.

Given a solution of (1), equations (2) and (3) can be easily solved, since these are linear in their respective unknowns ψ and χ.

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} - ak\dfrac{1}{w}\left(\dfrac{\partial w}{\partial x}\right)^2 + f(x,t)\dfrac{\partial w}{\partial x} + g(x,t)w + h(x,t)w^k.$

The substitution $u = w^{1-k}$ leads to the linear equation

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial x^2} + f(x,t)\frac{\partial u}{\partial x} + (1-k)g(x,t)u + (1-k)h(x,t).$$

8. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + f(w)\left(\dfrac{\partial w}{\partial x}\right)^2.$

The substitution

$$u = \int F(w)\,dw, \qquad \text{where} \quad F(w) = \exp\left[\int f(w)\,dw\right],$$

leads to the linear heat equation for $u = u(x,t)$:

$$\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}.$$

9. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + f(w)\left(\dfrac{\partial w}{\partial x}\right)^2 + g(x)\dfrac{\partial w}{\partial x}.$

The substitution

$$u = \int F(w)\,dw, \qquad \text{where} \quad F(w) = \exp\left[\int f(w)\,dw\right],$$

leads to a linear equation for $u = u(x,t)$:

$$\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2} + g(x)\frac{\partial u}{\partial x}.$$

Some exact solutions of this equation, for arbitrary g, can be found in Polyanin (2002).

10. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + f(w)\left(\dfrac{\partial w}{\partial x}\right)^2 + \big[xg(t) + h(t)\big]\dfrac{\partial w}{\partial x}.$

The substitution

$$u = \int F(w)\,dw, \qquad \text{where} \quad F(w) = \exp\left[\int f(w)\,dw\right],$$

leads to a linear equation for $u = u(x,t)$:

$$\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2} + \big[xg(t) + h(t)\big]\frac{\partial u}{\partial x}.$$

This equation can be reduced to the linear heat equation; see Polyanin (2002, p. 133).

11. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + f(w)\left(\dfrac{\partial w}{\partial x}\right)^2 + g(x,t)\dfrac{\partial w}{\partial x}.$

The substitution

$$u = \int F(w)\,dw, \qquad \text{where} \quad F(w) = \exp\left[\int f(w)\,dw\right],$$

leads to the linear equation

$$\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2} + g(x,t)\frac{\partial u}{\partial x}.$$

12. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(w)\left(\dfrac{\partial w}{\partial x}\right)^2 + g(w)\dfrac{\partial w}{\partial x} + h(w).$

Traveling-wave solution:

$$w = w(z), \quad z = x + \lambda t,$$

where the function $w = w(z)$ is determined by the autonomous ordinary differential equation

$$aw''_{zz} + f(w)(w'_z)^2 + [g(w) - \lambda]w'_z + h(w) = 0. \tag{1}$$

The substitution $w'_z = u(w)$ leads to the first-order equation

$$auu'_w + f(w)u^2 + [g(w) - \lambda]u + h(w) = 0. \tag{2}$$

For exact solutions of the ordinary differential equations (1) and (2) for various $f(w)$, $g(w)$, and $h(w)$, see the book by Polyanin and Zaitsev (2003).

Note that in the special case $h \equiv 0$, equation (2) becomes linear and, hence, can be readily integrated.

5.6.7. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f\left(x, t, w, \dfrac{\partial w}{\partial x}\right)$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(x)\left(\dfrac{\partial w}{\partial x}\right)^k + g(x)\dfrac{\partial w}{\partial x} + bw + h(x) + p(t).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x,t) + Ce^{bt},$$

where C is an arbitrary constant, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = \varphi(x) + Ce^{bt} + e^{bt}\int e^{-bt}p(t)\,dt,$$

where the function $\varphi(x)$ is determined by the second-order ordinary differential equation

$$a\varphi''_{xx} + f(x)(\varphi'_x)^k + g(x)\varphi'_x + b\varphi + h(x) = 0.$$

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f\left(x, \dfrac{\partial w}{\partial x}\right) + bw + g(t).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x,t) + Ce^{bt},$$

where C is an arbitrary constant, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = \varphi(x) + Ce^{bt} + e^{bt}\int e^{-bt}g(t)\,dt,$$

where the function $\varphi(x)$ is determined by the second-order ordinary differential equation

$$a\varphi''_{xx} + f(x, \varphi'_x) + b\varphi = 0.$$

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + wf\left(t, \dfrac{1}{w}\dfrac{\partial w}{\partial x}\right).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(x + C_2, t),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Multiplicative separable solution:

$$w(x,t) = A\exp\left[\lambda x + a\lambda^2 t + \int f(t,\lambda)\,dt\right],$$

where A and λ are arbitrary constants.

5.6.8. Equations of the Form $\dfrac{\partial w}{\partial t} = f(x,t)\dfrac{\partial^2 w}{\partial x^2} + g\left(x, t, w, \dfrac{\partial w}{\partial x}\right)$

1. $\dfrac{\partial w}{\partial t} = (ax^2 + b)\dfrac{\partial^2 w}{\partial x^2} + ax\dfrac{\partial w}{\partial x} + f(w).$

The substitution $z = \displaystyle\int \frac{dx}{\sqrt{ax^2 + b}}$ leads to an equation of the form 5.6.1.1:

$$\frac{\partial w}{\partial t} = \frac{\partial^2 w}{\partial z^2} + f(w).$$

2. $\dfrac{\partial w}{\partial t} = \dfrac{f(t)}{x^n}\dfrac{\partial}{\partial x}\left(x^n\dfrac{\partial w}{\partial x}\right) + g(t)w\ln w.$

This equation can be rewritten in the form

$$\frac{\partial w}{\partial t} = f(t)\frac{\partial^2 w}{\partial x^2} + \frac{nf(t)}{x}\frac{\partial w}{\partial x} + g(t)w\ln w.$$

Functional separable solution:

$$w(x,t) = \exp\bigl[\varphi(t)x^2 + \psi(t)\bigr],$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of first-order ordinary differential equations with variable coefficients

$$\varphi_t' = 4f\varphi^2 + g\varphi,$$
$$\psi_t' = 2(n+1)f\varphi + g\psi;$$

the arguments of f and g are omitted. Successively integrating, one obtains

$$\varphi(t) = e^G\left(A - 4\int f e^G dt\right)^{-1}, \quad G = \int g\,dt,$$
$$\psi(t) = Be^G + 2(n+1)e^G\int f\varphi e^{-G}dt,$$

where A and B are arbitrary constants.

3. $\dfrac{\partial w}{\partial t} = f(t)\dfrac{\partial^2 w}{\partial x^2} + \left[xg(t) + \dfrac{h(t)}{x}\right]\dfrac{\partial w}{\partial x} + s(t)w\ln w + \bigl[x^2 p(t) + q(t)\bigr]w.$

Functional separable solution:

$$w(x,t) = \exp\bigl[\varphi(t)x^2 + \psi(t)\bigr],$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of first-order ordinary differential equations with variable coefficients

$$\varphi_t' = 4f\varphi^2 + (2g+s)\varphi + p, \tag{1}$$
$$\psi_t' = s\psi + 2(f+h)\varphi + q. \tag{2}$$

For $p \equiv 0$, equation (1) is a Bernoulli equation and, hence, can be easily integrated. In the general case, (1) is a Riccati equation for $\varphi = \varphi(t)$, so it can be reduced to a second-order linear equation. The books by Kamke (1977) and Polyanin and Zaitsev (2003) present a considerable number of solutions to this equation for various f, g, s, and p. Having solved equation (1), one can find $\psi = \psi(t)$ from the linear equation (2).

4. $\dfrac{\partial w}{\partial t} = f(t)\dfrac{\partial}{\partial x}\left(e^{\lambda x}\dfrac{\partial w}{\partial x}\right) + g(t)w\ln w + h(t)w.$

Functional separable solution:

$$w(x,t) = \exp\bigl[\varphi(t)e^{-\lambda x} + \psi(t)\bigr],$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the ordinary differential equations

$$\varphi_t' = \lambda^2 f(t)\varphi^2 + g(t)\varphi,$$
$$\psi_t' = g(t)\psi + h(t).$$

Integrating yields

$$\varphi(t) = G(t)\left[A - \lambda^2\int f(t)G(t)\,dt\right]^{-1}, \quad G(t) = \exp\left[\int g(t)\,dt\right],$$
$$\psi(t) = BG(t) + G(t)\int\frac{h(t)}{G(t)}\,dt,$$

where A and B are arbitrary constants.

5. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(x)\dfrac{\partial w}{\partial x}\right] + aw\ln w.$

This equation can be rewritten in the form

$$\frac{\partial w}{\partial t} = f(x)\frac{\partial^2 w}{\partial x^2} + f'_x(x)\frac{\partial w}{\partial x} + aw\ln w.$$

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1 = \exp(C_1 e^{at})\, w(x, t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Multiplicative separable solution:

$$w(x,t) = \exp(Ce^{at})\,\varphi(x),$$

where C is an arbitrary constant, and the function $\varphi(t)$ is determined by the ordinary differential equation

$$(f\varphi'_x)'_x + a\varphi\ln\varphi = 0.$$

6. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(x)\dfrac{\partial w}{\partial x}\right] + aw\ln w + \big[g(x) + h(t)\big]w.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = \exp(Ce^{at})w(x,t),$$

where C is an arbitrary constant, is also a solution of the equation.

2°. Multiplicative separable solution:

$$w(x,t) = \exp\left[Ce^{at} + e^{at}\int e^{-at}h(t)\,dt\right]\varphi(x),$$

where the function $\varphi(x)$ is determined by the ordinary differential equation

$$(f\varphi'_x)'_x + a\varphi\ln\varphi + g(x)\varphi = 0.$$

7. $\dfrac{\partial w}{\partial t} = f(x)\dfrac{\partial^2 w}{\partial x^2} + g(x)\dfrac{\partial w}{\partial x} + aw\ln w + \big[h(x) + s(t)\big]w.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = \exp(Ce^{at})w(x,t),$$

where C is an arbitrary constant, is also a solution of the equation.

2°. Multiplicative separable solution:

$$w(x,t) = \exp\left[Ce^{at} + e^{at}\int e^{-at}s(t)\,dt\right]\varphi(x),$$

where the function $\varphi(x)$ is determined by the ordinary differential equation

$$f(x)\varphi''_{xx} + g(x)\varphi'_x + a\varphi\ln\varphi + h(x)\varphi = 0.$$

8. $\dfrac{\partial w}{\partial t} = f(x)\dfrac{\partial^2 w}{\partial x^2} + g(x)\left(\dfrac{\partial w}{\partial x}\right)^2 + h(x)\dfrac{\partial w}{\partial x} + aw + p(x) + q(t).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x,t) + Ce^{at},$$

where C is an arbitrary constant, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = \varphi(x) + Ce^{at} + e^{at}\int e^{-at}q(t)\,dt,$$

where the function $\varphi(x)$ is determined by the ordinary differential equation

$$f(x)\varphi''_{xx} + g(x)(\varphi'_x)^2 + h(x)\varphi'_x + a\varphi + p(x) = 0.$$

9. $\dfrac{\partial w}{\partial t} = f(x)\dfrac{\partial^2 w}{\partial x^2} + g(x)\left(\dfrac{\partial w}{\partial x}\right)^k + h(x)\dfrac{\partial w}{\partial x} + aw + p(x) + q(t).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x,t) + Ce^{at},$$

where C is an arbitrary constant, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = \varphi(x) + Ce^{at} + e^{at}\int e^{-at}q(t)\,dt,$$

where the function $\varphi(x)$ is determined by the ordinary differential equation

$$f(x)\varphi''_{xx} + g(x)(\varphi'_x)^k + h(x)\varphi'_x + a\varphi + p(x) = 0.$$

10. $\dfrac{\partial w}{\partial t} = f(x)\dfrac{\partial^2 w}{\partial x^2} + g\left(x, \dfrac{\partial w}{\partial x}\right) + aw + h(t).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x,t) + Ce^{at},$$

where C is an arbitrary constant, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = \varphi(x) + Ce^{at} + e^{at}\int e^{-at}h(t)\,dt,$$

where the function $\varphi(x)$ is determined by the ordinary differential equation

$$f(x)\varphi''_{xx} + g(x,\,\varphi'_x) + a\varphi = 0.$$

5.6.9. Equations of the Form $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + f(x,t,w)\dfrac{\partial w}{\partial x} + g(x,t,w)$

1. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + f(x)w + bx + c.$

Generalized separable solution:

$$w(x,t) = (bx + c)t + Ax + B - \frac{1}{a}\int_{x_0}^{x}(x-\xi)f(\xi)\,d\xi,$$

where A, B, and x_0 are arbitrary constants.

2. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + f(t)w + g(t).$

1°. Degenerate solution linear in x:

$$w(x,t) = F(t)(Ax + B) + F(t)\int \frac{g(t)}{F(t)}dt, \quad F(t) = \exp\left[\int f(t)\,dt\right],$$

where A and B are arbitrary constants.

2°. Generalized separable solution quadratic in x:

$$w(x,t) = \varphi(t)(x^2 + Ax + B) + \varphi(t)\int \frac{g(t)}{\varphi(t)}dt,$$

$$\varphi(t) = F(t)\left[C - 2a\int F(t)\,dt\right]^{-1}, \quad F(t) = \exp\left[\int f(t)\,dt\right],$$

where A, B, and C are arbitrary constants.

3. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + cw^2 + f(t)w + g(t).$

This is a special case of equation 5.6.10.1 with $b = 0$.

4. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} - ak^2w^2 + f(x)w + b_1\sinh(kx) + b_2\cosh(kx).$

Generalized separable solution:

$$w(x,t) = t\big[b_1\sinh(kx) + b_2\cosh(kx)\big] + \varphi(x).$$

Here, the function $\varphi(x)$ is determined by the linear nonhomogeneous ordinary differential equation with constant coefficients

$$a\varphi''_{xx} - ak^2\varphi + f(x) = 0,$$

whose general solution is given by

$$\varphi(x) = C_1\sinh(kx) + C_2\cosh(kx) - \frac{1}{ak}\int_{x_0}^{x} f(\xi)\sinh\big[k(x-\xi)\big]\,d\xi,$$

where A, B, and x_0 are arbitrary constants.

5. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + ak^2w^2 + f(x)w + b_1\sin(kx) + b_2\cos(kx).$

Generalized separable solution:

$$w(x,t) = t\big[b_1\sin(kx) + b_2\cos(kx)\big] + \varphi(x).$$

Here, the function $\varphi(x)$ is determined by the linear nonhomogeneous ordinary differential equation with constant coefficients

$$a\varphi''_{xx} + ak^2\varphi + f(x) = 0,$$

whose general solution is given by

$$\varphi(x) = C_1\sin(kx) + C_2\cos(kx) - \frac{1}{ak}\int_{x_0}^{x} f(\xi)\sin\big[k(x-\xi)\big]\,d\xi,$$

where A, B, and x_0 are arbitrary constants.

6. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + f(t)\dfrac{\partial w}{\partial x} + g(t)w.$

The transformation

$$w(x,t) = G(t)u(z,\tau), \quad z = x + \int f(t)\,dt, \quad \tau = \int G(t)\,dt, \qquad G(t) = \exp\left[\int g(t)\,dt\right]$$

leads to a simpler equation of the form 5.1.9.1:

$$\frac{\partial u}{\partial \tau} = au\frac{\partial^2 u}{\partial z^2}.$$

7. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + f(t)\dfrac{\partial w}{\partial x} + g(t)w + h(t).$

This is a special case of equation 5.6.10.5.

8. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + xf(t)\dfrac{\partial w}{\partial x} + g(t)w.$

The transformation

$$w(x,t) = G(t)u(z,\tau), \quad z = xF(t), \quad \tau = \int F^2(t)G(t)\,dt,$$

where the functions $F(t)$ and $G(t)$ are given by

$$F(t) = \exp\left[\int f(t)\,dt\right], \quad G(t) = \exp\left[\int g(t)\,dt\right],$$

leads to a simpler equation of the form 5.1.9.1:

$$\frac{\partial u}{\partial \tau} = au\frac{\partial^2 u}{\partial z^2}.$$

9. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + \big[xf(t) + g(t)\big]\dfrac{\partial w}{\partial x} + h(t)w.$

The transformation

$$w(x,t) = H(t)u(z,\tau), \quad z = xF(t) + \int g(t)F(t)\,dt, \quad \tau = \int F^2(t)H(t)\,dt,$$

where the functions $F(t)$ and $H(t)$ are given by

$$F(t) = \exp\left[\int f(t)\,dt\right], \quad H(t) = \exp\left[\int h(t)\,dt\right],$$

leads to a simpler equation of the form 5.1.9.1:

$$\frac{\partial u}{\partial \tau} = au\frac{\partial^2 u}{\partial z^2}.$$

10. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + f(x)w\dfrac{\partial w}{\partial x} + g(t)w + h(t).$

Generalized separable solution:

$$w(x,t) = \varphi(t)\Theta(x) + \psi(t),$$

where the functions $\varphi(t)$, $\psi(t)$, and $\Theta(x)$ are determined by the system of ordinary differential equations

$$\begin{aligned}
&\varphi'_t = C\varphi^2 + g(t)\varphi,\\
&\psi'_t = \big[C\varphi + g(t)\big]\psi + h(t),\\
&a\Theta''_{xx} + f(x)\Theta'_x = C,
\end{aligned}$$

where C is an arbitrary constant. Integrating successively, one obtains

$$\begin{aligned}
&\varphi(t) = G(t)\left[A_1 - C\int G(t)\,dt\right]^{-1}, \quad G(t) = \exp\left[\int g(t)\,dt\right],\\
&\psi(t) = A_2\varphi(t) + \varphi(t)\int \frac{h(t)}{\varphi(t)}\,dt,\\
&\Theta(x) = B_1\int \frac{dx}{F(x)} + B_2 + \frac{C}{a}\int\left[\int F(x)\,dx\right]\frac{dx}{F(x)}, \quad F(x) = \exp\left[\frac{1}{a}\int f(x)\,dx\right],
\end{aligned}$$

where A_1, A_2, B_1, and B_2 are arbitrary constants.

11. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + f(x)w\dfrac{\partial w}{\partial x} + g(x)w^2 + h(t)w.$

Multiplicative separable solution:

$$w(x,t) = \varphi(x)H(t)\left[A - B\int H(t)\,dt\right]^{-1}, \quad H(t) = \exp\left[\int h(t)\,dt\right].$$

Here, A and B are arbitrary constants, and the function $\varphi(x)$ is determined by the second-order linear ordinary differential equation

$$a\varphi''_{xx} + f(x)\varphi'_x + g(x)\varphi = B.$$

For exact solutions of this equation with various $f(x)$ and $g(x)$, see Kamke (1977) and Polyanin and Zaitsev (2003).

5.6.10. Equations of the Form $\dfrac{\partial w}{\partial t} = (aw+b)\dfrac{\partial^2 w}{\partial x^2} + f(x,t,w)\left(\dfrac{\partial w}{\partial x}\right)^2 + g(x,t,w)\dfrac{\partial w}{\partial x} + h(x,t,w)$

1. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + cw^2 + f(t)w + g(t).$

1°. Generalized separable solutions involving an exponential of x:

$$w(x,t) = \varphi(t) + \psi(t)\exp(\pm\lambda x), \quad \lambda = \left(\frac{-c}{a+b}\right)^{1/2}, \tag{1}$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of first-order ordinary differential equations with variable coefficients (the arguments of f and g are not indicated)

$$\varphi'_t = c\varphi^2 + f\varphi + g, \tag{2}$$
$$\psi'_t = (a\lambda^2\varphi + 2c\varphi + f)\psi. \tag{3}$$

Equation (2) is a Riccati equation for $\varphi = \varphi(t)$, so it can be reduced to a second-order linear equation. The books by Kamke (1977) and Polyanin and Zaitsev (2003) present a large number of solutions to this equation for various f and g.

In particular, for $g \equiv 0$, equation (2) is a Bernoulli equation, which is easy to integrate. In another special case, f, g = const, a particular solution of (2) is a number, $\varphi = \varphi_0$, which is a root of the quadratic equation $c\varphi_0^2 + f\varphi_0 + g = 0$. The substitution $u = \varphi - \varphi_0$ leads to a Bernoulli equation.

Given a solution of (2), the solution of equation (3) can be obtained in the form

$$\psi(t) = C\exp\left[\int (a\lambda^2\varphi + 2c\varphi + f)\,dt\right], \tag{4}$$

where C is an arbitrary constant.

2°. Generalized separable solution involving hyperbolic cosine (A is an arbitrary constant):

$$w(x,t) = \varphi(t) + \psi(t)\cosh(\lambda x + A), \quad \lambda = \left(\frac{-c}{a+b}\right)^{1/2}, \tag{5}$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of first-order ordinary differential equations with variable coefficients (the arguments of f and g are not specified)

$$\varphi'_t = c\varphi^2 - b\lambda^2\psi^2 + f\varphi + g, \tag{6}$$
$$\psi'_t = (a\lambda^2\varphi + 2c\varphi + f)\psi. \tag{7}$$

Solving equation (7) for φ to express it in terms of ψ and then substituting the resulting expression into (6), one arrives at a second-order nonlinear equation for ψ, which is autonomous if f, g = const and, hence, its order can be reduced.

3°. Generalized separable solution involving hyperbolic sine (A is an arbitrary constant):

$$w(x,t) = \varphi(t) + \psi(t)\sinh(\lambda x + A), \quad \lambda = \left(\frac{-c}{a+b}\right)^{1/2},$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of first-order ordinary differential equations

$$\varphi'_t = c\varphi^2 + b\lambda^2\psi^2 + f\varphi + g,$$
$$\psi'_t = (a\lambda^2\varphi + 2c\varphi + f)\psi.$$

4°. Generalized separable solution involving a trigonometric function (A is an arbitrary constant):

$$w(x,t) = \varphi(t) + \psi(t)\cos(\lambda x + A), \quad \lambda = \left(\frac{c}{a+b}\right)^{1/2}, \tag{8}$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of first-order ordinary differential equations

$$\varphi'_t = c\varphi^2 + b\lambda^2\psi^2 + f\varphi + g, \tag{9}$$
$$\psi'_t = (-a\lambda^2\varphi + 2c\varphi + f)\psi. \tag{10}$$

Solving equation (10) for φ to express it in terms of ψ and substituting the resulting expression into (9), one arrives at a second-order nonlinear equation for ψ, which is autonomous if f, g = const and, hence, its order can be reduced.

⊙ *References for equation* 5.6.10.1: V. A. Galaktionov (1995), V. F. Zaitsev and A. D. Polyanin (1996, pp. 425–427).

2. $$\frac{\partial w}{\partial t} = aw\frac{\partial^2 w}{\partial x^2} + f(t)\left(\frac{\partial w}{\partial x}\right)^2 + g(t)\frac{\partial w}{\partial x} + h(t)w + s(t).$$

Generalized separable solution quadratic in x:

$$w(x,t) = \varphi(t)x^2 + \psi(t)x + \chi(t),$$

where the functions $\varphi(t)$, $\psi(t)$, and $\chi(t)$ are determined by the system of first-order ordinary differential equations with variable coefficients (the arguments of f, g, h, and s are not specified)

$$\varphi'_t = 2(2f + a)\varphi^2 + h\varphi, \tag{1}$$
$$\psi'_t = (4f\varphi + 2a\varphi + h)\psi + 2g\varphi, \tag{2}$$
$$\chi'_t = (2a\varphi + h)\chi + f\psi^2 + g\psi + s. \tag{3}$$

Equation (1) is a Bernoulli equation for $\varphi = \varphi(t)$, so it is easy to integrate. After that, equation (2) and then (3) can be solved with ease, since both are linear in their respective unknowns ψ and χ.

⊙ *References*: V. A. Galaktionov (1995), V. F. Zaitsev and A. D. Polyanin (1996, p. 427).

3. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial^2 w}{\partial x^2} + f(x)\left(\dfrac{\partial w}{\partial x}\right)^2 + g(x)w\dfrac{\partial w}{\partial x} + h(x)w^2 + p(t)w.$

Multiplicative separable solution:

$$w(x,t) = \varphi(x)\psi(t),$$

where $\varphi(x)$ and $\psi(t)$ are determined by the following system of ordinary differential equations (C is an arbitrary constant):

$$a\varphi\varphi''_{xx} + f(x)(\varphi'_x)^2 + g(x)\varphi\varphi'_x + h(x)\varphi^2 = C\varphi, \tag{1}$$
$$\psi'_t = C\psi^2 + p(t)\psi. \tag{2}$$

The general solution of equation (2) is given by

$$\psi(t) = P(t)\left[A - C\int P(t)\,dt\right]^{-1}, \quad P(t) = \exp\left[\int p(t)\,dt\right],$$

where A is an arbitrary constant. In the special case $f \equiv 0$, equation (1) can be reduced, on dividing it by φ, to a second-order linear equation; for exact solutions of this equation with various $g(x)$ and $h(x)$, see Kamke (1997) and Polyanin and Zaitsev (2003).

4. $\dfrac{\partial w}{\partial t} = (aw + b)\dfrac{\partial^2 w}{\partial x^2} + c\left(\dfrac{\partial w}{\partial x}\right)^2 + f(t)\dfrac{\partial w}{\partial x} + kw^2 + g(t)w + h(t).$

The transformation

$$u(z,t) = w(x,t) + \frac{b}{a}, \quad z = x + \int f(t)\,dt$$

leads to an equation of the form 5.6.10.1 for $u = u(z,t)$.

5. $\dfrac{\partial w}{\partial t} = (aw + b)\dfrac{\partial^2 w}{\partial x^2} + f(t)\left(\dfrac{\partial w}{\partial x}\right)^2 + \big[g_1(t)x + g_0(x)\big]\dfrac{\partial w}{\partial x}$
$$+ h(t)w + p_2(t)x^2 + p_1(t)x + p_0(t).$$

There is a generalized separable solution quadratic in x:

$$w(x,t) = \varphi(t)x^2 + \psi(t)x + \chi(t),$$

where the functions $\varphi(t)$, $\psi(t)$, and $\chi(t)$ are determined by a system of first-order ordinary differential equations with variable coefficients, which is not written out here.

5.6.11. Equations of the Form $\dfrac{\partial w}{\partial t} = aw^m\dfrac{\partial^2 w}{\partial x^2} + f(x,t)\dfrac{\partial w}{\partial x} + g(x,t,w)$

1. $\dfrac{\partial w}{\partial t} = w^2\dfrac{\partial^2 w}{\partial x^2} + w^2\dfrac{\partial}{\partial x}[f(x)w].$

1°. Consider the nonlinear equation

$$\frac{\partial x}{\partial t} = \frac{\partial^2 x}{\partial z^2} + f(x)\left(\frac{\partial x}{\partial z}\right)^2, \tag{1}$$

which is reduced to the linear heat equation (see Equation 5.6.6.8). Dividing the equation by x_z, differentiating with respect to z, changing to the von Mises variables

$$t,\ z,\ x = x(t,z) \quad \Longrightarrow \quad t,\ x,\ w = w(t,x), \quad \text{where} \quad w = \frac{\partial x}{\partial z},$$

and taking into account the formula

$$\frac{\partial}{\partial z}\left(\frac{x_t}{x_z}\right) \equiv \frac{x_z x_{tz} - x_t x_{zz}}{x_z^2} = \frac{w_t}{w},$$

we arrive at the original equation.

2°. The original equation is related to equation (1) by the Bäcklund transformation

$$x_t = w_z + f(x)w^2,$$
$$x_z = w.$$

2. $\dfrac{\partial w}{\partial t} = aw^4\dfrac{\partial^2 w}{\partial x^2} + f(x)w^5.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(x, C_1^4 t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Suppose $u = u(x)$ is a nontrivial solution of the second-order linear ordinary differential equation

$$au''_{xx} + f(x)u = 0. \tag{1}$$

Then the transformation

$$\xi = \int \frac{dx}{u^2}, \quad z = \frac{w}{u}$$

simplifies the original equation bringing it to the form

$$\frac{\partial z}{\partial t} = az^4\frac{\partial^2 z}{\partial \xi^2}.$$

Using the change of variable $v = z^{-3}$, we obtain an equation of the form 5.1.10.4:

$$\frac{\partial v}{\partial t} = a\frac{\partial}{\partial \xi}\left(v^{-4/3}\frac{\partial v}{\partial \xi}\right).$$

3°. Multiplicative separable solution:

$$w(x,t) = (4\lambda t + C)^{-1/4} g(x),$$

where C and λ are arbitrary constants, and the function $g = g(x)$ is determined by *Yermakov's equation*

$$ag''_{xx} + f(x)g + \lambda g^{-3} = 0. \tag{2}$$

Given a particular solution, $u = u(x)$, of the linear equation (1), the general solution of the nonlinear equation (2) can be expressed as (e.g., see Polyanin and Zaitsev, 2003)

$$Ag^2 = -\frac{\lambda}{a}u^2 + u^2\left(B + A\int \frac{dx}{u^2}\right)^2,$$

where A and B are arbitrary constants ($A \neq 0$).

⊙ *Reference for equation* 5.6.11.2: V. F. Zaitsev and A. D. Polyanin (1996, pp. 427–428).

3. $\dfrac{\partial w}{\partial t} = aw^m \dfrac{\partial^2 w}{\partial x^2} + f(t)w.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-2} w(\pm C_1^m x + C_2, t),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. The transformation

$$w(x,t) = F(t)u(x,\tau), \quad \tau = \int F^m(t)\,dt, \quad F(t) = \exp\left[\int f(t)\,dt\right],$$

leads to a simpler equation of the form 5.1.9.20:

$$\frac{\partial u}{\partial \tau} = au^m \frac{\partial^2 u}{\partial x^2}.$$

4. $\dfrac{\partial w}{\partial t} = aw^m \dfrac{\partial^2 w}{\partial x^2} + f(x)w^{m+1}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(x, C_1^m t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Multiplicative separable solution (C and λ are arbitrary constants):

$$w(x,t) = (m\lambda t + C)^{-1/m}\varphi(x),$$

where the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$a\varphi^m \varphi''_{xx} + f(x)\varphi^{m+1} + \lambda\varphi = 0.$$

5. $\dfrac{\partial w}{\partial t} = aw^m \dfrac{\partial^2 w}{\partial x^2} + xf(t)\dfrac{\partial w}{\partial x} + g(t)w.$

The transformation

$$w(x,t) = u(z,\tau)G(t), \quad z = xF(t), \quad \tau = \int F^2(t)G^m(t)\,dt,$$

where the functions $F(t)$ and $G(t)$ are given by

$$F(t) = \exp\left[\int f(t)\,dt\right], \quad G(t) = \exp\left[\int g(t)\,dt\right],$$

leads to a simpler equation of the form 5.1.9.26:

$$\frac{\partial u}{\partial \tau} = au^m \frac{\partial^2 u}{\partial z^2}.$$

⊙ *Reference*: V. F. Zaitsev and A. D. Polyanin (1996, p. 428).

6. $\dfrac{\partial w}{\partial t} = aw^m \dfrac{\partial^2 w}{\partial x^2} + \big[f(t)x + g(t)\big]\dfrac{\partial w}{\partial x} + h(t)w.$

The transformation

$$w(x,t) = u(z,\tau)H(t), \quad z = xF(t) + \int g(t)F(t)\,dt, \quad \tau = \int F^2(t)H^m(t)\,dt,$$

where the functions $F(t)$ and $H(t)$ are given by

$$F(t) = \exp\left[\int f(t)\,dt\right], \quad H(t) = \exp\left[\int h(t)\,dt\right],$$

leads to a simpler equation of the form 5.1.9.26:

$$\frac{\partial u}{\partial \tau} = au^m \frac{\partial^2 u}{\partial z^2}.$$

5.6.12. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) + f(x,t)\dfrac{\partial w}{\partial x} + g(x,t,w)$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) + f(t).$

Generalized separable solutions linear and quadratic in x:

$$w(x,t) = C_1 x + aC_1^2 t + C_2 + \int f(t)\,dt,$$

$$w(x,t) = -\frac{(x+C_2)^2}{6a(t+C_1)} + C_3(t+C_1)^{-1/3} + (t+C_1)^{-1/3}\int (t+C_1)^{1/3} f(t)\,dt,$$

where C_1, C_2, and C_3 are arbitrary constants. The first solution is degenerate.

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) + f(t)w + g(t).$

This is a special case of equation 5.6.13.6 with $m = 1$.

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) + bw^2 + f(t)w + g(t).$

This is a special case of equation 5.6.13.7 with $m = 1$.

4. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) + f(x)w^2.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(x, C_1 t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Multiplicative separable solution:

$$w = (\lambda t + C)^{-1}\varphi(x),$$

where λ and C are arbitrary constants, and the function $\varphi(x)$ is determined by the ordinary differential equation

$$a(\varphi\varphi'_x)'_x + f(x)\varphi^2 + \lambda\varphi = 0.$$

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) + f(t)\dfrac{\partial w}{\partial x} + g(t)w.$

This is a special case of equation 5.6.13.8 with $m = 1$.

The transformation

$$w(x,t) = G(t)u(z,\tau), \quad z = x + \int f(t)\,dt, \quad \tau = \int G(t)\,dt, \quad G(t) = \exp\left[\int g(t)\,dt\right],$$

leads to a simpler equation of the form 5.1.10.1:

$$\frac{\partial u}{\partial t} = a\frac{\partial}{\partial z}\left(u\frac{\partial u}{\partial z}\right).$$

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) + xf(t)\dfrac{\partial w}{\partial x} + g(t)w.$

The transformation

$$w(t,x) = u(z,\tau)G(t), \quad z = xF(t), \quad \tau = \int F^2(t)G(t)\,dt,$$

where the functions $F(t)$ and $G(t)$ are given by

$$F(t) = \exp\left[\int f(t)\,dt\right], \quad G(t) = \exp\left[\int g(t)\,dt\right],$$

leads to a simpler equation of the form 5.1.10.1:

$$\frac{\partial u}{\partial \tau} = a\frac{\partial}{\partial z}\left(u\frac{\partial u}{\partial z}\right).$$

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) + \big[xf(t) + g(t)\big]\dfrac{\partial w}{\partial x} + h(t)w.$

This is a special case of equation 5.6.13.10 with $m = 1$.

5.6.13. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + f(x,t)\dfrac{\partial w}{\partial x} + g(x,t,w)$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{-4/3}\dfrac{\partial w}{\partial x}\right) + f(x)w^{-1/3}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(x, C_1^{-4/3}t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. The substitution $w = v^{-3}$ leads to an equation of the form 5.6.11.2:

$$\frac{\partial v}{\partial t} = av^4\frac{\partial^2 v}{\partial x^2} - \tfrac{1}{3}f(x)v^5.$$

3°. Suppose $u = u(x)$ is any nontrivial particular solution of the second-order linear ordinary differential equation

$$au''_{xx} - \tfrac{1}{3}f(x)u = 0.$$

The transformation

$$\xi = \pm\int \frac{dx}{u^2}, \quad z = wu^3$$

simplifies the original equation, bringing it to equation 5.1.10.4:

$$\frac{\partial z}{\partial t} = a\frac{\partial}{\partial \xi}\left(z^{-4/3}\frac{\partial z}{\partial \xi}\right).$$

⊙ *Reference for equation* 5.6.13.1: V. F. Zaitsev and A. D. Polyanin (1996).

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(\dfrac{1}{w^2}\dfrac{\partial w}{\partial x}\right) + f(x).$

This equation can be reduced to the generalized Burgers equation (see Example 26.36).

3. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(\dfrac{1}{w^2}\dfrac{\partial w}{\partial x}\right) - \dfrac{\partial}{\partial x}\left(\dfrac{f(x)}{w}\right).$

The substitution $w = 1/u$ leads to an equation of the form 5.6.11.1:

$$\frac{\partial u}{\partial t} = u^2\frac{\partial^2 u}{\partial x^2} + u^2\frac{\partial}{\partial x}[f(x)u].$$

Therefor the original equation can be reduced to a second-order linear equation.

4. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + f(t)w.$

The transformation

$$w(x,t) = u(x,\tau)F(t), \quad \tau = \int F^m(t)\,dt, \qquad F(t) = \exp\left[\int f(t)\,dt\right],$$

leads to a simpler equation of the form 5.1.10.8:

$$\frac{\partial u}{\partial \tau} = a\frac{\partial}{\partial x}\left(u^m\frac{\partial u}{\partial x}\right).$$

If $m = -1$ or $m = -2$, see 5.1.10.2 or 5.1.10.3 for solutions of this equation.

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + f(t)w^{1-m}.$

The substitution $u = w^m$ leads to an equation of the form 5.6.10.2:

$$\frac{\partial u}{\partial t} = au\frac{\partial^2 u}{\partial x^2} + \frac{a}{m}\left(\frac{\partial u}{\partial x}\right)^2 + mf(t),$$

which admits a generalized separable solution of the form $u = \varphi(t)x^2 + \psi(t)x + \chi(t)$.

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + f(t)w + g(t)w^{1-m}.$

The substitution $u = w^m$ leads to an equation of the form 5.6.10.2:

$$\frac{\partial u}{\partial t} = au\frac{\partial^2 u}{\partial x^2} + \frac{a}{m}\left(\frac{\partial u}{\partial x}\right)^2 + mf(t)u + mg(t),$$

which admits a generalized separable solution of the form $u = \varphi(t)x^2 + \psi(t)x + \chi(t)$.

⊙ *References*: V. A. Galaktionov (1995), V. F. Zaitsev and A. D. Polyanin (1996, p. 429).

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + bw^{1+m} + f(t)w + g(t)w^{1-m}.$

For $b = 0$, see equation 5.6.13.6.

The substitution $u = w^m$ leads to an equation of the form 5.6.10.1:

$$\frac{\partial u}{\partial t} = au\frac{\partial^2 u}{\partial x^2} + \frac{a}{m}\left(\frac{\partial u}{\partial x}\right)^2 + bmu^2 + mf(t)u + mg(t),$$

which admits generalized separable solutions of the following forms:

$$u(x,t) = \varphi(t) + \psi(t)\exp(\pm\lambda x),$$
$$u(x,t) = \varphi(t) + \psi(t)\cosh(\lambda x + C),$$
$$u(x,t) = \varphi(t) + \psi(t)\sinh(\lambda x + C),$$
$$u(x,t) = \varphi(t) + \psi(t)\cos(\lambda x + C),$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by systems of appropriate first-order ordinary differential equations, the parameter λ is a root of a quadratic equation, and C is an arbitrary constant.

⊙ *References*: V. A. Galaktionov (1995), V. F. Zaitsev and A. D. Polyanin (1996, p. 429).

8. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + f(x)w^{1+m}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(x, C_1^m t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Multiplicative separable solution:

$$w = (\lambda mt + C)^{-1/m}\varphi(x),$$

where λ and C are arbitrary constants, and the function $\varphi(x)$ is determined by the equation

$$a\psi''_{xx} + (m+1)f(x)\psi + \lambda(m+1)\psi^{\frac{1}{m+1}} = 0, \qquad \psi = \varphi^{m+1}.$$

The book by Polyanin and Zaitsev (2003) presents exact solutions of this equation for various $f(x)$.

9. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + g(x)w^{m+1} + f(t)w.$

Multiplicative separable solution:

$$w = \varphi(x)\psi(t),$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(t)$ are determined by the ordinary differential equations

$$a(\varphi^m\varphi_x')_x' + g(x)\varphi^{m+1} + C_1\varphi = 0,$$
$$\psi_t' - f(t)\psi + C_1\psi^{m+1} = 0,$$

and C_1 is an arbitrary constant. The general solution of the second equation for ψ is given by

$$\psi(t) = e^F\left(C_2 + mC_1\int e^{mF}\,dt\right)^{-1/m}, \qquad F = \int f(t)\,dt,$$

where C_2 is an arbitrary constant.

10. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + f(t)\dfrac{\partial w}{\partial x} + g(t)w.$

The transformation

$$w(x,t) = u(z,\tau)G(t), \quad z = x + \int f(t)\,dt, \quad \tau = \int G^m(t)\,dt, \quad G(t) = \exp\left[\int g(t)dt\right],$$

leads to a simpler equation of the form 5.1.10.8:

$$\frac{\partial u}{\partial \tau} = a\frac{\partial}{\partial z}\left(u^m\frac{\partial u}{\partial z}\right).$$

11. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + xf(t)\dfrac{\partial w}{\partial x} + g(t)w.$

The transformation

$$w(t,x) = u(z,\tau)G(t), \quad z = xF(t), \quad \tau = \int F^2(t)G^m(t)\,dt,$$

where the functions $F(t)$ and $G(t)$ are given by

$$F(t) = \exp\left[\int f(t)\,dt\right], \quad G(t) = \exp\left[\int g(t)\,dt\right],$$

leads to a simpler equation of the form 5.1.10.8:

$$\frac{\partial u}{\partial \tau} = a\frac{\partial}{\partial z}\left(u^m\frac{\partial u}{\partial z}\right).$$

In the special case $m = -2$, this equation can be transformed to the linear heat equation (see 5.1.10.3).

⊙ *Reference*: V. F. Zaitsev and A. D. Polyanin (1996, p. 430).

12. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + \big[xf(t) + g(t)\big]\dfrac{\partial w}{\partial x} + h(t)w.$

The transformation

$$w(x,t) = u(z,\tau)H(t), \quad z = xF(t) + \int g(t)F(t)\,dt, \quad \tau = \int F^2(t)H^m(t)\,dt,$$

where the functions $F(t)$ and $H(t)$ are given by

$$F(t) = \exp\left[\int f(t)\,dt\right], \quad H(t) = \exp\left[\int h(t)\,dt\right],$$

leads to a simpler equation of the form 5.1.10.8:

$$\frac{\partial u}{\partial \tau} = a\frac{\partial}{\partial z}\left(u^m\frac{\partial u}{\partial z}\right).$$

If $m = -1$ or $m = -2$, see 5.1.10.2 or 5.1.10.3 for solutions of this equation.

⊙ *Reference*: V. F. Zaitsev and A. D. Polyanin (1996, pp. 434–435).

5.6.14. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + f(x,t,w)$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + f(t).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(C_1x + C_2, t) - \frac{2}{\lambda}\ln|C_1|,$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. The transformation

$$w(x,t) = u(x,\tau) + F(t), \quad \tau = \int \exp\big[\lambda F(t)\big]\,dt, \qquad F(t) = \int f(t)\,dt,$$

leads to a simpler equation of the form 5.2.2.1:

$$\frac{\partial u}{\partial \tau} = a\frac{\partial}{\partial x}\left(e^{\lambda u}\frac{\partial u}{\partial x}\right).$$

⊙ *Reference for equation* 5.6.14.1: A. D. Polyanin and V. F. Zaitsev (2002, p. 74).

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + f(t) + g(t)e^{-\lambda w}.$

The substitution $u = e^{\lambda w}$ leads to an equation of the form 5.6.9.2:

$$\frac{\partial u}{\partial t} = au\frac{\partial^2 u}{\partial x^2} + \lambda f(t)u + \lambda g(t).$$

This equation admits a generalized separable solution of the form $u = \varphi(t)x^2 + \psi(t)x + \chi(t)$.

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + f(x) + (bx + c)e^{-\lambda w}.$

The substitution $u = e^{\lambda w}$ leads to an equation of the form 5.6.9.1:

$$\frac{\partial u}{\partial t} = au\frac{\partial^2 u}{\partial x^2} + \lambda f(x)u + \lambda(bx + c).$$

This equation admits a generalized separable solution of the form $u = \lambda(bx + c)t + \varphi(x)$.

4. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + be^{\lambda w} + f(t) + g(t)e^{-\lambda w}.$

For $b = 0$, see equation 5.6.14.2.

The substitution $u = e^{\lambda w}$ leads to an equation of the form 5.6.10.1:

$$\frac{\partial u}{\partial t} = au\frac{\partial^2 u}{\partial x^2} + bu^2 + \lambda f(t)u + \lambda g(t).$$

This equation admits generalized separable solutions of the following forms:

$$u(x, t) = \varphi(t) + \psi(t)\exp(\pm\mu x),$$
$$u(x, t) = \varphi(t) + \psi(t)\cosh(\mu x + C),$$
$$u(x, t) = \varphi(t) + \psi(t)\sinh(\mu x + C),$$
$$u(x, t) = \varphi(t) + \psi(t)\cos(\mu x + C),$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by systems of appropriate first-order ordinary differential equations, μ is a root of a quadratic equation, and C is an arbitrary constant.

⊙ *Reference*: V. F. Zaitsev and A. D. Polyanin (1996, pp. 430–431).

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + f(x)e^{\lambda w}.$

1°. Suppose $w(x, t)$ is a solution of this equation. Then the function

$$w_1 = w(x, C_1 t + C_2) + \frac{1}{\lambda}\ln C_1,$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Additive separable solution:

$$w = -\frac{1}{\lambda}\ln(\lambda t + C) + \varphi(x),$$

where λ and C are arbitrary constants, and the function $\varphi(x)$ is determined by the second-order linear ordinary differential equation

$$a\psi''_{xx} + \lambda f(x)\psi + \lambda = 0, \qquad \psi = e^{\lambda\varphi}.$$

⊙ *Reference for equation* 5.6.14.5: V. F. Zaitsev and A. D. Polyanin (1996, p. 431).

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + g(x)e^{\lambda w} + f(t).$

Additive separable solution:

$$w = \varphi(x) + \psi(t),$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(t)$ are determined by the ordinary differential equations

$$a(e^{\lambda\varphi}\varphi'_x)'_x + g(x)e^{\lambda\varphi} + C_1 = 0, \tag{1}$$

$$\psi'_t - f(t) + C_1 e^{\lambda\psi} = 0, \tag{2}$$

and C_1 is an arbitrary constant. Equation (1) can be reduced, with the change of variable $U = e^{\lambda\varphi}$, to the linear equation $aU''_{xx} + \lambda g(x)U + \lambda C_1 = 0$. The general solution of equation (2) is given by

$$\psi(t) = F - \frac{1}{\lambda}\ln\left(C_2 + \lambda C_1\int e^{\lambda F}\,dt\right), \qquad F = \int f(t)\,dt,$$

where C_2 is an arbitrary constant.

5.6.15. Equations of the Form $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + g\left(x, t, w, \dfrac{\partial w}{\partial x}\right)$

1. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right].$

This equation is frequently encountered in nonlinear problems of heat and mass transfer (with f being the thermal diffusivity or diffusion coefficient) and the theory of flows through porous media. For $f(w) = aw^m$, see Subsection 5.1.10; for $f(w) = e^{\lambda w}$, see equation 5.2.2.1; and for $f(w) = a\ln w + b$, see equation 5.4.2.8.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the function

$$w_1 = w(C_1 x + C_2, C_1^2 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solution in implicit form:

$$k^2\int\frac{f(w)\,dw}{\lambda w + C_1} = kx + \lambda t + C_2, \tag{1}$$

where C_1, C_2, k, and λ are arbitrary constants. To $\lambda = 0$ there corresponds a stationary solution.

3°. Self-similar solution:

$$w = w(z), \quad z = \frac{x}{\sqrt{t}} \qquad (0 \le x < \infty),$$

where the function $w(z)$ is determined by the ordinary differential equation

$$\left[f(w)w'_z\right]'_z + \tfrac{1}{2}zw'_z = 0. \tag{2}$$

Solutions of this form usually correspond to constant w in the initial and boundary conditions for the original partial differential equation (w_0, w_1 = const):

$$w = w_0 \quad \text{at} \quad t = 0 \qquad \text{(initial condition)},$$
$$w = w_1 \quad \text{at} \quad x = 0 \qquad \text{(boundary condition)},$$
$$w \to w_0 \quad \text{as} \quad x \to \infty \qquad \text{(boundary condition)}.$$

Then the boundary conditions for the ordinary differential equation (2) are as follows:

$$w = w_1 \quad \text{at} \quad z = 0, \qquad w \to w_0 \quad \text{as} \quad z \to \infty. \tag{3}$$

For $f(w) = aw^{-1}$, $f(w) = aw^{-2}$, and $f(w) = (\alpha w^2 + \beta w + \gamma)^{-1}$, the general solutions of (2) were obtained by Fujita (1952); see also the book by Lykov (1967).

4°. We now describe a simple method for finding an $f(w)$ such that equation (2) admits an exact solution. To this end, we integrate equation (2) with respect to z and then apply the hodograph transformation (where w is regarded as the independent variable and z as the dependent one) to obtain

$$f(w) = -\frac{1}{2}z'_w\left(\int z\,dw + A\right), \qquad A \text{ is an arbitrary constant.} \tag{4}$$

Substituting a specific expression $z = z(w)$ for z on the right-hand side of relation (4), one obtains a one-parameter family of functions $f(w)$ for which $z = z(w)$ solves equation (2). The explicit form of $w = w(z)$ is obtained by the inversion of $z = z(w)$.

The method just outlined was devised by Philip (1960); he obtained a large number of exact solutions to the original equation for various $f = f(w)$. Some of his results, those corresponding to a problem with the initial and boundary conditions of (3) with $w_0 = 0$ and $w_1 = 1$, are listed below in Table 5.1. All solutions are written out in implicit form, $z = z(w)$, and are valid within the range of their spatial localization $0 \le w \le 1$.

TABLE 5.1
Solutions of equation 5.6.15.1 for various $f = f(w)$, where $z = xt^{-1/2}$

No	Function $f = f(w)$	Solution $z = z(w)$	Conditions
1	$\frac{n}{2}w^n - \frac{n}{2(n+1)}w^{2n}$	$1 - w^n$	$n > 0$
2	$\frac{n}{2(n+1)}\left[(1-w)^{n-1} - (1-w)^{2n}\right]$	$(1-w)^n$	$n > 0$
3	$\frac{n}{2(1-n)}w^{-2n} - \frac{n}{2}w^{-n}$	$w^{-n} - 1$	$0 < n < 1$
4	$\frac{1}{2}\sin^2\left(\frac{1}{2}\pi w\right)$	$\cos\left(\frac{1}{2}\pi w\right)$	
5	$\frac{1}{8}\sin(\pi w)\left[\pi w + \sin(\pi w)\right]$	$\cos^2\left(\frac{1}{2}\pi w\right)$	
6	$\frac{1}{16}\sin^2(\pi w)\left[5 + \cos(\pi w)\right]$	$\cos^3\left(\frac{1}{2}\pi w\right)$	
7	$\frac{1}{2}\cos\left(\frac{1}{2}\pi w\right)\left[\cos\left(\frac{1}{2}\pi w\right) + \frac{1}{2}\pi w - 1\right]$	$1 - \sin(\frac{1}{2}\pi w)$	
8	$\frac{w\arccos w + 1}{2\sqrt{1-w^2}} - \frac{1}{2}$	$\arccos w$	
9	$\frac{\pi - 2(1-w)\arcsin(1-w)}{4\sqrt{2w-w^2}} - \frac{1}{2}$	$\arcsin(1-w)$	
10	$\frac{w\arcsin w}{4\sqrt{1-w^2}} + \frac{1}{4}w^2$	$\sqrt{1-w^2}$	
11	$\frac{1}{2}(1 - \ln w)$	$-\ln w$	

5°. There is another way to find an $f(w)$ for which equation (2) admits exact solutions. By direct substitution, one can verify that equation (2) is satisfied by

$$w = \phi'_z, \quad f(w) = \frac{s + \phi - z\phi'_z}{2\phi''_{zz}}, \tag{5}$$

where $\phi = \phi(z)$ is an arbitrary function, and s is an arbitrary constant. Expressions (5) define a parametric representation of $f = f(w)$; the explicit representation is obtained by eliminating z.

For example, assuming in (5) that

$$\phi(z) = w_0 z + \frac{1}{\lambda}(w_0 - w_1)e^{-\lambda z} \qquad (\lambda > 0,\ w_1 > w_0),$$

and eliminating z, one obtains

$$f(w) = \frac{A}{w - w_0} + B + C\ln(w - w_0), \qquad w = w_0 + (w_1 - w_0)e^{-\lambda z},$$

where $A = -\frac{1}{2}s\lambda^{-1}$, $B = \frac{1}{2}\lambda^{-2}\left[1 + \ln(w_1 - w_0)\right]$, and $C = -\frac{1}{2}\lambda^{-2}$. Note that this solution satisfies the boundary conditions of (3). Likewise, one can construct other $f(w)$.

6°. Here is one more method for constructing an $f(w)$ for which equation (2) admits exact solutions. Suppose $\bar{w} = \bar{w}(z)$ is a solution of equation (2) with an $f(w)$. Then $\bar{w} = \bar{w}(z)$ is also a solution of the more complicated equation $\left[F(w)w'_z\right]'_z + \frac{1}{2}zw'_z = 0$ with

$$F(w) = f(w) + Ag(w) \qquad (A \text{ is an arbitrary constant}), \tag{6}$$

where the function $g = g(w)$ is defined parametrically by

$$g(w) = \frac{1}{\bar{w}'_z}, \quad w = \bar{w}(z). \tag{7}$$

For example, the function $\bar{w} = bz^{2/m}$, where b is some constant, is a particular solution of equation (2) if $f(w)$ is a power-law function, $f(w) = aw^m$. It follows from (6) and (7) that $\bar{w}$ is also a solution of equation (2) with $f(w) = aw^m + Aw^{\frac{m-2}{2}}$.

For the first solution presented in Table 5.1, the method outlined gives the following one-parameter family of functions:

$$f(w) = \frac{n}{2}w^n - \frac{n}{2(n+1)}w^{2n} + Aw^{n-1},$$

for which $z = 1 - w^n$ is a solution of the equation.

7°. The transformation

$$\begin{aligned} &\bar{t} = t - t_0, \qquad \bar{w}(\bar{x}, \bar{t}) = \frac{1}{w(x,t)}, \\ &\bar{x} = \int_{x_0}^{x} w(y,t)\,dy + \int_{t_0}^{t} f\big(w(x_0,\tau)\big)\left[\frac{\partial w}{\partial x}(x,\tau)\right]_{x=x_0} d\tau \end{aligned} \tag{8}$$

takes a nonzero solution $w(x,t)$ of the original equation to a solution $\bar{w}(\bar{x},\bar{t})$ of a similar equation,

$$\frac{\partial \bar{w}}{\partial \bar{t}} = \frac{\partial}{\partial \bar{x}}\left[\bar{f}(\bar{w})\frac{\partial \bar{w}}{\partial \bar{x}}\right], \qquad \bar{f}(w) = \frac{1}{w^2} f\left(\frac{1}{w}\right). \tag{9}$$

In the special case of power-law dependence, $f(w) = aw^m$, transformation (8) leads to equation (9) where $\bar{f}(w) = aw^{-m-2}$.

8°. The equation in question is represented in conservative form, i.e., in the form of a conservation law.

Another conservation law:

$$\frac{\partial}{\partial t}(xw) + \frac{\partial}{\partial x}\left[F(w) - xf(w)\frac{\partial w}{\partial x}\right] = 0,$$

where $F(w) = \int f(w)\,dw$.

9°. For $f(w) = a(w^2 + b)^{-1}$, see equation 5.1.13.2 and Subsection 30.3.2 (Example 30.9).

10°. For $f(w) = aw^{2n} + bw^n$, see equation 5.1.13.3.

⊙ *References for equation* 5.6.15.1: L. V. Ovsiannikov (1959, 1962, 1982), V. A. Dorodnitsyn and S. R. Svirshchevskii (1983), W. Strampp (1982), J. R. Burgan, A. Munier, M. R. Feix, and E. Fijalkow (1984), J. R. King (1990 *b*), N. H. Ibragimov (1994, pp. 110, 118, 119), A. A. Samarskii, V. A. Galaktionov, S. P. Kurdyumov, and A. P. Mikhailov (1995), V. F. Zaitsev and A. D. Polyanin (1996, pp. 435–438), P. W. Doyle and P. J. Vassiliou (1998).

2. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + g(w).$

This equation governs unsteady heat conduction in a quiescent medium in the case where the thermal diffusivity and the rate of reaction are arbitrary functions of temperature.

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm x + C_1, t + C_2),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Traveling-wave solutions:

$$w = w(z), \quad z = \pm x + \lambda t,$$

where the function $w(z)$ is determined by the autonomous ordinary differential equation

$$[f(w)w_z']_z' - \lambda w_z' + g(w) = 0. \tag{1}$$

The substitution

$$y(w) = \frac{1}{\lambda} f(w)w_z'$$

brings (1) to an Abel equation of the second kind:

$$yy_w' - y = \varphi(w), \qquad \text{where} \quad \varphi(w) = -\lambda^{-2} f(w)g(w). \tag{2}$$

The book by Polyanin and Zaitsev (2003) presents a considerable number of solutions to equation (2) for various $\varphi = \varphi(w)$.

3°. Let the function $f = f(w)$ be arbitrary and let $g = g(w)$ be defined by

$$g(w) = \frac{A}{f(w)} + B,$$

where A and B are some numbers. In this case, there is a functional separable solution, which is defined implicitly by

$$\int f(w)\,dw = At - \frac{1}{2}Bx^2 + C_1x + C_2,$$

where C_1 and C_2 are arbitrary constants.

4°. Let now $g = g(w)$ be arbitrary and let $f = f(w)$ be defined by

$$f(w) = \frac{A_1A_2w + B}{g(w)} + \frac{A_2A_3}{g(w)}\int Z\,dw, \tag{3}$$

$$Z = -A_2\int \frac{dw}{g(w)}, \tag{4}$$

where A_1, A_2, and A_3 are some numbers. Then there are generalized traveling-wave solutions of the form

$$w = w(Z), \quad Z = \frac{\pm x + C_2}{\sqrt{2A_3t + C_1}} - \frac{A_1}{A_3} - \frac{A_2}{3A_3}(2A_3t + C_1),$$

where the function $w(Z)$ is determined by the inversion of (4), and C_1 and C_2 are arbitrary constants.

5°. Let $g = g(w)$ be arbitrary and let $f = f(w)$ be defined by

$$f(w) = \frac{1}{g(w)}\left(A_1w + A_3\int Z\,dw\right)\exp\left[-A_4\int \frac{dw}{g(w)}\right], \tag{5}$$

$$Z = \frac{1}{A_4}\exp\left[-A_4\int \frac{dw}{g(w)}\right] - \frac{A_2}{A_4}, \tag{6}$$

where A_1, A_2, A_3, and A_4 are some numbers ($A_4 \neq 0$). In this case, there are generalized traveling-wave solutions of the form

$$w = w(Z), \quad Z = \varphi(t)x + \psi(t),$$

where the function $w(Z)$ is determined by the inversion of (6),

$$\varphi(t) = \pm\left(C_1e^{2A_4t} - \frac{A_3}{A_4}\right)^{-1/2}, \quad \psi(t) = -\varphi(t)\left[A_1\int \varphi(t)\,dt + A_2\int \frac{dt}{\varphi(t)} + C_2\right],$$

and C_1 and C_2 are arbitrary constants.

6°. Let $f = f(w)$ be arbitrary and let $g = g(w)$ be defined by

$$g(w) = \left(\frac{a}{f(w)} + b\right)\left(\int f(w)\,dw + c\right),$$

where a, b, and c are arbitrary constants. In this case, there are generalized separable solutions defined implicitly by

$$\int f(w)\,dw + c = e^{at}z(x),$$

where

$$\begin{aligned} z(x) &= C_1\exp\bigl(x\sqrt{|b|}\,\bigr) + C_2\exp\bigl(-x\sqrt{|b|}\,\bigr) && \text{if } b < 0,\\ z(x) &= C_1\cos\bigl(x\sqrt{b}\,\bigr) + C_2\sin\bigl(x\sqrt{b}\,\bigr) && \text{if } b > 0,\\ z(x) &= C_1x + C_2 && \text{if } b = 0, \end{aligned}$$

and C_1 and C_2 are arbitrary constants.

7°. Let $f(w)$ and $g(w)$ be as follows:

$$f(w) = w\varphi'_w(w), \qquad g(w) = a\left[w + 2\frac{\varphi(w)}{\varphi'_w(w)}\right],$$

where $\varphi(w)$ is an arbitrary function and a is any number. Then there are functional separable solutions defined implicitly by

$$\varphi(w) = C_1e^{2at} - \tfrac{1}{2}a(x + C_2)^2,$$

where C_1 and C_2 are arbitrary constants.

8°. Let $f(w)$ and $g(w)$ be as follows:

$$f(w) = A\frac{V(z)}{V'_z(z)}, \qquad g(w) = B\bigl[2z^{-1/2}V'_z(z) + z^{-3/2}V(z)\bigr],$$

where A and B are arbitrary constants ($AB \neq 0$), $V(z)$ is an arbitrary function, and the function $z = z(w)$ is determined implicitly by the formula

$$w = \int z^{-1/2}V'_z(z)\,dz + C_1; \tag{7}$$

C_1 is an arbitrary constant. Then there exists a functional separable solution of the form (7) where

$$z = -\frac{(x + C_3)^2}{4At + C_2} + 2Bt + \frac{BC_2}{2A},$$

and C_2 and C_3 are arbitrary constants.

9°. Group classification of solutions to the equation in question was carried out by Dorodnitsyn (1979, 1982); see also Dorodnitsyn and Svirshchevskii (1983), Galaktionov, Dorodnitsyn, Elenin, Kurdyumov, and Samarskii (1986), and Ibragimov (1994). As a result, only a limited number of equations were extracted that possess symmetries other than translations. This means that symmetry analysis does not allow one to obtain the solutions given in Items 3°–8° above (for equations with functional arbitrariness).

10°. If $f = dF(w)/dw$ and $g = aF(w) + bw + c$, where $F(w)$ is an arbitrary function, and a, b, and c are arbitrary constants, then there is a conservation law

$$\big[e^{-bt}p(x)w\big]_t + \big\{e^{-bt}\big[p(x)_xF(w) - p(x)(F(w))_x + \varphi(x)\big]\big\}_x = 0.$$

Here,

$$p(x) = \begin{cases} C_1\sin(\sqrt{a}x) + C_2\cos(\sqrt{a}x) & \text{if } a > 0, \\ C_1e^{\sqrt{-a}x} + C_2e^{-\sqrt{-a}x} & \text{if } a < 0, \\ C_1x + C_2 & \text{if } a = 0, \end{cases}$$

where $\varphi'_x = cp(x)$; C_1 and C_2 are arbitrary constants.

11°. For specific equations of this form, see Subsections 5.1.1 to 5.1.3, 5.1.11 to 5.1.13, 5.2.1 to 5.2.3, and 5.4.1.

⊙ *References for equation* 5.6.15.2: V. A. Dorodnitsyn (1979), V. A. Galaktionov (1994), A. D. Polyanin and V. F. Zaitsev (2004, pp. 107–108), A. D. Polyanin and E. A. Vyazmina (2005).

3. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + \dfrac{g(t)}{f(w)} + h(x).$

Functional separable solution in implicit form:

$$\int f(w)\,dw = \int g(t)\,dt - \int_{x_0}^{x}(x-\xi)h(\xi)\,d\xi + C_1x + C_2,$$

where C_1 and C_2 are arbitrary constants, and x_0 is any number.

4. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] - (ax+b)\dfrac{\partial w}{\partial x}.$

This equation governs unsteady heat and mass transfer in an inhomogeneous fluid flow in the cases where the thermal diffusivity is arbitrarily dependent on temperature.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1 = w(x + C_1e^{at}, t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Generalized traveling-wave solution:

$$w = w(z), \qquad z = x + C_1e^{at},$$

where the function $w(z)$ is determined by the ordinary differential equation

$$[f(w)w'_z]'_z - (az+b)w'_z = 0.$$

3°. Functional separable solution in implicit form:

$$\int f(w)\,dw = C_1e^{-at}(ax+b) + C_2.$$

4°. On passing from t, x to the new variables

$$\tau = \frac{1}{2a}\big(1 - e^{-2at}\big), \qquad \zeta = e^{-at}\left(x + \frac{b}{a}\right),$$

one obtains a simpler equation of the form 5.6.15.1 for $w(\zeta,\tau)$:

$$\frac{\partial w}{\partial \tau} = \frac{\partial}{\partial \zeta}\left[f(w)\frac{\partial w}{\partial \zeta}\right].$$

⊙ *Reference for equation* 5.6.15.4: A. D. Polyanin and V. F. Zaitsev (2004, p. 109).

5. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + g(w)\dfrac{\partial w}{\partial x}.$

1°. Traveling-wave solution in implicit form:

$$k^2 \int \frac{f(w)\,dw}{\lambda w - kG(w) + C_1} = kx + \lambda t + C_2, \qquad G(w) = \int g(w)\,dw,$$

where C_1, C_2, k, and λ are arbitrary constants.

2°. The transformation

$$dz = w\,dx + \big[f(w)w_x + G(w)\big]\,dt, \quad d\tau = dt, \quad u = 1/w \qquad \big(dz = z_x\,dx + z_t\,dt\big)$$

leads to an equation of the similar form

$$\frac{\partial u}{\partial \tau} = \frac{\partial}{\partial z}\left[\Phi(u)\frac{\partial u}{\partial z}\right] + \Psi(u)\frac{\partial u}{\partial z},$$

where

$$\Phi(u) = \frac{1}{u^2} f\left(\frac{1}{u}\right), \quad \Psi(u) = \frac{1}{u} g\left(\frac{1}{u}\right) - G\left(\frac{1}{u}\right), \quad G(w) = \int g(w)\,dw.$$

Special case. For $f(w) = a$ and $g(w) = bw$, the original equation is an unnormalized Burgers equation 5.1.5.3. The above transformation brings it to the solvable equation

$$\frac{\partial u}{\partial \tau} = \frac{\partial}{\partial z}\left(\frac{a}{u^2}\frac{\partial u}{\partial z}\right) + \frac{b}{2u^2}\frac{\partial u}{\partial z},$$

which was studied by Fokas and Yortsos (1982).

3°. Let $f(w)$ and $g(w)$ be defined as

$$f(w) = Z'_w\left(A_1 w + A_3 \int Z\,dw\right), \qquad g(w) = A_2 + A_4 Z,$$

where

$$Z = Z(w) \tag{1}$$

is a prescribed function (chosen arbitrarily). Then the original equation has the following generalized traveling-wave solution:

$$w = w(Z), \qquad Z = \varphi(t)x + (A_2 t + C_1)\varphi(t) + A_1\varphi(t)\int \varphi(t)\,dt,$$

where C_1 is an arbitrary constant, the function $w(Z)$ is determined by the inversion of (1), and the function $\varphi(t)$ is determined by the first-order separable ordinary differential equation

$$\varphi'_t = A_3\varphi^3 + A_4\varphi^2, \tag{2}$$

whose general solution can be written out in implicit form.

In special cases, solutions of equation (2) are given by

$$\varphi(t) = (C_2 - 2A_3 t)^{-1/2} \quad \text{if } A_4 = 0,$$
$$\varphi(t) = (C_2 - A_4 t)^{-1} \quad \text{if } A_3 = 0.$$

4°. Conservation law:

$$D_t(w) + D_x\big[-f(w)w_x - G(w)\big] = 0, \qquad G(w) = \int g(w)\,dw.$$

⊙ *Reference for equation* 5.6.15.5: A. D. Polyanin and V. F. Zaitsev (2004, pp. 109–110).

6. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + g(t)\dfrac{\partial w}{\partial x}.$

This equation governs unsteady heat conduction in a moving medium in the case where the thermal diffusivity is arbitrarily dependent on temperature.

On passing from t, x to the new variables t, $z = x + \int g(t)\,dt$, one obtains a simpler equation of the form 5.6.15.1:

$$\frac{\partial w}{\partial t} = \frac{\partial}{\partial z}\left[f(w)\frac{\partial w}{\partial z}\right].$$

7. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + xg(t)\dfrac{\partial w}{\partial x}.$

On passing from t, x to the new variables (A and B are arbitrary constants)

$$\tau = \int G^2(t)\,dt + A, \quad z = xG(t), \qquad \text{where} \quad G(t) = B\exp\left[\int g(t)\,dt\right],$$

one obtains a simpler equation of the form 5.6.15.1 for $w(\tau, z)$:

$$\frac{\partial w}{\partial \tau} = \frac{\partial}{\partial z}\left[f(w)\frac{\partial w}{\partial z}\right].$$

8. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + \big[xg(t) + h(t)\big]\dfrac{\partial w}{\partial x}.$

The transformation

$$w = U(z,\tau), \quad z = xG(t) + \int h(t)G(t)\,dt, \quad \tau = \int G^2(t)\,dt, \quad G(t) = \exp\left[\int g(t)\,dt\right],$$

leads to a simpler equation of the form 5.6.15.1:

$$\frac{\partial U}{\partial \tau} = \frac{\partial}{\partial z}\left[f(U)\frac{\partial U}{\partial z}\right].$$

⊙ *Reference*: V. F. Zaitsev and A. D. Polyanin (1996, p. 441).

9. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + g(w)\dfrac{\partial w}{\partial x} + h(w).$

For $g \equiv \text{const}$, this equation governs unsteady heat conduction in a medium moving at a constant velocity in the case where the thermal diffusivity and the reaction rate are arbitrary functions of temperature.

Traveling-wave solution:

$$w = w(z), \quad z = x + \lambda t,$$

where the function $w(z)$ is determined by the autonomous ordinary differential equation

$$[f(w)w_z']_z' + [g(w) - \lambda]w_z' + h(w) = 0. \tag{1}$$

The substitution $y(w) = f(w)w_z'$ brings (1) to the Abel equation

$$yy_w' + [g(w) - \lambda]y + f(w)h(w) = 0. \tag{2}$$

The books by Polyanin and Zaitsev (1995, 2003) present a large number of exact solutions to equation (2) for various $f(w)$, $g(w)$, and $h(w)$.

10. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + \big[ax + g(w)\big]\dfrac{\partial w}{\partial x} + h(w).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x + C_1 e^{-at}, t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Generalized traveling-wave solution:

$$w = w(z), \qquad z = x + C_1 e^{-at},$$

where the function $w(z)$ is determined by the ordinary differential equation

$$[f(w)w_z']_z' + [az + g(w)]w_z' + h(w) = 0.$$

⊙ *Reference for equation* 5.6.15.10: A. D. Polyanin and V. F. Zaitsev (2004, p. 111).

5.6.16. Equations of the Form $\dfrac{\partial w}{\partial t} = f(x,w)\dfrac{\partial^2 w}{\partial x^2}$

1. $\dfrac{\partial w}{\partial t} = f(x)w^m\dfrac{\partial^2 w}{\partial x^2}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(x, C_1^m t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Multiplicative separable solution:

$$w(x,t) = (m\lambda t + C)^{-1/m}\varphi(x),$$

where C and λ are arbitrary constants, and the function $\varphi = \varphi(x)$ is determined by the generalized Emden–Fowler equation

$$\varphi_{xx}'' + \lambda\big[f(x)\big]^{-1}\varphi^{1-m} = 0. \tag{1}$$

For $m = 1$, a solution of equation (1) is given by

$$\varphi(x) = -\lambda\int_{x_0}^{x}\frac{(x-\xi)}{f(\xi)}d\xi + Ax + B,$$

where A, B, and x_0 are arbitrary constants.

The books by Polyanin and Zaitsev (1995, 2003) present a large number of solutions to equation (1) for various $f(x)$.

3°. The transformation $u = w/x$, $\xi = 1/x$ leads to an equation of the similar form

$$\frac{\partial u}{\partial t} = F(\xi)u^m\frac{\partial^2 u}{\partial \xi^2}, \qquad F(\xi) = \xi^{4-m}f(1/\xi).$$

2. $\dfrac{\partial w}{\partial t} = \dfrac{f(x)}{aw+b}\dfrac{\partial^2 w}{\partial x^2}.$

Generalized separable solution linear in t:

$$w(x,t) = \frac{1}{a}\big[\varphi(x)t + \psi(x) - b\big],$$

where the functions $\varphi(x)$ and $\psi(x)$ are determined by the system of ordinary differential equations

$$f(x)\varphi''_{xx} - \varphi^2 = 0,$$
$$f(x)\psi''_{xx} - \varphi\psi = 0.$$

The first equation can be treated independently from the second. The second equation has a particular solution $\psi(x) = \varphi(x)$, so its general solution is given by

$$\psi(x) = C_1\varphi(x) + C_2\varphi(x)\int \frac{dx}{\varphi^2(x)},$$

where C_1 and C_2 are arbitrary constants.

3. $\dfrac{\partial w}{\partial t} = f(w)\dfrac{\partial^2 w}{\partial x^2}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(C_1 x + C_2, C_1^2 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solution in implicit form:

$$k^2\int \frac{dw}{\lambda F(w) + C_1} = kx + \lambda t + C_2, \qquad F(w) = \int \frac{dw}{f(w)},$$

where C_1, C_2, k, and λ are arbitrary constants.

3°. Self-similar solution:

$$w = U(z), \qquad z = \frac{x + C_1}{\sqrt{C_2 t + C_3}},$$

where C_1, C_2, and C_3 are arbitrary constants, and the function $U(z)$ is determined by the ordinary differential equation

$$f(U)U''_{zz} + \tfrac{1}{2}C_2 z U'_z = 0.$$

4°. The substitution $u = \displaystyle\int \frac{dw}{f(w)}$ leads to an equation of the form 5.6.15.1:

$$\frac{\partial u}{\partial t} = \frac{\partial}{\partial x}\left[F(u)\frac{\partial u}{\partial x}\right],$$

where the function F is defined parametrically as

$$F(u) = f(w), \qquad u = \int \frac{dw}{f(w)}.$$

To obtain $F = F(u)$ in explicit form, one should eliminate w from the two relations.

5°. Conservation laws:

$$D_t(u) + D_x(-w_x) = 0,$$
$$D_t(xu) + D_x(w - xw_x) = 0,$$

where $D_t = \frac{\partial}{\partial t}$, $D_x = \frac{\partial}{\partial x}$; w_x is the partial derivative of w with respect to x; and u is defined in Item 4°.

4. $\dfrac{\partial w}{\partial t} = x^4 f\left(\dfrac{w}{x}\right)\dfrac{\partial^2 w}{\partial x^2}.$

The transformation $u = w/x$, $\xi = 1/x$ leads to a simpler equation of the form 5.6.16.3:

$$\frac{\partial u}{\partial t} = f(u)\frac{\partial^2 u}{\partial \xi^2}.$$

5. $\dfrac{\partial w}{\partial t} = w^4 f\left(\dfrac{w}{\sqrt{ax^2+bx+c}}\right)\dfrac{\partial^2 w}{\partial x^2}.$

With the transformation

$$w(x,t) = u(z,t)\sqrt{ax^2+bx+c}, \qquad z = \int \frac{dx}{ax^2+bx+c}$$

one arrives at the simpler equation

$$\frac{\partial u}{\partial t} = u^4 f(u)\frac{\partial^2 u}{\partial z^2} + (ac - \tfrac{1}{4}b^2)u^5 f(u),$$

which has a traveling-wave solution $u = u(z + \lambda t)$.

⊙ *Reference*: V. F. Zaitsev and A. D. Polyanin (1996, p. 432).

5.6.17. Equations of the Form $\dfrac{\partial w}{\partial t} = f(x,t,w)\dfrac{\partial^2 w}{\partial x^2} + g\left(x,t,w,\dfrac{\partial w}{\partial x}\right)$

1. $\dfrac{\partial w}{\partial t} = f(t)\dfrac{\partial^2 w}{\partial x^2} + w\left(\dfrac{\partial w}{\partial x}\right)^2 - aw^3.$

1°. Multiplicative separable solutions for $a > 0$:

$$w(x,t) = C\exp\left[\pm x\sqrt{a} + a\int f(t)\,dt\right],$$

where C is an arbitrary constant.

2°. Multiplicative separable solution for $a > 0$:

$$w(x,t) = \left(C_1 e^{x\sqrt{a}} + C_2 e^{-x\sqrt{a}}\right)e^F\left(C_3 + 8aC_1C_2\int e^{2F}\,dt\right)^{-1/2}, \qquad F = a\int f(t)\,dt,$$

where C_1, C_2, and C_3 are arbitrary constants.

3°. Multiplicative separable solution for $a < 0$:

$$w(x,t) = \left[C_1\sin\left(x\sqrt{|a|}\right) + C_2\cos\left(x\sqrt{|a|}\right)\right]e^F\left[C_3 + 2a(C_1^2 + C_2^2)\int e^{2F}\,dt\right]^{-1/2},$$

where $F = a\int f(t)\,dt$; C_1, C_2, and C_3 are arbitrary constants.

2. $\dfrac{\partial w}{\partial t} = f(t)\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) + g(t)w + h_2(t)x^2 + h_1(t)x + h_0(t).$

Generalized separable solution quadratic in x:

$$w(x,t) = \varphi(t)x^2 + \psi(t)x + \chi(t),$$

where the functions $\varphi = \varphi(t)$, $\psi = \psi(t)$, and $\chi = \chi(t)$ are determined by the system of ordinary differential equations

$$\begin{aligned}
\varphi_t' &= 6f(t)\varphi^2 + g(t)\varphi + h_2(t),\\
\psi_t' &= 6f(t)\varphi\psi + g(t)\psi + h_1(t),\\
\chi_t' &= 2f(t)\varphi\chi + f(t)\psi^2 + g(t)\chi + h_0(t).
\end{aligned}$$

3. $\dfrac{\partial w}{\partial t} + f(t)w\dfrac{\partial w}{\partial x} = g(t)\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right).$

Degenerate solution linear in x:

$$w(x,t) = \frac{1}{F(t)}\left[x + \int \frac{g(t)}{F(t)}\,dt + C_1\right], \qquad F(t) = \int f(t)\,dt + C_2,$$

where C_1 and C_2 are arbitrary constants.

4. $\dfrac{\partial w}{\partial t} + f(t)w\dfrac{\partial w}{\partial x} = g(t)\dfrac{\partial}{\partial x}\left(w^2\dfrac{\partial w}{\partial x}\right).$

Degenerate solution linear in x:

$$w(x,t) = (x + C_1)\varphi(t),$$

where the function $\varphi = \varphi(t)$ is determined by the ordinary differential equation

$$\varphi_t' = 2g(t)\varphi^3 - f(t)\varphi^2.$$

5. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(x)w^m\dfrac{\partial w}{\partial x}\right].$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(x, C_1^m t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Multiplicative separable solution:

$$w(x,t) = (m\lambda t + C)^{-1/m}\varphi(x),$$

where C and λ are arbitrary constants, and the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$[f(x)\varphi^m\varphi_x']_x' + \lambda\varphi = 0. \tag{1}$$

The transformation

$$z = \int \frac{dx}{f(x)}, \quad \Phi = \varphi^{m+1}$$

brings (1) to the generalized Emden–Fowler equation

$$\Phi''_{zz} + F(z)\Phi^{\frac{1}{m+1}} = 0, \tag{2}$$

where the function $F = F(z)$ is defined parametrically by

$$F = \lambda(m+1)f(x), \quad z = \int \frac{dx}{f(x)}.$$

The book by Polyanin and Zaitsev (2003, Sections 2.3 and 2.7) presents a large number of solutions to equation (2) for various $F = F(z)$.

3°. The transformation

$$w(x,t) = \big[\psi(x)\big]^{\frac{1}{m+1}} u(\xi,t), \quad \xi = -\int \big[\psi(x)\big]^{\frac{m+2}{m+1}} dx, \qquad \psi(x) = \int \frac{dx}{f(x)},$$

leads to an equation of the similar form

$$\frac{\partial u}{\partial t} = \frac{\partial}{\partial \xi}\left[F(\xi)u^m \frac{\partial u}{\partial \xi}\right],$$

where the function $F = F(\xi)$ is defined parametrically by

$$F = f(x)[\psi(x)]^{\frac{3m+4}{m+1}}, \quad \xi = -\int \big[\psi(x)\big]^{\frac{m+2}{m+1}} dx, \qquad \psi(x) = \int \frac{dx}{f(x)}.$$

6. $\dfrac{\partial w}{\partial t} = f(x)w^m \dfrac{\partial^2 w}{\partial x^2} + g(x)w^{m+1}$.

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(x, C_1^m t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Multiplicative separable solution (C and λ are arbitrary constants):

$$w(x,t) = (m\lambda t + C)^{-1/m}\varphi(x),$$

where the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$f(x)\varphi^m\varphi''_{xx} + g(x)\varphi^{m+1} + \lambda\varphi = 0. \tag{1}$$

In the special case of $f(x) = ax^n$ and $g(x) = bx^k$, equation (1) becomes

$$\varphi''_{xx} + (b/a)x^{k-n}\varphi + (\lambda/a)x^{-n}\varphi^{1-m} = 0. \tag{2}$$

The books by Polyanin and Zaitsev (1995, 2003) present a large number of solutions to equation (2) for various values of n, m, and k.

7. $\dfrac{\partial w}{\partial t} = f(t)\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + g(t)w^{1-m}.$

Functional separable solution:

$$w(x,t) = \left[\varphi(t)x^2 + \psi(t)\right]^{1/m},$$

where the functions $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are determined by the system of first-order ordinary differential equations

$$\varphi'_t = \frac{2(m+2)}{m}f\varphi^2, \qquad \psi'_t = 2f\varphi\psi + mg.$$

Integrating yields

$$\varphi = \frac{1}{F}, \quad \psi = F^{-\frac{m}{m+2}}\left(A + m\int gF^{\frac{m}{m+2}}\,dt\right),$$
$$F = B - \frac{2(m+2)}{m}\int f\,dt,$$

where A and B are arbitrary constants.

⊙ *Reference*: V. F. Zaitsev and A. D. Polyanin (1996, p. 433).

8. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(x)w^m\dfrac{\partial w}{\partial x}\right] + g(x)w^{m+1}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(x, C_1^m t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Multiplicative separable solution (C and λ are arbitrary constants):

$$w(x,t) = (m\lambda t + C)^{-1/m}\varphi(x),$$

where the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$[f(x)\varphi^m\varphi'_x]'_x + g(x)\varphi^{m+1} + \lambda\varphi = 0. \tag{1}$$

The transformation

$$z = \int \frac{dx}{f(x)}, \quad \Phi = \varphi^{m+1}$$

brings (1) to the equation

$$\Phi''_{zz} + F(z)\Phi^{\frac{1}{m+1}} + G(z)\Phi = 0, \tag{2}$$

where the functions $F = F(z)$ and $G = G(z)$ are defined parametrically by

$$\begin{cases} F = \lambda(m+1)f(x), \\ z = \displaystyle\int \frac{dx}{f(x)}, \end{cases} \qquad \begin{cases} G = (m+1)f(x)g(x), \\ z = \displaystyle\int \frac{dx}{f(x)}. \end{cases}$$

In the special case of $f(x) = ax^n$ and $g(x) = bx^k$, equation (2) becomes

$$\Phi''_{zz} + Az^{\frac{n}{1-n}}\Phi^{\frac{1}{m+1}} + Bz^{\frac{n+k}{1-n}}\Phi = 0, \qquad n \neq 1, \tag{3}$$

where $A = \lambda a(m+1)\left[a(1-n)\right]^{\frac{n}{1-n}}$ and $B = ab(m+1)\left[a(1-n)\right]^{\frac{n+k}{1-n}}$.

The books by Polyanin and Zaitsev (1995, 2003) present a large number of solutions to equation (3) for various values of n, m, and k.

⊙ *Reference for equation* 5.6.17.8: V. F. Zaitsev and A. D. Polyanin (1996, p. 434).

9. $\dfrac{\partial w}{\partial t} = f(t)\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + g(t)\dfrac{\partial w}{\partial x} + h(t)w.$

The transformation

$$w(x,t) = u(z,\tau)\exp\left[\int h(t)\,dt\right], \quad z = x + \int g(t)\,dt, \quad \tau = \int f(t)\exp\left[m\int h(t)dt\right]dt$$

leads to a simpler equation of the form 5.1.10.8:

$$\frac{\partial u}{\partial \tau} = \frac{\partial}{\partial z}\left(u^m\frac{\partial u}{\partial z}\right).$$

10. $\dfrac{\partial w}{\partial t} = f(t)\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + \big[xg(t) + h(t)\big]\dfrac{\partial w}{\partial x} + s(t)w.$

The transformation

$$w(x,t) = u(z,\tau)S(t), \quad z = xG(t) + \int h(t)G(t)\,dt, \quad \tau = \int f(t)G^2(t)S^m(t)\,dt,$$

where the functions $S(t)$ and $G(t)$ are given by

$$S(t) = \exp\left[\int s(t)\,dt\right], \quad G(t) = \exp\left[\int g(t)\,dt\right],$$

leads to a simpler equation of the form 5.1.10.8:

$$\frac{\partial u}{\partial \tau} = \frac{\partial}{\partial z}\left(u^m\frac{\partial u}{\partial z}\right).$$

⊙ *Reference*: V. F. Zaitsev and A. D. Polyanin (1996, pp. 434–435).

11. $\dfrac{\partial w}{\partial t} = x^k f(t)\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + xg(t)\dfrac{\partial w}{\partial x} + h(t)w.$

The transformation

$$w(t,x) = u(z,\tau)H(t), \quad z = xG(t), \quad \tau = \int f(t)G^{2-k}(t)H^m(t)\,dt,$$

where the functions $G(t)$ and $H(t)$ are given by

$$G(t) = \exp\left[\int g(t)\,dt\right], \quad H(t) = \exp\left[\int h(t)\,dt\right],$$

leads to a simpler equation of the form 5.1.17.10:

$$\frac{\partial u}{\partial \tau} = z^k\frac{\partial}{\partial z}\left(u^m\frac{\partial u}{\partial z}\right).$$

⊙ *Reference*: V. F. Zaitsev and A. D. Polyanin (1996, p. 440).

12. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(x)e^{\beta w}\dfrac{\partial w}{\partial x}\right].$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x, C_1 t + C_2) + \frac{1}{\beta}\ln C_1,$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = -\frac{1}{\beta}\ln(\beta t + C) + \frac{1}{\beta}\ln\left[\int \frac{A-\beta x}{f(x)}\,dx + B\right],$$

where A, B, and C are arbitrary constants.

13. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(x)e^{\beta w}\dfrac{\partial w}{\partial x}\right] + g(x)e^{\beta w}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x, C_1 t + C_2) + \frac{1}{\beta}\ln C_1,$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = -\frac{1}{\beta}\ln(\beta t + C) + \varphi(x),$$

where β and C are arbitrary constants, and the function $\varphi(x)$ is determined by the second-order linear ordinary differential equation

$$[f(x)\psi_x']_x' + \beta g(x)\psi + \beta = 0, \qquad \psi = e^{\beta\varphi}.$$

⊙ *Reference for equation* 5.6.17.13: V. F. Zaitsev and A. D. Polyanin (1996, p. 435).

14. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left\{\left[f_2(t)w^{2n} + f_1(t)w^n\right]\dfrac{\partial w}{\partial x}\right\} + g_1(t)w + g_2(t)w^{1-n}.$

Generalized traveling-wave solution:

$$w(x,t) = \left[\varphi(t)x + \psi(t)\right]^{1/n},$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of ordinary differential equations

$$\varphi_t' = \frac{(n+1)}{n}f_2(t)\varphi^3 + ng_1(t)\varphi,$$
$$\psi_t' = \frac{(n+1)}{n}f_2(t)\varphi^2\psi + ng_1(t)\psi + \frac{1}{n}f_1(t)\varphi^2 + ng_2(t),$$

which is easy to integrate (the first equation is a Bernoulli equation and the second one is linear in ψ).

15. $\dfrac{\partial w}{\partial t} = f(w)\dfrac{\partial^2 w}{\partial x^2} + \big[ax + g(w)\big]\dfrac{\partial w}{\partial x} + h(w).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x + C_1 e^{-at}, t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Generalized traveling-wave solution:

$$w = w(z), \qquad z = x + C_1 e^{-at},$$

where the function $w(z)$ is determined by the ordinary differential equation

$$f(w)w''_{zz} + [az + g(w)]w'_z + h(w) = 0.$$

16. $\dfrac{\partial w}{\partial t} = x^{1-n}\dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right].$

Nonlinear problems of the diffusion boundary layer, defined by equation 5.6.20.2, are reducible to equations of this form. For $n = 1$, see equation 5.6.15.1, and for $f(w) = aw^m$, see equation 5.1.17.10.

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(C_1 x, C_1^{n+1} t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Self-similar solution for $n \neq -1$:

$$w = w(z), \qquad z = xt^{-\frac{1}{n+1}} \qquad (0 \le x < \infty),$$

where the function $w(z)$ is determined by the ordinary differential equation

$$(n+1)[f(w)w'_z]'_z + z^n w'_z = 0, \tag{1}$$

which is often accompanied by the boundary conditions of (3) in 5.6.15.1.

The general solution of equation (1) with $f(w) = a(w+b)^{-1}$ and arbitrary n can be found in Zaitsev and Polyanin (1993).

3°. We now describe a simple way to find functions $f(w)$ for which equation (1) admits exact solutions. Let us integrate (1) with respect to z and then apply the hodograph transformation (with w regarded as the independent variable and z as the dependent one) to obtain

$$f(w) = -\frac{1}{n+1} z'_w \left(\int z^n \, dw + A \right), \qquad A \text{ is any.} \tag{2}$$

Substituting a specific $z = z(w)$ for z on the right-hand side of (2), one obtains a one-parameter family of functions $f(w)$ for which $z = z(w)$ solves equation (1). An explicit form of the solution, $w = w(z)$, is determined by the inversion of $z = z(w)$.

For example, setting $z = (1-w)^k$, one obtains from (2) the corresponding $f(w)$:

$$f(w) = A(1-w)^{k-1} - \frac{k}{(n+1)(nk+1)}(1-w)^{k(n+1)}, \qquad A \text{ is any.}$$

4°. There is another way to construct $f(w)$ for which equation (1) admits exact solutions. It involves the following. Let $\bar{w} = \bar{w}(z)$ be a solution of equation (1) with some function $f(w)$. Then $\bar{w} = \bar{w}(z)$ is also a solution of the more complicated equation $(n+1)[F(w)w'_z]'_z + z^n w'_z = 0$ with

$$F(w) = f(w) + Ag(w) \qquad (A \text{ is any}), \tag{3}$$

where the function $g = g(w)$ is defined parametrically by

$$g(w) = \frac{1}{\bar{w}'_z}, \quad w = \bar{w}(z). \tag{4}$$

For example, if $f(w)$ is a power-law function of w, $f(w) = aw^m$, then $\bar{w} = bz^{\frac{n+1}{m}}$ is a solution of equation (1), with b being a constant. It follows from (3) and (4) that $\bar{w}$ is also a solution of equation (1) with $f(w) = aw^m + Aw^{\frac{m-n-1}{n+1}}$.

5°. For $n = -1$, there is an exact solution of the form

$$w = w(\xi), \quad \xi = \ln|x| + \lambda t,$$

where the function $w(\xi)$ is defined implicitly by

$$\int \frac{f(w)\,dw}{\lambda w + F(w) + C_1} = \xi + C_2, \qquad F(w) = \int f(w)\,dw,$$

where λ, C_1, and C_2 are arbitrary constants. To $\lambda = 0$ there corresponds a stationary solution.

⊙ *Reference for equation* 5.6.17.16: V. F. Zaitsev and A. D. Polyanin (1996, pp. 439–440).

17. $\dfrac{\partial w}{\partial t} = \dfrac{1}{x^n}\dfrac{\partial}{\partial x}\left[x^n f(w)\dfrac{\partial w}{\partial x}\right] + g(w).$

This is a nonlinear equation of heat and mass transfer in the radial symmetric case ($n = 1$ corresponds to a plane problem and $n = 2$ to a spatial one).

1°. Let $f = f(w)$ be arbitrary and let $g = g(w)$ be defined by

$$g(w) = \left(\frac{a}{f(w)} + b\right)\left(\int f(w)\,dw + c\right),$$

where a, b, and c are arbitrary constants. In this case, there are functional separable solutions defined implicitly by

$$\int f(w)\,dw + c = e^{at} z(x),$$

where the function $z = z(x)$ is described by the linear ordinary differential equation

$$z''_{xx} + \frac{n}{x} z'_x + bz = 0.$$

Its general solution can be expressed in terms of Bessel functions or modified Bessel functions; see Polyanin and Zaitsev (2003).

2°. Let $f(w)$ and $g(w)$ be defined by

$$f(w) = w\varphi'_w(w), \qquad g(w) = a(n+1)w + 2a\frac{\varphi(w)}{\varphi'_w(w)},$$

where $\varphi(w)$ is an arbitrary function. In this case, there is a functional separable solution defined implicitly by

$$\varphi(w) = Ce^{2at} - \tfrac{1}{2}ax^2,$$

where C is an arbitrary constant.

3°. Let $f(w)$ and $g(w)$ be defined as follows:

$$f(w) = a\varphi^{-\frac{n+1}{2}}\varphi' \int \varphi^{\frac{n+1}{2}}\,dw, \qquad g(w) = b\frac{\varphi}{\varphi'},$$

where $\varphi = \varphi(w)$ is an arbitrary function. In this case, there is a functional separable solution defined implicitly by

$$\varphi(w) = \frac{bx^2}{Ce^{-bt} - 4a},$$

where C is an arbitrary constant.

4°. Let $f(w)$ and $g(w)$ be defined as follows:

$$f(w) = A\frac{V(z)}{V'_z(z)}, \qquad g(w) = B\Big[2z^{-\frac{n+1}{2}}V'_z(z) + (n+1)z^{-\frac{n+3}{2}}V(z)\Big], \tag{1}$$

where A and B are arbitrary constants ($AB \neq 0$), $V(z)$ is an arbitrary function, the function $z = z(w)$ defined implicitly by

$$w = \int z^{-\frac{n+1}{2}}V'_z(z)\,dz + C_1; \tag{2}$$

C_1 is an arbitrary constant. In this case, there is a functional separable solution of the form (2) where

$$z = -\frac{x^2}{4At + C_2} + 2Bt + \frac{BC_2}{2A},$$

and C_2 is an arbitrary constant.

Special case 1. For $f(w) = aw^k$ and $g(w) = bw^{1-k}$, which corresponds to the equation

$$\frac{\partial w}{\partial t} = \frac{a}{x^n}\frac{\partial}{\partial x}\left(x^n w^k \frac{\partial w}{\partial x}\right) + bw^{1-k},$$

there is the functional separable solution

$$w(x,t) = \left\{\frac{bk}{4a(kn+k+1)}[2a(kn+k+2)t + C] - \frac{kx^2}{2a(kn+k+2)t + C}\right\}^{1/k},$$

where C is an arbitrary constant.

Special case 2. For $f(w) = ae^{\lambda w}$ and $g(w) = be^{-\lambda w}$, which corresponds to the equation

$$\frac{\partial w}{\partial t} = \frac{a}{x^n}\frac{\partial}{\partial x}\left(x^n e^{\lambda w}\frac{\partial w}{\partial x}\right) + be^{-\lambda w},$$

there is the functional separable solution

$$w(x,t) = \frac{1}{\lambda}\ln\left\{\frac{b\lambda}{4a(n+1)}[2a(n+1)t + C] - \frac{x^2}{2a(n+1)t + C}\right\},$$

where C is an arbitrary constant.

⊙ *References for equation* 5.6.17.17: V. A. Galaktionov (1994), A. D. Polyanin and V. F. Zaitsev (2004, pp. 119–120), A. D. Polyanin and E. A. Vyazmina (2005), E. A. Vyazmina and A. D. Polyanin (2006).

18. $\dfrac{\partial w}{\partial t} = f(t)\varphi(w)\dfrac{\partial^2 w}{\partial x^2} + \big[xg(t) + h(t)\big]\dfrac{\partial w}{\partial x}.$

The transformation

$$z = xG(t) + \int h(t)G(t)\,dt, \quad \tau = \int f(t)G^2(t)\,dt, \qquad G(t) = \exp\left[\int g(t)\,dt\right],$$

leads to a simpler equation of the form 5.6.16.3:

$$\frac{\partial w}{\partial \tau} = \varphi(w)\frac{\partial^2 w}{\partial z^2}.$$

19. $\dfrac{\partial w}{\partial t} = f(t)\dfrac{\partial}{\partial x}\left[\varphi(w)\dfrac{\partial w}{\partial x}\right] + \big[xg(t) + h(t)\big]\dfrac{\partial w}{\partial x}.$

The transformation

$$z = xG(t) + \int h(t)G(t)\,dt, \quad \tau = \int f(t)G^2(t)\,dt, \qquad G(t) = \exp\left[\int g(t)\,dt\right],$$

leads to a simpler equation of the form 5.6.15.1:

$$\frac{\partial w}{\partial \tau} = \frac{\partial}{\partial z}\left[\varphi(w)\frac{\partial w}{\partial z}\right].$$

⊙ *Reference*: V. F. Zaitsev and A. D. Polyanin (1996, p. 441).

20. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2}{\partial x^2}\big[f(x,w)\big] + \dfrac{g(t)}{f_w(x,w)} + h(x).$

Here, f_w is the partial derivative of f with respect to w.

Functional separable solution in implicit form:

$$f(x,w) = \int g(t)\,dt - \int_{x_0}^{x}(x-\xi)h(\xi)\,d\xi + C_1 x + C_2,$$

where C_1 and C_2 are arbitrary constants, and x_0 is any number.

21. $f(x)\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[g(x)\varphi(w)\dfrac{\partial w}{\partial x}\right] + h(x)\psi(w)\dfrac{\partial w}{\partial x}.$

For Lie group classification, transformations, and exact solutions to solutions of this form, see the references cited below.

Special cases of this equation are considered in Subsections 5.1.10 and 5.1.15; see also equations 5.1.13.1–5.1.13.4, 5.1.16.1, 5.1.16.4, 5.1.17.9, 5.1.17.10, 5.2.2.1, 5.2.3.1, 5.2.3.7, 5.2.3.10, 5.2.4.2, 5.2.4.6–5.2.4.10, and others.

5.6.18. Equations of the Form $\dfrac{\partial w}{\partial t} = f\left(x, w, \dfrac{\partial w}{\partial x}\right)\dfrac{\partial^2 w}{\partial x^2} + g\left(x, t, w, \dfrac{\partial w}{\partial x}\right)$

1. $\dfrac{\partial w}{\partial t} = a\left(\dfrac{\partial w}{\partial x}\right)^k \dfrac{\partial^2 w}{\partial x^2} + \left[f(t)x + g(t)\right]\dfrac{\partial w}{\partial x} + h(t)w.$

With the transformation

$$w(x,t) = u(z,\tau)H(t), \quad z = xF(t) + \int g(t)F(t)\,dt, \quad \tau = \int F^{k+2}(t)H^k(t)\,dt,$$

where the functions $F(t)$ and $H(t)$ are given by

$$F(t) = \exp\left[\int f(t)\,dt\right], \quad H(t) = \exp\left[\int h(t)\,dt\right],$$

one arrives at the simpler equation

$$\frac{\partial u}{\partial \tau} = a\left(\frac{\partial u}{\partial x}\right)^k \frac{\partial^2 u}{\partial z^2}.$$

See equation 5.6.18.4, Special case 1.

2. $\dfrac{\partial w}{\partial t} = f(x)\left(\dfrac{\partial w}{\partial x}\right)^k \dfrac{\partial^2 w}{\partial x^2}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(x, C_1^k t + C_2) + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = At + B + \varphi(x),$$

where the function $\varphi(x)$ is given by

$$\varphi(x) = \int \left[A(k+1)\int \frac{dx}{f(x)} + C_1\right]^{\frac{1}{k+1}} dx + C_2 \quad \text{if } k \neq -1,$$

$$\varphi(x) = C_1 \int \exp\left[A\int \frac{dx}{f(x)}\right] dx + C_2 \quad \text{if } k = -1;$$

A, B, C_1, and C_2 are arbitrary constants.

3°. Generalized separable solution:

$$w(x,t) = (Akt + B)^{-1/k}\Theta(x) + C,$$

where A, B, and C are arbitrary constants, and the function $\Theta(x)$ is determined by the second-order ordinary differential equation

$$f(x)\left(\Theta'_x\right)^k \Theta''_{xx} + A\Theta = 0.$$

3. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(w)\left(\dfrac{\partial w}{\partial x}\right)^n\right] + g(w).$

Generalized porous medium equation with nonlinear source.

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x + C_1, t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solution:

$$w = w(z), \quad z = x + \lambda t,$$

where the function $w(z)$ is determined by the autonomous ordinary differential equation

$$[f(w)(w'_z)^n]'_z - \lambda w'_z + g(w) = 0.$$

3°. Suppose the function $f = f(w)$ is arbitrary and the function $g = g(w)$ is given by

$$g(w) = A[f(w)]^{-1/n} - B,$$

where A and B are some numbers. In this case, there is a functional separable solution determined implicitly by

$$\int [f(w)]^{1/n}\,dw = At + \frac{n}{B(n+1)}(Bx + C_1)^{\frac{n+1}{n}} + C_2,$$

where C_1 and C_2 are arbitrary constants.

4°. Now let the function $g = g(w)$ be arbitrary and let the function $f = f(w)$ be given by

$$f(w) = \frac{A}{[g(w)]^n}\exp\left[Bn\int \frac{dw}{g(w)}\right],$$

where A and B are some numbers. In this case, there is a functional separable solution determined implicitly by

$$\int \frac{dw}{g(w)} = t + \frac{1}{B}\ln|Bx + C_1| + C_2.$$

5°. Let the function $g = g(w)$ be arbitrary and let the function $f = f(w)$ be given by

$$f(w) = \frac{A_1 A_2^n\, w + B}{[g\,(w)]^n} + \frac{A_2^n A_3}{[g\,(w)]^n}\int Z\,dw, \tag{1}$$

$$Z = A_2 \int \frac{dw}{g\,(w)}, \tag{2}$$

where A_1, A_2, and A_3 are some numbers. In this case, there are traveling-wave solutions of the form

$$w = w(Z), \quad Z = \varphi(t)x + \psi(t),$$

where the function $w(Z)$ is determined by inverting relation (2) and the function $\varphi(t)$ and $\psi(t)$ are expressed as

$$\varphi(t) = \left[\frac{1}{C_1 - A_3\,(n+1)\,t}\right]^{\frac{1}{n+1}},$$

$$\psi(t) = \varphi\,(t)\left[A_1\int [\varphi\,(t)]^n\,dt + A_2\int \frac{dt}{\varphi\,(t)} + C_2\right];$$

C_1 and C_2 are arbitrary constants.

6°. Let $g = g(w)$ be arbitrary and let $f = f(w)$ be given by

$$f(w) = \frac{1}{[(g(w)]^n}\left(A_1 w + A_3 \int Z dw\right) \exp\left[nA_4 \int \frac{dw}{g(w)}\right], \tag{3}$$

$$Z = \frac{1}{A_4} \exp\left[A_4 \int \frac{dw}{g(w)}\right] - \frac{A_2}{A_4}, \tag{4}$$

where A_1, A_2, A_3, and A_4 are some numbers ($A_4 \neq 0$). In this case, there are generalized traveling-wave solution of the form

$$w = w(Z), \quad Z = \varphi(t)x + \psi(t),$$

where the function $w(Z)$ is determined by inverting relation (2) and the functions $\varphi(t)$ and $\psi(t)$ are expressed as

$$\varphi(t) = \left[C_1 e^{-(n+1)A_4 t} - \frac{A_3}{A_4}\right]^{-\frac{1}{n+1}},$$

$$\psi(t) = \varphi(t)\left[A_1 \int [\varphi(t)]^n dt + A_2 \int \frac{dt}{\varphi(t)} + C_2\right];$$

C_1 and C_2 are arbitrary constants.

7°. Let the functions $f(w)$ and $g(w)$ be given by

$$f(w) = A\exp\big[-bn\varphi(w)\big][\varphi'_w(w)]^n, \quad g(w) = \frac{a}{\varphi'_w(w)} - Acn\exp\big[-bn\varphi(w)\big],$$

where $\varphi(w)$ is an arbitrary function; A, a, b, and c are any numbers. In this case, there is a functional separable solution given implicitly by

$$\varphi(w) = at + \theta(x),$$

where the function $\theta(x)$ is determined by the autonomous ordinary differential equation

$$(\theta'_x)^{n-1}\theta''_{xx} = b(\theta'_x)^{n+1} + c.$$

The general solution to this equation can be written in parametric form as

$$\theta = \int \frac{u^n\,du}{bu^{n+1} + c} + C_1, \quad x = \int \frac{u^{n-1}\,du}{bu^{n+1} + c} + C_2.$$

8°. Let $f(w)$ and $g(w)$ be given by

$$f(w) = \frac{1}{\lambda^n}\left(a - \frac{n\lambda}{n+1}w\right)\big[\varphi'_w(w)\big]^n, \quad g(w) = \lambda\frac{\varphi(w)}{\varphi'_w(w)} + \frac{n\lambda}{n+1}w - a,$$

where $\varphi(w)$ is an arbitrary function; a and λ are arbitrary numbers. In this case, there is a functional separable solution given implicitly by

$$\varphi(w) = C_1 e^{\lambda t} + \frac{n\lambda}{n+1}(x + C_2)^{\frac{n+1}{n}};$$

C_1 and C_2 are arbitrary constants.

9°. Some equations of this form that admit functional separable solutions of the special form

$$w = F(\xi), \quad \xi = \varphi(x) + \psi(t)$$

were studied by Estévez, Qu, and Zhang (2002). Unlike the equations considered above in Items 3°–8°, the ones considered in this paper do not contain functional arbitrariness.

⊙ *References for equation* 5.6.18.3: A. D. Polyanin and E. A. Vyazmina (2005), E. A. Vyazmina and A. D. Polyanin (2006).

4. $\dfrac{\partial w}{\partial t} = f\left(\dfrac{\partial w}{\partial x}\right)\dfrac{\partial^2 w}{\partial x^2}$.

This equation occurs in the nonlinear theory of flows in porous media; it governs also the motion of a nonlinear viscoplastic medium.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1^{-1} w(C_1 x + C_2, C_1^2 t + C_3) + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. Solution:

$$w(x,t) = At + B + \varphi(z), \qquad z = kx + \lambda t, \tag{1}$$

where A, B, k, and λ are arbitrary constants, and the function $\varphi(z)$ is determined by the ordinary differential equation

$$k^2 f\left(k\varphi'_z\right)\varphi''_{zz} = \lambda\varphi'_z + A. \tag{2}$$

The general solution of equation (2) can be rewritten in parametric form as

$$\varphi = k\int \frac{uf(u)\,du}{\lambda u + Ak} + C_1, \qquad z = k^2 \int \frac{f(u)\,du}{\lambda u + Ak} + C_2, \tag{3}$$

where C_1 and C_2 are arbitrary constants,

Relations (1) and (3) define a traveling-wave solution for $A = 0$ and an additive separable solution for $\lambda = 0$.

3°. Self-similar solution:

$$w(x,t) = \sqrt{t}\,\Theta(\xi), \qquad \xi = \frac{x}{\sqrt{t}},$$

where the function $\Theta(\xi)$ is determined by the ordinary differential equation

$$2f\left(\Theta'_\xi\right)\Theta''_{\xi\xi} + \xi\Theta'_\xi - \Theta = 0.$$

4°. The original equation can be represented as the system of equations

$$\frac{\partial w}{\partial x} = u, \qquad \frac{\partial w}{\partial t} = f(u)\frac{\partial u}{\partial x}.$$

Eliminating u, we obtain the original equation for $w = w(x,t)$. Eliminating w, we obtain an equation of the form 5.6.15.1:

$$\frac{\partial u}{\partial t} = \frac{\partial}{\partial x}\left[f(u)\frac{\partial u}{\partial x}\right]. \tag{4}$$

5°. The hodograph transformation

$$\bar{x} = w(x,t), \qquad \bar{w}(\bar{x},t) = x$$

leads to an equation of the similar form

$$\frac{\partial \bar{w}}{\partial t} = \bar{f}\left(\frac{\partial \bar{w}}{\partial \bar{x}}\right)\frac{\partial^2 \bar{w}}{\partial \bar{x}^2}, \qquad \bar{f}(z) = \frac{1}{z^2} f\left(\frac{1}{z}\right).$$

6°. The transformation

$$\bar{t} = \alpha t + \gamma_1, \qquad \bar{x} = \beta_1 x + \beta_2 w + \gamma_2, \qquad \bar{w} = \beta_3 x + \beta_4 w + \gamma_3,$$

where α, the β_i, and the γ_i are arbitrary constants such that $\alpha \neq 0$ and $\beta_1\beta_4 - \beta_2\beta_3 \neq 0$, takes the original equation to an equation with the same form. We have

$$\bar{f}(\bar{w}_{\bar{x}}) = \frac{1}{\alpha}(\beta_1 + \beta_2 w_x)^2 f(w_x), \qquad w_x = \frac{\beta_1 \bar{w}_{\bar{x}} - \beta_3}{\beta_4 - \beta_2 \bar{w}_{\bar{x}}},$$

where the subscripts x and $\bar{x}$ denote the corresponding partial derivatives.

Special case 1. Equation

$$\frac{\partial w}{\partial t} = a\left(\frac{\partial w}{\partial x}\right)^k \frac{\partial^2 w}{\partial x^2}, \qquad k \neq 0.$$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(C_2 x + C_3, C_1^k C_2^{k+2} t + C_4) + C_5,$$

where $C_1, \ldots, C_5$ are arbitrary constants, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = aA^{k+1}t + B + \frac{A}{k+2}\big[(k+1)x + C\big]^{\frac{k+2}{k+1}},$$

where A, B, and C are arbitrary constants.

3°. Generalized separable solution:

$$w(x,t) = (t + C_1)^{-1/k} u(x) + C_2,$$

where C_1 and C_2 are arbitrary constants, and $u(x)$ is determined by the ordinary differential equation $ak(u'_x)^k u''_{xx} + u = 0$, the general solution of which can be written out in the implicit form as

$$\int \left(C_3 - \frac{k+2}{2ak}u^2\right)^{-\frac{1}{k+2}} du = x + C_4.$$

4°. For $k = -2$, the equation in question is reduced to equation (4) with $f(u) = au^{-2}$ and, hence, can be linearized (see equation 5.1.10.3).

Special case 2. Equation

$$\frac{\partial w}{\partial t} = \frac{a}{w_x^2 + b^2}\frac{\partial^2 w}{\partial x^2}, \qquad w_x = \frac{\partial w}{\partial x}.$$

1. Solution:

$$w(x,t) = \pm\sqrt{C_1 - b^2(x + C_2)^2 - 2at} + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants.

2. Solution:

$$w = bx\tan\left(\pm\frac{1}{2}z - \arctan\big(\psi(z)\big) \pm \frac{a}{b^2}t + C\right),$$
$$z = x^2\cos^{-2}\left(\pm\frac{1}{2}z - \arctan\big(\psi(z)\big) \pm \frac{a}{b^2}t + C\right),$$

where C is an arbitrary constant, and the function $\psi = \psi(z)$ is determined by the ordinary differential equation

$$\psi'_z = \frac{1}{2}(1 + \psi^2)\left(\pm 1 - \frac{\psi}{z}\right).$$

The function $z = z(x,t)$ in the solution is defined implicitly.

3. Solution:

$$w = bx\tan\left(\varphi(z) + \frac{C}{2}\ln\frac{at}{b^2}\right),$$
$$z = \frac{b^2x^2}{at}\cos^{-2}\left(\varphi(z) + \frac{C}{2}\ln\frac{at}{b^2}\right),$$

where C is an arbitrary constant, and the functions $\varphi(z)$ and $\psi(z)$ are determined by the system of ordinary differential equations

$$\varphi'_z = \frac{\psi}{2z}, \quad \psi'_z = \frac{1}{2}(1 + \psi^2)\left(\frac{C}{2} - \frac{\psi}{2} - \frac{\psi}{z}\right).$$

The function $z = z(x,t)$ in the solution is defined implicitly.

Special case 3. Equation

$$\frac{\partial w}{\partial t} = k\exp\left(\frac{\partial w}{\partial x}\right)\frac{\partial^2 w}{\partial x^2}.$$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1^{-1}w(C_1x + C_2, C_1^2e^{C_3}t + C_4) + C_3x + C_5,$$

where $C_1, \ldots, C_5$ are arbitrary constants, is also a solution of the equation.

2°. Solution:

$$w(x,t) = 2A\arctan\left(\frac{x+B}{A}\right) - (x+B)\ln\left|\frac{kt+C}{(x+B)^2+A^2}\right| - (2+\ln 2)x + D,$$

where A, B, C, and D are arbitrary constants.

⊙ *References for equation* 5.6.18.4: E. V. Lenskii (1966), I. Sh. Akhatov, R. K. Gazizov, and N. H. Ibragimov (1989), J. R. King (1990 *b*), N. H. Ibragimov (1994, pp. 115–118, 129–130), A. D. Polyanin and V. F. Zaitsev (2004, pp. 121–123).

5. $\dfrac{\partial w}{\partial t} = f(x)g(w)h(w_x)\dfrac{\partial^2 w}{\partial x^2}, \qquad w_x = \dfrac{\partial w}{\partial x}.$

The hodograph transformation, according to which x is taken to be the dependent variable and w the independent one,

$$x = x(w,t),$$

leads to the similar equation:

$$\frac{\partial x}{\partial t} = g(w)f(x)\overline{h}(x_w)\frac{\partial^2 x}{\partial w^2}, \qquad \text{where} \quad \overline{h}(z) = z^{-2}h(1/z).$$

6. $\dfrac{\partial w}{\partial t}\left(\dfrac{\partial w}{\partial x}\right)^2 = f(t,w)\dfrac{\partial^2 w}{\partial x^2}.$

Let us seek its solution in implicit form $x = x(w,t)$ (it is the *hodograph transformation*). As a result, we obtain the following second-order linear equation:

$$\frac{\partial x}{\partial t} = f(t,w)\frac{\partial^2 x}{\partial w^2}.$$

See Subsection 26.2.1 (Example 26.4) for details.

7. $\dfrac{\partial w}{\partial t} = f(t,w) + g(t,w)\dfrac{\partial w}{\partial x} + \dfrac{h(t,w)}{w_x^2}\dfrac{\partial^2 w}{\partial x^2}, \qquad w_x = \dfrac{\partial w}{\partial x}.$

The Bäcklund transformation

$$w_t = f(t,w) + g(t,w)\eta + h(t,w)\eta^{-2}\eta_x,$$
$$w_x = \eta$$

leads to the equation

$$\eta_t = \eta^2\frac{\partial}{\partial w}\left[\frac{f(t,w)}{\eta} + g(t,w) + h(t,w)\frac{\eta_w}{\eta^2}\right],$$

which is reduced, by the change of variable $\eta = 1/\zeta$, to the linear equation

$$\zeta_t = \frac{\partial}{\partial w}\Big[h(t,w)\zeta_w - f(t,w)\zeta - g(t,w)\Big].$$

Remark. Similar transformations are discussed in detail in Subsection 26.5.2, Item 3°, and are based on using formula (26.5.2.20).

8. $\dfrac{\partial w}{\partial t}+\dfrac{\partial}{\partial x}\left[\dfrac{f(w)}{w_x}\right]=0, \qquad w_x=\dfrac{\partial w}{\partial x}.$

By setting $v=f(w)/w_x$, we represent the equation as the equivalent system of two equations

$$\frac{\partial w}{\partial t}+\frac{\partial v}{\partial x}=0, \qquad v\frac{\partial w}{\partial x}=f(w).$$

Using the *nonclassical hodograph transformation*

$$x=x(w,t), \qquad v=v(w,t)$$

where w and t are treated as independent variables, while x and v are treated as the dependent variables, and expressing the "old" derivatives through the "new" ones

$$w_x=\frac{1}{x_w}, \quad w_t=-\frac{x_t}{x_w}, \quad v_x=\frac{v_w}{x_w}, \quad v_t=v_t-\frac{x_t}{x_w}v_w,$$

we get the linear system of equations

$$\frac{\partial x}{\partial t}-\frac{\partial v}{\partial w}=0, \qquad f(w)\frac{\partial x}{\partial w}=v.$$

Eliminating the function v, we obtain the linear heat equation

$$\frac{\partial x}{\partial t}=\frac{\partial}{\partial w}\left[f(w)\frac{\partial x}{\partial w}\right].$$

Exact solutions to this equation for arbitrary $f(w)$ can be found in the book by Polyanin (2002, p. 141).

9. $\dfrac{\partial w}{\partial t}+\dfrac{\partial}{\partial x}\left[\dfrac{f(t,w)}{w_x}+g(t,w)\right]=0, \qquad w_x=\dfrac{\partial w}{\partial x}.$

By setting $v=f(t,w)/w_x$, we represent the equation as the equivalent system of two equations

$$\frac{\partial w}{\partial t}+\frac{\partial v}{\partial x}+g_w(t,w)w_x=0, \qquad v\frac{\partial w}{\partial x}=f(t,w).$$

Using the nonclassical hodograph transformation

$$x=x(w,t), \qquad v=v(w,t)$$

where w and t are considered as independent variables, while x and v are considered as the dependent variables (for details about this transformation, see the previous equation) we get the linear system of equations

$$\frac{\partial x}{\partial t}-\frac{\partial v}{\partial w}=g_w(t,w), \qquad f(t,w)\frac{\partial x}{\partial w}=v.$$

Eliminating the function v, we obtain the linear equation

$$\frac{\partial x}{\partial t}=\frac{\partial}{\partial w}\left[f(t,w)\frac{\partial x}{\partial w}\right]+g_w(t,w).$$

5.6.19. Evolution Equations Nonlinear in the Second Derivative

1. $\dfrac{\partial w}{\partial t}\dfrac{\partial^2 w}{\partial x^2} = f\left(t, \dfrac{\partial w}{\partial x}\right).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1^{-1} w(C_1 x + C_2, t) + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. The *Euler transformation*

$$w(x,t) + u(\xi,\eta) = x\xi, \quad x = \frac{\partial u}{\partial \xi}, \quad t = \eta$$

leads to the linear equation

$$\frac{\partial u}{\partial \eta} = -f(\eta,\xi)\frac{\partial^2 u}{\partial \xi^2}.$$

For details, see Subsection 26.3.4 (Example 26.19).

2. $\dfrac{\partial w}{\partial t} + [a(t)w + b(t)x]\dfrac{\partial w}{\partial x} = \dfrac{f(t, w_x)}{w_{xx}} + g(t, w_x), \qquad w_x = \dfrac{\partial w}{\partial x}, \quad w_{xx} = \dfrac{\partial^2 w}{\partial x^2}.$

This equation can be reduced to a linear equation. For details, see Subsection 26.6.1 (Example 26.43).

3. $\dfrac{\partial w}{\partial t} = f(x)\exp\left(a\dfrac{\partial^2 w}{\partial x^2}\right).$

Generalized separable solution:

$$w = \varphi(x) + \psi(x)\theta(t),$$

where

$$\varphi(x) = \frac{1}{2a}A_1 x^2 + C_3 x + C_4 + \frac{1}{a}\int_{x_0}^{x}(x-\xi)\ln\frac{\psi(\xi)}{f(\xi)}\,d\xi,$$

$$\psi(x) = \frac{1}{2}A_2 x^2 + C_1 x + C_2,$$

$$\theta(t) = -\frac{1}{A_2 a}\ln\bigl(C_5 - A_2 a e^{A_1 t}\bigr),$$

and A_1, A_2, C_1, C_2, C_3, C_4, and C_5 are arbitrary constants.

5.6.20. Nonlinear Equations of the Thermal (Diffusion) Boundary Layer

1. $f(x)\dfrac{\partial w}{\partial x} + g(x)y\dfrac{\partial w}{\partial y} = \dfrac{\partial}{\partial y}\left[\varphi(w)\dfrac{\partial w}{\partial y}\right].$

This equation is encountered in nonlinear problems of the steady diffusion boundary layer (mass exchange between drops or bubbles and a flow); the coordinates x and y are reckoned along and normal to the interphase surface, respectively.

The transformation (A and B are arbitrary constants)

$$t = \int \frac{h^2(x)}{f(x)}dx + A, \quad z = yh(x), \qquad \text{where} \quad h(x) = B\exp\left[-\int \frac{g(x)}{f(x)}dx\right],$$

leads to a simpler equation of the form 5.6.15.1:

$$\frac{\partial w}{\partial t} = \frac{\partial}{\partial z}\left[\varphi(w)\frac{\partial w}{\partial z}\right].$$

⊙ *References*: A. D. Polyanin (1980, 1982), V. F. Zaitsev and A. D. Polyanin (1996, p. 443).

2. $f(x)y^{n-1}\dfrac{\partial w}{\partial x} + g(x)y^n\dfrac{\partial w}{\partial y} = \dfrac{\partial}{\partial y}\left[\varphi(w)\dfrac{\partial w}{\partial y}\right].$

This equation is encountered in nonlinear problems of the steady diffusion boundary layer (mass exchange between solid particles, drops, or bubbles and the ambient medium; convective diffusion to a flat plate and that in liquid films); the coordinates x and y are reckoned along and normal to the body surface, respectively. The value $n = 2$ corresponds to a solid particle and $n = 1$, to a drop or a bubble.

The transformation (A and B are arbitrary constants)

$$t = \int \frac{h^{n+1}(x)}{f(x)}dx + A, \quad z = yh(x), \qquad \text{where} \quad h(x) = B\exp\left[-\int \frac{g(x)}{f(x)}dx\right],$$

leads to a simpler equation of the form 5.6.17.16:

$$\frac{\partial w}{\partial t} = z^{1-n}\frac{\partial}{\partial z}\left[\varphi(w)\frac{\partial w}{\partial z}\right].$$

⊙ *References*: Yu. P. Gupalo, A. D. Polyanin, and Yu. S. Ryazantsev (1985), V. F. Zaitsev and A. D. Polyanin (1996, p. 443).

3. $f\left(\dfrac{y}{\sqrt{x}}\right)\dfrac{\partial w}{\partial x} + \dfrac{1}{\sqrt{x}}g\left(\dfrac{y}{\sqrt{x}}\right)\dfrac{\partial w}{\partial y} = \dfrac{\partial}{\partial y}\left[\varphi(w)\dfrac{\partial w}{\partial y}\right].$

This is a generalization of the linear equation of the thermal boundary layer on a flat plate.

1°. Self-similar solution:

$$w = w(\xi), \quad \xi = \frac{y}{\sqrt{x}}, \tag{1}$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$[\varphi(w)w'_\xi]'_\xi + \left[\tfrac{1}{2}\xi f(\xi) - g(\xi)\right]w'_\xi = 0. \tag{2}$$

2°. Solving the original partial differential equation with simple boundary conditions of the first kind,

$$x = 0,\ w = a; \quad y = 0,\ w = b; \quad y \to \infty,\ w \to a,$$

where a and b are some constants, is reduced to solving equation (2) with the boundary conditions

$$\xi = 0,\ w = b; \quad \xi \to \infty,\ w \to a.$$

Remark. The classical thermal boundary layer equation is defined by

$$f(\xi) = \mathrm{Pr}F'_\xi(\xi), \quad g(\xi) = \tfrac{1}{2}\mathrm{Pr}\left[\xi F'_\xi(\xi) - F(\xi)\right],$$

where $F(\xi)$ is the Blasius solution in the hydrodynamic problem on the longitudinal homogeneous translational flow of a viscid incompressible fluid past a flat plane, and Pr is the Prandtl number (x the coordinate along the plate and y the coordinate normal to the plate surface).

⊙ *References for equation* 5.6.20.3: H. Schlichting (1981), A. D. Polyanin and V. F. Zaitsev (2002, p. 87–88).

5.7. Nonlinear Schrödinger Equations and Related Equations

5.7.1. Equations of the Form $i\frac{\partial w}{\partial t} + \frac{\partial^2 w}{\partial x^2} + f(|w|)w = 0$ Involving Arbitrary Parameters

▷ *Throughout this subsection, w is a complex function of real variables x and t; $i^2 = -1$.*

1. $i\frac{\partial w}{\partial t} + \frac{\partial^2 w}{\partial x^2} + k|w|^2 w = 0.$

Schrödinger equation with a cubic nonlinearity. Here, k is a real number. This equation occurs in various chapters of theoretical physics, including nonlinear optics, superconductivity, and plasma physics.

1°. Suppose $w(x,t)$ is a solution of the Schrödinger equation in question. Then the functions

$$w_1 = \pm A_1 w(\pm A_1 x + A_2, A_1^2 t + A_3),$$
$$w_2 = e^{-i(\lambda x + \lambda^2 t + B)} w(x + 2\lambda t, t),$$

where A_1, A_2, A_3, B, and λ are arbitrary real constants, are also solutions of the equation. The plus or minus signs in the expression of w_1 are chosen arbitrarily.

2°. Solutions:

$$w(x,t) = C_1 \exp\{i\,[C_2 x + (kC_1^2 - C_2^2)t + C_3]\},$$
$$w(x,t) = \pm C_1 \sqrt{\frac{2}{k}}\,\frac{\exp[i(C_1^2 t + C_2)]}{\cosh(C_1 x + C_3)},$$
$$w(x,t) = \pm A \sqrt{\frac{2}{k}}\,\frac{\exp[iBx + i(A^2 - B^2)t + iC_1]}{\cosh(Ax - 2ABt + C_2)},$$
$$w(x,t) = \frac{C_1}{\sqrt{t}} \exp\left[i\frac{(x + C_2)^2}{4t} + i(kC_1^2 \ln t + C_3)\right],$$

where A, B, C_1, C_2, and C_3 are arbitrary real constants. The second and third solutions are valid for $k > 0$. The third solution describes the motion of a soliton in a rapidly decaying case.

3°. Solution:

$$w(x,t) = (ax + b)\exp\big[i(\alpha x^2 + \beta x + \gamma)\big],$$

where the functions $a = a(t)$, $b = b(t)$, $\alpha = \alpha(t)$, $\beta = \beta(t)$, and $\gamma = \gamma(t)$ are determined by the autonomous system of ordinary differential equations

$$a'_t = -6a\alpha,$$
$$b'_t = -2a\beta - 2b\alpha,$$
$$\alpha'_t = ka^2 - 4\alpha^2,$$
$$\beta'_t = 2kab - 4\alpha\beta,$$
$$\gamma'_t = kb^2 - \beta^2.$$

4°. N-soliton solutions for $k > 0$:

$$w(x,t) = \sqrt{\frac{2}{k}}\,\frac{\det \mathbf{R}(x,t)}{\det \mathbf{M}(x,t)}.$$

Here, $\mathbf{M}(x,t)$ is an $N \times N$ matrix with entries

$$M_{n,k}(x,t) = \frac{1 + \overline{g}_n(x,t)g_n(x,t)}{\overline{\lambda}_n - \lambda_k}, \quad g_n(x,t) = \gamma_n e^{i(\lambda_n x - \lambda_n^2 t)}, \qquad n,\, k = 1,\, \ldots,\, N,$$

where the λ_n and γ_n are arbitrary complex numbers that satisfy the constraints $\operatorname{Im}\lambda_n > 0$ ($\lambda_n \neq \lambda_k$ if $n \neq k$) and $\gamma_n \neq 0$; the bar over a symbol denotes the complex conjugate. The square matrix $\mathbf{R}(x,t)$ is of order $N+1$; it is obtained by augmenting $\mathbf{M}(x,t)$ with a column on the right and a row at the bottom. The entries of $\mathbf{R}$ are defined as

$R_{n,k}(x,t) = M_{n,k}(x,t)$	for	$n,k = 1,\, \ldots,\, N$	(bulk of the matrix),
$R_{n,N+1}(x,t) = g_n(x,t)$	for	$n = 1,\, \ldots,\, N$	(rightmost column),
$R_{N+1,n}(x,t) = 1$	for	$n = 1,\, \ldots,\, N$	(bottom row),
$R_{N+1,N+1}(x,t) = 0$			(lower right diagonal entry).

The above solution can be represented, for $t \to \pm\infty$, as the sum of N single-soliton solutions.

5°. Self-similar solution:

$$w(x,t) = \frac{1}{\sqrt{C_1 t + C_2}}\,u(z), \qquad z = \frac{x + C_3}{\sqrt{C_1 t + C_2}},$$

where C_1, C_2, and C_3 are arbitrary constants, and the function $u = u(z)$ is determined by the ordinary differential equation

$$u''_{zz} + k|u|^2 u - \tfrac{1}{2}iC_1(zu'_z + u) = 0.$$

6°. For other exact solutions, see equation 5.7.5.1 with $f(u) = ku^2$.

7°. Auto-Bäcklund transformations preserving the form of the equation (with $k = 1$):

$$\frac{\partial w}{\partial x} - \frac{\partial \widetilde{w}}{\partial x} = iaf_1 - \frac{i}{2}f_2 g_1,$$
$$\frac{\partial w}{\partial t} - \frac{\partial \widetilde{w}}{\partial t} = \frac{1}{2}g_1\left(\frac{\partial w}{\partial x} + \frac{\partial \widetilde{w}}{\partial x}\right) - ag_2 + \frac{i}{4}f_1\bigl(|f_1|^2 + |f_2|^2\bigr).$$

Here,

$$f_1 = w - \widetilde{w}, \quad f_2 = w + \widetilde{w}, \quad g_1 = i\varepsilon\bigl(b - 2|f_1|^2\bigr)^{1/2}, \quad g_2 = i\bigl(af_1 - \tfrac{1}{2}f_2 g_1\bigr),$$

where a and b are arbitrary real constants and $\varepsilon = \pm 1$.

8°. The Schrödinger equation with a cubic nonlinearity admits infinitely many integrals of motion.

The first three integrals for $k = 2$:

$$C_1 = \int_{-\infty}^{\infty} |w|^2\,dx, \quad C_2 = \int_{-\infty}^{\infty} \left(\overline{w}\frac{\partial w}{\partial x} - w\frac{\partial \overline{w}}{\partial x}\right) dx, \quad C_3 = \int_{-\infty}^{\infty} \left(2\left|\frac{\partial w}{\partial x}\right|^2 - |w|^4\right) dx.$$

It is assumed here that the initial distribution $w(x, 0)$ decays quite rapidly as $|x| \to \infty$. The bar over a symbol denotes the complex conjugate.

The first three integrals for $k = -2$:

$$C_1 = \int_{-\infty}^{\infty} \left(1 - |w|^2\right) dx, \quad C_2 = -\int_{-\infty}^{\infty} \left(\overline{w}\frac{\partial w}{\partial x} - w\frac{\partial \overline{w}}{\partial x}\right) dx, \quad C_3 = \int_{-\infty}^{\infty} \left(\left|\frac{\partial w}{\partial x}\right|^2 + |w|^4 - 1\right) dx.$$

9°. The Schrödinger equation with a cubic nonlinearity is integrable by the inverse scattering method; see the literature cited below.

⊙ *References for equation* 5.7.1.1: V. E. Zakharov and A. B. Shabat (1972), G. L. Lamb (1974), M. J. Ablowitz and H. Segur (1981), R. K. Dodd, J. C. Eilbeck, J. D. Gibbon, and H. C. 2. $i\dfrac{\partial w}{\partial t} + \dfrac{\partial^2 w}{\partial x^2} + (A|w|^2 + B)w = 0.$

Schrödinger equation with a cubic nonlinearity. The numbers A and B are assumed real.

1°. Solutions:

$$w(x,t) = C_1 \exp\left\{i\left[C_2 x + (AC_1^2 + B - C_2^2)t + C_3\right]\right\},$$
$$w(x,t) = \frac{C_1}{\sqrt{t}} \exp\left[i\frac{(x + C_2)^2}{4t} + i(AC_1^2 \ln t + Bt + C_3)\right],$$

where C_1, C_2, and C_3 are arbitrary real constants.

2°. Solution:

$$w(x,t) = (ax + b)\exp\left[i(\alpha x^2 + \beta x + \gamma)\right],$$

where the functions $a = a(t)$, $b = b(t)$, $\alpha = \alpha(t)$, $\beta = \beta(t)$, and $\gamma = \gamma(t)$ are determined by the autonomous system of ordinary differential equations

$$a'_t = -6a\alpha,$$
$$b'_t = -2a\beta - 2b\alpha,$$
$$\alpha'_t = Aa^2 - 4\alpha^2,$$
$$\beta'_t = 2Aab - 4\alpha\beta,$$
$$\gamma'_t = Ab^2 - \beta^2 + B.$$

3°. For other exact solutions, see equation 5.7.5.1 with $f(u) = Au^2 + B$.

3. $i\dfrac{\partial w}{\partial t}+\dfrac{\partial^2 w}{\partial x^2}+(A|w|^2+B|w|+C)w=0.$

Schrödinger equation with a cubic nonlinearity. The numbers A, B, and C are assumed real.

1°. There is an exact solution of the form

$$w(x,t)=(ax+b)\exp\bigl[i(\alpha x^2+\beta x+\gamma)\bigr],$$

where $a=a(t)$, $b=b(t)$, $\alpha=\alpha(t)$, $\beta=\beta(t)$, and $\gamma=\gamma(t)$ are real functions of a real variable.

2°. For other exact solutions, see equation 5.7.5.1 with $f(u)=Au^2+Bu+C$.

4. $i\dfrac{\partial w}{\partial t}+\dfrac{\partial^2 w}{\partial x^2}+A|w|^{2n}w=0.$

Schrödinger equation with a power-law nonlinearity. The numbers A and n are assumed real.

1°. Suppose $w(x,t)$ is a solution of the Schrödinger equation in question. Then the functions

$$w_1=\pm B_1 w(\pm B_1^n x+B_2,B_1^{2n}t+B_3),$$
$$w_2=e^{-i(\lambda x+\lambda^2 t+C)}w(x+2\lambda t,t),$$

where B_1, B_2, B_3, C, and λ are arbitrary real constants, are also solutions of the equation. The plus or minus signs in the expression of w_1 are chosen arbitrarily.

2°. Solutions:

$$w(x,t)=C_1\exp\bigl\{i\,[C_2x+(A|C_1|^{2n}-C_2^2)t+C_3]\bigr\},$$
$$w(x,t)=\pm\left[\frac{(n+1)C_1^2}{A\cosh^2(C_1nx+C_2)}\right]^{\frac{1}{2n}}\exp[i(C_1^2t+C_3)],$$
$$w(x,t)=\frac{C_1}{\sqrt{t}}\exp\left[i\frac{(x+C_2)^2}{4t}+i\left(\frac{AC_1^{2n}}{1-n}t^{1-n}+C_3\right)\right],$$

where C_1, C_2, and C_3 are arbitrary real constants.

3°. Solution:

$$w(x,t)=e^{-i(\lambda x+\lambda^2 t+C)}U(x+2\lambda t),$$

where C and λ are arbitrary constants, and the function $U=U(y)$ is determined by the autonomous ordinary differential equation $U''_{yy}+AU^{2n+1}=0$. Its solution can be represented in implicit form.

4°. Self-similar solution:

$$w(x,t)=(C_1t+C_2)^{-\frac{1}{2n}}u(z),\qquad z=\frac{x+C_3}{\sqrt{C_1t+C_2}},$$

where C_1, C_2, and C_3 are arbitrary constants, and the function $u=u(z)$ is determined by the ordinary differential equation

$$u''_{zz}+k|u|^{2n}u-\frac{1}{2}iC_1\left(zu'_z+\frac{1}{n}u\right)=0.$$

5°. For other exact solutions, see equation 5.7.5.1 with $f(u)=Au^{2n}$.

⊙ *References for equation* 5.7.1.4: M. J. Ablowitz and H. Segur (1981), A. D. Polyanin and V. F. Zaitsev (2004, pp. 127–128).

5.7.2. Equations of the Form $i\frac{\partial w}{\partial t} + \frac{1}{x^n}\frac{\partial}{\partial x}\left(x^n\frac{\partial w}{\partial x}\right) + f(|w|)w = 0$ Involving Arbitrary Parameters

▷ *Throughout this subsection, w is a complex function of real variables x and t; $i^2 = -1$. To $n = 1$ there corresponds a two-dimensional Schrödinger equation with axial symmetry, and to $n = 2$, a three-dimensional Schrödinger equation with central symmetry.*

1. $i\frac{\partial w}{\partial t} + \frac{1}{x^n}\frac{\partial}{\partial x}\left(x^n\frac{\partial w}{\partial x}\right) + A|w|^2w = 0.$

Schrödinger equation with a cubic nonlinearity.

1°. Suppose $w(x,t)$ is a solution of the Schrödinger equation in question. Then the functions

$$w_1 = C_1 e^{iC_2} w(\pm C_1 x, C_1^2 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary real constants, are also solutions of the equation.

2°. Multiplicative separable solution:

$$w(x,t) = u(x)e^{i(C_1 t + C_2)},$$

where C_1 and C_2 are arbitrary real constants, and the function $u = u(x)$ is determined by the ordinary differential equation

$$x^{-n}(x^n u'_x)'_x - C_1 u + Au^3 = 0.$$

3°. Solution:

$$w(x,t) = u(x)\exp\bigl[i\varphi(x,t)\bigr], \qquad \varphi(x,t) = C_1 t + C_2\int\frac{dx}{x^n u^2(x)} + C_3,$$

where C_1, C_2, and C_3 are arbitrary real constants, and the function $u = u(x)$ is determined by the ordinary differential equation

$$x^{-n}(x^n u'_x)'_x - C_1 u - C_2^2 x^{-2n}u^{-3} + Au^3 = 0.$$

4°. Solution:

$$w(x,t) = C_1(t + C_2)^{-\frac{n+1}{2}}\exp\bigl[i\varphi(x,t)\bigr], \qquad \varphi(x,t) = \frac{x^2}{4(t + C_2)} - \frac{AC_1^2}{n(t + C_2)^n} + C_3,$$

where C_1, C_2, and C_3 are arbitrary real constants.

⊙ *References for equation* 5.7.2.1: A. D. Polyanin and V. F. Zaitsev (2002, p. 90).

2. $i\frac{\partial w}{\partial t} + \frac{1}{x^n}\frac{\partial}{\partial x}\left(x^n\frac{\partial w}{\partial x}\right) + (A|w|^2 + B)w = 0.$

Schrödinger equation with a cubic nonlinearity.

1°. Multiplicative separable solution:

$$w(x,t) = u(x)e^{i(C_1 t+C_2)},$$

where C_1 and C_2 are arbitrary real constants, and the function $u = u(x)$ is determined by the ordinary differential equation

$$x^{-n}(x^n u'_x)'_x - C_1 u + (Au^2 + B)u = 0.$$

2°. Solution:

$$w(x,t) = u(x)\exp\big[i\varphi(x,t)\big], \qquad \varphi(x,t) = C_1 t + C_2 \int \frac{dx}{x^n u^2(x)} + C_3,$$

where C_1, C_2, and C_3 are arbitrary real constants, and the function $u = u(x)$ is determined by the ordinary differential equation

$$x^{-n}(x^n u'_x)'_x - C_1 u - C_2^2 x^{-2n} u^{-3} + (Au^2 + B)u = 0.$$

3°. Solution:

$$w(x,t) = C_1(t + C_2)^{-\frac{n+1}{2}}\exp\big[i\varphi(x,t)\big], \qquad \varphi(x,t) = \frac{x^2}{4(t + C_2)} - \frac{AC_1^2}{n(t + C_2)^n} + Bt + C_3,$$

where C_1, C_2, and C_3 are arbitrary real constants.

3. $\boldsymbol{i\dfrac{\partial w}{\partial t} + \dfrac{1}{x^n}\dfrac{\partial}{\partial x}\left(x^n\dfrac{\partial w}{\partial x}\right) + (A|w|^2 + B|w| + C)w = 0.}$

This is a special case of equation 5.7.5.2 with $f(u) = Au^2 + Bu + C$.

4. $\boldsymbol{i\dfrac{\partial w}{\partial t} + \dfrac{1}{x^n}\dfrac{\partial}{\partial x}\left(x^n\dfrac{\partial w}{\partial x}\right) + A|w|^k w = 0.}$

Schrödinger equation with power-law nonlinearity.

1°. Suppose $w(x,t)$ is a solution of the Schrödinger equation in question. Then the functions

$$w_1 = \pm C_1^2 e^{iC_2} w(\pm C_1^k x, C_1^{2k} t + C_3),$$

where C_1, C_2, and C_3 are arbitrary real constants, are also solutions of the equation. The plus or minus signs are chosen arbitrarily.

2°. Multiplicative separable solution:

$$w(x,t) = u(x)e^{i(C_1 t+C_2)},$$

where C_1 and C_2 are arbitrary real constants, and the function $u = u(x)$ is determined by the ordinary differential equation

$$x^{-n}(x^n u'_x)'_x - C_1 u + A|u|^k u = 0.$$

3°. Solution:

$$w(x,t) = u(x)\exp\bigl[i\varphi(x,t)\bigr], \qquad \varphi(x,t) = C_1 t + C_2 \int \frac{dx}{x^n u^2(x)} + C_3,$$

where C_1, C_2, and C_3 are arbitrary real constants, and the function $u = u(x)$ is determined by the ordinary differential equation

$$x^{-n}(x^n u'_x)'_x - C_1 u - C_2^2 x^{-2n} u^{-3} + A|u|^k u = 0.$$

4°. Solution:

$$w(x,t) = C_1(t+C_2)^{-\frac{n+1}{2}}\exp\bigl[i\varphi(x,t)\bigr],$$
$$\varphi(x,t) = \frac{x^2}{4(t+C_2)} + \frac{2A|C_1|^k}{2-k-nk}(t+C_2)^{\frac{2-k-nk}{2}} + C_3,$$

where C_1, C_2, and C_3 are arbitrary real constants.

⊙ *References for equation* 5.7.2.4: A. D. Polyanin and V. F. Zaitsev (2002, p. 91).

5.7.3. Other Equations Involving Arbitrary Parameters

1. $\boldsymbol{i\dfrac{\partial w}{\partial t} + \dfrac{\partial^2 w}{\partial x^2} + a\bigl(1 - e^{-k|w|}\bigr)w = 0.}$

This equation is encountered in plasma theory and laser physics. This is a special case of equation 5.7.5.1 with $f(u) = a\bigl(1 - e^{-ku}\bigr)$.

⊙ *Reference*: R. K. Bullough (1977, 1978).

2. $\boldsymbol{i\dfrac{\partial w}{\partial t} + \dfrac{\partial^2 w}{\partial x^2} + ia\dfrac{\partial}{\partial x}\bigl(|w|^2 w\bigr) = 0.}$

This equation is encountered in plasma physics (propagation of Alfven and radio waves); a is a real number.

1°. Suppose $w(x,t)$ is a solution of the Schrödinger equation in question. Then the function

$$w_1 = C_1 w(C_1^2 x + C_2, C_1^4 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary real constants, is also a solution of the equation.

2°. Solution:

$$w(x,t) = u(t)\exp[iv(x,t)], \qquad v(x,t) = \varphi(t)x^2 + \psi(t)x + \chi(t).$$

Here,

$$u = \frac{C_2}{\sqrt{t+C_1}}, \quad \varphi = \frac{1}{4(t+C_1)}, \quad \psi = \frac{C_3 - 2aC_2^2\ln|t+C_1|}{4(t+C_1)}, \quad \chi = -\int\bigl(\psi^2 + a\psi u^2\bigr)\,dt + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary real constants.

3°. For another solution, see Item 2° of equation 5.7.5.4 with $f(z) = az^2$. See also Calogero and Degasperis (1982).

3. $i\dfrac{\partial w}{\partial t}+a\dfrac{\partial^2}{\partial x^2}\left(\dfrac{w}{\sqrt{1+|w|^2}}\right)=0.$

This is a special case of equation 5.7.5.5 with $f(z)=a(1+z^2)^{-1/2}$.

⊙ *Reference*: F. Calogero and A. Degasperis (1982).

4. $i\dfrac{\partial w}{\partial t}+(1+ia)\dfrac{\partial^2 w}{\partial x^2}+f(x,t)w|w|^2+g(x,t)w=0.$

Exact solutions of this equation for some specific $f(x,t)$ and $g(x,t)$ are listed in Table 5.2. See also equation 5.7.4.4 with $f_1(t)=1$ and $f_2(t)=a$, and equation 5.7.4.5 $f_1(x)=1$ and $f_2(x)=a$.

5.7.4. Equations with Cubic Nonlinearities Involving Arbitrary Functions

▷ *Throughout this subsection, w is a complex function of real variables x and t; $i^2=-1$.*

1. $i\dfrac{\partial w}{\partial t}+\dfrac{\partial^2 w}{\partial x^2}+\left[f(t)|w|^2+g(t)\right]w=0.$

Schrödinger equation with a cubic nonlinearity. Here, $f(t)$ and $g(t)$ are real functions of a real variable.

1°. Solution:

$$w(x,t) = C_1 \exp\bigl[i\varphi(x,t)\bigr], \qquad \varphi(x,t) = C_2 x - C_2^2 t + \int \bigl[C_1^2 f(t) + g(t)\bigr]\,dt + C_3,$$

where C_1, C_2, and C_3 are arbitrary real constants.

2°. Solution:

$$w(x,t) = \frac{C_1}{\sqrt{t}} \exp\bigl[i\varphi(x,t)\bigr], \qquad \varphi(x,t) = \frac{(x+C_2)^2}{4t} + \int \bigl[C_1^2 f(t) + tg(t)\bigr]\,\frac{dt}{t} + C_3,$$

where C_1, C_2, and C_3 are arbitrary real constants.

3°. Solution:

$$w(x,t) = (ax+b)\exp\bigl[i(\alpha x^2 + \beta x + \gamma)\bigr],$$

where the functions $a = a(t)$, $b = b(t)$, $\alpha = \alpha(t)$, $\beta = \beta(t)$, and $\gamma = \gamma(t)$ are determined by the system of ordinary differential equations

$$\begin{aligned}
a'_t &= -6a\alpha,\\
b'_t &= -2a\beta - 2b\alpha,\\
\alpha'_t &= f(t)a^2 - 4\alpha^2,\\
\beta'_t &= 2f(t)ab - 4\alpha\beta,\\
\gamma'_t &= f(t)b^2 - \beta^2 + g(t).
\end{aligned}$$

⊙ *References for equation* 5.7.4.1: A. D. Polyanin and V. F. Zaitsev (2002, p. 91).

2. $i\dfrac{\partial w}{\partial t} + \dfrac{\partial^2 w}{\partial x^2} + [f_1(t) + if_2(t)]w|w|^2 + [g_1(t) + ig_2(t)]w = 0.$

Equations of this form occur in nonlinear optics.

1°. Solutions:

$$w(x,t) = \pm u(t)\exp[i\varphi(x,t)], \qquad \varphi(x,t) = C_1 x - C_1^2 t + \int [f_1(t)u^2(t) + g_1(t)]\,dt + C_2.$$

Here, the function $u = u(t)$ is determined by the Bernoulli equation $u'_t + f_2(t)u^3 + g_2(t)u = 0$, whose general solution is given by

$$u(t) = \left[C_3 e^{G(t)} + 2e^{G(t)} \int e^{-G(t)} f_2(t)\,dt\right]^{-1/2}, \qquad G(t) = 2\int g_2(t)\,dt.$$

2°. Solutions:

$$w(x,t) = \pm u(t)\exp[i\varphi(x,t)], \qquad \varphi(x,t) = \frac{(x+C_1)^2}{4t} + \int [f_1(t)u^2(t) + g_1(t)]\,dt + C_2,$$

where the function $u = u(t)$ is determined by the Bernoulli equation

$$u'_t + f_2(t)u^3 + \left[g_2(t) + \frac{1}{2t}\right]u = 0.$$

Integrating yields

$$u(t) = \left[C_3 e^{G(t)} + 2e^{G(t)} \int e^{-G(t)} f_2(t)\,dt\right]^{-1/2}, \qquad G(t) = \ln t + 2\int g_2(t)\,dt.$$

⊙ *References for equation* 5.7.4.2: A. D. Polyanin and V. F. Zaitsev (2002, p. 92).

3. $i\dfrac{\partial w}{\partial t}+\dfrac{\partial^2 w}{\partial x^2}+[f_1(x)+if_2(x)]w|w|^2+[g_1(x)+ig_2(x)]w=0.$

Solutions:

$$w(x,t)=\pm u(x)\exp[iC_1t+i\theta(x)],$$

where the functions $u=u(x)$ and $\theta=\theta(x)$ are determined by the system of ordinary differential equations

$$2u'_x\theta'_x+u\theta''_{xx}+f_2(x)u^3+g_2(x)u=0,$$
$$u''_{xx}-C_1u-u(\theta'_x)^2+f_1(x)u^3+g_1(x)u=0.$$

4. $i\dfrac{\partial w}{\partial t}+[f_1(t)+if_2(t)]\dfrac{\partial^2 w}{\partial x^2}+[g_1(t)+ig_2(t)]w|w|^2+[h_1(t)+ih_2(t)]w=0.$

Solutions:

$$w(x,t)=\pm u(t)\exp[i\varphi(x,t)],\quad \varphi(x,t)=C_1x+\int[-C_1^2f_1(t)+g_1(t)u^2(t)+h_1(t)]\,dt+C_2.$$

Here, the function $u=u(t)$ is determined by the Bernoulli equation

$$u'_t+g_2(t)u^3+[h_2(t)-C_1^2f_2(t)]u=0,$$

whose general solution is given by

$$u(t)=\left[C_3e^{F(t)}+2e^{F(t)}\int e^{-F(t)}g_2(t)\,dt\right]^{-1/2},\quad F(t)=2\int\left[h_2(t)-C_1^2f_2(t)\right]dt.$$

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2002, p. 92).

5. $i\dfrac{\partial w}{\partial t}+[f_1(x)+if_2(x)]\dfrac{\partial^2 w}{\partial x^2}+[g_1(x)+ig_2(x)]w|w|^2+[h_1(x)+ih_2(x)]w=0.$

Solutions:

$$w(x,t)=\pm u(x)\exp[iC_1t+i\theta(x)],$$

where the functions $u=u(x)$ and $\theta=\theta(x)$ are determined by the system of ordinary differential equations

$$2f_1u'_x\theta'_x+f_1u\theta''_{xx}+f_2u''_{xx}-f_2u(\theta'_x)^2+g_2u^3+h_2u=0,$$
$$f_1u''_{xx}-C_1u-f_1u(\theta'_x)^2-2f_2u'_x\theta'_x-f_2u\theta''_{xx}+g_1u^3+h_1u=0.$$

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2002, p. 92).

6. $\dfrac{\partial w}{\partial t}+[f_1(t)+if_2(t)]\dfrac{\partial^2 w}{\partial x^2}+[g_1(t)+ig_2(t)]w|w|^2+[h_1(t)+ih_2(t)]w=0.$

With f_n, g_n, h_n = const, this equation is used for describing two-component reaction-diffusion systems near a bifurcation point.

Solutions:

$$w(x,t)=\pm u(t)\exp[i\varphi(x,t)],$$
$$\varphi(x,t)=C_1x+\int[C_1^2f_2(t)-g_2(t)u^2(t)-h_2(t)]\,dt+C_2.$$

Here, the function $u = u(t)$ is determined by the Bernoulli equation

$$u'_t + g_1(t)u^3 + [h_1(t) - C_1^2 f_1(t)]u = 0,$$

whose general solution is given by

$$u(t) = \left[C_3 e^{F(t)} + 2e^{F(t)} \int e^{-F(t)} g_1(t)\, dt\right]^{-1/2},$$
$$F(t) = 2\int \left[h_1(t) - C_1^2 f_1(t)\right] dt.$$

⊙ *References*: Y. Kuramoto and T. Tsuzuki (1975), A. D. Polyanin and V. F. Zaitsev (2002, p. 93).

7. $\dfrac{\partial w}{\partial t} + [f_1(x) + i f_2(x)]\dfrac{\partial^2 w}{\partial x^2} + [g_1(x) + i g_2(x)]w|w|^2 + [h_1(x) + i h_2(x)]w = 0.$

Solutions:

$$w(x,t) = \pm u(x)\exp[iC_1 t + i\theta(x)],$$

where the functions $u = u(x)$ and $\theta = \theta(x)$ are determined by the system of ordinary differential equations

$$f_1 u''_{xx} - f_1 u(\theta'_x)^2 - f_2 u\theta''_{xx} - 2f_2 u'_x\theta'_x + g_1 u^3 + h_1 u = 0,$$
$$f_2 u''_{xx} + C_1 u - f_2 u(\theta'_x)^2 + f_1 u\theta''_{xx} + 2f_1 u'_x\theta'_x + g_2 u^3 + h_2 u = 0.$$

5.7.5. Equations of General Form Involving Arbitrary Functions of a Single Argument

▷ *Throughout this subsection, w is a complex function of real variables x and t; $i^2 = -1$.*

1. $i\dfrac{\partial w}{\partial t} + \dfrac{\partial^2 w}{\partial x^2} + f(|w|)w = 0.$

Schrödinger equation of general form; $f(u)$ is a real function of a real variable.

1°. Suppose $w(x,t)$ is a solution of the Schrödinger equation in question. Then the function

$$w_1 = e^{-i(\lambda x + \lambda^2 t + C_1)} w(x + 2\lambda t + C_2, t + C_3),$$

where C_1, C_2, C_3, and λ are arbitrary real constants, is also a solution of the equation.

2°. Traveling-wave solution:

$$w(x,t) = C_1 \exp\left[i\varphi(x,t)\right], \qquad \varphi(x,t) = C_2 x - C_2^2 t + f(|C_1|)t + C_3.$$

3°. Multiplicative separable solution:

$$w(x,t) = u(x)e^{i(C_1 t + C_2)},$$

where the function $u = u(x)$ is defined implicitly by

$$\int \frac{du}{\sqrt{C_1 u^2 - 2F(u) + C_3}} = C_4 \pm x, \qquad F(u) = \int u f(|u|)\, du.$$

Here, $C_1, \ldots, C_4$ are arbitrary real constants.

4°. Solution:

$$w(x,t) = U(\xi)e^{i(Ax+Bt+C)}, \qquad \xi = x - 2At, \tag{1}$$

where the function $U = U(\xi)$ is determined by the autonomous ordinary differential equation $U''_{\xi\xi} + f(|U|)U - (A^2 + B)U = 0$. Integrating yields the general solution in implicit form:

$$\int \frac{dU}{\sqrt{(A^2 + B)U^2 - 2F(U) + C_1}} = C_2 \pm \xi, \qquad F(U) = \int U f(|U|)\, dU. \tag{2}$$

Relations (1) and (2) involve arbitrary real constants A, B, C, C_1, and C_2.

5°. Solution (A, B, and C are arbitrary real constants):

$$w(x,t) = \psi(z)\exp\big[i(Axt - \tfrac{2}{3}A^2t^3 + Bt + C)\big], \qquad z = x - At^2,$$

where the function $\psi = \psi(z)$ is determined by the ordinary differential equation

$$\psi''_{zz} + f(|\psi|)\psi - (Az + B)\psi = 0.$$

6°. Solutions:

$$w(x,t) = \pm\frac{1}{\sqrt{C_1 t}}\exp\big[i\varphi(x,t)\big], \qquad \varphi(x,t) = \frac{(x + C_2)^2}{4t} + \int f\big(|C_1 t|^{-1/2}\big)\, dt + C_3,$$

where C_1, C_2, and C_3 are arbitrary real constants.

7°. Solution:

$$w(x,t) = u(x)\exp\big[i\varphi(x,t)\big], \qquad \varphi(x,t) = C_1 t + C_2\int \frac{dx}{u^2(x)} + C_3,$$

where C_1, C_2, and C_3 are arbitrary real constants, and the function $u = u(x)$ is determined by the autonomous ordinary differential equation

$$u''_{xx} - C_1 u - C_2^2 u^{-3} + f(|u|)u = 0,$$

whose general solution can be written in implicit form.

8°. Solution:

$$w(x,t) = u(z)\exp\big[iAt + i\varphi(z)\big], \qquad z = kx + \lambda t,$$

where A, k, and λ are arbitrary real constants, and the functions $u = u(z)$ and $\varphi = \varphi(z)$ are determined by the system of ordinary differential equations

$$\begin{aligned} k^2 u\varphi''_{zz} + 2k^2 u'_z\varphi'_z + \lambda u'_z &= 0,\\ k^2 u''_{zz} - k^2 u(\varphi'_z)^2 - \lambda u\varphi'_z - Au + f(|u|)u &= 0. \end{aligned}$$

⊙ *Reference for equation* 5.7.5.1: A. D. Polyanin and V. F. Zaitsev (2002, pp. 93–94).

2. $i\dfrac{\partial w}{\partial t}+\dfrac{1}{x^n}\dfrac{\partial}{\partial x}\left(x^n\dfrac{\partial w}{\partial x}\right)+f(|w|)w=0.$

Schrödinger equation of general form; $f(u)$ is a real function of a real variable. To $n=1$ there corresponds a two-dimensional Schrödinger equation with axial symmetry and to $n=2$, a three-dimensional Schrödinger equation with central symmetry.

1°. Multiplicative separable solution:

$$w(x,t)=u(x)e^{i(C_1t+C_2)},$$

where C_1 and C_2 are arbitrary real constants, and the function $u=u(x)$ is determined by the ordinary differential equation

$$x^{-n}(x^nu'_x)'_x-C_1u+f(|u|)u=0.$$

2°. Solution:

$$w(x,t)=u(x)\exp\bigl[i\varphi(x,t)\bigr],\qquad \varphi(x,t)=C_1t+C_2\int\frac{dx}{x^nu^2(x)}+C_3,$$

where C_1, C_2, and C_3 are arbitrary real constants, and the function $u=u(x)$ is determined by the ordinary differential equation

$$x^{-n}(x^nu'_x)'_x-C_1u-C_2^2x^{-2n}u^{-3}+f(|u|)u=0.$$

3°. Solution:

$$w(x,t)=C_1t^{-\frac{n+1}{2}}\exp\bigl[i\varphi(x,t)\bigr],\qquad \varphi(x,t)=\frac{x^2}{4t}+\int f\Bigl(|C_1|t^{-\frac{n+1}{2}}\Bigr)\,dt+C_2,$$

where C_1 and C_2 are arbitrary real constants.

⊙ *Reference for equation* 5.7.5.2: A. D. Polyanin and V. F. Zaitsev (2002, p. 95).

3. $\dfrac{\partial w}{\partial t}=(a+ib)\dfrac{\partial^2w}{\partial x^2}+\bigl[f(|w|)+ig(|w|)\bigr]w.$

Generalized Landau–Ginzburg equation; $f(u)$ and $g(u)$ are real functions of a real variable, a and b are real numbers. Equations of this form are used for studying second-order phase transitions in superconductivity theory (see Landau and Ginzburg, 1950) and to describe two-component reaction-diffusion systems near a point of bifurcation (Kuramoto and Tsuzuki, 1975).

1°. Suppose $w(x,t)$ is a solution of the generalized Landau–Ginzburg equation. Then the function

$$w_1=e^{iC_1}w(x+C_2,t+C_3),$$

where C_1, C_2, and C_3 are arbitrary real constants, is also a solution of the equation.

2°. Traveling-wave solutions:

$$w(x,t)=C_1\exp\bigl[i\varphi(x,t)\bigr],\qquad \varphi(x,t)=\pm x\sqrt{\frac{f(|C_1|)}{a}}+t\left[g(|C_1|)-\frac{b}{a}f(|C_1|)\right]+C_2,$$

where C_1 and C_2 are arbitrary real constants.

3°. Solution:

$$w(x,t) = u(t)\exp\bigl[i\varphi(x,t)\bigr], \qquad \varphi(x,t) = C_1 x - C_1^2 bt + \int g(|u|)\,dt + C_2,$$

where $u = u(t)$ is determined by the ordinary differential equation $u_t' = f(|u|)u - aC_1^2 u$, whose general solution can be represented in implicit form as

$$\int \frac{du}{f(|u|)u - aC_1^2 u} = t + C_3.$$

4°. Solution:

$$w(x,t) = U(z)\exp\bigl[iC_1 t + i\theta(z)\bigr], \qquad z = x + \lambda t,$$

where C_1 and λ are arbitrary real constants, and the functions $U = U(z)$ and $\theta = \theta(z)$ are determined by the system of ordinary differential equations

$$aU_{zz}'' - aU(\theta_z')^2 - bU\theta_{zz}'' - 2bU_z'\theta_z' - \lambda U_z' + f(|U|)U = 0,$$
$$aU\theta_{zz}'' - bU(\theta_z')^2 + bU_{zz}'' + 2aU_z'\theta_z' - \lambda U\theta_z' - C_1 U + g(|U|)U = 0.$$

⊙ *References for equation* 5.7.5.3: V. S. Berman and Yu. A. Danilov (1981), A. D. Polyanin and V. F. Zaitsev (2002, pp. 96–97).

4. $i\dfrac{\partial w}{\partial t} + \dfrac{\partial^2 w}{\partial x^2} + i\dfrac{\partial}{\partial x}\bigl[f(|w|)w\bigr] = 0.$

1°. Solution:

$$w(x,t) = u(t)\exp[iv(x,t)], \qquad v(x,t) = \varphi(t)x^2 + \psi(t)x + \chi(t),$$

where the functions $u = u(t)$, $\varphi = \varphi(t)$, $\psi = \psi(t)$, and $\chi = \chi(t)$ are determined by the system of ordinary differential equations

$$u_t' + 2\varphi u = 0,$$
$$\varphi_t' + 4\varphi^2 = 0,$$
$$\psi_t' + 4\varphi\psi + 2\varphi f(u) = 0,$$
$$\chi_t' + \psi^2 + \psi f(u) = 0.$$

Integrating yields

$$u = \frac{C_2}{\sqrt{t + C_1}}, \quad \varphi = \frac{1}{4(t + C_1)}, \quad \psi = -2\varphi\int f(u)\,dt + C_3\varphi, \quad \chi = -\int\bigl[\psi^2 + \psi f(u)\bigr]\,dt + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary real constants.

2°. Solution:

$$w(x,t) = U(z)\exp[i\beta t + iV(z)], \qquad z = kx + \lambda t,$$

where k, β, and λ are arbitrary real constants, and the functions $U = U(z)$ and $V = V(z)$ are determined by the system of ordinary differential equations

$$\lambda U_z' + k^2(UV_z')_z' + k^2 U_z' V_z' + k[f(U)U]_z' = 0,$$
$$-U(\beta + \lambda V_z') + k^2 U_{zz}'' - k^2 U(V_z')^2 - kf(U)UV_z' = 0.$$

⊙ *Reference for equation* 5.7.5.4: A. D. Polyanin and V. F. Zaitsev (2004, p. 136).

5. $i\dfrac{\partial w}{\partial t} + \dfrac{\partial^2}{\partial x^2}\big[f(|w|)w\big] = 0.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = \pm e^{iC_1} w(\pm C_2 x + C_3, C_2^2 t + C_4),$$

where $C_1, \ldots, C_4$ are arbitrary real constants, are also solutions of the equation. The plus or minus signs are chosen arbitrarily.

2°. Solution:

$$w(x,t) = u(t)\exp[iv(x,t)], \quad v(x,t) = \varphi(t)x^2 + \psi(t)x + \chi(t),$$

where the functions $u = u(t)$, $\varphi = \varphi(t)$, $\psi = \psi(t)$, and $\chi = \chi(t)$ are determined by the system of ordinary differential equations

$$\begin{aligned} u_t' + 2u\varphi f(u) &= 0,\\ \varphi_t' + 4\varphi^2 f(u) &= 0,\\ \psi_t' + 4\varphi\psi f(u) &= 0,\\ \chi_t' + \psi^2 f(u) &= 0. \end{aligned}$$

Integrating yields

$$\varphi = C_1 u^2, \quad \psi = C_2 u^2, \quad \chi = -C_2^2 \int u^4 f(u)\,dt + C_3,$$

where C_1, C_2, and C_3 are arbitrary real constants, and the function $u = u(t)$ is defined implicitly as (C_4 is an arbitrary constant)

$$\int \frac{du}{u^3 f(u)} + 2C_1 t + C_4 = 0.$$

3°. There is a solution of the form

$$w(x,t) = U(z)\exp[i\beta t + iV(z)], \quad z = kx + \lambda t,$$

where k, β, and λ are arbitrary real constants, and the functions $U = U(z)$ and $V = V(z)$ are determined by an appropriate system of ordinary differential equations (which is not written out here).

4°. There is a self-similar solution of the form $w(x,t) = V(\xi)$, where $\xi = x^2/t$.

⊙ *Reference for equation* 5.7.5.5: A. D. Polyanin and V. F. Zaitsev (2004, pp. 136–137).

5.7.6. Equations of General Form Involving Arbitrary Functions of Two Arguments

▷ *Throughout this subsection, w is a complex function of real variables x and t; $i^2 = -1$.*

1. $i\dfrac{\partial w}{\partial t}+\dfrac{\partial^2 w}{\partial x^2}+f(x,|w|)w=0.$

Schrödinger equation of general form; $f(x,u)$ is a real function of two real variables.

1°. Multiplicative separable solution:

$$w(x,t)=u(x)e^{i(C_1t+C_2)},$$

where C_1 and C_2 are arbitrary real constants, and the function $u=u(x)$ is determined by the ordinary differential equation

$$u''_{xx}-C_1u+f(x,|u|)u=0.$$

2°. Solution:

$$w(x,t)=u(x)\exp\bigl[i\varphi(x,t)\bigr],\qquad \varphi(x,t)=C_1t+C_2\int\frac{dx}{u^2(x)}+C_3,$$

where C_1, C_2, and C_3 are arbitrary real constants, and the function $u=u(x)$ is determined by the ordinary differential equation

$$u''_{xx}-C_1u-C_2^2u^{-3}+f(x,|u|)u=0.$$

⊙ *Reference for equation* 5.7.6.1: A. D. Polyanin and V. F. Zaitsev (2002, p. 94).

2. $i\dfrac{\partial w}{\partial t}+\dfrac{\partial^2 w}{\partial x^2}+f(t,|w|)w=0.$

Schrödinger equation of general form; $f(t,u)$ is a real function of two real variables.

1°. Suppose $w(x,t)$ is a solution of the Schrödinger equation in question. Then the function

$$w_1=e^{-i(\lambda x+\lambda^2t+C_1)}w(x+2\lambda t+C_2,\ t),$$

where C_1, C_2, and λ are arbitrary real constants, is also a solution of the equation.

2°. Solutions:

$$w(x,t)=C_1\exp\bigl[i\varphi(x,t)\bigr],\qquad \varphi(x,t)=C_2x-C_2^2t+\int f(t,|C_1|)\,dt+C_3;$$

$$w(x,t)=C_1t^{-1/2}\exp\bigl[i\psi(x,t)\bigr],\qquad \psi(x,t)=\frac{(x+C_2)^2}{4t}+\int f\bigl(t,|C_1|t^{-1/2}\bigr)\,dt+C_3,$$

where C_1, C_2, and C_3 are arbitrary real constants.

⊙ *Reference for equation* 5.7.6.2: A. D. Polyanin and V. F. Zaitsev (2002, pp. 94–95).

3. $i\dfrac{\partial w}{\partial t}+\dfrac{1}{x^n}\dfrac{\partial}{\partial x}\left(x^n\dfrac{\partial w}{\partial x}\right)+f(x,|w|)w=0.$

Schrödinger equation of general form; $f(x,u)$ is a real function of two real variables. To $n=1$ there corresponds a two-dimensional Schrödinger equation with axial symmetry, and to $n=2$, a three-dimensional Schrödinger equation with central symmetry.

1°. Multiplicative separable solution:

$$w(x,t) = u(x)e^{i(C_1t+C_2)},$$

where C_1 and C_2 are arbitrary real constants, and the function $u = u(x)$ is determined by the ordinary differential equation

$$x^{-n}(x^n u'_x)'_x - C_1u + f(x,|u|)u = 0.$$

2°. Solution:

$$w(x,t) = u(x)\exp\big[i\varphi(x,t)\big], \qquad \varphi(x,t) = C_1t + C_2\int\frac{dx}{x^n u^2(x)} + C_3,$$

where C_1, C_2, and C_3 are arbitrary real constants, and the function $u = u(x)$ is determined by the ordinary differential equation

$$x^{-n}(x^n u'_x)'_x - C_1u - C_2^2x^{-2n}u^{-3} + f(x,|u|)u = 0.$$

⊙ *Reference for equation* 5.7.6.3: A. D. Polyanin and V. F. Zaitsev (2002, p. 95).

4. $i\dfrac{\partial w}{\partial t} + \dfrac{1}{x^n}\dfrac{\partial}{\partial x}\left(x^n\dfrac{\partial w}{\partial x}\right) + f(t,|w|)w = 0.$

Schrödinger equation of general form; $f(t,u)$ is a real function of two real variables.

Solution:

$$w(x,t) = C_1t^{-\frac{n+1}{2}}\exp\big[i\varphi(x,t)\big], \qquad \varphi(x,t) = \frac{x^2}{4t} + \int f\Big(t,|C_1|t^{-\frac{n+1}{2}}\Big)\,dt + C_2,$$

where C_1 and C_2 are arbitrary real constants.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2002, p. 96).

5. $i\dfrac{\partial w}{\partial t} + f(x)\dfrac{\partial^2 w}{\partial x^2} + g(x)\dfrac{\partial w}{\partial x} + \Phi(x,|w|)w = 0.$

Schrödinger equation of general form; $\Phi(x,u)$ is a real function of two real variables. The case $g(x) = f'_x(x)$ corresponds to an anisotropic medium.

1°. Multiplicative separable solution:

$$w(x,t) = u(x)e^{i(C_1t+C_2)},$$

where C_1 and C_2 are arbitrary real constants, and the function $u = u(x)$ is determined by the ordinary differential equation

$$f(x)u''_{xx} + g(x)u'_x - C_1u + \Phi(x,|u|)u = 0.$$

2°. Solution:

$$w(x,t) = U(x)\exp\big[i\varphi(x,t)\big],$$

$$\varphi(x,t) = C_1t + C_2\int\frac{R(x)}{U^2(x)}\,dx + C_3, \quad R(x) = \exp\left[-\int\frac{g(x)}{f(x)}\,dx\right],$$

where C_1, C_2, and C_3 are arbitrary real constants, and the function $U = U(x)$ is determined by the ordinary differential equation

$$f(x)U''_{xx} + g(x)U'_x - C_1U - C_2^2f(x)R^2(x)U^{-3} + \Phi(x,|U|)U = 0.$$

6. $\dfrac{\partial w}{\partial t} = \big[f_1(t,|w|) + if_2(t,|w|)\big]\dfrac{\partial^2 w}{\partial x^2} + \big[g_1(t,|w|) + ig_2(t,|w|)\big]w.$

Solution:

$$w(x,t) = u(t)\exp\big[i\varphi(x,t)\big], \qquad \varphi(x,t) = C_1 x + \int \big[g_2(t,|u|) - C_1^2 f_2(t,|u|)\big]\,dt + C_2,$$

where C_1 and C_2 are arbitrary real constants, and the function $u = u(t)$ is determined by the ordinary differential equation

$$u_t' = ug_1(t,|u|) - C_1^2 u f_1(t,|u|).$$

7. $\dfrac{\partial w}{\partial t} = \big[f_1(x,|w|) + if_2(x,|w|)\big]\dfrac{\partial^2 w}{\partial x^2} + \big[g_1(x,|w|) + ig_2(x,|w|)\big]w.$

Solution:

$$w(x,t) = u(x)\exp\big[i\varphi(x,t)\big], \qquad \varphi(x,t) = C_1 t + \theta(x),$$

where the functions $u = u(x)$ and $\theta = \theta(x)$ are determined by the system of ordinary differential equations

$$f_1 u_{xx}'' - f_1 u(\theta_x')^2 - f_2 u\theta_{xx}'' - 2f_2 u_x'\theta_x' + g_1 u = 0,$$
$$f_1 u\theta_{xx}'' - f_2 u(\theta_x')^2 + f_2 u_{xx}'' + 2f_1 u_x'\theta_x' - C_1 u + g_2 u = 0.$$

Here, for brevity, the notation $f_n = f_n(x,|u|)$ and $g_n = g_n(x,|u|)$ with $n = 1,\ 2$ is used.

8. $i\dfrac{\partial w}{\partial t} + \dfrac{\partial^2 w}{\partial x^2} + i\dfrac{\partial}{\partial x}\big[f(t,|w|)w\big] = 0.$

Solution:

$$w(x,t) = u(t)\exp[iv(x,t)], \qquad v(x,t) = \varphi(t)x^2 + \psi(t)x + \chi(t),$$

where the functions $u = u(t)$, $\varphi = \varphi(t)$, $\psi = \psi(t)$, and $\chi = \chi(t)$ are determined by the system of ordinary differential equations

$$u_t' + 2\varphi u = 0,$$
$$\varphi_t' + 4\varphi^2 = 0,$$
$$\psi_t' + 4\varphi\psi + 2\varphi f(t,u) = 0,$$
$$\chi_t' + \psi^2 + \psi f(t,u) = 0.$$

Integrating yields

$$u = \frac{C_2}{\sqrt{t+C_1}}, \quad \varphi = \frac{1}{4(t+C_1)}, \quad \psi = -2\varphi\int f(t,u)\,dt + C_3\varphi, \quad \chi = -\int\big[\psi^2 + \psi f(t,u)\big]\,dt + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary real constants.

9. $i\dfrac{\partial w}{\partial t} + \dfrac{\partial^2 w}{\partial x^2} + i\dfrac{\partial}{\partial x}\big[f(x,|w|)w\big] = 0.$

Solution:

$$w(x,t) = U(x)\exp[i\beta t + iV(x)],$$

where β is an arbitrary real constant, and the real functions $U = U(x)$ and $V = V(x)$ are determined by the system of ordinary differential equations

$$(UV_x')_x' + U_x'V_x' + [f(x,U)U]_x' = 0,$$
$$-\beta U + U_{xx}'' - U(V_x')^2 - f(x,U)UV_x' = 0.$$

10. $i\dfrac{\partial w}{\partial t}+\dfrac{\partial^2}{\partial x^2}\big[f(t,|w|)w\big]=0.$

Solution:

$$w(x,t)=u(t)\exp[iv(x,t)],\quad v(x,t)=\varphi(t)x^2+\psi(t)x+\chi(t),$$

where the functions $u=u(t)$, $\varphi=\varphi(t)$, $\psi=\psi(t)$, and $\chi=\chi(t)$ are determined by the system of ordinary differential equations

$$\begin{aligned}u_t'+2u\varphi f(t,u)&=0,\\ \varphi_t'+4\varphi^2 f(t,u)&=0,\\ \psi_t'+4\varphi\psi f(t,u)&=0,\\ \chi_t'+\psi^2 f(t,u)&=0.\end{aligned}$$

Integrating yields

$$\varphi=C_1u^2,\quad \psi=C_2u^2,\quad \chi=-C_2^2\int u^4 f(t,u)\,dt+C_3,$$

where C_1, C_2, and C_3 are arbitrary real constants, and $u=u(t)$ is determined by the ordinary differential equation $u_t'+2C_1u^3f(t,u)=0$.

11. $i\dfrac{\partial w}{\partial t}+\dfrac{\partial}{\partial x}\left[f(t,|w|)\dfrac{\partial w}{\partial x}\right]=0.$

Solution:

$$w(x,t)=u(t)\exp[iv(x,t)],\quad v(x,t)=\varphi(t)x^2+\psi(t)x+\chi(t),$$

where the functions $u=u(t)$, $\varphi=\varphi(t)$, $\psi=\psi(t)$, and $\chi=\chi(t)$ are determined by the system of ordinary differential equations

$$\begin{aligned}u_t'+2u\varphi f(t,u)&=0,\\ \varphi_t'+4\varphi^2 f(t,u)&=0,\\ \psi_t'+4\varphi\psi f(t,u)&=0,\\ \chi_t'+\psi^2 f(t,u)&=0.\end{aligned}$$

Integrating yields

$$\varphi=C_1u^2,\quad \psi=C_2u^2,\quad \chi=-C_2^2\int u^4 f(t,u)\,dt+C_3,$$

where C_1, C_2, and C_3 are arbitrary real constants, and $u=u(t)$ is determined by the ordinary differential equation $u_t'+2C_1u^3f(t,u)=0$.

12. $i\dfrac{\partial w}{\partial t}+\dfrac{\partial}{\partial x}\left[f(x,|w|)\dfrac{\partial w}{\partial x}\right]=0.$

There is a solution of the form

$$w(x,t)=U(x)\exp[i\beta t+iV(x)],$$

where β is an arbitrary real constant, and the functions $U=U(z)$ and $V=V(z)$ are determined by an appropriate system of ordinary differential equations (which is not written out here).

Chapter 6
Second-Order Parabolic Equations with Two or More Space Variables

6.1. Equations with Two Space Variables Involving Power-Law Nonlinearities

6.1.1. Equations of the Form

$$\frac{\partial w}{\partial t} = \frac{\partial}{\partial x}\left[f(x)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(y)\frac{\partial w}{\partial y}\right] + aw^p$$

1. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right) + cw^p.$

This is a special case of equation 6.4.2.1 with $f(w) = cw^p$.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w\Big(C_1^{\frac{p-1}{2-n}}x,\ C_1^{\frac{p-1}{2-m}}y,\ C_1^{p-1}t + C_2\Big),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. There are "two-dimensional" solutions of the following forms:

$$w(x, y, t) = U(r, t), \quad r^2 = \frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2};$$

$$w(x, y, t) = t^{\frac{1}{1-p}}V(z_1, z_2), \quad z_1 = xt^{\frac{1}{n-2}}, \quad z_2 = yt^{\frac{1}{m-2}}.$$

2. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\lambda y}\dfrac{\partial w}{\partial y}\right) + cw^p.$

This is a special case of equation 6.4.2.3 with $f(w) = cw^p$.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w\Big(C_1^{\frac{p-1}{2-n}}x,\ y + \frac{1-p}{\lambda}\ln C_1,\ C_1^{p-1}t + C_2\Big),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. There are "two-dimensional" solutions of the following forms:

$$w(x, y, t) = U(r, t), \quad r^2 = \frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\lambda y}}{b\lambda^2};$$

$$w(x, y, t) = t^{\frac{1}{1-p}}V(z_1, z_2), \quad z_1 = xt^{\frac{1}{n-2}}, \quad z_2 = y + \frac{1}{\lambda}\ln t.$$

3. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ae^{\beta x}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\lambda y}\dfrac{\partial w}{\partial y}\right) + cw^p.$

This is a special case of equation 6.4.2.2 with $f(w) = cw^p$.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w\Big(x + \frac{1-p}{\beta}\ln C_1,\ y + \frac{1-p}{\lambda}\ln C_1,\ C_1^{p-1}t + C_2\Big),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. There are "two-dimensional" solutions of the following forms:

$$w(x, y, t) = U(r, t), \quad r^2 = \frac{e^{-\beta x}}{a\beta^2} + \frac{e^{-\lambda y}}{b\lambda^2};$$

$$w(x, y, t) = t^{\frac{1}{1-p}}V(z_1, z_2), \quad z_1 = x + \frac{1}{\beta}\ln t, \quad z_2 = y + \frac{1}{\lambda}\ln t.$$

6.1.2. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + b\dfrac{\partial}{\partial y}\left(w^k\dfrac{\partial w}{\partial y}\right)$

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\dfrac{\partial}{\partial y}\left(w\dfrac{\partial w}{\partial y}\right).$

This is a special case of equation 6.1.3.1 with $c = 0$.

2. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(w\dfrac{\partial w}{\partial y}\right).$

Boussinesq equation. It arises in nonlinear heat conduction theory and the theory of unsteady flows through porous media with a free surface (see Polubarinova–Kochina, 1962). This is a special case of equation 6.1.2.4 with $n = 1$.

1°. Solution linear in all independent variables:

$$w(x, y, t) = Ax + By + (A^2 + B^2)t + C,$$

where A, B, and C are arbitrary constants.

2°. Traveling-wave solution (k_1, k_2, and λ are arbitrary constants):

$$w = w(\xi), \quad \xi = k_1 x + k_2 y + \lambda t,$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$\lambda w'_\xi = (k_1^2 + k_2^2)(ww'_\xi)'_\xi.$$

The solution of this equation can be written out in implicit form:

$$\xi = B + \frac{k_1^2 + k_2^2}{\lambda^2}\big(\lambda w - A\ln|A + \lambda w|\big),$$

where A and B are arbitrary constants.

3°. Generalized separable solution quadratic in the space variables:

$$w(x,y,t) = f(t)x^2 + g(t)xy + h(t)y^2,$$

where the functions $f(t)$, $g(t)$, and $h(t)$ are determined by the autonomous system of ordinary differential equations

$$f'_t = 6f^2 + 2fh + g^2, \tag{1}$$
$$g'_t = 6(f+h)g, \tag{2}$$
$$h'_t = 6h^2 + 2fh + g^2. \tag{3}$$

It follows from (1) and (3) that $f'_t - h'_t = 6(f+h)(f-h)$. Further, using (2) and assuming $g \not\equiv 0$, we find that $f = h + Ag$, where A is an arbitrary constant. With this relation, we eliminate h from (2) and (3) to obtain a nonlinear ordinary differential equation for $g(t)$:

$$3gg''_{tt} - 5g'^2_t - 36(1+A^2)g^4 = 0.$$

On solving this equation with the change of variable $u(g) = (g'_t)^2$, we obtain (B is an arbitrary constant)

$$g'_t = g\Phi(g), \qquad \Phi(g) = \pm\sqrt{Bg^{4/3} + 36(1+A^2)g^2}, \tag{4}$$
$$h = \tfrac{1}{12}\Phi(g) - \tfrac{1}{2}Ag, \quad f = \tfrac{1}{12}\Phi(g) + \tfrac{1}{2}Ag,$$

where the first equation is separable, and, hence, its solution can be written out in implicit form.

In the special case $B = 0$, the solution can be represented in explicit form (C is an arbitrary constant):

$$f(t) = \frac{\mu + A}{2(C-\mu t)}, \quad g(t) = \frac{1}{C-\mu t}, \quad h(t) = \frac{\mu - A}{2(C-\mu t)}, \qquad \mu = \pm\sqrt{1+A^2}.$$

4°. Generalized separable solution (generalizes the solution of Item 3°):

$$w(x,y,t) = f(t)x^2 + g(t)xy + h(t)y^2 + \varphi(t)x + \psi(t)y + \chi(t),$$

where the functions $f(t)$, $g(t)$, $h(t)$, $\varphi(t)$, $\psi(t)$, and $\chi(t)$ are determined by the system of ordinary differential equations

$$f'_t = 6f^2 + 2fh + g^2, \quad \varphi'_t = 2(3f+h)\varphi + 2g\psi,$$
$$g'_t = 6(f+h)g, \quad \psi'_t = 2g\varphi + 2(f+3h)\psi,$$
$$h'_t = 6h^2 + 2fh + g^2, \quad \chi'_t = \varphi^2 + \psi^2 + 2(f+h)\chi.$$

The first three equations for f, g, and h can be solved independently (see Item 3°).

Special case. Solution:

$$w(x,t) = -\frac{y^2}{6t} + Cxt^{-1/3} + \frac{3}{2}C^2t^{1/3},$$

where C is an arbitrary constant.

5°. There is a "two-dimensional" solution in multiplicative separable form:

$$w(x,y,t) = (At+B)^{-1}\Theta(x,y),$$

where A and B are arbitrary constants, and the function Θ is determined by the stationary equation written out in Item 4° of equation 6.1.2.4 with $n = \alpha = 1$.

⊙ *References for equation* 6.1.2.2: S. S. Titov and V. A. Ustinov (1985), V. V. Pukhnachov (1995), A. D. Polyanin, A. V. Vyazmin, A. I. Zhurov, and D. A. Kazenin (1998).

3. $\dfrac{\partial w}{\partial t} = \alpha\left[\dfrac{\partial}{\partial x}\left(\dfrac{1}{w}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(\dfrac{1}{w}\dfrac{\partial w}{\partial y}\right)\right].$

This is a special case of equation 6.1.2.4 with $n = -1$. This equation arises as a model for long van der Waals interactions in thin films of a fluid spreading on a solid surface if fourth-order effects are neglected; see Gennes (1885), Bertozzi and Pugh (1996).

1°. Traveling-wave solutions:

$$w(\xi) = -\frac{\alpha(k_1^2 + k_2^2)}{\lambda(\xi + A)}, \quad \xi = k_1 x + k_2 y + \lambda t,$$

$$w(\xi) = \left\{A + B\exp\left[\frac{\lambda\xi}{\alpha A(k_1^2 + k_2^2)}\right]\right\}^{-1},$$

where A, B, k_1, k_2, and λ are arbitrary constants.

2°. Solutions:

$$w(x, y, t) = \frac{2\alpha t + B}{(\sin y + Ae^x)^2},$$

$$w(x, y, t) = \frac{2A^2\alpha t + C}{e^{2x}\sinh^2\left(Ae^{-x}\sin y + B\right)},$$

$$w(x, y, t) = \frac{C - 2A^2\alpha t}{e^{2x}\cosh^2\left(Ae^{-x}\sin y + B\right)},$$

$$w(x, y, t) = \frac{2A^2\alpha t + C}{e^{2x}\cos^2\left(Ae^{-x}\sin y + B\right)},$$

where A, B, and C are arbitrary constants.

3°. The exact solutions specified in Item 2° are special cases of a more general solution having the form of the product of two functions with different arguments:

$$w(x, y, t) = (A\alpha t + B)e^{\Theta(x,y)},$$

where A and B are arbitrary constants, and the function $\Theta(x, y)$ is a solution of the stationary equation

$$\Delta\Theta - Ae^{\Theta} = 0, \qquad \Delta = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2},$$

which is encountered in combustion theory. For solutions of this equation, see 9.2.1.1.

4°. Other exact solutions:

$$w(x, y, t) = \frac{2\sinh(\alpha t + C)\cosh(\alpha t + C)}{(x + A)^2\sinh^2(\alpha t + C) + (y + B)^2\cosh^2(\alpha t + C)},$$

$$w(x, y, t) = \left[\frac{1}{A + \alpha\mu^2 t} + B(A + \alpha\mu^2 t)e^{\mu x} \pm \frac{\sin(\mu y + \eta_0)}{A + \alpha\mu^2 t}\right]^{-1},$$

$$w(x, y, t) = \left[A\coth\theta(t) + B\sinh\theta(t)\,e^{\mu x} \pm A\frac{\sin(\mu y + \eta_0)}{\sinh\theta(t)}\right]^{-1},$$

$$w(x,y,t)=\left[A\cot\theta(t)+B\sin\theta(t)\,e^{\mu x}\pm A\frac{\sin(\mu y+\eta_0)}{\sin\theta(t)}\right]^{-1},$$

$$w(x,y,t)=\left[\frac{A}{\cos\theta(t)}\pm A\frac{1+\sin\theta(t)}{2\cos\theta(t)}\cosh(\mu x+\xi_0)+sA\frac{1-\sin\theta(t)}{2\cos\theta(t)}\sin(\mu y+\eta_0)\right]^{-1},$$

$$w(x,y,t)=\left[-\frac{A}{\cos\theta(t)}\pm A\frac{1-\sin\theta(t)}{2\cos\theta(t)}\cosh(\mu x+\xi_0)+sA\frac{1+\sin\theta(t)}{2\cos\theta(t)}\sin(\mu y+\eta_0)\right]^{-1},$$

$$w(x,y,t)=\left[\frac{A}{\sinh\theta(t)}\pm A\frac{1-\cosh\theta(t)}{2\sinh\theta(t)}\cosh(\mu x+\xi_0)+sA\frac{1+\cosh\theta(t)}{2\sinh\theta(t)}\sin(\mu y+\eta_0)\right]^{-1},$$

$$w(x,y,t)=\left[-\frac{A}{\sinh\theta(t)}\pm A\frac{1+\cosh\theta(t)}{2\sinh\theta(t)}\cosh(\mu x+\xi_0)+sA\frac{1-\cosh\theta(t)}{2\sinh\theta(t)}\sin(\mu y+\eta_0)\right]^{-1},$$

where $\theta(t)=\alpha\mu^2At+\tau_0$; A, B, μ, ξ_0, η_0, and τ_0 are arbitrary constants; and s is a parameter that admits the values 1 or –1 (the first solution was indicated by Pukhnachov, 1995).

By swapping the variables, $x\rightleftarrows y$, in the above relations, one can obtain another group of solutions (not written out here).

5°. Solutions with axial symmetry:

$$w(r,t)=\frac{\lambda^2r^{\lambda-2}}{r^\lambda+Ce^{\alpha t}},$$

$$w(r,t)=\frac{\lambda\varphi r^{\varphi-2}}{C_1+r^\varphi(\varphi\ln r-1)},\quad \varphi=\frac{\lambda}{\alpha t+C_2},$$

where $r=\sqrt{x^2+y^2}$ and C, C_1, C_2, and λ are arbitrary constants.

6°. The transformation $w=1/U$ leads to an equation of the form 6.1.4.4 with $\beta=0$:

$$\frac{\partial U}{\partial t}=\alpha U\Delta U-\alpha\left[\left(\frac{\partial U}{\partial x}\right)^2+\left(\frac{\partial U}{\partial y}\right)^2\right].$$

7°. The original equation is invariant under the transformation

$$\bar x=\varphi(x,y),\quad \bar y=\psi(x,y),\quad \bar w=\frac{w}{\varphi_x^2+\varphi_y^2},\tag{1}$$

where φ and ψ are arbitrary independent harmonic conjugate functions that solve the equations

$$\psi_x=\varphi_y,\quad \psi_y=-\varphi_x\qquad(\psi_x\varphi_y-\psi_y\varphi_x\neq0).\tag{2}$$

Applying the transformation (1)–(2) to a solution $w=f(x,y,t)$ we have an infinite family of solutions

$$w(x,y,t)=(\varphi_x^2+\varphi_y^2)f(\varphi(x,y),\psi(x,y),t),$$

containing a pair of harmonic conjugate functions (2). In particular, taking solution $w=f(x,t)$ independent of y, i.e., satisfying the one-dimensional equation 5.1.10.2, $w_t=a(w_x/w)_x$, yields the solution

$$w(x,y,t)=(\varphi_x^2+\varphi_y^2)f(\varphi(x,y),t).$$

⊙ *References for equation* 6.1.2.3: G. A. Nariboli (1970), V. A. Dorodnitsyn, I. V. Knyazeva, and S. R. Svirshchevskii (1983), V. A. Galaktionov and S. A. Posashkov (1989), J. R. King (1992), N. H. Ibragimov (1994), V. V. Pukhnachov (1995), A. D. Polyanin, A. V. Vyazmin, A. I. Zhurov, and D. A. Kazenin (1998, pp. 297–298), S. N. Aristov (1999), A. D. Polyanin and V. F. Zaitsev (2004, pp. 143–145).

4. $\dfrac{\partial w}{\partial t} = \alpha\left[\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(w^n\dfrac{\partial w}{\partial y}\right)\right].$

This is a two-dimensional heat and mass transfer equation with power-law temperature-dependent thermal conductivity (diffusion coefficient), where n can be integer, fractional, and negative. This is a special case of equation 6.4.3.3 with $f(w) = \alpha w^n$.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^{-2/n} C_2^{1/n} w(\pm C_1 x + C_3, \pm C_1 y + C_4, C_2 t + C_5),$$
$$w_2 = w(x\cos\beta - y\sin\beta, x\sin\beta + y\cos\beta, t),$$

where $C_1, \ldots, C_5$ and β are arbitrary constants, are also solutions of the equation. The plus or minus signs can be chosen arbitrarily.

2°. Traveling-wave solution:

$$w = \left[\frac{n\lambda(k_1 x + k_2 y + \lambda t + C)}{\alpha(k_1^2 + k_2^2)}\right]^{1/n},$$

where C, k_1, k_2, and λ are arbitrary constants.

3°. Traveling-wave solution in implicit form (generalizes the solution of Item 2°):

$$\alpha(k_1^2 + k_2^2)\int \frac{w^n\,dw}{\lambda w + C_1} = k_1 x + k_2 y + \lambda t + C_2,$$

where C_1, C_2, k_1, k_2, and λ are arbitrary constants.

4°. Multiplicative separable solution:

$$w(x, y, t) = f(t)\Theta(x, y), \qquad f(t) = (A\alpha n t + B)^{-1/n}.$$

Here, A and B are arbitrary constants, and the function $\Theta(x, y)$ is a solution of the two-dimensional stationary equation

$$\frac{\partial}{\partial x}\left(\Theta^n\frac{\partial\Theta}{\partial x}\right) + \frac{\partial}{\partial y}\left(\Theta^n\frac{\partial\Theta}{\partial y}\right) + A\Theta = 0.$$

If $n \neq -1$, this equation can be reduced to

$$\Delta u + A(n+1)u^{\frac{1}{n+1}} = 0, \qquad \Delta = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}, \quad u = \Theta^{n+1}.$$

5°. There are "two-dimensional" solutions of the following forms:

$$w(x, y, t) = F(z, t), \qquad z = k_1 x + k_2 y;$$
$$w(x, y, t) = G(r, t), \qquad r = \sqrt{x^2 + y^2};$$
$$w(x, y, t) = H(\xi_1, \xi_2), \qquad \xi_1 = k_1 x + \lambda_1 t, \quad \xi_2 = k_2 y + \lambda_2 t;$$
$$w(x, y, t) = t^\beta U(\eta_1, \eta_2), \qquad \eta_1 = x t^{-\frac{n\beta+1}{2}}, \quad \eta_2 = y t^{-\frac{n\beta+1}{2}};$$
$$w(x, y, t) = e^{2\beta t} V(\zeta_1, \zeta_2), \quad \zeta_1 = x e^{-\beta n t}, \quad \zeta_2 = y e^{-\beta n t},$$

where k_1, k_2, λ_1, λ_2, and β are arbitrary constants.

6°. See also equations 6.5.5.5 and 6.5.5.6 for the case of two space variables.

⊙ *References for equation* 6.1.2.4: V. A. Dorodnitsyn, I. V. Knyazeva, and S. R. Svirshchevskii (1983), S. S. Titov and V. A. Ustinov (1985), J. R. King (1993), V. V. Pukhnachov (1995).

5. $\dfrac{\partial w}{\partial t} = a_1 \dfrac{\partial}{\partial x}\left(w^{n_1}\dfrac{\partial w}{\partial x}\right) + a_2 \dfrac{\partial}{\partial y}\left(w^{n_2}\dfrac{\partial w}{\partial y}\right).$

This is a special case of equation 6.4.3.4 with $f(w) = a_1 w^{n_1}$ and $g(w) = a_2 w^{n_2}$.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the functions

$$w_1 = A^2 w(\pm A^{-n_1} Bx + C_1, \pm A^{-n_2} By + C_2, B^2 t + C_3),$$

where A, B, C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation (the plus or minus signs can be chosen arbitrarily).

2°. Traveling-wave solution in implicit form:

$$\int \frac{a_1 k_1^2 w^{n_1} + a_2 k_2^2 w^{n_2}}{\lambda w + C_1}\, dw = k_1 x + k_2 y + \lambda t + C_2,$$

where C_1, C_2, k_1, k_2, and λ are arbitrary constants.

3°. "Two-dimensional" solution:

$$w(x, y, t) = t^k U(\xi, \eta), \quad \xi = x t^{-\frac{1}{2}(kn_1+1)}, \quad \eta = y t^{-\frac{1}{2}(kn_2+1)},$$

where k is an arbitrary constant and the function $U(\xi, \eta)$ is determined by the differential equation

$$kU - \tfrac{1}{2}(kn_1 + 1)\xi \frac{\partial U}{\partial \xi} - \tfrac{1}{2}(kn_2 + 1)\eta \frac{\partial U}{\partial \eta} = a_1 \frac{\partial}{\partial x}\left(U^{n_1}\frac{\partial U}{\partial x}\right) + a_2 \frac{\partial}{\partial y}\left(U^{n_2}\frac{\partial U}{\partial y}\right).$$

4°. "Two-dimensional" solution:

$$w(x, y, t) = e^{2\beta t} V(z_1, z_2), \quad z_1 = x e^{-\beta n_1 t}, \quad z_2 = y e^{-\beta n_2 t},$$

where β is an arbitrary constant and the function $V(z_1, z_2)$ is determined by the differential equation

$$2\beta V - \beta n_1 z_1 \frac{\partial V}{\partial z_1} - \beta n_2 z_2 \frac{\partial V}{\partial z_2} = a_1 \frac{\partial}{\partial z_1}\left(V^{n_1}\frac{\partial V}{\partial z_1}\right) + a_2 \frac{\partial}{\partial z_2}\left(V^{n_2}\frac{\partial V}{\partial z_2}\right).$$

5°. There is a "two-dimensional" solution of the form

$$w(x, y, t) = F(\xi_1, \xi_2), \quad \xi_1 = \alpha_1 x + \beta_1 y + \gamma_1 t, \quad \xi_2 = \alpha_2 x + \beta_2 y + \gamma_2 t,$$

where the α_i, β_i, and γ_i are arbitrary constants.

⊙ *References for equation* 6.1.2.5: A. A. Samarskii and I. M. Sobol' (1963), V. A. Dorodnitsyn, I. V. Knyazeva, and S. R. Svirshchevskii (1983), N. H. Ibragimov (1994, pp. 155–158).

6.1.3. Equations of the Form $\dfrac{\partial w}{\partial t}=\dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[g(w)\dfrac{\partial w}{\partial y}\right]+h(w)$

1. $\dfrac{\partial w}{\partial t}=a\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial}{\partial y}\left[(bw+c)\dfrac{\partial w}{\partial y}\right]$.

1°. Suppose $w(x,y,t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-2} w(\pm C_2 x + C_3, \pm C_1 C_2 y + C_4, C_2^2 t + C_5) + \frac{c(1-C_1^2)}{bC_1^2},$$

where $C_1, \ldots, C_5$ are arbitrary constants, are also solutions of the equation (the plus or minus signs can be chosen arbitrarily).

2°. Traveling-wave solution in implicit form:

$$bk_2^2 w + (ak_1^2 + ck_2^2 - C_1 bk_2^2)\ln|w + C_1| = \lambda(k_1 x + k_2 y + \lambda t) + C_2,$$

where C_1, C_2, k_1, k_2, and λ are arbitrary constants.

3°. Solution:

$$w = u(z) - 4abC_1^2 x^2 - 4abC_1 C_2 x, \qquad z = y + bC_1 x^2 + bC_2 x + C_3 t,$$

where C_1, C_2, and C_3 are arbitrary constants and the function $u(z)$ is determined by the first-order ordinary differential equation

$$(bu + c + ab^2 C_2^2)u'_z + (2abC_1 - C_3)u = 8a^2 bC_1^2 z + C_4.$$

With appropriate translations in both variables, one can reduce this equation to a homogeneous one, which can be integrated by quadrature.

4°. Generalized separable solution linear in y (a degenerate solution):

$$w = F(x,t)y + G(x,t),$$

where the functions F and G are determined by solving the one-dimensional equations

$$\frac{\partial F}{\partial t} - a\frac{\partial^2 F}{\partial x^2} = 0, \tag{1}$$

$$\frac{\partial G}{\partial t} - a\frac{\partial^2 G}{\partial x^2} = bF^2. \tag{2}$$

Equation (1) is a linear homogeneous heat equation. Given $F = F(x,t)$, equation (2) can be treated as a linear nonhomogeneous heat equation. For these equations, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

5°. Generalized separable solution quadratic in y:

$$w = f(x,t)y^2 + g(x,t)y + h(x,t),$$

where the functions $f = f(x,t)$, $g = g(x,t)$, and $h = h(x,t)$ are determined by the system of differential equations

$$f_t = af_{xx} + 6bf^2,$$
$$g_t = ag_{xx} + 6bfg,$$
$$h_t = ah_{xx} + bg^2 + 2bfh + 2cf.$$

Here, the subscripts denote partial derivatives.

6°. "Two-dimensional" solution:

$$w = |y + C|^{1/2}\theta(x,t) - \frac{c}{b},$$

where the function $\theta(x,t)$ is determined by the linear heat equation

$$\frac{\partial \theta}{\partial t} = a\frac{\partial^2 \theta}{\partial x^2}.$$

7°. "Two-dimensional" solution:

$$w = U(\xi,t) - \frac{aC_1^2 + cC_2^2}{bC_2^2}, \qquad \xi = C_1 x + C_2 y,$$

where C_1 and C_2 are arbitrary constants and the function $U(\xi,t)$ is determined by a differential equation of the form 5.10.1.1:

$$\frac{\partial U}{\partial t} = bC_2^2 \frac{\partial}{\partial \xi}\left(U\frac{\partial U}{\partial \xi}\right).$$

8°. "Two-dimensional" solution:

$$w = V(\eta,t) - 4abC_1^2x^2 - 4abC_1C_2x, \qquad \eta = y + bC_1x^2 + bC_2x,$$

where C_1 and C_2 are arbitrary constants and the function $V(\eta,t)$ is determined by the differential equation

$$\frac{\partial V}{\partial t} = \frac{\partial}{\partial \eta}\left[(bV + c + ab^2C_2^2)\frac{\partial V}{\partial \eta}\right] + 2abC_1\frac{\partial V}{\partial \eta} - 8a^2bC_1^2.$$

9°. Solution:

$$w = U(z) + f(x,t), \qquad z = y + g(x,t).$$

Here,

$$f(x,t) = -\frac{C_2^2}{2\sqrt{a}\,b}xt + \frac{C_2^2}{2b}t^2 - \frac{2\sqrt{a}\,BC_2}{b}t + \frac{C_3}{b} - \frac{1}{b}(C_2\eta + 4aB)\psi'(\eta),$$
$$g(x,t) = \frac{C_2}{8a}\left(x^2 + 2\sqrt{a}\,xt - 3at^2\right) + B(x + \sqrt{a}\,t) + \psi(\eta) \quad \eta = x - t\sqrt{a},$$

where $\psi(\eta)$ is an arbitrary function and the prime denotes a derivative with respect to η.

⊙ *References for equation* 6.1.3.1: A. D. Polyanin and V. F. Zaitsev (2004, pp. 147–148), A. D. Polyanin, V. F. Zaitsev, and A. I. Zhurov (2005, pp. 101–102).

2. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[(\alpha w + \beta)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[(\alpha w + \beta)\dfrac{\partial w}{\partial y}\right].$

This is a two-dimensional heat and mass transfer equation with a linear temperature-dependent thermal conductivity (diffusion coefficient).

The substitution $U = \alpha w + \beta$ leads to an equation of the form 6.1.2.2 for $U = U(x,y,t)$.

3. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(\dfrac{1}{\alpha w+\beta}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(\dfrac{1}{\alpha w+\beta}\dfrac{\partial w}{\partial y}\right).$

This is a two-dimensional heat and mass transfer equation with a hyperbolic temperature-dependent thermal conductivity (diffusion coefficient).

The substitution $U = \alpha w + \beta$ leads to an equation of the form 6.1.2.3 for $U = U(x, y, t)$.

4. $\dfrac{\partial w}{\partial t} = \alpha\left[\dfrac{\partial}{\partial x}\left(\dfrac{1}{w}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(\dfrac{1}{w}\dfrac{\partial w}{\partial y}\right)\right] + \beta w.$

1°. The transformation

$$w(x, y, t) = e^{\beta t}u(x, y, \tau), \quad \tau = C - \frac{1}{\beta}e^{-\beta t},$$

where C is an arbitrary constant, leads to a simpler equation of the form 6.1.2.3:

$$\frac{\partial u}{\partial \tau} = \alpha\left[\frac{\partial}{\partial x}\left(\frac{1}{u}\frac{\partial u}{\partial x}\right) + \frac{\partial}{\partial y}\left(\frac{1}{u}\frac{\partial u}{\partial y}\right)\right].$$

2°. In Zhuravlev (2000), a nonlinear superposition principle is presented that allows the construction of complicated multimodal solutions of the original equation; some exact solutions are also specified there.

5. $\dfrac{\partial w}{\partial t} = \alpha\left[\dfrac{\partial}{\partial x}\left(\dfrac{1}{w}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(\dfrac{1}{w}\dfrac{\partial w}{\partial y}\right)\right] + \beta w^2.$

The substitution $w = 1/U$ leads to an equation of the form 6.1.4.4 for $U = U(x, y, t)$.

⊙ *References*: V. A. Galaktionov and S. A. Posashkov (1989), N. H. Ibragimov (1994, pp. 157–158).

6. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(w^{1/2}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(w^{1/2}\dfrac{\partial w}{\partial y}\right) + aw + bw^{1/2}.$

Solution:

$$w = [f(x, y) + g(x, y)e^{at/2}]^2,$$

where the functions $f = f(x, y)$ and $g = g(x, y)$ are described by the system of stationary equations

$$\frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} + af^2 + bf = 0, \qquad \frac{\partial^2 g}{\partial x^2} + \frac{\partial^2 g}{\partial y^2} + afg + bg = 0.$$

The former equation does not include g and is solved for f independently (it is a special case of equation 6.4.1.1). The latter equation is linear in g and is easy to solve once f has been found.

⊙ *Reference*: O. V. Kaptsov and I. V. Verevkin (2003).

7. $\dfrac{\partial w}{\partial t} = \alpha\left[\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(w^n\dfrac{\partial w}{\partial y}\right)\right] + \beta w.$

The transformation (C is an arbitrary constant)

$$w(x, y, t) = e^{\beta t}U(x, y, \tau), \quad \tau = \frac{1}{\beta n}e^{\beta n t} + C$$

leads to a simpler equation of the form 6.1.2.4:

$$\frac{\partial U}{\partial \tau} = \alpha\left[\frac{\partial}{\partial x}\left(U^n\frac{\partial U}{\partial x}\right) + \frac{\partial}{\partial y}\left(U^n\frac{\partial U}{\partial y}\right)\right].$$

8. $\dfrac{\partial w}{\partial t} = a_1 \dfrac{\partial}{\partial x}\left(w^{n_1}\dfrac{\partial w}{\partial x}\right) + a_2 \dfrac{\partial}{\partial y}\left(w^{n_2}\dfrac{\partial w}{\partial y}\right) + bw^k.$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = A^2 w(\pm A^{k-n_1-1}x + B_1, \pm A^{k-n_2-1}y + B_2, A^{2k-2}t + B_3),$$

where A, B_1, B_2, and B_3 are arbitrary constants, are also solutions of the equation (the plus or minus signs can be chosen arbitrarily).

2°. Traveling-wave solution:

$$w(x, y, t) = u(z), \quad z = t - \lambda_1 x - \lambda_2 y,$$

where λ_1 and λ_2 are arbitrary constants, and the function $u = u(z)$ is determined by the ordinary differential equation

$$u'_z = [(a_1\lambda_1^2 u^{n_1} + a_2\lambda_2^2 u^{n_2})u'_z]'_z + bu^k.$$

3°. "Two-dimensional" solution:

$$w(x, y, t) = (\alpha t + \beta)^{\frac{1}{1-k}} F(\xi, \eta), \quad \xi = x(\alpha t + \beta)^{\frac{n_1-k+1}{2(k-1)}}, \quad \eta = y(\alpha t + \beta)^{\frac{n_2-k+1}{2(k-1)}},$$

where the function $F = F(\xi, \eta)$ is determined by the differential equation

$$\frac{\alpha}{1-k}F + \alpha\frac{n_1-k+1}{2(k-1)}\xi\frac{\partial F}{\partial \xi} + \alpha\frac{n_2-k+1}{2(k-1)}\eta\frac{\partial F}{\partial \eta} = a_1\frac{\partial}{\partial \xi}\left(F^{n_1}\frac{\partial F}{\partial \xi}\right) + a_2\frac{\partial}{\partial \eta}\left(F^{n_2}\frac{\partial F}{\partial \eta}\right) + bF^k.$$

⊙ *References for equation* 6.1.3.8: V. A. Dorodnitsyn, I. V. Knyazeva, and S. R. Svirshchevskii (1983), M. I. Bakirova, S. N. Dimova, V. A. Dorodnitsyn, S. P. Kurdyumov, A. A. Samarskii, and S. R. Svirshchevskii (1988), N. H. Ibragimov (1994, pp. 156–158).

6.1.4. Other Equations

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + bw\dfrac{\partial w}{\partial y}.$

Nonlinear Kolmogorov type equation. This equation arises in mathematical finance, when studying agents' decisions under risk [see Citti, Pascucci, and Polidoro (2001), Pascucci and Polidoro (2003), and Pascucci (2005)].

1°. Suppose $w(x, t)$ is a solution of this equation. Then the functions

$$w_1 = A^{-1}w(\pm B^{1/2}x + D_1, ABy + ABCbt + D_2, Bt + D_3) + C,$$

where A, B, C, D_1, D_2, and D_3 are arbitrary constants, are also solutions of the equation.

2°. "Two-dimensional" solution:

$$w = Au(z,t) + B, \qquad z = x + \lambda y + bB\lambda t,$$

where A, B, and λ are arbitrary constants, and the function $u = u(x,t)$ is described by the unnormalized Burgers equation of the form 5.1.5.3:

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial z^2} + Ab\lambda u\frac{\partial u}{\partial z}.$$

3°. Generalized separable solution:

$$w = \frac{u(x,t) - y}{b(t + C)}, \tag{1}$$

where C is an arbitrary constant and the function $u = u(x,t)$ is described by the linear heat equation

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial x^2}.$$

4°. Generalized separable solution (generalizes the solution from Item 3°):

$$w = f(x,t)y + g(x,t), \tag{2}$$

where the functions $f = f(x,t)$ and $g = g(x,t)$ are determined by the system of differential equations

$$f_t = af_{xx} + bf^2,$$
$$g_t = ag_{xx} + bfg.$$

The first equation for f coincides, up to obvious renaming, with equation 5.1.1.1. The second equation has a particular solution $g = Cf$.

Remark. Solutions (1) and (2) are generalizations of the solutions pointed out by Lagno and Stognii (2010):

$$w = -\frac{y}{bt} + \varphi(z), \qquad z = \frac{x}{\sqrt{t}}, \qquad a\varphi''_{zz} + \frac{1}{2}z\varphi'_z - \varphi = 0;$$
$$w = -\frac{y}{bt} + \frac{1}{t}\varphi(z), \qquad z = \frac{x}{\sqrt{t}}, \qquad a\varphi''_{zz} + \frac{1}{2}z\varphi'_z = 0;$$
$$w = -\frac{y}{bt} \pm \frac{\ln t}{bt} + \frac{1}{t}\varphi(z), \qquad z = \frac{x}{\sqrt{t}}, \qquad a\varphi''_{zz} + \frac{1}{2}z\varphi'_z \mp \frac{1}{b} = 0;$$
$$w = \frac{y}{t}\varphi(z), \qquad z = \frac{x}{\sqrt{t}}, \qquad a\varphi''_{zz} + \frac{1}{2}z\varphi'_z + \varphi + b\varphi^2 = 0.$$

The second and third equations for φ are integrable by quadrature using the substitution $\psi(x) = \varphi'_x$. The solution of the first equation is expressed in terms of degenerate hypergeometric functions.

5°. "Two-dimensional" solution:

$$w = t^k\theta(\xi,\eta), \qquad \xi = xt^{-1/2}, \qquad \eta = yt^{-k-1},$$

where k is an arbitrary constant and the function $\theta = \theta(\xi,\eta)$ is determined by the differential equation

$$ku - \tfrac{1}{2}\xi u_\xi - (k+1)\eta u_\eta = au_{\xi\xi} + buu_\eta.$$

2. $\dfrac{\partial w}{\partial t} = aw\left(\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2}\right).$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = C_1 w(C_2 x + C_3, C_2 y + C_4, C_1 C_2^2 t + C_5),$$
$$w_2 = w(x\cos\beta - y\sin\beta, x\sin\beta + y\cos\beta, t),$$

where $C_1, \ldots, C_5$ and β are arbitrary constants, are also solutions of the equation.

2°. Multiplicative separable solution:

$$w(x, y, t) = \varphi(t)(C_1 x^2 + C_2 xy + C_3 y^2 + C_4 x + C_5 y + C_6), \qquad \varphi(t) = \frac{1}{C_7 - 2a(C_1 + C_3)t},$$

where $C_1, \ldots, C_7$ are arbitrary constants.

3°. The equation admits a more general solution in the form of the product of functions with different arguments:

$$w(x, y, t) = \frac{\Theta(x, y)}{A + Bt},$$

where A and B are arbitrary constants, and the function $\Theta = \Theta(x, y)$ satisfies the two-dimensional Poisson equation

$$a\Delta\Theta + B = 0, \qquad \Delta = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}.$$

For solutions of this linear equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

4°. Traveling-wave solution in implicit form:

$$a(k_1^2 + k_2^2)\int \frac{dw}{\lambda \ln|w| + C_1} = k_1 x + k_2 y + \lambda t + C_2,$$

where C_1, C_2, k_1, k_2, and λ are arbitrary constants.

5°. The equation has "two-dimensional" solutions with the following forms:

$$w(x, y, t) = F(z, t), \qquad z = k_1 x + k_2 y;$$
$$w(x, y, t) = G(r, t), \qquad r = \sqrt{x^2 + y^2};$$
$$w(x, y, t) = H(\xi_1, \xi_2), \qquad \xi_1 = k_1 x + \lambda_1 t, \quad \xi_2 = k_2 y + \lambda_2 t;$$
$$w(x, y, t) = t^{\beta} U(\eta_1, \eta_2), \quad \eta_1 = x^2 t^{-\beta-1}, \quad \eta_2 = y^2 t^{-\beta-1};$$
$$w(x, y, t) = e^{2t} V(\zeta_1, \zeta_2), \quad \zeta_1 = xe^{-t}, \quad \zeta_2 = ye^{-t},$$

where k_1, k_2, λ_1, λ_2, and β are arbitrary constants.

3. $\dfrac{\partial w}{\partial t} = (\alpha + \beta w)\left(\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2}\right) + \gamma w^2 + \delta w + \varepsilon.$

Generalized separable solution:

$$w(x, y, t) = f(t) + g(t)\Theta(x, y).$$

Here, $\Theta(x, y)$ is any solution of the two-dimensional Helmholtz equation

$$\Delta\Theta + \kappa\Theta = 0, \qquad \Delta = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}, \tag{1}$$

where $\kappa = \gamma/\beta$ ($\beta \neq 0$). For solutions of the linear equation (1), see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

The functions $f(t)$ and $g(t)$ are determined by the autonomous system of ordinary differential equations

$$\begin{aligned} f'_t &= \gamma f^2 + \delta f + \varepsilon, \\ g'_t &= (\gamma f + \delta - \alpha\kappa)g. \end{aligned} \tag{2}$$

The first equation in (2) is independent of $g(t)$ and is separable. On finding $f(t)$, one can solve the second equation in (2), which is linear in $g(t)$.

The functions $f(t)$ and $g(t)$ have different forms depending on the values of the equation parameters. Below are five possible cases; C_1 and C_2 are arbitrary constants.

1°. For $\gamma = \delta = 0$,

$$f(t) = C_1 + \varepsilon t, \quad g(t) = C_2 e^{-\alpha\kappa t}.$$

2°. For $\gamma = 0$ and $\delta \neq 0$,

$$f(t) = C_1 e^{\delta t} - \frac{\varepsilon}{\delta}, \quad g(t) = C_2 e^{(\delta - \alpha\kappa)t}.$$

3°. For $\gamma \neq 0$ and $\delta^2 - 4\gamma\varepsilon = \mu^2 > 0$ ($\mu > 0$),

$$f(t) = \frac{s_1 + s_2 C_1 e^{\mu t}}{1 + C_1 e^{\mu t}}, \quad g(t) = \frac{C_2}{1 + C_1 e^{\mu t}} e^{-(\gamma s_2 + \alpha\kappa)t}, \qquad s_{1,2} = \frac{-\delta \pm \mu}{2\gamma}.$$

4°. For $\gamma \neq 0$ and $\delta^2 - 4\gamma\varepsilon = 0$,

$$f(t) = -\frac{\delta}{2\gamma} - \frac{1}{C_1 + \gamma t}, \quad g(t) = \frac{C_2}{C_1 + \gamma t} \exp\left[\left(\tfrac{1}{2}\delta - \alpha\kappa\right)t\right].$$

5°. For $\gamma \neq 0$ and $\delta^2 - 4\gamma\varepsilon = -\mu^2 < 0$ ($\mu > 0$),

$$f(t) = \frac{\mu}{2\gamma} \tan\left(\tfrac{1}{2}\mu t + C_1\right) - \frac{\delta}{2\gamma}, \quad g(t) = C_2 \frac{\exp\left[\left(\tfrac{1}{2}\delta - \alpha\kappa\right)t\right]}{\cos\left(\tfrac{1}{2}\mu t + C_1\right)}.$$

⊙ *References for equation* 6.1.4.3: V. A. Galaktionov and S. A. Posashkov (1989), N. H. Ibragimov (1994, pp. 155–158).

4. $\dfrac{\partial w}{\partial t} = \alpha w\left(\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2}\right) - \alpha\left[\left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2\right] - \beta.$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-1} w(C_1 x + C_2, C_1 y + C_3, C_1 t + C_4),$$
$$w_2 = w(x\cos\beta - y\sin\beta, x\sin\beta + y\cos\beta, t),$$

where $C_1, \ldots, C_4$ and β are arbitrary constants, are also solutions of the equation.

2°. Generalized separable solution:

$$w(x, y, t) = C_1 - \beta t + C_2 \exp\left[\alpha(\mu^2 + \nu^2)\left(C_1 t - \tfrac{1}{2}\beta t^2\right)\right] e^{\mu x + \nu y},$$

where μ, ν, C_1, and C_2 are arbitrary constants.

3°. Solutions for $\beta = 0$:

$$w(x, y, t) = \frac{1}{A + \alpha\mu^2 t} + B(A + \alpha\mu^2 t)e^{\mu x} \pm \frac{\sin(\mu y + \eta_0)}{A + \alpha\mu^2 t},$$
$$w(x, y, t) = A\coth\theta(t) + B\sinh\theta(t)\, e^{\mu x} \pm A\frac{\sin(\mu y + \eta_0)}{\sinh\theta(t)},$$
$$w(x, y, t) = A\cot\theta(t) + B\sin\theta(t)\, e^{\mu x} \pm A\frac{\sin(\mu y + \eta_0)}{\sin\theta(t)},$$
$$w(x, y, t) = \frac{A}{\cos\theta(t)} \pm A\frac{1 + \sin\theta(t)}{2\cos\theta(t)}\cosh(\mu x + \xi_0) + sA\frac{1 - \sin\theta(t)}{2\cos\theta(t)}\sin(\mu y + \eta_0),$$
$$w(x, y, t) = -\frac{A}{\cos\theta(t)} \pm A\frac{1 - \sin\theta(t)}{2\cos\theta(t)}\cosh(\mu x + \xi_0) + sA\frac{1 + \sin\theta(t)}{2\cos\theta(t)}\sin(\mu y + \eta_0),$$
$$w(x, y, t) = \frac{A}{\sinh\theta(t)} \pm A\frac{1 - \cosh\theta(t)}{2\sinh\theta(t)}\cosh(\mu x + \xi_0) + sA\frac{1 + \cosh\theta(t)}{2\sinh\theta(t)}\sin(\mu y + \eta_0),$$
$$w(x, y, t) = -\frac{A}{\sinh\theta(t)} \pm A\frac{1 + \cosh\theta(t)}{2\sinh\theta(t)}\cosh(\mu x + \xi_0) + sA\frac{1 - \cosh\theta(t)}{2\sinh\theta(t)}\sin(\mu y + \eta_0),$$

where A, B, μ, ξ_0, η_0, and τ_0 are arbitrary constants, $\theta(t) = \alpha\mu^2 At + \tau_0$, and s is a parameter that can assume the values 1 or –1.

By swapping the variables, $x \rightleftarrows y$, in the above relations, one can obtain another group of solutions (not written out here).

4°. There are generalized separable solutions of the form

$$w(x, y, t) = f(t) + g(t)\varphi(x) + h(t)\psi(y). \tag{1}$$

In particular, if $\varphi''_{xx} = \nu\varphi$ and $\psi''_{yy} = -\nu\psi$, where ν is an arbitrary constant, we have

$$\varphi(x) = A_1\cosh\mu x + A_2\sinh\mu x, \quad \psi(y) = B_1\cos\mu y + B_2\sin\mu y \qquad (\nu = \mu^2 > 0),$$
$$\varphi(x) = A_1\cos\mu x + A_2\sin\mu x, \qquad \psi(y) = B_1\cosh\mu y + B_2\sinh\mu y \quad (\nu = -\mu^2 < 0).$$

Here, A_1, A_2, B_1, and B_2 are arbitrary constants. The functions $f(t)$, $g(t)$, and $h(t)$ in (1) are determined by the system of ordinary differential equations

$$f'_t = \alpha\nu(A_1^2 - sA_2^2)g^2 - \alpha\nu(B_1^2 + sB_2^2)h^2 - \beta,$$
$$g'_t = \alpha\nu fg,$$
$$h'_t = -\alpha\nu fh,$$

where $s = \operatorname{sign}\nu$. The order of this system can be reduced by 2; then the system becomes

$$f = \Phi(h), \quad g = C_2/h, \quad h'_t = -\alpha\nu h\Phi(h),$$

where

$$\Phi(h) = \pm\sqrt{C_1 + (A_1^2 - sA_2^2)\frac{C_2^2}{h^2} + \frac{2\beta}{\alpha\nu}\ln|h| + (B_1^2 + sB_2^2)h^2}\,;$$

C_1 and C_2 are arbitrary constants. For $\beta = 0$, solutions in explicit form may be obtained in some cases (see Item 3°).

5°. There are generalized separable solutions of the form

$$w(x, y, t) = f(t) + g(t)\varphi(x) + h(t)\psi(y) + u(t)\theta(x)\chi(y). \tag{2}$$

For $\varphi''_{xx} = 4\nu\varphi$, $\psi''_{yy} = -4\nu\psi$, $\theta''_{xx} = \nu\theta$, and $\chi''_{yy} = -\nu\chi$, where ν is an arbitrary constant, one can set in (2)

for $\nu = \mu^2 > 0$	for $\nu = -\mu^2 < 0$
$\varphi(x) = A_1\cosh 2\mu x + A_2\sinh 2\mu x$	$\varphi(x) = A_1\cos 2\mu x + A_2\sin 2\mu x$
$\psi(y) = B_1\cos 2\mu y + B_2\sin 2\mu y$	$\psi(y) = B_1\cosh 2\mu y + B_2\sinh 2\mu y$
$\theta(x) = C_1\cosh \mu x + C_2\sinh \mu x$	$\theta(x) = C_1\cos \mu x + C_2\sin \mu x$
$\chi(y) = D_1\cos \mu y + D_2\sin \mu y$	$\chi(y) = D_1\cosh \mu y + D_2\sinh \mu y$

The functions $f(t)$, $g(t)$, $h(t)$, and $u(t)$ are determined by the following system of ordinary differential equations ($s = \operatorname{sign}\nu$):

$$\begin{aligned}
f'_t &= -4\alpha\nu(A_1^2 - sA_2^2)g^2 + 4\alpha\nu(B_1^2 + sB_2^2)h^2 - \beta,\\
g'_t &= -4\alpha\nu fg + \alpha\nu a_1(D_1^2 + sD_2^2)u^2,\\
h'_t &= 4\alpha\nu fh - \alpha\nu a_2(C_1^2 - sC_2^2)u^2,\\
u'_t &= -2\alpha\nu(a_3 g - a_4 h)u.
\end{aligned}$$

The arbitrary constants A_1, A_2, B_1, B_2, C_1, C_2, D_1, and D_2 are related by the two constraints

$$2A_1C_1C_2 = A_2(C_1^2 + sC_2^2), \quad 2B_1D_1D_2 = B_2(D_1^2 - sD_2^2).$$

The coefficients a_1, a_2, a_3, and a_4 are defined by

$$a_1 = \frac{C_1^2 + sC_2^2}{2A_1}, \quad a_2 = \frac{D_1^2 - sD_2^2}{2B_1}, \quad a_3 = A_2\frac{C_1^2 - sC_2^2}{C_1C_2}, \quad a_4 = B_2\frac{D_1^2 + sD_2^2}{D_1D_2},$$

provided $A_1 \neq 0$, $B_1 \neq 0$, $C_1C_2 \neq 0$, and $D_1D_2 \neq 0$.

If $A_1 = 0$ ($A_2 \neq 0$), then one should set $a_1 = C_1C_2/A_2$. If $B_1 = 0$ ($B_2 \neq 0$), then $a_2 = D_1D_2/B_2$. If $C_1 = 0$ ($C_2 \neq 0$), then $a_3 = -A_1$. If $C_2 = 0$ ($C_1 \neq 0$), then $a_3 = A_1$. If $D_1 = 0$ ($D_2 \neq 0$), then $a_4 = -B_1$. If $D_2 = 0$ ($D_1 \neq 0$), then $a_4 = B_1$.

6°. The equation admits a traveling-wave solution: $w = w(k_1x + k_2y + \lambda t)$, where k_1, k_2, and λ are arbitrary constants.

7°. There is a generalized separable solution of the form

$$w(x,y,t) = f(t)x^2 + g(t)xy + h(t)y^2 + \varphi(t)x + \psi(t)y + \chi(t).$$

In the special case $\varphi(t) = \psi(t) \equiv 0$, the functions $f(t)$, $g(t)$, $h(t)$, and $\chi(t)$ are determined by the autonomous system of ordinary differential equations

$$\begin{aligned} f'_t &= \alpha(2fh - 2f^2 - g^2), \qquad & h'_t &= \alpha(2fh - 2h^2 - g^2),\\ g'_t &= -2\alpha g(f+h), & \chi'_t &= 2\alpha(f+h)\chi - \beta, \end{aligned}$$

which can be completely integrated.

8°. In the special case $\beta = 0$, the original equation is invariant under the transformation

$$\bar{x} = \varphi(x,y), \quad \bar{y} = \psi(x,y), \quad \bar{w} = (\varphi_x^2 + \varphi_y^2)w, \tag{1}$$

where φ and ψ are arbitrary independent harmonic conjugate functions solving the equations

$$\psi_x = \varphi_y, \quad \psi_y = -\varphi_x \qquad (\psi_x\varphi_y - \psi_y\varphi_x \neq 0). \tag{2}$$

Applying the transformation (1)–(2) to a solution $w = f(x,y,t)$ we have an infinite family of solutions

$$w(x,y,t) = \frac{f(\varphi(x,y), \psi(x,y), t)}{\varphi_x^2 + \varphi_y^2},$$

containing a pair of harmonic conjugate functions (2). In particular, taking solution $w = f(x,t)$ independent of y, i.e., satisfying the one-dimensional equation 5.1.9.8 with $b = 0$, $w_t = a(ww_{xx} - w_x^2)$, yields the solution

$$w(x,y,t) = \frac{f(\varphi(x,y), t)}{\varphi_x^2 + \varphi_y^2}.$$

⊙ *References for equation* 6.1.4.4: V. A. Galaktionov and S. A. Posashkov (1989), A. D. Polyanin, A. V. Vyazmin, A. I. Zhurov, and D. A. Kazenin (1998, pp. 293–295), A. D. Polyanin and V. F. Zaitsev (2002, pp. 100–101), V. A. Galaktionov and S. R. Svirshchevskii (2007).

5. $\dfrac{\partial w}{\partial t} = \alpha\left[\dfrac{\partial}{\partial x}\left(|\nabla w|\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(|\nabla w|\dfrac{\partial w}{\partial y}\right)\right] + \beta w^2.$

Here, $|\nabla w|^2 = \left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2$.

1°. Suppose $w(x,y,t)$ is a solution of the equation in question. Then the functions

$$\begin{aligned} w_1 &= C_1 w(\pm x + C_2, \pm y + C_3, C_1 t + C_4),\\ w_2 &= w(x\cos\beta - y\sin\beta, x\sin\beta + y\cos\beta, t), \end{aligned}$$

where $C_1, \ldots, C_4$ and β are arbitrary constants, are also solutions of the equation (the plus or minus signs can be chosen arbitrarily).

2°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,t) = U(\xi,\eta), \quad \xi = C_1x + C_1y + C_3t, \quad \eta = C_4x + C_5y + C_6t,$$
$$w(x,y,t) = (C_1t + C_2)^{-1}V(x,y).$$

3°. "Two-dimensional" generalized separable solution:

$$w(x,y,t) = \frac{1}{C_1 - \beta t} + \frac{C_2}{(C_1 - \beta t)^2}F(x,y),$$

where C_1 and C_2 are arbitrary constants, and the function $F(x,y)$ is any solution of the stationary equation

$$\frac{\partial}{\partial x}\left(|\nabla F|\frac{\partial F}{\partial x}\right) + \frac{\partial}{\partial y}\left(|\nabla F|\frac{\partial F}{\partial y}\right) + \kappa F^2 = 0, \qquad \kappa = \frac{\beta}{\alpha}\operatorname{sign} C_2.$$

4°. "Two-dimensional" generalized separable solution:

$$w(x,y,t) = f(t) + g(t)\Theta(x,y).$$

Here, the functions $f(t)$ and $g(t)$ are given by

$$f(t) = \frac{1}{B - \beta t}, \quad g(t) = \frac{\beta}{(B - \beta t)[A + C(B - \beta t)]},$$

where A, B, and C are arbitrary constants, and the function $\Theta(x,y)$ is any solution of the stationary equation

$$\frac{\partial}{\partial x}\left(|\nabla\Theta|\frac{\partial\Theta}{\partial x}\right) + \frac{\partial}{\partial y}\left(|\nabla\Theta|\frac{\partial\Theta}{\partial y}\right) \pm \kappa\Theta^2 = \mu\Theta, \qquad \kappa = \frac{\beta}{\alpha}, \quad \mu = \frac{A}{\alpha}.$$

⊙ *References for equation* 6.1.4.5: V. A. Galaktionov and S. A. Posashkov (1989), N. H. Ibragimov (1994).

6.2. Equations with Two Space Variables Involving Exponential Nonlinearities

6.2.1. Equations of the Form $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(x)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[g(y)\dfrac{\partial w}{\partial y}\right] + ae^{\lambda w}$

1. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right) + ce^{\lambda w}.$

This is a special case of equation 6.4.2.1 with $f(w) = ce^{\lambda w}$.

1°. Suppose $w(x,y,t)$ is a solution of the equation in question. Then the function

$$w_1 = w\Big(C_1^{\frac{1}{2-n}}x,\ C_1^{\frac{1}{2-m}}y,\ C_1t + C_2\Big) + \frac{1}{\lambda}\ln C_1,$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,t) = U(r,t), \quad r^2 = \frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2};$$
$$w(x,y,t) = V(z_1,z_2) - \frac{1}{\lambda}\ln t, \quad z_1 = xt^{\frac{1}{n-2}}, \quad z_2 = yt^{\frac{1}{m-2}}.$$

2. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\lambda y}\dfrac{\partial w}{\partial y}\right) + ce^{\beta w}.$

This is a special case of equation 6.4.2.3 with $f(w) = ce^{\beta w}$.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the function

$$w_1 = w\Big(C_1^{\frac{1}{2-n}}x,\ y - \frac{1}{\lambda}\ln C_1,\ C_1 t + C_2\Big) + \frac{1}{\beta}\ln C_1,$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. There are "two-dimensional" solutions of the following forms:

$$w(x, y, t) = U(r, t), \quad r^2 = \frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\lambda y}}{b\lambda^2};$$

$$w(x, y, t) = V(z_1, z_2) - \frac{1}{\beta}\ln t, \quad z_1 = xt^{\frac{1}{n-2}}, \quad z_2 = y + \frac{1}{\lambda}\ln t.$$

3. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ae^{\beta x}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\lambda y}\dfrac{\partial w}{\partial y}\right) + ce^{\mu w}.$

This is a special case of equation 6.4.2.2 with $f(w) = ce^{\mu w}$.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the function

$$w_1 = w\Big(x - \frac{1}{\beta}\ln C_1,\ y - \frac{1}{\lambda}\ln C_1,\ C_1 t + C_2\Big) + \frac{1}{\mu}\ln C_1,$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. There are "two-dimensional" solutions of the following forms:

$$w(x, y, t) = U(r, t), \quad r^2 = \frac{e^{-\beta x}}{a\beta^2} + \frac{e^{-\lambda y}}{b\lambda^2};$$

$$w(x, y, t) = V(z_1, z_2) - \frac{1}{\mu}\ln t, \quad z_1 = x + \frac{1}{\beta}\ln t, \quad z_2 = y + \frac{1}{\lambda}\ln t.$$

6.2.2. Equations of the Form $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\beta w}\dfrac{\partial w}{\partial x}\right) + b\dfrac{\partial}{\partial y}\left(e^{\lambda w}\dfrac{\partial w}{\partial y}\right) + f(w)$

1. $\dfrac{\partial w}{\partial t} = \alpha\left[\dfrac{\partial}{\partial x}\left(e^{\mu w}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(e^{\mu w}\dfrac{\partial w}{\partial y}\right)\right].$

This is a two-dimensional nonstationary heat (diffusion) equation with exponential temperature (concentration) dependent thermal diffusivity (diffusion coefficient). This is a special case of equation 6.4.3.3 with $f(w) = \alpha e^{\mu w}$.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the functions

$$w_1 = w(C_1 x + C_3, C_1 y + C_4, C_2 t + C_5) + \frac{1}{\mu}\ln\frac{C_2}{C_1^2},$$

$$w_2 = w(x\cos\beta - y\sin\beta, x\sin\beta + y\cos\beta, t),$$

where $C_1, \ldots, C_5$ and β are arbitrary constants, are also solutions of the equation.

2°. Traveling-wave solution in implicit form:

$$\alpha(k_1^2+k_2^2)\int \frac{e^{\mu w}\,dw}{\lambda w+C_1} = k_1x+k_2y+\lambda t+C_2,$$

where C_1, C_2, k_1, k_2, and λ are arbitrary constants.

3°. "Two-dimensional" additive separable solution:

$$w(x,y,t) = f(t)+\frac{1}{\mu}\ln\Theta(x,y), \qquad f(t) = -\frac{1}{\mu}\ln(A\alpha t+B).$$

Here, A, B, and μ are arbitrary constants, and the function $\Theta(x,y)$ is any solution of the Poisson equation

$$\Delta\Theta + A = 0, \qquad \Delta = \frac{\partial^2}{\partial x^2}+\frac{\partial^2}{\partial y^2}.$$

For solutions of this linear equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

4°. There are "two-dimensional" solutions of the following forms:

$$\begin{aligned}
&w(x,y,t) = F(z,t), && z = k_1x+k_2y;\\
&w(x,y,t) = G(r,t), && r = \sqrt{x^2+y^2};\\
&w(x,y,t) = G(\xi_1,\xi_2), && \xi_1 = k_1x+\lambda_1t,\ \ \xi_2 = k_2y+\lambda_2t;\\
&w(x,y,t) = H(\eta_1,\eta_2), && \eta_1 = x^2/t,\quad \eta_2 = y^2/t;\\
&w(x,y,t) = \frac{2}{\mu}t+U(\zeta_1,\zeta_2), && \zeta_1 = xe^{-t},\quad \zeta_2 = ye^{-t},
\end{aligned}$$

where k_1, k_2, λ_1, and λ_2 are arbitrary constants.

⊙ *Reference for equation* 6.2.2.1: V. A. Dorodnitsyn, I. V. Knyazeva, and S. R. Svirshchevskii (1983).

2. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\beta w}\dfrac{\partial w}{\partial x}\right)+b\dfrac{\partial}{\partial y}\left(e^{\lambda w}\dfrac{\partial w}{\partial y}\right).$

1°. Suppose $w(x,y,t)$ is a solution of this equation. Then the functions

$$w_1 = w(C_1C_2^{\beta}x+C_3, \pm C_1C_2^{\lambda}y+C_4, C_1^2t+C_5)-2\ln|C_2|,$$

where $C_1,\ldots,C_5$ are arbitrary constants, are also solutions of the equation.

2°. "Two-dimensional" solution:

$$w(x,y,t) = u(\theta,t), \quad \theta = c_1x+c_2y,$$

where c_1 and c_2 are arbitrary constants, and the function $u = u(\theta,t)$ is determined by the differential equation

$$\frac{\partial u}{\partial t} = \frac{\partial}{\partial\theta}\left[\left(ac_1^2e^{\beta w}+bc_2^2e^{\lambda w}\right)\frac{\partial w}{\partial\theta}\right].$$

3°. "Two-dimensional" solution:

$$w(x,y,t) = u(\zeta_1,\zeta_2), \quad \zeta_1 = k_1x+m_1t, \quad \zeta_2 = k_2y+m_2t,$$

where k_1, k_2, m_1, and m_2 are arbitrary constants, and the function $u = u(\zeta_1, \zeta_2)$ is determined by the differential equation

$$m_1\frac{\partial u}{\partial \zeta_1} + m_2\frac{\partial u}{\partial \zeta_2} = ak_1^2\frac{\partial}{\partial \zeta_1}\left(e^{\beta w}\frac{\partial w}{\partial \zeta_1}\right) + bk_2^2\frac{\partial}{\partial \zeta_2}\left(e^{\lambda w}\frac{\partial w}{\partial \zeta_2}\right).$$

4°. "Two-dimensional" solution:

$$w(x, y, t) = U(\xi, \eta) + 2kt, \quad \xi = xe^{-k\beta t}, \quad \eta = ye^{-k\lambda t},$$

where k is an arbitrary constant, and the function $U = U(\xi, \eta)$ is determined by the differential equation

$$2k - k\beta\xi\frac{\partial U}{\partial \xi} - k\lambda\eta\frac{\partial U}{\partial \eta} = a\frac{\partial}{\partial \xi}\left(e^{\beta U}\frac{\partial U}{\partial \xi}\right) + b\frac{\partial}{\partial \eta}\left(e^{\lambda U}\frac{\partial U}{\partial \eta}\right).$$

5°. "Two-dimensional" solution:

$$w(x, y, t) = V(z_1, z_2), \quad z_1 = \frac{x + C_1}{\sqrt{t + C_3}}, \quad z_2 = \frac{y + C_2}{\sqrt{t + C_3}},$$

where C_1, C_2, and C_3 are arbitrary constants, and the function $V = V(z_1, z_2)$ is determined by the differential equation

$$-\frac{1}{2}z_1\frac{\partial V}{\partial z_1} - \frac{1}{2}z_2\frac{\partial V}{\partial z_2} = a\frac{\partial}{\partial z_1}\left(e^{\beta w}\frac{\partial w}{\partial z_1}\right) + b\frac{\partial}{\partial z_2}\left(e^{\lambda w}\frac{\partial w}{\partial z_2}\right).$$

6°. "Two-dimensional" solution ($\beta = 1$):

$$w(x, y, t) = u(z, t) + 2\ln|x|, \quad z = x^{-\lambda}y,$$

where the function $u = u(z, t)$ is determined by the differential equation

$$\frac{\partial u}{\partial t} = \left(a\lambda^2 z^2 e^u + be^{\lambda u}\right)\frac{\partial^2 u}{\partial z^2} + \lambda\left(a\lambda z^2 e^u + be^{\lambda u}\right)\left(\frac{\partial u}{\partial z}\right)^2 + a\lambda(\lambda - 3)ze^u\frac{\partial u}{\partial z} + 2ae^u.$$

⊙ *References for equation* 6.2.2.2: V. A. Dorodnitsyn, I. V. Knyazeva, and S. R. Svirshchevskii (1983), N. H. Ibragimov (1994, pp. 155–156).

3. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^{\lambda_1 w}\dfrac{\partial w}{\partial x}\right) + b\dfrac{\partial}{\partial y}\left(e^{\lambda_2 w}\dfrac{\partial w}{\partial y}\right) + ce^{\beta w}.$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1^{\beta-\lambda_1}x + C_2, \pm C_1^{\beta-\lambda_2}y + C_3, C_1^{2\beta}t + C_4) + 2\ln|C_1|,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs can be chosen arbitrarily).

2°. There is a "two-dimensional" solution of the form

$$w(x, y, t) = U(\xi, \eta) - \frac{1}{\beta}\ln t, \quad \xi = xt^{\frac{\lambda_1-\beta}{2\beta}}, \quad \eta = yt^{\frac{\lambda_2-\beta}{2\beta}}.$$

⊙ *References for equation* 6.2.2.3: V. A. Dorodnitsyn, I. V. Knyazeva, and S. R. Svirshchevskii (1983), N. H. Ibragimov (1994, pp. 155–156).

4. $\dfrac{\partial w}{\partial t} = \alpha\left[\dfrac{\partial}{\partial x}\left(e^{\mu w}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(e^{\mu w}\dfrac{\partial w}{\partial y}\right)\right] + \beta e^{\mu w} + \gamma + \delta e^{-\mu w}.$

The substitution $w = \dfrac{1}{\mu}\ln U$ leads to an equation of the form 6.1.4.3:

$$\frac{\partial U}{\partial t} = \alpha U\left(\frac{\partial^2 U}{\partial x^2} + \frac{\partial^2 U}{\partial y^2}\right) + \beta\mu U^2 + \mu\gamma U + \mu\delta.$$

⊙ *References*: V. A. Galaktionov and S. A. Posashkov (1989), N. H. Ibragimov (1994, pp. 155–156).

6.3. Other Equations with Two Space Variables Involving Arbitrary Parameters

6.3.1. Equations with Logarithmic Nonlinearities

1. $\dfrac{\partial w}{\partial t} = a\left(\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2}\right) - kw\ln w.$

This is a nonstationary equation with a logarithmic source arising in heat and mass transfer theory and combustion theory. This is a special case of equation 6.4.1.1 with $f(w) = -kw\ln w$.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the functions

$$w_1 = \exp(C_1 e^{-kt})w(x + C_2, \pm y + C_3, t + C_4),$$
$$w_2 = w(x\cos\beta - y\sin\beta, x\sin\beta + y\cos\beta, t),$$

where $C_1, \ldots, C_4$ and β are arbitrary constants, are also solutions of the equation.

2°. "Two-dimensional" multiplicative separable solution:

$$w(x, y, t) = \exp(C_1 e^{-kt})\Theta(x, y),$$

where the function $\Theta(x, y)$ is a solution of the stationary equation

$$a\left(\frac{\partial^2\Theta}{\partial x^2} + \frac{\partial^2\Theta}{\partial y^2}\right) - k\Theta\ln\Theta = 0.$$

This equation has a particular solution of the form

$$\Theta = \exp(A_1x^2 + A_2xy + A_3y^2 + A_4x + A_5y + A_6),$$

where the coefficients A_k are determined by an algebraic system of equations.

3°. "Two-dimensional" solution with incomplete separation of variables (the solution is separable in the space variables x and y, but is not separable in time t):

$$w(x, y, t) = \varphi(x, t)\psi(y, t),$$

where the functions $\varphi(x, t)$ and $\psi(y, t)$ are determined by solving two independent one-dimensional nonlinear parabolic differential equations:

$$\frac{\partial\varphi}{\partial t} = a\frac{\partial^2\varphi}{\partial x^2} - k\varphi\ln\varphi,$$
$$\frac{\partial\psi}{\partial t} = a\frac{\partial^2\psi}{\partial y^2} - k\psi\ln\psi.$$

For solutions of these equations, see 5.6.1.4 with $f(t) = 0$.

4°. There are exact solutions in the form of the product of functions representing two independent traveling waves:

$$w(x, y, t) = \varphi(\xi)\psi(\eta), \qquad \xi = a_1x + b_1t, \qquad \eta = a_2y + b_2t,$$

where a_1, b_1, a_2, and b_2 are arbitrary constants. This solution is a special case of the solution presented in Item 3°.

⊙ *References for equation* 6.3.1.1: V. A. Dorodnitsyn, I. V. Knyazeva, and S. R. Svirshchevskii (1983), V. K. Andreev, O. V. Kaptsov, V. V. Pukhnachov, and A. A. Rodionov (1999), A. D. Polyanin and V. F. Zaitsev (2002, p. 98).

2. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right) + cw\ln w + sw.$

This is a special case of equation 6.4.2.1 with $f(w) = cw\ln w + sw$ and a special case of equation 6.4.2.4 in which a should be renamed c and b renamed s and then the functions $f(x)$ and $g(y)$ should be substituted by ax^n and by^m, respectively.

There are "two-dimensional" solutions of the following forms:

$$w(x,y,t) = F(\xi,t), \qquad \xi^2 = \frac{4}{a(2-n)^2}x^{2-n} + \frac{4}{b(2-m)^2}y^{2-m};$$
$$w(x,y,t) = \exp(Ae^{ct})G(x,y);$$
$$w(x,y,t) = H_1(x,t)H_2(y,t),$$

where A is an arbitrary constant.

3. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ae^{\beta x}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\lambda y}\dfrac{\partial w}{\partial y}\right) + cw\ln w + sw.$

This is a special case of equation 6.4.2.2 with $f(w) = cw\ln w + sw$ and a special case of equation 6.4.2.4 in which a should be renamed c and b renamed s and then the functions $f(x)$ and $g(y)$ should be substituted by $e^{\beta x}$ and $be^{\lambda y}$, respectively.

There are exact solutions of the following forms:

$$w(x,y,t) = F(\xi,t), \qquad \xi^2 = \frac{4}{a\beta^2}e^{-\beta x} + \frac{4}{b\lambda^2}e^{-\lambda y};$$
$$w(x,y,t) = \exp(Ae^{ct})G(x,y);$$
$$w(x,y,t) = H_1(x,t)H_2(y,t),$$

where A is an arbitrary constant.

4. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\lambda y}\dfrac{\partial w}{\partial y}\right) + cw\ln w + sw.$

This is a special case of equation 6.4.2.3 with $f(w) = cw\ln w + sw$ and a special case of equation 6.4.2.4 in which a should be renamed c and b renamed s and then the functions $f(x)$ and $g(y)$ should be substituted by ax^n and $be^{\lambda y}$, respectively.

There are exact solutions of the following forms:

$$w(x,y,t) = F(\xi,t), \qquad \xi^2 = \frac{4}{a(2-n)^2}x^{2-n} + \frac{4}{b\lambda^2}e^{-\lambda y};$$
$$w(x,y,t) = \exp(Ae^{ct})G(x,y);$$
$$w(x,y,t) = H_1(x,t)H_2(y,t),$$

where A is an arbitrary constant.

6.3.2. Equations with Trigonometrical Nonlinearities

1. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right) + c\sin^k(pw+q).$

This is a special case of equation 6.4.2.1 with $f(w) = c\sin^k(pw+q)$.

There is an exact solution of the form

$$w(x,y,t) = U(\xi,t), \qquad \xi^2 = \frac{4}{a(2-n)^2}x^{2-n} + \frac{4}{b(2-m)^2}y^{2-m}.$$

2. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ae^{\beta x}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\lambda y}\dfrac{\partial w}{\partial y}\right) + c\sin^k(pw+q).$

This is a special case of equation 6.4.2.2 with $f(w) = c\sin^k(pw+q)$.

There is an exact solution of the form

$$w(x,y,t) = U(\xi,t), \qquad \xi^2 = \frac{4}{a\beta^2}e^{-\beta x} + \frac{4}{b\lambda^2}e^{-\lambda y}.$$

3. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\lambda y}\dfrac{\partial w}{\partial y}\right) + c\sin^k(pw+q).$

This is a special case of equation 6.4.2.3 with $f(w) = c\sin^k(pw+q)$.

There is an exact solution of the form

$$w(x,y,t) = U(\xi,t), \qquad \xi^2 = \frac{4}{a(2-n)^2}x^{2-n} + \frac{4}{b\lambda^2}e^{-\lambda y}.$$

4. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right) + c\tan^k(pw+q).$

This is a special case of equation 6.4.2.1 with $f(w) = c\tan^k(pw+q)$.

There is an exact solution of the form

$$w(x,y,t) = U(\xi,t), \qquad \xi^2 = \frac{4}{a(2-n)^2}x^{2-n} + \frac{4}{b(2-m)^2}y^{2-m}.$$

5. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ae^{\beta x}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\lambda y}\dfrac{\partial w}{\partial y}\right) + c\tan^k(pw+q).$

This is a special case of equation 6.4.2.2 with $f(w) = c\tan^k(pw+q)$.

There is an exact solution of the form

$$w(x,y,t) = U(\xi,t), \qquad \xi^2 = \frac{4}{a\beta^2}e^{-\beta x} + \frac{4}{b\lambda^2}e^{-\lambda y}.$$

6. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\lambda y}\dfrac{\partial w}{\partial y}\right) + c\tan^k(pw+q).$

This is a special case of equation 6.4.2.3 with $f(w) = c\tan^k(pw+q)$.

There is an exact solution of the form

$$w(x,y,t) = U(\xi,t), \qquad \xi^2 = \frac{4}{a(2-n)^2}x^{2-n} + \frac{4}{b\lambda^2}e^{-\lambda y}.$$

6.4. Equations Involving Arbitrary Functions

6.4.1. Heat and Mass Transfer Equations in Quiescent or Moving Media with Chemical Reactions

1. $\dfrac{\partial w}{\partial t} = a\left(\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2}\right) + f(w).$

This is a two-dimensional equation of unsteady heat/mass transfer or combustion in a quiescent medium.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the functions

$$w_1 = w(\pm x + C_1, \pm y + C_2, t + C_3),$$
$$w_2 = w(x\cos\beta - y\sin\beta, x\sin\beta + y\cos\beta, t),$$

where C_1, C_2, C_3, and β are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 can be chosen independently of each other).

2°. Traveling-wave solution:

$$w = w(\xi), \qquad \xi = Ax + By + \lambda t,$$

where A, B, and λ are arbitrary constants, and the function $w(\xi)$ is determined by the autonomous ordinary differential equation

$$a(A^2 + B^2)w''_{\xi\xi} - \lambda w'_\xi + f(w) = 0.$$

For solutions of this equation, see Polyanin and Zaitsev (1995, 2003).

3°. There are "two-dimensional" solutions of the following forms:

$$w(x, y, t) = F(z, t), \qquad z = k_1 x + k_2 y;$$
$$w(x, y, t) = G(r, t), \qquad r = \sqrt{x^2 + y^2};$$
$$w(x, y, t) = H(\xi_1, \xi_2), \quad \xi_1 = k_1 x + \lambda_1 t, \quad \xi_2 = k_2 y + \lambda_2 t,$$

where k_1, k_2, λ_1, and λ_2 are arbitrary constants.

2. $\dfrac{\partial w}{\partial t} + a\dfrac{\partial w}{\partial x} + b\dfrac{\partial w}{\partial y} = \dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} - f(w).$

This is a two-dimensional equation of unsteady heat/mass transfer with a volume chemical reaction in a steady translational fluid flow.

The transformation

$$w = U(\xi, \eta, t), \qquad \xi = x - at, \qquad \eta = y - bt$$

leads to a simpler equation of the form 6.4.1.1:

$$\frac{\partial U}{\partial t} = \frac{\partial^2 U}{\partial \xi^2} + \frac{\partial^2 U}{\partial \eta^2} - f(U).$$

3. $\dfrac{\partial w}{\partial t} + (a_1 x + b_1 y + c_1)\dfrac{\partial w}{\partial x} + (a_2 x + b_2 y + c_2)\dfrac{\partial w}{\partial y} = \dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} - f(w).$

This is a two-dimensional equation of unsteady heat/mass transfer with a volume chemical reaction in a steady translational-shear fluid flow.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the functions

$$w_1 = w\big(x + Cb_1 e^{\lambda t}, y + C(\lambda - a_1)e^{\lambda t}, t\big),$$

where C is an arbitrary constant and $\lambda = \lambda_{1,2}$ are roots of the quadratic equation

$$\lambda^2 - (a_1 + b_2)\lambda + a_1 b_2 - a_2 b_1 = 0, \tag{1}$$

are also solutions of the equation.

2°. Solutions:

$$w = w(z), \qquad z = a_2x + (\lambda - a_1)y + Ce^{\lambda t},$$

where $\lambda = \lambda_{1,2}$ are roots of the quadratic equation (1), and the function $w(z)$ is determined by the ordinary differential equation

$$\big[\lambda z + a_2c_1 + (\lambda - a_1)c_2\big]w'_z = \big[a_2^2 + (\lambda - a_1)^2\big]w''_{zz} - f(w).$$

3°. "Two-dimensional" solutions:

$$w = U(\zeta, t), \qquad \zeta = a_2x + (\lambda - a_1)y,$$

where $\lambda = \lambda_{1,2}$ are roots of the quadratic equation (1), and the function $U(\zeta, t)$ is determined by the differential equation

$$\frac{\partial U}{\partial t} + \big[\lambda\zeta + a_2c_1 + (\lambda - a_1)c_2\big]\frac{\partial U}{\partial \zeta} = \big[a_2^2 + (\lambda - a_1)^2\big]\frac{\partial^2 U}{\partial \zeta^2} - f(U).$$

Remark. In the case of an incompressible fluid, the equation coefficients must satisfy the condition $a_1 + b_2 = 0$.

⊙ *Reference for equation* 6.4.1.3: A. D. Polyanin and V. F. Zaitsev (2004, p. 160).

4. $\dfrac{\partial w}{\partial t} + f_1(t)\dfrac{\partial w}{\partial x} + f_2(t)\dfrac{\partial w}{\partial y} = \dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} - g(w).$

This equation describes mass transfer with volume chemical reaction in an unsteady translational fluid flow.

The transformation

$$w = U(\xi, \eta, t), \qquad \xi = x - \int f_1(t)\,dt, \qquad \eta = y - \int f_2(t)\,dt,$$

leads to a simpler equation of the form 6.4.1.1:

$$\frac{\partial U}{\partial t} = \frac{\partial^2 U}{\partial \xi^2} + \frac{\partial^2 U}{\partial \eta^2} - g(U).$$

6.4.2. Equations of the Form $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(x)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[g(y)\dfrac{\partial w}{\partial y}\right] + h(w)$

1. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right) + f(w).$

This is a two-dimensional equation of unsteady heat (mass) transfer or combustion in an anisotropic case with power-law coordinate-dependent principal thermal diffusivities (diffusion coefficients).

Solution for $n \neq 2$ and $m \neq 2$:

$$w = w(\xi, t), \qquad \xi^2 = \frac{4}{a(2-n)^2}x^{2-n} + \frac{4}{b(2-m)^2}y^{2-m},$$

where the function $w(\xi, t)$ is determined by the one-dimensional nonstationary equation

$$\frac{\partial w}{\partial t} = \frac{\partial^2 w}{\partial \xi^2} + \frac{A}{\xi}\frac{\partial w}{\partial \xi} + f(w), \qquad A = \frac{4 - nm}{(2-n)(2-m)}.$$

For solutions of this equation with $A = 0$ and various $f(w)$, see Subsections 5.1.1 to 5.1.3 and equations 5.2.1.1 to 5.2.1.3, 5.4.1.2, 5.4.1.3, 5.4.1.7, and 5.4.1.8.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2002, p. 108).

2. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ae^{\beta x}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\lambda y}\dfrac{\partial w}{\partial y}\right) + f(w).$

This is a two-dimensional equation of unsteady heat (mass) transfer or combustion in an anisotropic case with exponential coordinate-dependent principal thermal diffusivities (diffusion coefficients).

Solution for $\beta \neq 0$ and $\lambda \neq 0$:

$$w = w(\xi, t), \qquad \xi^2 = \frac{4}{a\beta^2}e^{-\beta x} + \frac{4}{b\lambda^2}e^{-\lambda y},$$

where the function $w(\xi, t)$ is determined by the one-dimensional nonstationary equation

$$\frac{\partial w}{\partial t} = \frac{\partial^2 w}{\partial \xi^2} - \frac{1}{\xi}\frac{\partial w}{\partial \xi} + f(w).$$

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2002, p. 108).

3. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\lambda y}\dfrac{\partial w}{\partial y}\right) + f(w).$

Solution for $n \neq 2$ and $\lambda \neq 0$:

$$w = w(\xi, t), \qquad \xi^2 = \frac{4}{a(2-n)^2}x^{2-n} + \frac{4}{b\lambda^2}e^{-\lambda y},$$

where the function $w(\xi, t)$ is determined by the one-dimensional nonstationary equation

$$\frac{\partial w}{\partial t} = \frac{\partial^2 w}{\partial \xi^2} + \frac{n}{2-n}\frac{1}{\xi}\frac{\partial w}{\partial \xi} + f(w).$$

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2002, p. 108).

4. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(x)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[g(y)\dfrac{\partial w}{\partial y}\right] + aw\ln w + bw.$

This is a two-dimensional equation of unsteady heat (mass) transfer or combustion in an anisotropic case with arbitrary coordinate-dependent principal thermal diffusivities (diffusion coefficients) and a logarithmic source.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the function

$$w_1 = \exp(C_1 e^{at})w(x, y, t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. "Two-dimensional" multiplicative separable solution:

$$w(x, y, t) = \exp(C_1 e^{at})U(x, y),$$

where the function $U(x, y)$ is determined by the stationary equation

$$\frac{\partial}{\partial x}\left[f(x)\frac{\partial U}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(y)\frac{\partial U}{\partial y}\right] + aU\ln U + bU = 0.$$

3°. "Two-dimensional" solution with incomplete separation of variables (the solution is separable in the space variables x and y, but is not separable in time t):

$$w(x,y,t)=\varphi(x,t)\psi(y,t),$$

where the functions $\varphi(x,t)$ and $\psi(y,t)$ are determined from the two independent one-dimensional nonlinear parabolic differential equations

$$\frac{\partial\varphi}{\partial t}=\frac{\partial}{\partial x}\left[f(x)\frac{\partial\varphi}{\partial x}\right]+a\varphi\ln\varphi+C(t)\varphi,$$
$$\frac{\partial\psi}{\partial t}=\frac{\partial}{\partial y}\left[g(y)\frac{\partial\psi}{\partial y}\right]+a\psi\ln\psi+b\psi-C(t)\psi,$$

and $C(t)$ is an arbitrary function.

⊙ *Reference for equation* 6.4.2.4: A. D. Polyanin (2000).

6.4.3. Equations of the Form $\dfrac{\partial w}{\partial t}=\dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[g(w)\dfrac{\partial w}{\partial y}\right]+h(t,w)$

1. $\dfrac{\partial w}{\partial t}=a\left[\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(w^n\dfrac{\partial w}{\partial y}\right)\right]+f(t)w.$

1°. Suppose $w(x,y,t)$ is a solution of this equation. Then the functions

$$w_1=C_1^{-2}w\big(\pm C_1^n x+C_2,\ \pm C_1^n y+C_3,\ t\big),$$
$$w_2=w(x\cos\beta-y\sin\beta,\ x\sin\beta+y\cos\beta,\ t),$$

where C_1, C_2, C_3, and β are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 can be chosen independently of each other).

2°. Multiplicative separable solution:

$$w(x,y,t)=\exp\left[\int f(t)\,dt\right]\big[\Theta(x,y)\big]^{\frac{1}{n+1}},\tag{1}$$

where the function $\Theta(x,y)$ is a solution of the Laplace equation

$$\Delta\Theta=0,\qquad \Delta\equiv\frac{\partial^2}{\partial x^2}+\frac{\partial^2}{\partial y^2}.$$

For solutions of this linear stationary equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

3°. Multiplicative separable solution:

$$w(x,y,t)=\varphi(t)\big[\Theta(x,y)\big]^{\frac{1}{n+1}},\tag{2}$$

where the function $\varphi(t)$ is a solution of the Bernoulli equation

$$\varphi_t'-f(t)\varphi+Aa\varphi^{n+1}=0,\tag{3}$$

A is an arbitrary constant, and the function $\Theta(x,y)$ is determined by the stationary equation

$$\Delta\Theta+A(n+1)\Theta^{\frac{1}{n+1}}=0,\qquad \Delta\equiv\frac{\partial^2}{\partial x^2}+\frac{\partial^2}{\partial y^2}.$$

The general solution of equation (3) is given by

$$\varphi(t)=\exp\big[F(t)\big]\left\{Aan\int\exp\big[nF(t)\big]\,dt+B\right\}^{-1/n},\quad F(t)=\int f(t)\,dt,$$

where B is an arbitrary constant.

4°. The transformation

$$w(x,y,t)=F(t)U(x,y,\tau),\quad \tau=\int F^n(t)\,dt,\qquad F(t)=\exp\left[\int f(t)\,dt\right]$$

leads to a simpler equation of the form 6.1.2.4:

$$\frac{\partial U}{\partial \tau}=a\left[\frac{\partial}{\partial x}\left(U^n\frac{\partial U}{\partial x}\right)+\frac{\partial}{\partial y}\left(U^n\frac{\partial U}{\partial y}\right)\right].$$

2. $\dfrac{\partial w}{\partial t}=a\left[\dfrac{\partial}{\partial x}\left(e^{\mu w}\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(e^{\mu w}\dfrac{\partial w}{\partial y}\right)\right]+f(t).$

1°. Suppose $w(x,y,t)$ is a solution of this equation. Then the functions

$$w_1=w\big(C_1x+C_2,\ \pm C_1y+C_3,\ t\big)-\frac{2}{\mu}\ln|C_1|,$$
$$w_2=w(x\cos\beta-y\sin\beta,\ x\sin\beta+y\cos\beta,\ t),$$

where C_1, C_2, C_3, and β are arbitrary constants, are also solutions of the equation.

2°. Additive separable solution:

$$w(x,y,t)=\varphi(t)+\frac{1}{\mu}\ln\Theta(x,y),$$

where the function $\varphi=\varphi(t)$ is determined by the ordinary differential equation

$$\varphi'_t+A(a/\mu)\exp(\mu\varphi)-f(t)=0, \tag{1}$$

and the function $\Theta(x,y)$ is a solution of the two-dimensional Poisson equation

$$\Delta\Theta+A=0,\qquad \Delta\equiv\frac{\partial^2}{\partial x^2}+\frac{\partial^2}{\partial y^2}. \tag{2}$$

The general solution of equation (1) is given by

$$\varphi(t)=F(t)-\frac{1}{\mu}\ln\left\{B+Aa\int\exp\big[\mu F(t)\big]\,dt\right\},\qquad F(t)=\int f(t)\,dt. \tag{3}$$

For solutions of the linear stationary equation (2), see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

Note that equations (1), (2) and relation (3) involve arbitrary constants A and B.

3°. The transformation

$$w(x,y,t)=U(x,y,\tau)+F(t),\quad \tau=\int\exp[\mu F(t)]\,dt,\qquad F(t)=\int f(t)\,dt,$$

leads to a simpler equation of the form 6.2.2.1:

$$\frac{\partial U}{\partial \tau}=a\left[\frac{\partial}{\partial x}\left(e^{\mu U}\frac{\partial U}{\partial x}\right)+\frac{\partial}{\partial y}\left(e^{\mu U}\frac{\partial U}{\partial y}\right)\right].$$

⊙ *Reference for equation* 6.4.3.2: A. D. Polyanin and V. F. Zaitsev (2002, p. 110).

3. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[f(w)\dfrac{\partial w}{\partial y}\right].$

This is a two-dimensional nonlinear heat and mass transfer equation for an anisotropic medium.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the functions

$$w_1 = w(C_1x + C_2, C_1y + C_3, C_1^2t + C_4),$$
$$w_2 = w(x\cos\beta - y\sin\beta, x\sin\beta + y\cos\beta, t),$$

where $C_1, \ldots, C_4$ and β are arbitrary constants, are also solutions of the equation.

2°. Traveling-wave solution in implicit form:

$$(k_1^2 + k_2^2)\int \frac{f(w)\,dw}{\lambda w + C_1} = k_1x + k_2y + \lambda t + C_2,$$

where C_1, C_2, k_1, k_2, and λ are arbitrary constants.

3°. Solution:

$$w(x, y, t) = U(\xi), \qquad \xi = \frac{x^2 + y^2}{t},$$

where the function $U = U(\xi)$ is determined by the ordinary differential equation

$$[\xi f(U)U'_\xi]'_\xi + \tfrac{1}{4}\xi U'_\xi = 0.$$

4°. "Two-dimensional" solutions (for the axisymmetric problems):

$$w(x, y, t) = V(r, t), \qquad r = \sqrt{x^2 + y^2},$$

where the function $V = V(r, t)$ is determined by the differential equation

$$\frac{\partial V}{\partial t} = \frac{1}{r}\frac{\partial}{\partial r}\left[rf(V)\frac{\partial V}{\partial r}\right].$$

5°. For other "two-dimensional" solutions, see equation 6.4.3.4 with $g(w) = f(w)$.

⊙ *Reference for equation* 6.4.3.3: V. A. Dorodnitsyn, I. V. Knyazeva, and S. R. Svirshchevskii (1983).

4. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[g(w)\dfrac{\partial w}{\partial y}\right].$

This is a two-dimensional unsteady heat (mass) transfer equation in an anisotropic case with arbitrary dependence of the principal thermal diffusivities (diffusion coefficients) on temperature (concentration).

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the functions

$$w_1 = w(C_1x + C_2, \pm C_1y + C_3, C_1^2t + C_4),$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation.

2°. Traveling-wave solution in implicit form:

$$\int \frac{k_1^2 f(w) + k_2^2 g(w)}{\lambda w + C_1}\, dw = k_1 x + k_2 y + \lambda t + C_2,$$

where C_1, C_2, k_1, k_2, and λ are arbitrary constants.

3°. "Two-dimensional" solution:

$$w(x, y, t) = U(z, t), \qquad z = k_1 x + k_2 y,$$

where the function $U = U(z, t)$ is determined by a differential equation of the form 5.6.15.1:

$$\frac{\partial U}{\partial t} = \frac{\partial}{\partial z}\left[\varphi(U)\frac{\partial U}{\partial z}\right], \qquad \varphi(U) = k_1^2 f(U) + k_2^2 g(U).$$

4°. There are more complicated "two-dimensional" solutions of the form

$$w(x, y, t) = V(\zeta_1, \zeta_2), \qquad \zeta_1 = a_1 x + a_2 y + a_3 t, \qquad \zeta_2 = b_1 x + b_2 y + b_3 t.$$

5°. "Two-dimensional" solution:

$$w(x, y, t) = W(\xi, \eta), \qquad \xi = \frac{x}{\sqrt{at}}, \qquad \eta = \frac{y}{\sqrt{at}},$$

where $a \neq 0$ is any number and the function $W = W(\xi, \eta)$ is determined by the differential equation

$$\frac{\partial}{\partial \xi}\left[f(W)\frac{\partial W}{\partial \xi}\right] + \frac{\partial}{\partial \eta}\left[g(W)\frac{\partial W}{\partial \eta}\right] + \frac{a}{2}\xi\frac{\partial W}{\partial \xi} + \frac{a}{2}\eta\frac{\partial W}{\partial \eta} = 0.$$

6°. For group classification of the equation in question, see Dorodnitsyn, Knyazeva, and Svirshchevskii (1983).

5. $\dfrac{\partial w}{\partial t} = \Delta f(w) + \dfrac{a f(w) + b}{f'(w)} + c[a f(w) + b], \qquad \Delta = \dfrac{\partial^2}{\partial x^2} + \dfrac{\partial^2}{\partial y^2}.$

1°. Solution in implicit form with $a \neq 0$:

$$f(w) = \frac{1}{a}[\rho(x, y)e^{at} - b],$$

where $\rho = \rho(x, y)$ is an arbitrary solution of the linear two-dimensional *Helmholtz equation*

$$\Delta\rho + ac\rho = 0.$$

2°. Solution in implicit form with $a = 0$:

$$f(w) = \rho(x, y) + bt,$$

where $\rho = \rho(x, y)$ is an arbitrary solution of the linear two-dimensional *Poisson equation*

$$\Delta\rho + bc = 0.$$

⊙ *Reference for equation* 6.4.3.5: V. A. Galaktionov and S. R. Svirshchevskii (2007, p. 391).

6.4.4. Other Equations Linear in the Highest Derivatives

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + f(w)\dfrac{\partial w}{\partial y}.$

Nonlinear Kolmogorov type equation. This equation arises in mathematical finance [see Pascucci and Polidoro (2003), and Pascucci (2005)].

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(Ax + B, A^2y + C, A^2t + D),$$

where A, B, C, and D are arbitrary constants, is also a solution of the equation.

2°. "Two-dimensional" solution:

$$w = u(z,t), \qquad z = x + \lambda y + \mu t,$$

where λ and μ are arbitrary constants, and the function $u = u(x,t)$ is described by the generalized Burgers equation of the form 5.6.3.8:

$$\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial z^2} + [\lambda f(u) - \mu]\frac{\partial u}{\partial z}.$$

3°. "Two-dimensional" solution:

$$w = \theta(\xi,\eta), \qquad \xi = xt^{-1/2}, \qquad \eta = yt^{-1},$$

where k is an arbitrary constant and the function $\theta = \theta(\xi,\eta)$ is determined by the differential equation

$$-\tfrac{1}{2}\xi\theta_\xi - \eta\theta_\eta = a\theta_{\xi\xi} + f(\theta)\theta_\eta.$$

⊙ *Reference for equation* 6.4.4.1: V. I. Lagno and V. I. Stognii (2010).

2. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} + f(w)\left[\left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2\right].$

The substitution

$$U = \int F(w)\,dw, \qquad \text{where} \quad F(w) = \exp\left[\int f(w)\,dw\right],$$

leads to the linear heat equation

$$\frac{\partial U}{\partial t} = \frac{\partial^2 U}{\partial x^2} + \frac{\partial^2 U}{\partial y^2}.$$

For solutions of this equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

3. $\dfrac{\partial w}{\partial t} = \big[aw + f(t)\big]\left(\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2}\right) + bw^2 + g(t)w + h(t), \qquad a \neq 0.$

"Two-dimensional" generalized separable solution:

$$w(x, y, t) = \varphi(t) + \psi(t)\Theta(x, y),$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of ordinary differential equations

$$\varphi'_t = b\varphi^2 + g(t)\varphi + h(t), \tag{1}$$
$$\psi'_t = \big[b\varphi - \beta f(t) + g(t)\big]\psi, \qquad \beta = b/a, \tag{2}$$

and the function $\Theta(x, y)$ is any solution of the two-dimensional Helmholtz equation

$$\Delta\Theta + \beta\Theta = 0, \qquad \Delta \equiv \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}. \tag{3}$$

The first equation (1) is independent of ψ and is a Riccati equation for φ. In Polyanin and Zaitsev (2003), many exact solutions of equation (1) for various $g(t)$ and $h(t)$ are presented. Solving equation (1) followed by substituting the expression of $\varphi = \varphi(t)$ into (2), we arrive at a linear equation for $\psi = \psi(t)$, which is easy to integrate.

In the special case $B = 0$, a solution of system (1), (2) is given by

$$\varphi(t) = \exp\big[G(t)\big]\left\{A + \int h(t)\exp\big[-G(t)\big]\,dt\right\}, \quad G(t) = \int g(t)\,dt,$$
$$\psi(t) = B\exp\big[G(t) - \beta F(t)\big], \quad F(t) = \int f(t)\,dt,$$

where A and B are arbitrary constants.

For solutions of the linear stationary equation (3), see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

4. $\dfrac{\partial w}{\partial t} = aw\left(\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2}\right) - a\left[\left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2\right] + f(t).$

1°. Generalized separable solution:

$$w(x, y, t) = \varphi(t) + \psi(t)e^{\beta x + \gamma y},$$

where β and γ are arbitrary constants and the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of ordinary differential equations

$$\varphi'_t = f(t), \qquad \psi'_t = a(\beta^2 + \gamma^2)\varphi\psi.$$

Solving this system yields the solution

$$w(x, y, t) = \varphi(t) + A\exp\left[\beta x + \gamma y + a(\beta^2 + \gamma^2)\int \varphi(t)\,dt\right], \quad \varphi(t) = \int f(t)\,dt + B,$$

where A and B are arbitrary constants.

2°. There are generalized separable solutions of the following forms:

$$w(x,y,t)=\varphi(t)+\psi(t)(A_1\cosh\mu x+A_2\sinh\mu x)+\chi(t)(B_1\cos\mu y+B_2\sin\mu y),$$
$$w(x,y,t)=\varphi(t)+\psi(t)(A_1\cos\mu x+A_2\sin\mu x)+\chi(t)(B_1\cosh\mu y+B_2\sinh\mu y),$$

where A_1, A_2, B_1, B_2, and μ are arbitrary constants, and the functions $\varphi(t)$, $\psi(t)$, and $\chi(t)$ are determined by a system of ordinary differential equations (not written out here).

3°. There is a generalized separable solution of the form

$$w(x,y,t)=\varphi(t)+\psi(t)F(x)+\chi(t)G(y)+\eta(t)H(x)P(y),$$

where

$$F(x)=A_1\cos 2\mu x+A_2\sin 2\mu x,\qquad G(y)=B_1\cosh 2\mu y+B_2\sinh 2\mu y,$$
$$H(x)=C_1\cos\mu x+C_2\sin\mu x,\qquad P(y)=D_1\cosh\mu y+D_2\sinh\mu y,$$

where the constants A_1, A_2, B_1, B_2, C_1, C_2, D_1, D_2, and μ are related by two constraints, and the functions $\varphi(t)$, $\psi(t)$, $\chi(t)$, and $\eta(t)$ are determined by a system of ordinary differential equations (not written out here).

5. $$\frac{\partial w}{\partial t}+(a_1x+b_1y+c_1)\frac{\partial w}{\partial x}+(a_2x+b_2y+c_2)\frac{\partial w}{\partial y}=\frac{\partial}{\partial x}\left[f(w)\frac{\partial w}{\partial x}\right]+\frac{\partial}{\partial y}\left[g(w)\frac{\partial w}{\partial y}\right].$$

This equation describes unsteady anisotropic heat/mass transfer in a steady translational-shear fluid flow.

1°. Suppose $w(x,y,t)$ is a solution of the equation in question. Then the functions

$$w_{1,2}=w\big(x+Cb_1e^{\lambda t},y+C(\lambda-a_1)e^{\lambda t},t\big),$$

where C is an arbitrary constant and $\lambda=\lambda_{1,2}$ are roots of the quadratic equation

$$\lambda^2-(a_1+b_2)\lambda+a_1b_2-a_2b_1=0, \tag{1}$$

are also solutions of the equation.

2°. Solutions:

$$w=w(z),\qquad z=a_2x+(\lambda-a_1)y+Ce^{\lambda t}, \tag{2}$$

where $\lambda=\lambda_{1,2}$ are roots of the quadratic equation (1), and the function $w(z)$ is determined by the ordinary differential equation

$$\big[\lambda z+a_2c_1+(\lambda-a_1)c_2\big]w'_z=[\varphi(w)w'_z]'_z,\qquad \varphi(w)=a_2^2f(w)+(\lambda-a_1)^2g(w).$$

3°. "Two-dimensional" solutions:

$$w=U(\zeta,t),\qquad \zeta=a_2x+(\lambda-a_1)y, \tag{3}$$

where $\lambda=\lambda_{1,2}$ are roots of the quadratic equation (1), and the function $U(\zeta,t)$ is determined by the differential equation

$$\frac{\partial U}{\partial t}+[\lambda\zeta+a_2c_1+(\lambda-a_1)c_2]\frac{\partial U}{\partial\zeta}=\frac{\partial}{\partial\zeta}\left[\varphi(U)\frac{\partial U}{\partial\zeta}\right],\qquad \varphi(U)=a_2^2f(U)+(\lambda-a_1)^2g(U).$$

Remark 1. A more general equation, with an additional term $h(w)$ on the right-hand side, where h is an arbitrary function, also has solutions of the forms (2) and (3).

Remark 2. In the case of an incompressible fluid, the equation coefficients must satisfy the condition $a_1+b_2=0$.

⊙ *Reference for equation* 6.4.4.5: A. D. Polyanin and V. F. Zaitsev (2004, p. 166).

6. $\dfrac{\partial w}{\partial t} = f(w)\mathbf{L}[w] + g(t)w + h(t).$

Here, $\mathbf{L}$ is an arbitrary linear differential operator with respect to the space variables x, y (the operator is independent of t).

"Two-dimensional" generalized separable solution:

$$w(x, y, t) = \varphi(t) + \psi(t)\Theta(x, y),$$

where the functions $\varphi(t)$ and $\psi(t)$ are given by

$$\varphi(t) = e^{G(t)}\left[A + \int h(t)e^{-G(t)}\,dt\right], \quad \psi(t) = Be^{G(t)}, \qquad G(t) = \int g(t)\,dt,$$

A is an arbitrary constant, and the function $\Theta(x, y)$ is a solution of the linear stationary equation

$$\mathbf{L}[\Theta] = 0.$$

Remark 1. In the equation under consideration, the order of the linear operator $\mathbf{L}$ and the number of space variables can be any. The coefficients of $\mathbf{L}$ can be dependent on the space variables.

Remark 2. The above remains valid if $f(w)$ in the equation is substituted by a function $f(x, y, t, w)$. In the special case $f(x, y, t, w) = f_1(t) + \alpha w$, $\mathbf{L}[w] = \Delta w + \beta w$, where Δ is the Laplace operator, α and β are some constants, we obtain an equation of the form 6.4.4.3.

7. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(x, y)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[g(x, y)\dfrac{\partial w}{\partial y}\right] + kw\ln w.$

This is an equation of unsteady heat (mass) transfer or combustion in an anisotropic case with arbitrary coordinate-dependent principal thermal diffusivities (diffusion coefficients) and a logarithmic source.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the function

$$w_1 = \exp(C_1e^{kt})w(x, y, t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Multiplicative separable solution:

$$w(x, y, t) = \exp(C_1e^{kt})\Theta(x, y),$$

where the function $U(x, y)$ satisfies the stationary equation

$$\frac{\partial}{\partial x}\left[f(x, y)\frac{\partial U}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(x, y)\frac{\partial U}{\partial y}\right] + kU\ln U = 0.$$

8. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f_1(x, t)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[f_2(y, t)\dfrac{\partial w}{\partial y}\right] + \big[g_1(x, t) + g_2(y, t)\big]w + h(t)w\ln w.$

Exact solution with incomplete separation of variables (the solution is separable in the space variables x and y, but is not separable in time t):

$$w(x, y, t) = \varphi(x, t)\psi(y, t).$$

Here, the functions $\varphi(x, t)$ and $\psi(y, t)$ are determined from the two one-dimensional nonlinear parabolic differential equations

$$\frac{\partial \varphi}{\partial t} = \frac{\partial}{\partial x}\left[f_1(x, t)\frac{\partial \varphi}{\partial x}\right] + g_1(x, t)\varphi + h(t)\varphi\ln\varphi + C(t)\varphi,$$

$$\frac{\partial \psi}{\partial t} = \frac{\partial}{\partial y}\left[f_2(y, t)\frac{\partial \psi}{\partial y}\right] + g_2(y, t)\psi + h(t)\psi\ln\psi - C(t)\psi,$$

where $C(t)$ is an arbitrary function.

9. $$\frac{\partial w}{\partial t} = f_1(x,y)\frac{\partial^2 w}{\partial x^2} + f_2(x,y)\frac{\partial^2 w}{\partial x \partial y} + f_3(x,y)\frac{\partial^2 w}{\partial y^2} + g_1(x,y)\frac{\partial w}{\partial x} + g_2(x,y)\frac{\partial w}{\partial y} + \big[h(x,y) + s(t)\big]w + kw\ln w.$$

Multiplicative separable solution:

$$w(x,y,t) = \exp\left[Ae^{kt} + e^{kt}\int e^{-kt}s(t)\,dt\right]\Theta(x,y),$$

where A is an arbitrary constant, and the function $\Theta(x,y)$ is a solution of the stationary equation

$$f_1(x,y)\frac{\partial^2\Theta}{\partial x^2} + f_2(x,y)\frac{\partial^2\Theta}{\partial x\partial y} + f_3(x,y)\frac{\partial^2\Theta}{\partial y^2} + g_1(x,y)\frac{\partial\Theta}{\partial x} + g_2(x,y)\frac{\partial\Theta}{\partial y} + h(x,y)\Theta + k\Theta\ln\Theta = 0.$$

10. $$\frac{\partial w}{\partial t} = \frac{\partial}{\partial x}\left[f(x,t)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left\{\big[g(x,t)w + h(x,t)\big]\frac{\partial w}{\partial y}\right\}.$$

There are "two-dimensional" generalized separable solutions linear and quadratic in y:

$$w(x,y,t) = \varphi(x,t)y + \psi(x,t),$$
$$w(x,y,t) = \varphi(x,t)y^2 + \psi(x,t)y + \chi(x,t).$$

6.4.5. Nonlinear Diffusion Boundary Layer Equations

1. $$\frac{\partial w}{\partial t} + f(x,t)\frac{\partial w}{\partial x} + g(x,t)y\frac{\partial w}{\partial y} = h(x,t)\frac{\partial}{\partial y}\left[k(w)\frac{\partial w}{\partial y}\right].$$

This equation arises in nonlinear problems of the unsteady diffusion boundary layer (mass exchange of drops and bubbles with a flow, convective diffusion in fluid films), where the coordinates x and y are longitudinal and normal to the interphase surface, respectively.

The transformation

$$w = U(\zeta,\tau,\psi), \quad \zeta = y\varphi(x,t), \quad \tau = \tau(x,t), \quad \psi = \psi(x,t),$$

where the functions $\varphi(x,t)$, $\tau(x,t)$, and $\psi(x,t)$ are determined by the system of first-order partial differential equations

$$\begin{aligned}
&\frac{\partial\varphi}{\partial t} + f(x,t)\frac{\partial\varphi}{\partial x} = -g(x,t)\varphi,\\
&\frac{\partial\tau}{\partial t} + f(x,t)\frac{\partial\tau}{\partial x} = h(x,t)\varphi^2,\\
&\frac{\partial\psi}{\partial t} + f(x,t)\frac{\partial\psi}{\partial x} = 0,
\end{aligned} \tag{1}$$

leads to a simpler equation of the form 5.6.15.1:

$$\frac{\partial U}{\partial\tau} = \frac{\partial}{\partial\zeta}\left[k(U)\frac{\partial U}{\partial\zeta}\right]. \tag{2}$$

The cyclic variable ψ does not appear in equation (2); however, it can be involved in the transformed initial and boundary conditions as a parameter.

Integrating system (1) is reduced to solving a single ordinary differential equation: $x'_t = f(x,t)$. In particular, if the functions f, g, and h are only dependent on x, the general solution of system (1) is given by

$$\varphi = \Phi_1(z)E(x), \quad \tau = \Phi_1^2(z)\int \frac{h(x)}{f(x)}E^2(x)\,dx + \Phi_2(z), \quad \psi = \Phi_3(z),$$

where $\Phi_1(z)$, $\Phi_2(z)$, and $\Phi_3(z)$ are arbitrary functions, and

$$z = t - \int \frac{dx}{f(x)}, \quad E(x) = \exp\left[-\int \frac{g(x)}{f(x)}\,dx\right].$$

⊙ *References*: A. D. Polyanin (1982), A. D. Polyanin and V. F. Zaitsev (2004, pp. 168–169).

2. $\boldsymbol{f(x,y)z^{n-1}\dfrac{\partial w}{\partial x} + g(x,y)z^{n-1}\dfrac{\partial w}{\partial y} + h(x,y)z^n\dfrac{\partial w}{\partial z} = \dfrac{\partial}{\partial z}\left[k(w)\dfrac{\partial w}{\partial z}\right].}$

This equation arises in nonlinear problems of the steady three-dimensional diffusion boundary layer (mass exchange of solid particles, drops, and bubbles with a flow, convective diffusion in fluid films), where z is a normal coordinate to the particle surface. To a solid particle there corresponds $n = 2$ and to drops and bubbles, $n = 1$.

The transformation

$$w = U(\zeta,\tau,\psi), \quad \zeta = z\varphi(x,y), \quad \tau = \tau(x,y), \quad \psi = \psi(x,y),$$

where the functions $\varphi(x,y)$, $\tau(x,y)$, and $\psi(x,y)$ are determined by the system of first-order partial differential equations

$$f(x,y)\frac{\partial\varphi}{\partial x} + g(x,y)\frac{\partial\varphi}{\partial y} = -h(x,y)\varphi, \tag{1}$$

$$f(x,y)\frac{\partial\tau}{\partial x} + g(x,y)\frac{\partial\tau}{\partial y} = \varphi^2, \tag{2}$$

$$f(x,y)\frac{\partial\psi}{\partial x} + g(x,y)\frac{\partial\psi}{\partial y} = 0, \tag{3}$$

leads to a simpler equation of the form 5.6.17.16:

$$\frac{\partial U}{\partial\tau} = \zeta^{1-n}\frac{\partial}{\partial\zeta}\left[k(U)\frac{\partial U}{\partial\zeta}\right]. \tag{4}$$

The cyclic variable ψ does not enter into equation (4); however, it can appear in the transformed initial and boundary conditions as a parameter.

Suppose an integral of the ordinary differential equation $f(x,y)y'_x = g(x,y)$ has the form

$$\Xi(x,y) = C.$$

Then the general solution of equation (3) is given by $\psi = F(\Xi)$, where F is an arbitrary function. On passing in (1)–(2) from x, y to the new variables x, Ξ, one arrives at ordinary differential equations with independent variable x where Ξ appears as a parameter.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2004, p. 169).

6.4.6. Equations Nonlinear in the Highest Derivatives

1. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} - \left(\dfrac{\partial^2 w}{\partial x \partial y}\right)^2.$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = \frac{D}{(A_1B_2 - A_2B_1)^2} w(A_1x + B_1y + C_1, A_2x + B_2y + C_2, Dt + C_3) + C_4x + C_5y + C_6,$$

where A_k, B_k, C_n, and D are arbitrary constants, are also solutions of the equation ($A_1B_2 - A_2B_1 \neq 0$).

2°. There are generalized separable solutions of the form:

$$w = \sum_{i,j=0}^{i+j\le 4} \varphi_{i,j}(t) x^i y^j.$$

Special case 1. There is a solution that only contains even powers:

$$w = \psi_1(t) + \psi_2(t)x^2 + \psi_3(t)y^2 + \psi_4(t)x^2y^2 + \psi_5(t)x^4 + \psi_6(t)y^4,$$

where the functions $\psi_n = \psi_n(t)$ are determined by the system of ordinary differential equations

$$\begin{aligned}
\psi_1' &= 4\psi_2\psi_3,\\
\psi_2' &= 4\psi_2\psi_4 + 24\psi_3\psi_5,\\
\psi_3' &= 24\psi_2\psi_6 + 4\psi_3\psi_4,\\
\psi_4' &= -12\psi_4^2 + 144\psi_5\psi_6,\\
\psi_5' &= 24\psi_4\psi_5,\\
\psi_6' &= 24\psi_4\psi_6.
\end{aligned}$$

⊙ *Reference*: V. A. Galaktionov and S. R. Svirshchevskii (2007, p. 306).

3°. Additive separable solution:

$$w = f(x, y) - At - B,$$

where A and B are arbitrary constants and the function $f = f(x, y)$ satisfies a Monge–Ampère equation of the form 11.2.2.2:

$$\left(\frac{\partial^2 f}{\partial x \partial y}\right)^2 - \frac{\partial^2 f}{\partial x^2}\frac{\partial^2 f}{\partial y^2} = A.$$

4°. Multiplicative separable solution:

$$w = \frac{g(x, y)}{t + C},$$

where C is an arbitrary constant and the function $f = f(x, y)$ is determined by the differential equation

$$\left(\frac{\partial^2 g}{\partial x \partial y}\right)^2 - \frac{\partial^2 g}{\partial x^2}\frac{\partial^2 g}{\partial y^2} = g.$$

This equation is a special case of equation 11.2.3.1 with $f(x) = 1$, $g(x) = 0$ and a special case of equation 11.2.3.5 with $f(w) = w$.

5°. Generalized separable solution:

$$w = f(x,t)y^2 + g(x,t)y + h(x,t),$$

where the functions $f = f(x,t)$, $g = g(x,t)$, and $h = h(x,t)$ are determined by the system of differential equations

$$f_t = 2ff_x - 4f_x^2,$$
$$g_t = 2fg_x - 4f_xg_x,$$
$$h_t = 2fh_x - g_x^2.$$

6°. "Two-dimensional" solution:

$$w(x,y,t) = u(z,t), \quad z = ax^2 + bxy + cy^2 + kx + sy,$$

where a, b, c, k, and s are arbitrary constants and the function $u = u(z,t)$ is determined by the differential equation

$$u_t = 2\big[(4ac - b^2)z + as^2 + ck^2 - bks\big]u_zu_{zz} + (4ac - b^2)(u_z)^2.$$

Special case 2. In particular, for $b = c = k = 0$, we have the equation $u_t = 2as^2u_zu_{zz}$, which admits exact solutions of the form

$$u = \varphi_0(t) + \varphi_1(t)z + \varphi_2(t)z^2 + \varphi_3(t)z^3,$$
$$u = \phi_1(t) + \psi_2(t)z^{3/2} + \psi_3(t)z^3.$$

7°. "Two-dimensional" solution:

$$w = t\Phi(\xi,\eta), \quad \xi = xt^{-k}, \quad \eta = yt^{k-1},$$

where k is an arbitrary constant and the function $\Phi = \Phi(\xi,\eta)$ is determined by the differential equation

$$\Phi - k\xi\Phi_\xi + (k-1)\eta\Phi_\eta = \Phi_{\xi\xi}\Phi_{\eta\eta} - \Phi_{\xi\eta}^2.$$

2. $\dfrac{\partial w}{\partial t} = f(U), \quad U = \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} - \left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2.$

This kind of equation arises in various geometric problems and applications, such as logarithmic Gauss and Hessian curvature flows, the Minkowski problem, the Weyl problem, and many others; see Taylor (1996), Gilbarg and Trudinger (2001), Gutiérres (2001).

1°. Suppose $w(x,y,t)$ is a solution of this equation. Then the functions

$$w_1 = \frac{1}{D}w(A_1x + B_1y + C_1, A_2x + B_2y + C_2, Dt + C_3) + C_4x + C_5y + C_6,$$

where $D = \pm(A_1B_2 - A_2B_1) \neq 0$ and A_k, B_k, and C_n are arbitrary constants, are also solutions of the equation.

2°. Generalized separable solution:

$$w = C_1x^2 + C_2xy + C_3y^2 + C_4x + C_5y + C_6 + f(4C_1C_3 - C_2^2)t,$$

where $C_1, \ldots, C_6$ are arbitrary constants.

⊙ *Reference*: V. A. Galaktionov and S. R. Svirshchevskii (2007, p. 305).

3°. Additive separable solution:

$$w = f(C_1)t + C_2 + u(x, y),$$

where C_1 and C_2 are arbitrary constants and the function $u = u(x, y)$ is determined by an equation of the form 11.2.2.2:

$$\left(\frac{\partial^2 u}{\partial x \partial y}\right)^2 - \frac{\partial^2 u}{\partial x^2}\frac{\partial^2 u}{\partial y^2} = -C_1.$$

4°. "Two-dimensional" solution:

$$w(x, y, t) = u(z, t), \quad z = ax^2 + bxy + cy^2 + kx + sy,$$

where a, b, c, k, and s are arbitrary constants and the function $u = u(z, t)$ is determined by the differential equation

$$u_t = f\Big(2\big[(4ac - b^2)z + as^2 + ck^2 - bks\big]u_z u_{zz} + (4ac - b^2)u_z^2\Big).$$

5°. "Two-dimensional" solution:

$$w = t\Phi(\xi, \eta), \quad \xi = xt^{-k}, \quad \eta = yt^{k-1},$$

where k is an arbitrary constant and the function $\Phi = \Phi(\xi, \eta)$ is determined by the differential equation

$$\Phi - k\xi\Phi_\xi + (k-1)\eta\Phi_\eta = f\big(\Phi_{\xi\xi}\Phi_{\eta\eta} - \Phi_{\xi\eta}^2\big).$$

3. $\dfrac{\partial w}{\partial t} = f(w, U), \quad U = \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} - \left(\dfrac{\partial^2 w}{\partial x \partial y}\right)^2.$

"Two-dimensional" solution:

$$w(x, y, t) = u(z, t), \quad z = ax^2 + bxy + cy^2 + kx + sy,$$

where a, b, c, k, and s are arbitrary constants and the function $u = u(z, t)$ is determined by the differential equation

$$u_t = f\big(u,\ 2[(4ac - b^2)z + as^2 + ck^2 - bks]u_z u_{zz} + (4ac - b^2)u_z^2\big).$$

6.5. Equations with Three or More Space Variables

6.5.1. Equations of Mass Transfer in Quiescent or Moving Media with Chemical Reactions

1. $\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} + \dfrac{\partial^2 w}{\partial z^2} - f(w).$

This equation describes unsteady mass or heat transfer with a volume reaction in a quiescent medium.

The equation admits translations in any of the variables x, y, z, t.

1°. There is a traveling-wave solution, $w = w(k_1 x + k_2 y + k_3 z + \lambda t)$.

2°. For the axisymmetric case, the Laplace operator on the right-hand side of the equation takes the following forms in cylindrical and spherical coordinates, respectively:

$$\frac{\partial^2 w}{\partial x^2}+\frac{\partial^2 w}{\partial y^2}+\frac{\partial^2 w}{\partial z^2}=\frac{1}{\rho}\frac{\partial}{\partial \rho}\left(\rho\frac{\partial w}{\partial \rho}\right)+\frac{\partial^2 w}{\partial z^2}, \qquad \rho=\sqrt{x^2+y^2};$$

$$\frac{\partial^2 w}{\partial x^2}+\frac{\partial^2 w}{\partial y^2}+\frac{\partial^2 w}{\partial z^2}=\frac{1}{r^2}\frac{\partial}{\partial r}\left(r^2\frac{\partial w}{\partial r}\right)+\frac{1}{r^2\sin\theta}\frac{\partial}{\partial \theta}\left(\sin\theta\frac{\partial w}{\partial \theta}\right), \quad r=\sqrt{x^2+y^2+z^2}.$$

Consequently, there are solutions of the forms $w = w(\rho, t)$ and $w = w(r, t)$.

3°. "Three-dimensional" solution:

$$w = u(\xi,\eta,t), \qquad \xi = y+\frac{x}{C}, \quad \eta = (C^2-1)x^2-2Cxy+C^2z^2,$$

where C is an arbitrary constant ($C \neq 0$), and the function $u = u(\xi, \eta, t)$ is determined by the equation

$$\frac{\partial u}{\partial t}=\left(1+\frac{1}{C^2}\right)\frac{\partial^2 u}{\partial \xi^2}-4\xi\frac{\partial^2 u}{\partial \xi\partial \eta}+4C^2(\xi^2+\eta)\frac{\partial^2 u}{\partial \eta^2}+2(2C^2-1)\frac{\partial u}{\partial \eta}-f(u).$$

Remark. The solution specified in Item 3° can be used to obtain other "three-dimensional" solutions by means of the cyclic permutations of the space variables.

4°. "Three-dimensional" solution:

$$w = u(\xi,\eta,t), \qquad \xi = Ax+By+Cz, \quad \eta=\sqrt{(Bx-Ay)^2+(Cy-Bz)^2+(Az-Cx)^2},$$

where A, B, and C are arbitrary constants and the function $u = u(\xi, \eta, t)$ is determined by the equation

$$\frac{\partial u}{\partial t}=(A^2+B^2+C^2)\left(\frac{\partial^2 u}{\partial \xi^2}+\frac{\partial^2 u}{\partial \eta^2}+\frac{1}{\eta}\frac{\partial u}{\partial \eta}\right)-f(u).$$

2. $\dfrac{\partial w}{\partial t}=a\left(\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}+\dfrac{\partial^2 w}{\partial z^2}\right)+f(t)w\ln w+g(t)w.$

1°. There is a functional separable solution of the form

$$w(x,y,z,t)=\exp\left[\sum_{n,m=1}^{3}\varphi_{nm}(t)x_nx_m+\sum_{n=1}^{3}\psi_n(t)x_n+\chi(t)\right], \qquad x_1=x,\ \ x_2=y,\ \ x_3=z.$$

2°. There is an incomplete separable solution of the form

$$w(x,y,z,t)=\Phi_1(x,t)\Phi_2(y,t)\Phi_3(z,t).$$

3°. For $f(t) = b = \text{const}$, the equation also has a multiplicative separable solution of the form

$$w(x,y,z,t)=\varphi(t)\Theta(x,y,z),$$

where $\varphi(t)$ is given by

$$\varphi(t)=\exp\left[Ae^{bt}+e^{bt}\int e^{-bt}g(t)\,dt\right],$$

A is an arbitrary constant, and $\Theta(x, y, z)$ is a solution of the stationary equation

$$a\left(\frac{\partial^2\Theta}{\partial x^2}+\frac{\partial^2\Theta}{\partial y^2}+\frac{\partial^2\Theta}{\partial z^2}\right)+b\Theta\ln\Theta=0.$$

3. $\dfrac{\partial w}{\partial t} + a_1\dfrac{\partial w}{\partial x} + a_2\dfrac{\partial w}{\partial y} + a_3\dfrac{\partial w}{\partial z} = \dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} + \dfrac{\partial^2 w}{\partial z^2} - f(w).$

This equation describes unsteady mass transfer with a volume chemical reaction in a steady translational fluid flow.

The transformation

$$w = U(\xi, \eta, \zeta, t), \quad \xi = x - a_1 t, \quad \eta = y - a_2 t, \quad \zeta = z - a_3 t$$

leads to a simpler equation of the form 6.5.1.1:

$$\frac{\partial U}{\partial t} = \frac{\partial^2 U}{\partial \xi^2} + \frac{\partial^2 U}{\partial \eta^2} + \frac{\partial^2 U}{\partial \zeta^2} - f(U).$$

4. $\dfrac{\partial w}{\partial t} + f_1(t)\dfrac{\partial w}{\partial x} + f_2(t)\dfrac{\partial w}{\partial y} + f_3(t)\dfrac{\partial w}{\partial z} = \dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} + \dfrac{\partial^2 w}{\partial z^2} - g(w).$

This equation describes unsteady mass transfer with a volume chemical reaction in an unsteady translational fluid flow.

The transformation

$$w = U(\xi, \eta, t), \quad \xi = x - \int f_1(t)\,dt, \quad \eta = y - \int f_2(t)\,dt, \quad \zeta = z - \int f_3(t)\,dt$$

leads to a simpler equation of the form 6.5.1.1:

$$\frac{\partial U}{\partial t} = \frac{\partial^2 U}{\partial \xi^2} + \frac{\partial^2 U}{\partial \eta^2} + \frac{\partial^2 U}{\partial \zeta^2} - g(U).$$

5. $\dfrac{\partial w}{\partial t} + (a_1x + b_1y + c_1z + d_1)\dfrac{\partial w}{\partial x} + (a_2x + b_2y + c_2z + d_2)\dfrac{\partial w}{\partial y}$
$$+ (a_3x + b_3y + c_3z + d_3)\frac{\partial w}{\partial z} = \frac{\partial^2 w}{\partial x^2} + \frac{\partial^2 w}{\partial y^2} + \frac{\partial^2 w}{\partial z^2} - f(w).$$

This equation describes unsteady mass transfer with a volume chemical reaction in a three-dimensional steady translational-shear fluid flow.

1°. Let λ be a root of the cubic equation

$$\begin{vmatrix} a_1 - \lambda & a_2 & a_3 \\ b_1 & b_2 - \lambda & b_3 \\ c_1 & c_2 & c_3 - \lambda \end{vmatrix} = 0, \tag{1}$$

and let the constants A_1, A_2, and A_3 solve the degenerate system of linear algebraic equations

$$\begin{aligned} (a_1 - \lambda)A_1 + a_2A_2 + a_3A_3 &= 0, \\ b_1A_1 + (b_2 - \lambda)A_2 + b_3A_3 &= 0, \\ c_1A_1 + c_2A_2 + (c_3 - \lambda)A_3 &= 0. \end{aligned} \tag{2}$$

One of these equations can be omitted, since it is a consequence of the other two.

Suppose $w(x, y, z, t)$ is a solution of the equation in question. Then the function

$$w_1 = w\big(x + A_1Ce^{\lambda t}, y + A_2Ce^{\lambda t}, z + A_3Ce^{\lambda t}, t\big),$$

where C is an arbitrary constant, λ is a root of the cubic equation (1), and A_1, A_2, and A_3 are the corresponding solution of the algebraic system (2), is also a solution of the equation.

2°. Solution:

$$w = w(\xi), \qquad \xi = A_1x + A_2y + A_3z + Ce^{\lambda t},$$

where C is an arbitrary constant, λ is a root of the cubic equation (1), A_1, A_2, and A_3 are the corresponding solution of the algebraic system (2), and the function $w(\xi)$ is determined by the ordinary differential equation

$$(\lambda\xi + A_1d_1 + A_2d_2 + A_3d_3)w'_\xi = (A_1^2 + A_2^2 + A_3^2)w''_{\xi\xi} - f(w).$$

3°. Let λ be a root of the cubic equation (1) and let A_1, A_2, and A_3 be the corresponding solution of the algebraic system (2).

"Two-dimensional" solution:

$$w = U(\zeta, t), \qquad \zeta = A_1x + A_2y + A_3z,$$

where the function $U(\zeta, t)$ is determined by the differential equation

$$\frac{\partial U}{\partial t} + (\lambda\zeta + A_1d_1 + A_2d_2 + A_3d_3)\frac{\partial U}{\partial \zeta} = (A_1^2 + A_2^2 + A_3^2)\frac{\partial^2 U}{\partial \zeta^2} - f(U).$$

Remark. In the case of an incompressible fluid, the equation coefficients must satisfy the condition $a_1 + b_2 + c_3 = 0$.

6.5.2. Heat Equations with Power-Law or Exponential Temperature-Dependent Thermal Diffusivity

▷ *Throughout this subsection, the symbols* div, ∇, *and* Δ *stand for the divergence operator, gradient operator, and Laplace operator in Cartesian coordinates* x, y, z *(cylindrical, spherical, and other three-dimensional orthogonal systems of coordinates can be used instead of the Cartesian coordinates).*

1. $\dfrac{\partial w}{\partial t} = \Delta(w^m).$

This is a special case of equation 6.5.5.6.

2. $\dfrac{\partial w}{\partial t} = \alpha\,\mathrm{div}\big(w^n\nabla w\big) + f(t)w.$

1°. Multiplicative separable solution:

$$w(x, y, z, t) = \exp\left[\int f(t)\,dt\right]\big[\Theta(x, y, z)\big]^{\frac{1}{n+1}}, \tag{1}$$

where the function $\Theta(x, y, z)$ satisfies the Laplace equation

$$\Delta\Theta = 0.$$

For solutions of this linear equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

2°. Multiplicative separable solution:

$$w(x,y,z,t)=\varphi(t)\big[\Theta(x,y,z)\big]^{\frac{1}{n+1}}, \tag{2}$$

where the function $\varphi(t)$ is determined by the Bernoulli equation

$$\varphi_t'-f(t)\varphi+A\alpha\varphi^{n+1}=0. \tag{3}$$

Here, A is an arbitrary constant, and $\Theta(x,y,z)$ is a solution of the stationary equation

$$\Delta\Theta+A(n+1)\Theta^{\frac{1}{n+1}}=0.$$

The general solution of equation (3) is given by

$$\varphi(t)=\exp\big[F(t)\big]\left\{A\alpha n\int\exp\big[nF(t)\big]\,dt+B\right\}^{-1/n},\quad F(t)=\int f(t)\,dt,$$

where B is an arbitrary constant.

3°. Using the transformation

$$w(x,y,z,t)=F(t)U(x,y,z,\tau),\quad \tau=\int F^n(t)\,dt,\qquad F(t)=\exp\left[\int f(t)\,dt\right],$$

one arrives at the simpler equation $\dfrac{\partial U}{\partial\tau}=\alpha\operatorname{div}(U^n\nabla U)$.

3. $\dfrac{\partial w}{\partial t}=\Delta(w^{1/2})+aw+bw^{1/2}$.

Solution:

$$w=[f(x,y,z)+g(x,y,z)e^{at/2}]^2,$$

where functions $f=f(x,y,z)$ and $g=g(x,y,z)$ satisfy the system of two stationary equations

$$\Delta f+af^2+bf=0,\qquad \Delta g+afg+bg=0.$$

The former equation is solved independently for f. The latter equation is linear in g and is easy to solve once f has been found.

Remark. The original equation and the above solution admit a generalization to the case where the Laplace operator depends on n spatial coordinates.

⊙ *Reference*: O. V. Kaptsov and I. V. Verevkin (2003).

4. $\dfrac{\partial w}{\partial t}=\alpha\operatorname{div}(w^n\nabla w)+f(t)w+g(t)w^{1-n}$.

The substitution $U=w^n$ leads to a special case of equation 6.5.4.4:

$$\frac{\partial U}{\partial t}=\alpha U\Delta U+\frac{\alpha}{n}|\nabla U|^2+nf(t)U+ng(t).$$

5. $\dfrac{\partial w}{\partial t} = \alpha \operatorname{div}\left(e^{\mu w}\nabla w\right) + f(t).$

1°. Additive separable solution:

$$w(x, y, z, t) = \int f(t)\,dt + \frac{1}{\mu}\ln\Theta(x, y, z),$$

where the function $\Theta = \Theta(x, y, z)$ is any solution of the Laplace equation $\Delta\Theta = 0$.

2°. Additive separable solution:

$$w(x, y, z, t) = \varphi(t) + \frac{1}{\mu}\ln\Theta(x, y, z),$$

where the function $\varphi = \varphi(t)$ is determined by the ordinary differential equation

$$\varphi'_t + A(\alpha/\mu)\exp(\mu\varphi) - f(t) = 0. \tag{1}$$

Here, A is an arbitrary constant, and the function $\Theta = \Theta(x, y, z)$ is a solution of the Poisson equation

$$\Delta\Theta + A = 0. \tag{2}$$

The general solution of equation (1) is given by

$$\varphi(t) = F(t) - \frac{1}{\mu}\ln\left\{B + A\alpha\int \exp\left[\mu F(t)\right]dt\right\}, \qquad F(t) = \int f(t)\,dt. \tag{3}$$

For solutions of the linear stationary equation (2), see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

Note that equations (1), (2) and relation (3) contain arbitrary constants A and B.

3°. Using the transformation

$$w(x, y, z, t) = U(x, y, z, \tau) + F(t), \quad \tau = \int \exp[\mu F(t)]\,dt, \qquad F(t) = \int f(t)\,dt,$$

one arrives at the simpler equation $\dfrac{\partial U}{\partial \tau} = \alpha \operatorname{div}(e^{\mu U}\nabla U)$.

6. $\dfrac{\partial w}{\partial t} = a \operatorname{div}\left(e^{\mu w}\nabla w\right) + be^{\mu w} + g(t) + h(t)e^{-\mu w}.$

The substitution $U = e^{\mu w}$ leads to an equation of the form 6.5.4.5 for $U = U(x, y, z, t)$:

$$\frac{\partial U}{\partial t} = aU\Delta U + b\mu U^2 + \mu g(t)U + \mu h(t).$$

Hence, the original equation has solutions of the form

$$w(x, y, z, t) = \frac{1}{\mu}\ln[\varphi(t) + \psi(t)\Theta(x, y, z)].$$

Note that, with $g(t) \equiv$ const and $h(t) \equiv$ const, the original equation was studied in Galaktionov and Posashkov (1989) and Ibragimov (1994, pp. 158–163).

6.5.3. Equations of Heat and Mass Transfer in Anisotropic Media

1. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right) + \dfrac{\partial}{\partial z}\left(cz^n\dfrac{\partial w}{\partial z}\right) + f(w).$

1°. Solution for $m \neq 2$ and $n \neq 2$:

$$w = w(\xi, t), \qquad \xi^2 = \frac{x^2}{a} + \frac{4\,y^{2-m}}{b(2-m)^2} + \frac{4\,z^{2-n}}{c(2-n)^2},$$

where the function $w(\xi, t)$ is determined by the one-dimensional nonstationary equation

$$\frac{\partial w}{\partial t} = \frac{\partial^2 w}{\partial \xi^2} + \frac{A}{\xi}\frac{\partial w}{\partial \xi} + f(w), \qquad A = \frac{2(4-m-n)}{(2-m)(2-n)}.$$

For solutions of this equation with $A = 0$ and various $f(w)$, see Subsections 5.1.1 to 5.1.3 and equations 5.2.1.1 to 5.2.1.3, 5.4.1.2, 5.4.1.3, 5.4.1.7, and 5.4.1.8.

2°. Solution for $m \neq 2$ and $n \neq 2$:

$$w = w(x, \xi, t), \qquad \xi^2 = \frac{4\,y^{2-m}}{b(2-m)^2} + \frac{4\,z^{2-n}}{c(2-n)^2},$$

where the function $w(x, \xi)$ is determined by the two-dimensional nonstationary equation

$$\frac{\partial w}{\partial t} = a\frac{\partial^2 w}{\partial x^2} + \frac{\partial^2 w}{\partial \xi^2} + \frac{A}{\xi}\frac{\partial w}{\partial \xi} + f(w), \qquad A = \frac{4-mn}{(2-m)(2-n)}.$$

2. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right) + \dfrac{\partial}{\partial z}\left(cz^l\dfrac{\partial w}{\partial z}\right) + f(w).$

Solution for $n \neq 2$, $m \neq 2$, and $l \neq 2$:

$$w = w(\xi, t), \qquad \xi^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} + \frac{z^{2-l}}{c(2-l)^2}\right],$$

where the function $w(\xi, t)$ is determined by the one-dimensional nonstationary equation

$$\frac{\partial w}{\partial t} = \frac{\partial^2 w}{\partial \xi^2} + \frac{A}{\xi}\frac{\partial w}{\partial \xi} + f(w), \qquad A = 2\left(\frac{1}{2-n} + \frac{1}{2-m} + \frac{1}{2-l}\right) - 1.$$

For solutions of this equation with $A = 0$ and various $f(w)$, see Subsections 5.1.1 to 5.1.3 and equations 5.2.1.1 to 5.2.1.3, 5.4.1.2, 5.4.1.3, 5.4.1.7, and 5.4.1.8.

3. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ae^{\lambda x}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\mu y}\dfrac{\partial w}{\partial y}\right) + \dfrac{\partial}{\partial z}\left(ce^{\nu z}\dfrac{\partial w}{\partial z}\right) + f(w).$

Solution for $\lambda \neq 0$, $\mu \neq 0$, and $\nu \neq 0$:

$$w = w(\xi, t), \qquad \xi^2 = 4\left(\frac{e^{-\lambda x}}{a\lambda^2} + \frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2}\right),$$

where the function $w(\xi, t)$ is determined by the one-dimensional nonstationary equation

$$\frac{\partial w}{\partial t} = \frac{\partial^2 w}{\partial \xi^2} - \frac{1}{\xi}\frac{\partial w}{\partial \xi} + f(w).$$

4. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right) + \dfrac{\partial}{\partial z}\left(ce^{\nu z}\dfrac{\partial w}{\partial z}\right) + f(w).$

Solution for $n \neq 2$, $m \neq 2$, and $\nu \neq 0$:

$$w = w(\xi, t), \qquad \xi^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} + \frac{e^{-\nu z}}{c\nu^2}\right],$$

where the function $w(\xi, t)$ is determined by the one-dimensional nonstationary equation

$$\frac{\partial w}{\partial t} = \frac{\partial^2 w}{\partial \xi^2} + \frac{A}{\xi}\frac{\partial w}{\partial \xi} + f(w), \qquad A = \frac{4-nm}{(2-n)(2-m)}.$$

For solutions of this equation with $A = 0$ and various $f(w)$, see Subsections 5.1.1 to 5.1.3 and equations 5.2.1.1 to 5.2.1.3, 5.4.1.2, 5.4.1.3, 5.4.1.7, and 5.4.1.8.

5. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\mu y}\dfrac{\partial w}{\partial y}\right) + \dfrac{\partial}{\partial z}\left(ce^{\nu z}\dfrac{\partial w}{\partial z}\right) + f(w).$

Solution for $n \neq 2$, $\mu \neq 0$, and $\nu \neq 0$:

$$w = w(\xi, t), \qquad \xi^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2}\right],$$

where the function $w(\xi, t)$ is determined by the one-dimensional nonstationary equation

$$\frac{\partial w}{\partial t} = \frac{\partial^2 w}{\partial \xi^2} + \frac{n}{2-n}\frac{1}{\xi}\frac{\partial w}{\partial \xi} + f(w).$$

6. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f_1(w)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[f_2(w)\dfrac{\partial w}{\partial y}\right] + \dfrac{\partial}{\partial z}\left[f_3(w)\dfrac{\partial w}{\partial z}\right] + g(w).$

For group classification and exact solutions of this equation for some $f_n(w)$ and $g(w)$, see Dorodnitsyn, Knyazeva, and Svirshchevskii (1983).

7. $\dfrac{\partial w}{\partial t} + (a_1x + b_1y + c_1z + d_1)\dfrac{\partial w}{\partial x} + (a_2x + b_2y + c_2z + d_2)\dfrac{\partial w}{\partial y} + (a_3x + b_3y + c_3z + d_3)\dfrac{\partial w}{\partial z} = \dfrac{\partial}{\partial x}\left[f_1(w)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[f_2(w)\dfrac{\partial w}{\partial y}\right] + \dfrac{\partial}{\partial z}\left[f_3(w)\dfrac{\partial w}{\partial z}\right].$

This equation describes unsteady anisotropic heat or mass transfer in a three-dimensional steady translational-shear fluid flow.

1°. Let λ be a root of the cubic equation

$$\begin{vmatrix} a_1-\lambda & a_2 & a_3 \\ b_1 & b_2-\lambda & b_3 \\ c_1 & c_2 & c_3-\lambda \end{vmatrix} = 0, \tag{1}$$

and let the constants A_1, A_2, and A_3 solve the degenerate system of linear algebraic equations

$$\begin{aligned} (a_1-\lambda)A_1 + a_2A_2 + a_3A_3 &= 0, \\ b_1A_1 + (b_2-\lambda)A_2 + b_3A_3 &= 0, \\ c_1A_1 + c_2A_2 + (c_3-\lambda)A_3 &= 0. \end{aligned} \tag{2}$$

One of these equations is redundant and can be omitted.

Suppose $w(x, y, z, t)$ is a solution of the equation in question. Then the function

$$w_1 = w\big(x + A_1 C e^{\lambda t}, y + A_2 C e^{\lambda t}, z + A_3 C e^{\lambda t}, t\big),$$

where C is an arbitrary constant, λ is a root of the cubic equation (1), and A_1, A_2, and A_3 are the corresponding solution of the algebraic system (2), is also a solution of the equation.

2°. Solution:

$$w = w(\xi), \qquad \xi = A_1 x + A_2 y + A_3 z + C e^{\lambda t}, \tag{3}$$

where C is an arbitrary constant, λ is a root of the cubic equation (1), and A_1, A_2, and A_3 are the corresponding solution of the algebraic system (2), and the function $w(\xi)$ is determined by the ordinary differential equation

$$(\lambda\xi + A_1 d_1 + A_2 d_2 + A_3 d_3) w'_\xi = [\varphi(w) w'_\xi]'_\xi,$$
$$\varphi(w) = A_1^2 f_1(w) + A_2^2 f_2(w) + A_3^2 f_3(w).$$

3°. Let λ be a root of the cubic equation (1) and let A_1, A_2, and A_3 be the corresponding solution of the algebraic system (2).

"Two-dimensional" solutions:

$$w = U(\zeta, t), \qquad \zeta = A_1 x + A_2 y + A_3 z, \tag{4}$$

where the function $U(\zeta, t)$ is determined by the differential equation

$$\frac{\partial U}{\partial t} + (\lambda\zeta + A_1 d_1 + A_2 d_2 + A_3 d_3)\frac{\partial U}{\partial \zeta} = \frac{\partial}{\partial \zeta}\left[\varphi(U)\frac{\partial U}{\partial \zeta}\right],$$
$$\varphi(U) = A_1^2 f_1(U) + A_2^2 f_2(U) + A_3^2 f_3(U).$$

Remark 1. A more general equation, with an additional term $g(w)$ on the right-hand side, where $g(w)$ is an arbitrary function, also has solutions of the forms (3) and (4).

Remark 2. In the case of an incompressible fluid, the equation coefficients must satisfy the condition $a_1 + b_2 + c_3 = 0$.

6.5.4. Other Equations with Three Space Variables

▷ *Throughout this subsection, the symbols* div, ∇, *and* Δ *stand for the divergence operator, gradient operator, and Laplace operator in Cartesian coordinates* x, y, z; *cylindrical, spherical, and other three-dimensional orthogonal systems of coordinates can be used instead of the Cartesian coordinates.*

1. $\dfrac{\partial w}{\partial t} = a\Delta w + f(t)|\nabla w|^2 + g(t)w + h(t).$

There is a generalized separable solution of the form

$$w(x_1, x_2, x_3, t) = \sum_{k,l=1}^{3} \varphi_{kl}(t) x_k x_l + \sum_{k=1}^{3} \psi_k(t) x_k + \chi(t).$$

Remark. The more general equation

$$\frac{\partial w}{\partial t} = \sum_{n,m=1}^{3} a_{nm}(t)\frac{\partial^2 w}{\partial x_n \partial x_m} + \sum_{n=1}^{3} b_n(t)\left(\frac{\partial w}{\partial x_n}\right)^2 + \sum_{n=1}^{3} c_n(t)\frac{\partial w}{\partial x_n} + g(t)w + h(t)$$

has solutions of the same form.

2. $\dfrac{\partial w}{\partial t} = \Delta w + f(w)|\nabla w|^2.$

The substitution

$$U = \int F(w)\,dw, \qquad \text{where} \quad F(w) = \exp\left[\int f(w)\,dw\right],$$

leads to the linear heat equation

$$\frac{\partial U}{\partial t} = \Delta U.$$

For solutions of this equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

3. $\dfrac{\partial w}{\partial t} = \alpha w \Delta w - \alpha|\nabla w|^2 - \beta.$

1°. Solutions:

$$w(x,y,z,t) = Ax + By + Cz - [\alpha(A^2 + B^2 + C^2) + \beta]t + D,$$
$$w(x,y,z,t) = A - \beta t + B\exp\left[\alpha(\kappa^2 + \mu^2 + \nu^2)\left(At - \tfrac{1}{2}\beta t^2\right)\right]e^{\kappa x + \mu y + \nu z},$$

where A, B, C, D, κ, μ, and ν are arbitrary constants.

2°. See 6.5.4.4 with $f(t) = -\alpha$, $g(t) = 0$, and $h(t) = -\beta$.

4. $\dfrac{\partial w}{\partial t} = \alpha w \Delta w + f(t)|\nabla w|^2 + g(t)w + h(t).$

There are generalized separable solutions of the form

$$w(x_1, x_2, x_3, t) = \sum_{k,l=1}^{3} \varphi_{kl}(t)x_k x_l + \sum_{k=1}^{3} \psi_k(t)x_k + \chi(t).$$

Remark. The more general equation

$$\frac{\partial w}{\partial t} = \sum_{n,m=1}^{3} \left[a_{nm}(t)w + b_{nm}(t)\right]\frac{\partial^2 w}{\partial x_n \partial x_m} + \sum_{n=1}^{3} c_n(t)\left(\frac{\partial w}{\partial x_n}\right)^2 + \sum_{n=1}^{3} s_n(t)\frac{\partial w}{\partial x_n} + g(t)w + h(t)$$

has solutions of the same form.

5. $\dfrac{\partial w}{\partial t} = [aw + f(t)]\Delta w + bw^2 + g(t)w + h(t).$

Here, $f(t)$, $g(t)$, and $h(t)$ are arbitrary functions; a and b are arbitrary parameters ($a \neq 0$). This is a special case of equation 6.5.4.6 with $\mathbf{L}[w] \equiv \Delta w$.

Note that, with $f(t) \equiv \text{const}$, $g(t) \equiv \text{const}$, and $h(t) \equiv \text{const}$, this equation was studied in Galaktionov and Posashkov (1989) and Ibragimov (1994, pp. 158–163).

6. $\dfrac{\partial w}{\partial t} = [aw + f(t)]\mathbf{L}[w] + bw^2 + g(t)w + h(t).$

Here, $f(t)$, $g(t)$, and $h(t)$ are arbitrary functions; a and b are arbitrary parameters ($a \neq 0$); $\mathbf{L}[w]$ is an arbitrary linear differential operator of the second (or any) order that depends on the space variables $x_1 = x$, $x_2 = y$, $x_3 = z$ only and satisfies the condition $\mathbf{L}[\text{const}] \equiv 0$:

$$\mathbf{L}[w] \equiv \sum_{n,m=1}^{3} p_{nm}(\mathbf{x})\frac{\partial^2 w}{\partial x_n \partial x_m} + \sum_{n=1}^{3} q_n(\mathbf{x})\frac{\partial w}{\partial x_n}, \qquad \mathbf{x} = \{x_1, x_2, x_3\}.$$

There is a generalized separable solution of the form

$$w(x_1, x_2, x_3, t) = \varphi(t) + \psi(t)\Theta(x_1, x_2, x_3),$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of ordinary differential equations

$$\varphi_t' = b\varphi^2 + g(t)\varphi + h(t), \tag{1}$$

$$\psi_t' = \big[b\varphi - \beta f(t) + g(t)\big]\psi, \qquad \beta = b/a, \tag{2}$$

and the function $\Theta(x_1, x_2, x_3)$ is a solution of the linear stationary equation

$$\mathbf{L}[\Theta] + \beta\Theta = 0. \tag{3}$$

Equation (1) is independent of ψ and represents a Riccati equation for φ. A large number of exact solutions to equation (1) for various $g(t)$ and $h(t)$ can be found in Polyanin and Zaitsev (2003). On solving (1) and substituting the resulting $\varphi = \varphi(t)$ into (2), one obtains a linear equation for $\psi = \psi(t)$, which is easy to integrate.

In the special case $b = 0$, the solution of system (1), (2) is given by

$$\varphi(t) = \exp\big[G(t)\big]\left\{A + \int h(t)\exp\big[-G(t)\big]\,dt\right\}, \quad G(t) = \int g(t)\,dt,$$

$$\psi(t) = B\exp\big[G(t) - \beta F(t)\big], \quad F(t) = \int f(t)\,dt,$$

where A and B are arbitrary constants.

In the special case $\mathbf{L} \equiv \Delta$, see Tikhonov and Samarskii (1990) and Polyanin (2002) for solutions of the linear stationary equation (3).

7. $\dfrac{\partial w}{\partial t} = f(t)\mathbf{N}_\beta[w] + g(t)w.$

Here, $\mathbf{N}_\beta[w]$ is an arbitrary homogeneous nonlinear differential operator of degree β with respect to w (i.e., $\mathbf{N}_\beta[\alpha w] = \alpha^\beta \mathbf{N}_\beta[w]$, $\alpha = \text{const}$) that depends on the space variables x, y, z only (and is independent of t).

Using the transformation

$$w(x, y, z, t) = G(t)U(x, y, z, \tau), \quad \tau = \int f(t)G^{\beta-1}(t)\,dt, \quad G(t) = \exp\left[\int g(t)\,dt\right],$$

one arrives at the simpler equation

$$\frac{\partial U}{\partial \tau} = \mathbf{N}_\beta[U], \tag{1}$$

which has a multiplicative separable solution $U = \varphi(\tau)\Theta(x, y, z)$.

Remark 1. The order of the nonlinear operator $\mathbf{N}_\beta$ (with respect to the derivatives) and the number of the space variables in the original equation can be any. The coefficients of $\mathbf{N}_\beta$ can be dependent on the space variables.

Remark 2. If $\mathbf{N}_\beta$ is independent explicitly of the space variables, then equation (1) has also a traveling-wave solution, $U = U(\xi)$, where $\xi = k_1x + k_2y + k_3z + \lambda\tau$. Below are two examples of such operators:

$$\mathbf{N}_\beta[w] = a\,\mathrm{div}(w^{\beta-1}\nabla w) + b|\nabla w|^\beta + cw^\beta,$$
$$\mathbf{N}_\beta[w] = a\,\mathrm{div}(|\nabla w|^{\beta-1}\nabla w) + bw^\mu|\nabla w|^{\beta-\mu},$$

where a, b, c, and μ are some constants.

8. $\dfrac{\partial w}{\partial t} + (\mathbf{v}\cdot\nabla)w = \Delta w + f(w)|\nabla w|^2.$

This is a special case of equation 6.5.5.8 with $n = 3$.

9. $\dfrac{\partial w}{\partial t} + (\mathbf{v}\cdot\nabla)w = a\Delta w + a|\nabla w|^2 + f(\mathbf{x}, t).$

This is a special case of equation 6.5.5.9 with $n = 3$.

10. $\dfrac{\partial \mathbf{w}}{\partial t} + (\mathbf{w}\cdot\nabla)\mathbf{w} = a\Delta\mathbf{w}.$

Vector Burgers equation; $\mathbf{w} = \{w_1, w_2, w_3\}$ and $w_n = w_n(x_1, x_2, x_3)$. The Hamilton operator ∇ and Laplace operator Δ can be represented in any orthogonal system of coordinates.

Solution:

$$\mathbf{w} = -\frac{2a}{\theta}\nabla\theta,$$

where θ is a solution of the linear heat equation

$$\frac{\partial\theta}{\partial t} = a\Delta\theta.$$

For solutions of this equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

⊙ *Reference*: S. Nerney, E. J. Schmahl, and Z. E. Musielak (1996).

6.5.5. Equations with n Space Variables

▷ *Notation:* $\mathbf{x} = (x_1, \ldots, x_n)$, $\Delta w = \sum\limits_{k=1}^{n} \dfrac{\partial^2 w}{\partial x_k^2}$, $|\nabla w|^2 = \sum\limits_{k=1}^{n} \left(\dfrac{\partial w}{\partial x_k}\right)^2$, $(\mathbf{v}\cdot\nabla)w = \sum\limits_{k=1}^{n} v_k \dfrac{\partial w}{\partial x_k}$, $\nabla\cdot\mathbf{v} = \sum\limits_{k=1}^{n} \dfrac{\partial v_k}{\partial x_k}$.

1. $\dfrac{\partial w}{\partial t} = \Delta w + f(w)|\nabla w|^2.$

The substitution $U = \int F(w)\,dw$, where $F(w) = \exp\left[\int f(w)\,dw\right]$, leads to the linear heat equation

$$\frac{\partial U}{\partial t} = \Delta U.$$

For solutions of this equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

2. $\dfrac{\partial w}{\partial t} = f(t)\Delta w + g(t)w\ln w + h(t)w.$

There is a functional separable solution of the form

$$w(x_1,\dots,x_n,t) = \exp\left[\sum_{i,j=1}^{n}\varphi_{ij}(t)x_ix_j + \sum_{i=1}^{n}\psi_i(t)x_i + \chi(t)\right].$$

Special case 1. Let $f(t) = 1$, $g(t) = 1$, and $h(t) = 0$. Solutions in the radially symmetric case:

$$w = \exp\left(\frac{n}{2} - \frac{1}{4}r^2 + Be^t\right), \quad r = \sqrt{x_1^2 + \cdots + x_n^2},$$

$$w = \exp\left\{-\frac{1}{4}r^2(1 - Ae^{-t})^{-1} + e^t\left[B - \frac{n}{2A}\ln(1 - Ae^{-t})\right]\right\},$$

where A and B are arbitrary constants, $A < 1$. The first solution is a special case of the second solution as $A \to 0$.

Special case 2. Let $f(t) = 1$, $g(t) = -1$, and $h(t) = 0$. Solution in radially symmetric case:

$$w = \exp\left\{-\frac{1}{4}r^2(Ae^t - 1)^{-1} + e^{-t}\left[B - \frac{n}{2A}\ln(Ae^t - 1)\right]\right\},$$

where A and B are arbitrary constants, $A > 1$.

⊙ *Reference*: A. A. Samarskii, V. A. Galaktionov, S. P. Kurdyumov, and A. P. Mikhailov (1995).

3. $\dfrac{\partial w}{\partial t} = f_1(t)\Delta w + f_2(t)|\nabla w|^2 + f_3(t)w + \sum\limits_{i,j=1}^{n} g_{ij}(t)x_ix_j + \sum\limits_{i=1}^{n} h_i(t)x_i + p(t).$

There are exact solutions of the following forms:

$$w(x_1,\dots,x_n,t) = \sum_{i,j=1}^{n}\varphi_{ij}(t)x_ix_j + \sum_{i=1}^{n}\psi_i(t)x_i + \chi(t).$$

4. $\dfrac{\partial w}{\partial t} = f_1(t)w\Delta w + f_2(t)|\nabla w|^2 + f_3(t)w + \sum\limits_{i,j=1}^{n} g_{ij}(t)x_ix_j + \sum\limits_{i=1}^{n} h_i(t)x_i + p(t).$

There are exact solutions of the following forms:

$$w(x_1,\dots,x_n,t) = \sum_{i,j=1}^{n}\varphi_{ij}(t)x_ix_j + \sum_{i=1}^{n}\psi_i(t)x_i + \chi(t).$$

5. $\dfrac{\partial w}{\partial t} = a\nabla\cdot(w^m\nabla w).$

For $m > 1$, this equation describes the flow of a polytropic gas through a homogeneous porous medium (w is the gas density).

1°. In the radially symmetric case the equation is written as

$$\frac{\partial w}{\partial t} = \frac{a}{r^{n-1}}\frac{\partial}{\partial r}\left(r^{n-1}w^m\frac{\partial w}{\partial r}\right), \qquad r = \sqrt{x_1^2 + \cdots + x_n^2}.$$

Its exact solutions are given in 5.1.15.13, where n should be substituted by $n - 1$.

2°. Solution of the instantaneous source type for $a = 1$:

$$w = \begin{cases} t^{-n/(nm+2)}\left[\dfrac{m}{2(nm+2)}\left(K_0^2 - \dfrac{r^2}{t^{2/(nm+2)}}\right)\right]^{1/m} & \text{if } r \le K_0 t^{1/(nm+2)}, \\ 0 & \text{if } r > K_0 t^{1/(nm+2)}, \end{cases}$$

where

$$K_0 = \left\{\pi^{-n/2}\left[\frac{2(nm+2)}{m}\right]^{1/m}\frac{\Gamma(n/m+1+1/m)}{\Gamma(1/m+1)}E_0\right\}^{m/(nm+2)}, \qquad E_0 = \text{const}.$$

This is the solution of the initial-value problem with initial function

$$w(\mathbf{x}, 0) = E_0\delta(\mathbf{x}), \qquad \mathbf{x} \in \mathbb{R}^n,$$

satisfying the condition of constant energy:

$$\int_{\mathbb{R}^n} w(\mathbf{x}, t)\, d\mathbf{x} = E_0 = \text{const} > 0.$$

3°. See also equation 6.5.5.6, in which m should be substituted by $m + 1$.

⊙ *References for equation* 6.5.5.5: Ya. B. Zel'dovich and A. S. Kompaneets (1950), G. I. Barenblatt (1952).

6. $\dfrac{\partial w}{\partial t} = \Delta(w^m)$.

For $m > 1$, this equation describes the flow of a polytropic gas through a homogeneous porous medium (w is the gas density). It can be rewritten in the form of equation 6.5.5.5:

$$\frac{\partial w}{\partial t} = m\nabla \cdot (w^{m-1}\nabla w).$$

1°. Solution for $m > 1$:

$$w = \left(\prod_{k=1}^{n}\varphi_k\right)^{-1}\left(A - \sum_{k=1}^{n}\frac{x_k^2}{\varphi_k^2}\right)^{\frac{1}{m-1}},$$

where A is an arbitrary constant ($A > 0$), and the functions $\varphi_k = \varphi_k(t)$ are determined by the system of ordinary differential equations

$$\varphi_1\frac{d\varphi_1}{dt} = \cdots = \varphi_n\frac{d\varphi_n}{dt} = \frac{2m}{m-1}\left(\prod_{k=1}^{n}\varphi_k\right)^{1-m}. \tag{1}$$

System (1) admits $n - 1$ first integrals:

$$\varphi_j^2 = \varphi_n^2 + C_j, \qquad j = 1, 2, \ldots, n-1, \tag{2}$$

where the C_j are arbitrary constants.

The function $\varphi_n = \varphi_n(t)$ is defined in implicit form by (the C_j are assumed to be positive)

$$\int_B^{\varphi_n} z^m\left(\prod_{j=1}^{n-1}(z^2 + C_j)\right)^{\frac{m-1}{2}} dz = \frac{2mt}{m-1},$$

where B is an arbitrary constant, and the remaining $\varphi_j(t)$ are determined by the positive roots of the quadratic equations (2).

2°. Solution for $0 < m < 1$:

$$w = \left(\prod_{k=1}^{n} \varphi_k\right)^{-1} \left(A + \sum_{k=1}^{n} \frac{x_k^2}{\varphi_k^2}\right)^{\frac{1}{m-1}},$$

where A is an arbitrary constant, and the functions $\varphi_k = \varphi_k(t)$ are determined by the system of ordinary differential equations (1).

3°. There is an exact solution of the form

$$w = \left(\sum_{i,j=1}^{n} a_{ij}(t)x_i x_j + \sum_{i=1}^{n} b_i(t)x_i + c(t)\right)^{\frac{1}{m-1}}.$$

⊙ *References for equation* 6.5.5.6: S. S. Titov and V. A. Ustinov (1985), J. R. King (1993), V. V. Pukhnachov (1995), G. A. Rudykh and E. I. Semenov (2000; other exact solutions are also given there).

7. $\dfrac{\partial w}{\partial t} = [aw + f(t)]\Delta w + bw^2 + g(t)w + h(t).$

Here, $f(t)$, $g(t)$, and $h(t)$ are arbitrary functions; a and b are arbitrary parameters ($a \neq 0$).

There is a generalized separable solution of the form

$$w(x_1, \ldots, x_n, t) = \varphi(t) + \psi(t)\Theta(x_1, \ldots, x_n),$$

where the functions $\varphi(t)$, $\psi(t)$ are determined by the system of ordinary differential equations

$$\varphi_t' = b\varphi^2 + g(t)\varphi + h(t), \tag{1}$$

$$\psi_t' = \big[b\varphi - \beta f(t) + g(t)\big]\psi, \qquad \beta = b/a, \tag{2}$$

and the function $\Theta(x_1, \ldots, x_n)$ is a solution of the Helmholtz equation

$$\Delta\Theta + \beta\Theta = 0. \tag{3}$$

Equation (1) is independent of ψ and represents a Riccati equation for φ. A large number of exact solutions to equation (1) for various $g(t)$ and $h(t)$ can be found in Polyanin and Zaitsev (2003). On solving (1) and substituting the resulting $\varphi = \varphi(t)$ into (2), one obtains a linear equation for $\psi = \psi(t)$, which is easy to integrate.

For solutions of the linear stationary equation (3), see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

8. $\dfrac{\partial w}{\partial t} + (\mathbf{v} \cdot \nabla)w = \Delta w + f(w)|\nabla w|^2.$

Here, $\mathbf{v}$ is a prescribed vector function dependent on the space coordinates and time (but independent of w).

The substitution

$$\Theta = \int F(w)\, dw, \qquad \text{where} \quad F(w) = \exp\left[\int f(w)\, dw\right],$$

leads to a linear convective heat and mass transfer equation for $\Theta = \Theta(x_1, \ldots, x_n, t)$:

$$\frac{\partial \Theta}{\partial t} + (\mathbf{v} \cdot \nabla)\Theta = \Delta\Theta.$$

9. $\dfrac{\partial w}{\partial t} + (\mathbf{v}\cdot\nabla)w = a\Delta w + a|\nabla w|^2 + f(\mathbf{x},t).$

Here, $\mathbf{v}$ is a prescribed vector function dependent on the space coordinates and time (but independent of w).

The substitution $\Theta = e^w$ leads to the linear equation

$$\frac{\partial \Theta}{\partial t} + (\mathbf{v}\cdot\nabla)\Theta = a\Delta\Theta + f(\mathbf{x},t)\Theta.$$

10. $\dfrac{\partial w}{\partial t} = \alpha\nabla\cdot\left(w^m\nabla w\right) + f(t)w.$

1°. Multiplicative separable solution:

$$w(\mathbf{x},t) = \exp\left[\int f(t)\,dt\right]\left[\Theta(\mathbf{x})\right]^{\frac{1}{m+1}}, \tag{1}$$

where the function $\Theta(\mathbf{x})$ satisfies the Laplace equation

$$\Delta\Theta = 0.$$

For solutions of this linear equation, see Tikhonov and Samarskii (1990) and Polyanin (2002).

2°. Multiplicative separable solution:

$$w(\mathbf{x},t) = \varphi(t)\left[\Theta(\mathbf{x})\right]^{\frac{1}{m+1}}, \tag{2}$$

where the function $\varphi(t)$ is determined by the Bernoulli equation

$$\varphi_t' - f(t)\varphi + A\alpha\varphi^{m+1} = 0. \tag{3}$$

Here, A is an arbitrary constant and the function $\Theta(\mathbf{x})$ satisfies the stationary equation

$$\Delta\Theta + A(m+1)\Theta^{\frac{1}{m+1}} = 0.$$

The general solution of equation (3) is given by

$$\varphi(t) = \exp\left[F(t)\right]\left\{A\alpha m\int \exp\left[mF(t)\right]dt + B\right\}^{-1/m}, \quad F(t) = \int f(t)\,dt,$$

where B is an arbitrary constant.

3°. The transformation

$$w(\mathbf{x},t) = F(t)U(\mathbf{x},\tau), \quad \tau = \int F^m(t)\,dt, \qquad F(t) = \exp\left[\int f(t)\,dt\right],$$

leads to a simpler equation: $\dfrac{\partial U}{\partial \tau} = \alpha\nabla\cdot(U^m\nabla w)$.

Special case. For $\alpha = 1$, $f(t) = -\beta < 0$, we have

$$\frac{\partial w}{\partial t} = \nabla \cdot (w^m \nabla w) - \beta w.$$

Solution in the radially symmetric case:

$$w = \begin{cases} e^{-\beta t/m}[g(t)]^{-n/(nm+2)}\left[\dfrac{m}{2(nm+2)}\left(\eta_0^2 - \dfrac{r^2}{[g(t)]^{2/(nm+2)}}\right)\right]^{1/m} & \text{if } r \le r_*(t), \\ 0 & \text{if } r > r_*(t), \end{cases}$$

where

$$r = \sqrt{x_1^2 + \cdots + x_n^2}, \quad g(t) = 1 + \frac{1 - e^{-\beta m t}}{\beta m}, \quad r_*(t) = \eta_0\left(1 + \frac{1 - e^{-\beta m t}}{\beta m}\right)^{1/(nm+2)}.$$

The diameter of the support of this solution is monotonically increasing but is bounded now by the constant

$$L = \lim_{t\to\infty} |r_*(t)| = \eta_0\left(1 + \frac{1}{\beta m}\right)^{1/(nm+2)} < \infty.$$

The perturbation is localized in a ball of radius L.

⊙ *References for equation* 6.5.5.10: L. K. Martinson and K. B. Pavlov (1972), A. D. Polyanin and V. F. Zaitsev (2002, pp. 116–117).

11. $\dfrac{\partial w}{\partial t} = \nabla \cdot (w^m \nabla w) - w^{1-m}$.

Solution in the radially symmetric case for $0 < m < 1$:

$$w = \begin{cases} \left[\dfrac{2(nm+2)}{m}t\right]^{-1/m} V^{1/m} & \text{if } V \ge 0, \\ 0 & \text{if } V < 0, \end{cases}$$

where

$$V = At^{2/(nm+2)} - \frac{(nm+2)^2}{nm+1}t^2 - r^2, \qquad r = \sqrt{x_1^2 + \cdots + x_n^2};$$

A is an arbitrary constant ($A > 0$). The solution has a compact support. The diameter of the support increases with t on the time interval $(0, t_*)$, where

$$t_* = \left[\frac{A(nm+1)}{(nm+2)^3}\right]^{\frac{nm+2}{nm+1}}$$

and decreases on the interval (t_*, T_0), where

$$T_0 = \left[\frac{A(nm+1)}{(nm+2)^2}\right]^{\frac{nm+2}{2(nm+1)}}.$$

The solution vanishes at $t = T_0$.

⊙ *References*: R. Kersner (1978), L. K. Martinson (1979).

12. $\dfrac{\partial w}{\partial t} = a\nabla\cdot(e^{\lambda w}\nabla w) + be^{\lambda w} + f(t) + g(t)e^{-\lambda w}.$

Functional separable solution:

$$w(\mathbf{x},t) = \frac{1}{\lambda}\ln\big[\varphi(t) + \psi(t)\Theta(\mathbf{x})\big], \qquad \psi(t) = \exp\left\{\lambda\int\big[b\varphi(t) + f(t)\big]\,dt\right\},$$

where the function $\varphi(t)$ is determined by the Riccati equation

$$\varphi_t' = b\lambda\varphi^2 + \lambda f(t)\varphi + \lambda g(t), \tag{1}$$

and the function $\Theta = \Theta(\mathbf{x})$ is a solution of the Helmholtz equation

$$a\Delta\Theta + b\lambda\Theta = 0. \tag{2}$$

For details about the Riccati equation (1), see Kamke (1977) and Polyanin and Zaitsev (2003). For solutions of the linear equation (2), see Tikhonov and Samarskii (1990) and Polyanin (2002).

13. $\dfrac{\partial w}{\partial t} = \nabla\cdot[f(w)\nabla w] + \dfrac{a}{f(w)} + b.$

Solution in implicit form:

$$\int f(w)\,dw = at + U(\mathbf{x}),$$

where the function $U(\mathbf{x})$ is determined by the Poisson equation

$$\Delta U + b = 0.$$

For details about this equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

⊙ *Reference*: V. A. Galaktionov (1994).

14. $\dfrac{\partial w}{\partial t} = \nabla\cdot[f(w)\nabla w] + \dfrac{g(t)}{f(w)} + h(\mathbf{x}).$

Solution in implicit form:

$$\int f(w)\,dw = \int g(t)\,dt + U(\mathbf{x}),$$

where the function $U(\mathbf{x})$ is determined by the Poisson equation

$$\Delta U + h(\mathbf{x}) = 0.$$

15. $\dfrac{\partial w}{\partial t} = \Delta f(w) + \dfrac{af(w) + b}{f'(w)} + c[af(w) + b].$

Solution in implicit form:

$$f(w) = e^{at}U(\mathbf{x}) - \frac{b}{a},$$

where the function $U(\mathbf{x})$ is determined by the Helmholtz equation

$$\Delta U + acU = 0.$$

For details about this equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

⊙ *Reference*: V. A. Galaktionov (1994).

16. $\dfrac{\partial w}{\partial t} = \mathbf{L}\,[f(w)] + \dfrac{g(t)}{f'(w)} + h(\mathbf{x}).$

Here, $\mathbf{L}$ is an arbitrary linear differential operator of the second (or any) order with respect to the space variables with coefficients independent of t; the operator satisfies the condition $\mathbf{L}\,[\text{const}] = 0$.

Solution in implicit form:

$$f(w) = \int g(t)\,dt + U(\mathbf{x}),$$

where the function $U(\mathbf{x})$ is determined by the linear equation

$$\mathbf{L}\,[U] + h(\mathbf{x}) = 0.$$

17. $\dfrac{\partial w}{\partial t} = \mathbf{L}\,[f(w)] + \dfrac{af(w) + b}{f'(w)} + g(\mathbf{x})[af(w) + b].$

Here, $\mathbf{L}$ is an arbitrary linear differential operator of the second (or any) order with respect to the space variables with coefficients independent of t; the operator satisfies the condition $\mathbf{L}\,[\text{const}] = 0$.

Solution in implicit form:

$$f(w) = e^{at}U(\mathbf{x}) - \frac{b}{a},$$

where the function $U(\mathbf{x})$ is determined by the linear equation

$$\mathbf{L}\,[U] + ag(\mathbf{x})U = 0.$$

18. $\dfrac{\partial w}{\partial t} = \mathbf{L}\,[f(x, w)] + \dfrac{g(t)}{f_w(x, w)} + h(\mathbf{x}).$

Here, $\mathbf{L}$ is an arbitrary linear differential operator of the second (or any) order with respect to the space variables with coefficients independent of t; the operator satisfies the condition $\mathbf{L}\,[\text{const}] = 0$; and f_w stands for the partial derivative of f with respect to w.

Solution in implicit form:

$$f(x, w) = \int g(t)\,dt + U(\mathbf{x}),$$

where the function $U(\mathbf{x})$ is determined by the linear equation

$$\mathbf{L}\,[U] + h(\mathbf{x}) = 0.$$

19. $\dfrac{\partial w}{\partial t} = \mathbf{L}\,[f(x, w)] + \dfrac{af(x, w) + b}{f_w(x, w)} + g(\mathbf{x})[af(x, w) + b].$

Here, $\mathbf{L}$ is an arbitrary linear differential operator of the second (or any) order with respect to the space variables with coefficients independent of t; the operator satisfies the condition $\mathbf{L}\,[\text{const}] = 0$.

Solution in implicit form:

$$f(x, w) = e^{at}U(\mathbf{x}) - \frac{b}{a},$$

where the function $U(\mathbf{x})$ is determined by the linear equation

$$\mathbf{L}\,[U] + ag(\mathbf{x})U = 0.$$

20. $\dfrac{\partial w}{\partial t} = a\nabla\cdot(|\nabla w|\nabla w) + bw^2 + f(t)w + g(t).$

Generalized separable solution:

$$w(\mathbf{x},t) = \varphi(t) + \exp\left\{\int\left[2b\varphi(t) + f(t)\right]dt\right\}\Theta(\mathbf{x}),$$

where the function $\varphi(t)$ is determined by the Riccati equation

$$\varphi_t' = b\varphi^2 + f(t)\varphi + g(t),$$

and the function $\Theta = \Theta(\mathbf{x})$ is a solution of the stationary equation

$$a\nabla\cdot(|\nabla\Theta|\nabla\Theta) + b\Theta^2 = 0.$$

6.6. Nonlinear Schrödinger Equations

6.6.1. Two-Dimensional Equations

1. $i\dfrac{\partial w}{\partial t} + \dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} + A|w|^2 w = 0.$

Two-dimensional Schrödinger equation with a cubic nonlinearity. This is a special case of equation 6.6.1.3 with $f(u) = Au^2$.

1°. Suppose $w(x,y,t)$ is a solution of the Schrödinger equation in question. Then the functions

$$w_1 = \pm C_1 w(\pm C_1 x + C_2, \pm C_1 y + C_3, C_1^2 t + C_4),$$
$$w_2 = e^{-i[\lambda_1 x + \lambda_2 y + (\lambda_1^2+\lambda_2^2)t + C_5]} w(x + 2\lambda_1 t, y + 2\lambda_2 t, t),$$
$$w_3 = w(x\cos\beta - y\sin\beta, x\sin\beta + y\cos\beta, t),$$

where $C_1, \ldots, C_5$, λ_1, λ_2, and β are arbitrary real constants, are also solutions of the equation. The plus or minus signs in the expression for w_1 are chosen arbitrarily.

2°. Solutions:

$$w(x,y,t) = C_1\exp\left\{i\left[C_2 x + C_3 y + (AC_1^2 - C_2^2 - C_3^2)t + C_4\right]\right\},$$
$$w(x,y,t) = \frac{C_1}{t}\exp\left[i\frac{(x+C_2)^2 + (y+C_3)^2 - 4AC_1^2}{4t} + iC_4\right],$$

where $C_1, \ldots, C_4$ are arbitrary real constants.

3°. "Two-dimensional" solution:

$$w(x,y,t) = e^{i(C_1 t + C_2)}u(x,y),$$

where C_1 and C_2 are arbitrary real constants, and the function $u = u(x,y)$ is determined by the stationary equation

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + Au^3 - C_1 u = 0.$$

4°. Solution:

$$w(x,y,t) = (f_1x + f_2y + f_3)\exp\bigl[i(g_1x^2 + g_2xy + g_3y^2 + h_1x + h_2y + h_3)\bigr],$$

where the functions $f_k = f_k(t)$, $g_k = g_k(t)$, and $h_k = h_k(t)$ are determined by the autonomous system of ordinary differential equations

$$\begin{aligned}
f_1' + 2(3g_1 + g_3)f_1 + 2f_2g_2 &= 0,\\
f_2' + 2(g_1 + 3g_3)f_2 + 2f_1g_2 &= 0,\\
f_3' + 2(g_1 + g_3)f_3 + 2(f_1h_1 + f_2h_2) &= 0,\\
g_1' + 4g_1^2 + g_2^2 - Af_1^2 &= 0,\\
g_2' + 4(g_1 + g_3)g_2 - 2Af_1f_2 &= 0,\\
g_3' + g_2^2 + 4g_3^2 - Af_2^2 &= 0,\\
h_1' + 4g_1h_1 + 2g_2h_2 - 2Af_1f_3 &= 0,\\
h_2' + 2g_2h_1 + 4g_3h_2 - 2Af_2f_3 &= 0,\\
h_3' + h_1^2 + h_2^2 - Af_3^2 &= 0.
\end{aligned}$$

The prime denotes a derivative with respect to t.

5°. "Two-dimensional" solution:

$$w(x,y,t) = U(\xi_1,\xi_2)e^{i(k_1x+k_2y+at+b)}, \quad \xi_1 = x - 2k_1t, \quad \xi_2 = y - 2k_2t,$$

where k_1, k_2, a, and b are arbitrary constants, and the function $U = U(\xi_1,\xi_2)$ is determined by a differential equation of the form 9.4.1.1:

$$\frac{\partial^2 U}{\partial\xi_1^2} + \frac{\partial^2 U}{\partial\xi_2^2} + A|U|^2U - (k_1^2 + k_2^2 + a)U = 0.$$

For solutions of this equation, see also equation 9.1.1.2 with $n = 3$.

6°. "Two-dimensional" solution:

$$w(x,y,t) = \Phi(z_1,z_2)\exp\bigl[i(k_1xt + k_2yt - \tfrac{2}{3}k_1^2t^3 - \tfrac{2}{3}k_2^2t^3 + at + b)\bigr], \quad z_1 = x - k_1t^2, \quad z_2 = y - k_2t^2,$$

where k_1, k_2, a, and b are arbitrary constants, and the function $\Phi = \Phi(z_1,z_2)$ is determined by a differential equation of the form 9.4.1.1:

$$\frac{\partial^2 \Phi}{\partial z_1^2} + \frac{\partial^2 \Phi}{\partial z_2^2} + A|\Phi|^2\Phi - (k_1z_1 + k_2z_2 + a)\Phi = 0.$$

7°. "Two-dimensional" solution:

$$w(x,y,t) = \frac{1}{\sqrt{C_1t + C_2}}u(\xi,\eta), \quad \xi = \frac{x + C_3}{\sqrt{C_1t + C_2}}, \quad \eta = \frac{y + C_4}{\sqrt{C_1t + C_2}},$$

where $C_1, \ldots, C_4$ are arbitrary constants, and the function $u = u(\xi,\eta)$ is determined by the differential equation

$$\frac{\partial^2 u}{\partial\xi^2} + \frac{\partial^2 u}{\partial\eta^2} - \frac{1}{2}iC_1\left(\xi\frac{\partial u}{\partial\xi} + \eta\frac{\partial u}{\partial\eta} + u\right) + A|u|^2u = 0.$$

⊙ *References for equation* 6.6.1.1: L. Gagnon, P. Winternitz (1988, 1989), N. H. Ibragimov (1995, pp. 437–438), A. M. Vinogradov and I. S. Krasil'shchik (1997), A. D. Polyanin and V. F. Zaitsev (2004, pp. 186–187).

2. $i\dfrac{\partial w}{\partial t}+\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}+A|w|^{2n}w=0.$

Two-dimensional Schrödinger equation with a power-law nonlinearity; A and n are real numbers. This is a special case of equation 6.6.1.3 with $f(u)=Au^{2n}$.

1°. Suppose $w(x,y,t)$ is a solution of the Schrödinger equation in question. Then the functions

$$w_1=\pm C_1 w(\pm C_1^n x+C_2,\pm C_1^n y+C_3,C_1^{2n}t+C_4),$$
$$w_2=e^{-i[\lambda_1 x+\lambda_2 y+(\lambda_1^2+\lambda_2^2)t+C_5]}w(x+2\lambda_1 t,y+2\lambda_2 t,t),$$
$$w_3=w(x\cos\beta-y\sin\beta,x\sin\beta+y\cos\beta,t),$$

where $C_1,\ldots,C_5$, β, λ_1, and λ_2 are arbitrary real constants, are also solutions of the equation. The plus or minus signs in the expression for w_1 are chosen arbitrarily.

2°. Solutions:

$$w(x,y,t)=C_1\exp\bigl\{i\,[C_2x+C_3y+(A|C_1|^{2n}-C_2^2-C_3^2)t+C_4]\bigr\},$$
$$w(x,y,t)=\frac{C_1}{t}\exp\left[i\frac{(x+C_2)^2+(y+C_3)^2}{4t}+i\frac{AC_1^{2n}}{1-2n}t^{1-2n}+iC_4\right],$$

where $C_1,\ldots,C_4$ are arbitrary real constants.

3°. For other exact solutions, see equation 6.6.1.3 with $f(w)=Aw^{2n}$.

3. $i\dfrac{\partial w}{\partial t}+\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}+f(|w|)w=0.$

Two-dimensional nonlinear Schrödinger equation of general form.

1°. Suppose $w(x,y,t)$ is a solution of the Schrödinger equation in question. Then the functions

$$w_1=e^{-i[\lambda_1 x+\lambda_2 y+(\lambda_1^2+\lambda_2^2)t+A]}w(x+2\lambda_1 t+C_1,y+2\lambda_2 t+C_2,t+C_3),$$
$$w_2=w(x\cos\beta-y\sin\beta,x\sin\beta+y\cos\beta,t),$$

where A, C_1, C_2, C_3, λ_1, λ_2, and β are arbitrary real constants, are also solutions of the equation.

2°. Traveling-wave solution:

$$w(x,y,t)=C_1\exp\bigl[i\,(C_2x+C_3y+\lambda t+C_4)\bigr],\qquad \lambda=f(|C_1|)-C_2^2-C_3^2,$$

where $C_1,\ldots,C_4$ are arbitrary real constants.

3°. Exact solutions depending only on the radial variable $r=\sqrt{x^2+y^2}$ and time t are determined by the equation

$$i\frac{\partial w}{\partial t}+\frac{1}{r}\frac{\partial}{\partial r}\left(r\frac{\partial w}{\partial r}\right)+f(|w|)w=0,$$

which is a special case of equation 5.7.5.2 with $n=1$.

4°. "Two-dimensional" solution:

$$w(x,y,t) = e^{i(At+B)}u(x,y),$$

where A and B are arbitrary real constants, and the function $u = u(x,y)$ is determined by a stationary equation of the form 9.4.1.1:

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + f(|u|)u - Au = 0.$$

5°. "Two-dimensional" solution:

$$w(x,y,t) = U(\xi,\eta)e^{i(A_1x+A_2y+Bt+C)}, \quad \xi = x - 2A_1t, \quad \eta = y - 2A_2t,$$

where A_1, A_2, B, and C are arbitrary constants, and the function $U = U(\xi,\eta)$ is determined by a differential equation of the form 9.4.1.1:

$$\frac{\partial^2 U}{\partial \xi^2} + \frac{\partial^2 U}{\partial \eta^2} + f(|U|)U - (A_1^2 + A_2^2 + B)U = 0.$$

6°. "Two-dimensional" solution:

$$w(x,y,t) = \Phi(z_1,z_2)\exp\left[i(k_1xt + k_2yt - \tfrac{2}{3}k_1^2t^3 - \tfrac{2}{3}k_2^2t^3 + at + b)\right], \quad z_1 = x - k_1t^2, \quad z_2 = y - k_2t^2,$$

where k_1, k_2, a, and b are arbitrary constants, and the function $\Phi = \Phi(z_1,z_2)$ is determined by the differential equation of the form 9.4.1.1:

$$\frac{\partial^2 \Phi}{\partial z_1^2} + \frac{\partial^2 \Phi}{\partial z_2^2} + f(|\Phi|)\Phi - (k_1z_1 + k_2z_2 + a)\Phi = 0.$$

7°. There is a "two-dimensional" solution of the form

$$w(x,y,t) = U(z_1,z_2), \quad z_1 = a_1x + b_1y + c_1t, \quad z_2 = a_2x + b_2y + c_2t.$$

8°. For group classification of the original equation, see Gagnon and Winternitz (1988) and Ibragimov (1995, pp. 437–438).

6.6.2. Three and n-Dimensional Equations

1. $\boldsymbol{i\dfrac{\partial w}{\partial t} + \dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} + \dfrac{\partial^2 w}{\partial z^2} + A|w|^2w = 0.}$

Three-dimensional Schrödinger equation with a cubic nonlinearity. This is a special case of equation 6.6.2.2 with $f(u) = Au^2$.

1°. Suppose $w(x,y,t)$ is a solution of the Schrödinger equation in question. Then the functions

$$w_1 = \pm C_1 w(\pm C_1x + C_2, \pm C_1y + C_3, \pm C_1z + C_4, C_1^2t + C_5),$$
$$w_2 = e^{-i[\lambda_1x + \lambda_2y + \lambda_3z + (\lambda_1^2 + \lambda_2^2 + \lambda_3^2)t + C_6]}w(x + 2\lambda_1t, y + 2\lambda_2t, z + 2\lambda_3t, t),$$

where $C_1, \ldots, C_6$, λ_1, λ_2, and λ_3 are arbitrary real constants, are also solutions of the equation. The plus or minus signs in the expression for w_1 are chosen arbitrarily.

2°. There is an exact solution of the form

$$w=(f_1x+f_2y+f_3z+f_4)\exp\left[i(g_1x^2+g_2y^2+g_3z^2+g_4xy+g_5xz+g_6yz+h_1x+h_2y+h_3z+h_4)\right],$$

where the functions $f_k = f_k(t)$, $g_k = g_k(t)$, and $h_k = h_k(t)$ are determined by an appropriate system of ordinary differential equations (which is not written out here).

3°. Solution:

$$w(x,y,z,t)=U(\xi_1,\xi_2,\xi_3)e^{i(k_1x+k_2y+k_3z+at+b)},\quad \xi_1=x-2k_1t,\quad \xi_2=y-2k_2t,\quad \xi_3=z-2k_3t,$$

where k_1, k_2, k_3, a, and b are arbitrary constants, and the function $U = U(\xi_1, \xi_2, \xi_3)$ is determined by the differential equation

$$\frac{\partial^2U}{\partial\xi_1^2}+\frac{\partial^2U}{\partial\xi_2^2}+\frac{\partial^2U}{\partial\xi_3^2}+A|U|^2U-(k_1^2+k_2^2+k_3^2+a)U=0.$$

4°. "Three-dimensional" solution:

$$w(x,y,z,t)=\frac{1}{\sqrt{C_1t+C_2}}u(\xi,\eta,\zeta),\quad \xi=\frac{x+C_3}{\sqrt{C_1t+C_2}},\quad \eta=\frac{y+C_4}{\sqrt{C_1t+C_2}},\quad \zeta=\frac{z+C_5}{\sqrt{C_1t+C_2}},$$

where $C_1, \ldots, C_5$ are arbitrary constants, and the function $u = u(\xi, \eta, \zeta)$ is determined by the differential equation

$$\frac{\partial^2u}{\partial\xi^2}+\frac{\partial^2u}{\partial\eta^2}+\frac{\partial^2u}{\partial\zeta^2}-\frac{1}{2}iC_1\left(\xi\frac{\partial u}{\partial\xi}+\eta\frac{\partial u}{\partial\eta}+\zeta\frac{\partial u}{\partial\zeta}+u\right)+A|u|^2u=0.$$

⊙ *References for equation* 6.6.2.1: L. Gagnon, P. Winternitz (1988, 1989), N. H. Ibragimov (1995, pp. 437–438), A. M. Vinogradov and I. S. Krasil'shchik (1997), A. D. Polyanin and V. F. Zaitsev (2004, p. 189).

2. $i\dfrac{\partial w}{\partial t}+\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}+\dfrac{\partial^2 w}{\partial z^2}+f(|w|)w=0.$

Three-dimensional nonlinear Schrödinger equation of general form. It admits translations in any of the independent variables.

1°. Suppose $w(x, y, z, t)$ is a solution of the Schrödinger equation in question. Then the function

$$w_1=e^{-i[\lambda_1x+\lambda_2y+\lambda_3z+(\lambda_1^2+\lambda_2^2+\lambda_3^2)t+A]}w(x+2\lambda_1t+C_1,y+2\lambda_2t+C_2,z+2\lambda_3t+C_3,t+C_4),$$

where A, $C_1, \ldots, C_4$, λ_1, λ_2, and λ_3 are arbitrary real constants, is also a solution of the equation.

2°. Exact solutions depending only on the radial variable $r=\sqrt{x^2+y^2+z^2}$ and time t are determined by the equation

$$i\frac{\partial w}{\partial t}+\frac{1}{r^2}\frac{\partial}{\partial r}\left(r^2\frac{\partial w}{\partial r}\right)+f(|w|)w=0,$$

which is a special case of equation 5.7.5.2 with $n = 2$.

3°. "Three-dimensional" solution:

$$w(x, y, z, t) = e^{i(At+B)}u(x, y, z),$$

where A and B are arbitrary real constants, and the function $u = u(x, y, z)$ is determined by the stationary equation

$$\Delta u + f(|u|)u - Au = 0.$$

4°. Axisymmetric solutions in cylindrical and spherical coordinates are determined by equations where the Laplace operator has the form

$$\frac{\partial^2 w}{\partial x^2} + \frac{\partial^2 w}{\partial y^2} + \frac{\partial^2 w}{\partial z^2} = \frac{1}{\rho}\frac{\partial}{\partial \rho}\left(\rho\frac{\partial w}{\partial \rho}\right) + \frac{\partial^2 w}{\partial z^2}, \qquad \rho = \sqrt{x^2 + y^2};$$

$$\frac{\partial^2 w}{\partial x^2} + \frac{\partial^2 w}{\partial y^2} + \frac{\partial^2 w}{\partial z^2} = \frac{1}{r^2}\frac{\partial}{\partial r}\left(r^2\frac{\partial w}{\partial r}\right) + \frac{1}{r^2\sin\theta}\frac{\partial}{\partial \theta}\left(\sin\theta\frac{\partial w}{\partial \theta}\right), \quad r = \sqrt{x^2 + y^2 + z^2},$$

respectively. Consequently, there are solutions of the forms $w = w(\rho, t)$ and $w = w(r, t)$.

5°. "Three-dimensional" solution:

$$w = U(\xi, \eta, t), \qquad \xi = y + \frac{x}{C}, \quad \eta = (C^2 - 1)x^2 - 2Cxy + C^2z^2,$$

where C is an arbitrary constant ($C \neq 0$), and the function $U = U(\xi, \eta, t)$ is determined by the differential equation

$$i\frac{\partial U}{\partial t} + \left(1 + \frac{1}{C^2}\right)\frac{\partial^2 U}{\partial \xi^2} - 4\xi\frac{\partial^2 U}{\partial \xi \partial \eta} + 4C^2(\xi^2 + \eta)\frac{\partial^2 U}{\partial \eta^2} + 2(2C^2 - 1)\frac{\partial U}{\partial \eta} + f(|U|)U = 0.$$

6°. "Three-dimensional" solution:

$$w = V(\xi, \eta, t), \qquad \xi = Ax + By + Cz, \quad \eta = \sqrt{(Bx - Ay)^2 + (Cy - Bz)^2 + (Az - Cx)^2},$$

where A, B, and C are arbitrary constants and the function $V = V(\xi, \eta, t)$ is determined by the equation

$$i\frac{\partial V}{\partial t} + (A^2 + B^2 + C^2)\left(\frac{\partial^2 V}{\partial \xi^2} + \frac{\partial^2 V}{\partial \eta^2} + \frac{1}{\eta}\frac{\partial V}{\partial \eta}\right) + f(|V|)V = 0.$$

⊙ *References for equation* 6.6.2.2: L. Gagnon, P. Winternitz (1988, 1989), N. H. Ibragimov (1995, pp. 437–438), A. D. Polyanin and V. F. Zaitsev (2004, pp. 189–190).

3. $i\dfrac{\partial w}{\partial t} + \Delta w + A|w|^2 w = 0.$

This is an *n-dimensional Schrödinger equation with a cubic nonlinearity*.

1°. Suppose $w(x_1, \ldots, x_n, t)$ is a solution to the original Schrödinger equation. Then the functions

$$w_1 = \pm C_1 w(\pm C_1 x_1 + C_2, \ \ldots, \ \pm C_1 x_n + C_{n+1}, C_1^2 t + C_{n+2}),$$

$$w_2 = e^{-i[\lambda_1 x_1 + \cdots + \lambda_n x_n + (\lambda_1^2 + \cdots + \lambda_n^2)t + C_{n+3}]}w(x_1 + 2\lambda_1 t, \ \ldots, \ x_n + 2\lambda_n t, t),$$

where $C_1, \ \ldots, \ C_{n+3}, \ \lambda_1, \ \ldots, \ \lambda_n$ are arbitrary real constants, are also solutions of the equation. The plus and minus signs in the expression of w_1 can be chosen arbitrarily.

2°. There is an exact solution of the form

$$w = \left(\sum_{k=1}^{n} f_k x_k + f_{n+1}\right) \exp\left[i\left(\sum_{k,m=1}^{n} g_{km} x_k x_m + \sum_{k=1}^{n} h_k x_k + p\right)\right],$$

where $f_k = f_k(t)$, $g_{km} = g_{km}(t)$, $h_k = h_k(t)$, and $p = p(t)$.

3°. Solution:

$$w(x_1, \ldots, x_n, t) = U(\xi_1, \ldots, \xi_n) e^{i(k_1 x_1 + \cdots + k_n x_n + at + b)}, \quad \xi_1 = x_1 - 2k_1 t, \quad \ldots, \quad \xi_n = x_n - 2k_n t,$$

where $k_1, \ldots, k_n$, a, and b are arbitrary constants, and the function $U = U(\xi_1, \ldots, \xi_n)$ is described by the stationary equation

$$\frac{\partial^2 U}{\partial \xi_1^2} + \cdots + \frac{\partial^2 U}{\partial \xi_n^2} + A|U|^2 U - (k_1^2 + \cdots + k_n^2 + a)U = 0.$$

4. $i\dfrac{\partial w}{\partial t} = \Delta w + |w|^2 w.$

This is an *n-dimensional modified Schrödinger equation with a cubic nonlinearity*.

Conservation laws:

$$\left(|w|^2\right)_t + i\nabla \cdot \left(\bar{w}\nabla w - w\nabla \bar{w}\right)_x = 0,$$
$$\left(|\nabla w|^2 - \tfrac{1}{2}|w|^4\right)_t + i\nabla \cdot \left[(\Delta w + |w|^2 w)\nabla \bar{w} - (\Delta \bar{w} + |w|^2 \bar{w})\nabla w\right]_x = 0.$$

The bar over a symbol denotes the complex conjugate.

Chapter 7
Second-Order Hyperbolic Equations with One Space Variable

7.1. Equations with Power-Law Nonlinearities

7.1.1. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + aw + bw^n + cw^{2n-1}$

▷ *The general properties of equations of this type are outlined in 7.4.1.1; traveling-wave solutions and some other solutions are also presented there.*

1. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + aw^n.$

This is a special case of equation 7.4.1.1 with $f(w) = aw^n$.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^2 w\big(\pm C_1^{n-1}x + C_2,\ \pm C_1^{n-1}t + C_3\big),$$
$$w_2 = w(x\cosh\lambda + t\sinh\lambda,\ x\sinh\lambda + t\cosh\lambda),$$

where C_1, C_2, C_3, and λ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Solutions:

$$w(x,t) = b\big(x + C_1 t + C_2\big)^{\frac{2}{1-n}}, \qquad b = \left[\frac{2(1+n)(C_1^2-1)}{a(1-n)^2}\right]^{\frac{1}{n-1}};$$
$$w(x,t) = \big[k(t+C_1)^2 - k(x+C_2)^2\big]^{\frac{1}{1-n}}, \qquad k = \tfrac{1}{4}a(1-n)^2,$$

where C_1 and C_2 are arbitrary constants.

3°. The solutions of Item 2° are special cases of solutions of the following forms:

$$w(x,t) = F(z), \quad z = x + C_1 t + C_2;$$
$$w(x,t) = G(\xi), \quad \xi = (t+C_1)^2 - (x+C_2)^2.$$

4°. Self-similar solution:

$$w(x,t) = (t+C_1)^{\frac{2}{1-n}}\,u(\xi), \qquad \xi = \frac{x+C_2}{t+C_1},$$

where the function $u(\xi)$ is determined by the ordinary differential equation

$$(1-\xi^2)u''_{\xi\xi} + \frac{2(1+n)}{1-n}\xi u'_\xi - \frac{2(1+n)}{(1-n)^2}u + au^n = 0.$$

The transformation

$$u = (\cosh\theta)^{\frac{2}{n-1}}U(\theta), \qquad \xi = \tanh\theta$$

brings this equation to the autonomous form

$$U''_{\theta\theta} - \frac{4}{(1-n)^2}U + aU^n = 0.$$

Integrating yields the general solution in implicit form

$$\int\left[\frac{4}{(n-1)^2}U^2 - \frac{2a}{n+1}U^{n+1} + C_3\right]^{-1/2} dU = C_4 \pm \theta,$$

where C_3 and C_4 are arbitrary constants.

2. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + aw + bw^3.$

This is a special case of equation 7.4.1.1 with $f(w) = aw + bw^3$.

1°. Traveling-wave solutions:

$$w = \pm\sqrt{-\frac{a}{b}}\,\tanh\left[\sqrt{\frac{a}{2(1-C_1^2)}}\,(x + C_1 t + C_2)\right],$$

$$w = \pm\sqrt{\frac{a}{b}}\,\tan\left[\sqrt{\frac{a}{2(C_1^2-1)}}\,(x + C_1 t + C_2)\right],$$

where C_1 and C_2 are arbitrary constants.

⊙ *Reference*: M. Dehghan and A. Shokri (2009).

2°. See also equation 7.1.1.3 with $n = 3$.

3. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + aw + bw^n.$

This is a special case of equation 7.4.1.1 with $f(w) = aw + bw^n$.

1°. Traveling-wave solutions for $a > 0$:

$$w = \left[\frac{2b\sinh^2 z}{a(n+1)}\right]^{\frac{1}{1-n}}, \qquad z = \tfrac{1}{2}\sqrt{a}\,(1-n)(x\sinh C_1 \pm t\cosh C_1) + C_2 \quad \text{if } b(n+1) > 0,$$

$$w = \left[-\frac{2b\cosh^2 z}{a(n+1)}\right]^{\frac{1}{1-n}}, \quad z = \tfrac{1}{2}\sqrt{a}\,(1-n)(x\sinh C_1 \pm t\cosh C_1) + C_2 \quad \text{if } b(n+1) < 0,$$

where C_1 and C_2 are arbitrary constants.

2°. Traveling-wave solutions for $a < 0$ and $b(n+1) > 0$:

$$w = \left[-\frac{2b\cos^2 z}{a(n+1)}\right]^{\frac{1}{1-n}}, \quad z = \tfrac{1}{2}\sqrt{|a|}\,(1-n)(x\sinh C_1 \pm t\cosh C_1) + C_2.$$

4. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + aw^n + bw^{2n-1}.$

This is a special case of equation 7.4.1.1 with $f(w) = aw^n + bw^{2n-1}$.

Solutions:

$$w(x,t) = \left[\frac{a(1-n)^2}{2(n+1)}(x\sinh C_1 \pm t\cosh C_1 + C_2)^2 - \frac{b(n+1)}{2an}\right]^{\frac{1}{1-n}},$$

$$w(x,t) = \left\{\frac{1}{4}a(1-n)^2\left[(t+C_1)^2 - (x+C_2)^2\right] - \frac{b}{an}\right\}^{\frac{1}{1-n}},$$

where C_1 and C_2 are arbitrary constants.

5. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + aw - a(n+1)w^n + bw^{2n-1}.$

1°. Traveling-wave solutions:

$$w(x,t) = \left(\lambda + C_1\exp z\right)^{\frac{1}{1-n}}, \qquad z = \sqrt{a}\,(1-n)(x\sinh C_2 \pm t\cosh C_2),$$

where $\lambda = \lambda_{1,2}$ are roots of the quadratic equation $a\lambda^2 - a(n+1)\lambda + b = 0$, and C_1 and C_2 are arbitrary constants.

2°. See also equation 7.1.1.6, in which b should be renamed $-a(n+1)$ and c renamed b.

6. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + aw + bw^n + cw^{2n-1}.$

This is a special case of equation 7.4.1.1 with $f(w) = aw + bw^n + cw^{2n-1}$.

1°. Traveling-wave solutions for $a > 0$:

$$w(x,t) = (A + B\cosh z)^{\frac{1}{1-n}}, \quad z = \sqrt{a}\,(1-n)(x\sinh C_1 \pm t\cosh C_1) + C_2,$$
$$A = -\frac{b}{a(n+1)}, \quad B = \pm\left[\frac{b^2}{a^2(n+1)^2} - \frac{c}{an}\right]^{1/2};$$

$$w(x,t) = (A + B\sinh z)^{\frac{1}{1-n}}, \quad z = \sqrt{a}\,(1-n)(x\sinh C_1 \pm t\cosh C_1) + C_2,$$
$$A = -\frac{b}{a(n+1)}, \quad B = \pm\left[\frac{c}{an} - \frac{b^2}{a^2(n+1)^2}\right]^{1/2},$$

where C_1 and C_2 are arbitrary constants (the expressions in square brackets must be nonnegative).

2°. Traveling-wave solutions for $a < 0$:

$$w(x,t) = (A + B\cos z)^{\frac{1}{1-n}}, \quad z = \sqrt{|a|}\,(1-n)(x\sinh C_1 \pm t\cosh C_1) + C_2,$$
$$A = -\frac{b}{a(n+1)}, \quad B = \pm\left[\frac{b^2}{a^2(n+1)^2} - \frac{c}{an}\right]^{1/2},$$

where C_1 and C_2 are arbitrary constants.

3°. The substitution $u = w^{1-n}$ leads to an equation with a quadratic nonlinearity:

$$u\left(\frac{\partial^2 u}{\partial t^2} - \frac{\partial^2 u}{\partial x^2}\right) + \frac{n}{1-n}\left[\left(\frac{\partial u}{\partial t}\right)^2 - \left(\frac{\partial u}{\partial x}\right)^2\right] = a(1-n)u^2 + b(1-n)u + c(1-n).$$

7.1.2. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f(x,t,w)$

1. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + a(x^2 - t^2)w^k.$

This is a special case of equation 7.4.1.2 with $f(w) = aw^k$.

2. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + c(x + bt)^n w^k.$

This is a special case of equation 7.4.1.4 with $f(z,w) = cz^n w^k$. For $b = \pm 1$, see also equations 7.4.1.13 and 7.4.1.14 with $f(\xi) = c\xi^n$, $g(w) = w^k$.

3. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + a(x^2 - t^2)(xt)^n w^k.$

This is a special case of equation 7.4.1.5 with $f(z,w) = az^n w^k$.

4. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + ae^{\beta t} w^k.$

This is a special case of equation 7.4.1.7 with $f(w) = aw^k$.

Functional separable solutions:

$$w(x,t) = \left\{ C\exp\left[\frac{\beta(k-1)}{4(k+1)}(t \pm x)\right] + \frac{\sqrt{a}}{\beta}(1-k)e^{\beta t/2} \right\}^{\frac{2}{1-k}},$$

$$w(x,t) = \left\{ C\exp\left[\frac{\beta(k-1)}{4(k+1)}(t \pm x)\right] - \frac{\sqrt{a}}{\beta}(1-k)e^{\beta t/2} \right\}^{\frac{2}{1-k}},$$

where C is an arbitrary constant.

5. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + aw + be^{\beta t} w^k.$

Functional separable solutions:

$$w(x,t) = \left\{ C\exp\left[\frac{k-1}{4\beta(k+1)}\left(\pm\sqrt{[\beta^2 - (k-1)^2 a][\beta^2 - (k+3)^2 a]}\,x + [\beta^2 + (k-1)(k+3)a]\,t\right)\right] + (k-1)\sqrt{\frac{b}{\beta^2 - (k-1)^2 a}}\,e^{\beta t/2} \right\}^{\frac{2}{1-k}},$$

$$w(x,t) = \left\{ C\exp\left[\frac{k-1}{4\beta(k+1)}\left(\pm\sqrt{[\beta^2 - (k-1)^2 a][\beta^2 - (k+3)^2 a]}\,x + [\beta^2 + (k-1)(k+3)a]\,t\right)\right] - (k-1)\sqrt{\frac{b}{\beta^2 - (k-1)^2 a}}\,e^{\beta t/2} \right\}^{\frac{2}{1-k}},$$

where C is an arbitrary constant.

⊙ *Reference*: A. D. Polyanin, A. V. Vyazmin, A. I. Zhurov, and D. A. Kazenin (1998).

6. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + e^{\beta t}(a + be^{\beta t})w^k.$

Functional separable solutions:

$$w(x,t) = \left\{ C\exp\left[\frac{\beta(k-1)}{2(k+1)}(t \pm x)\right] + \frac{1}{\beta\sqrt{b}}\left[a + \tfrac{1}{2}(1-k)be^{\beta t}\right]\right\}^{\frac{2}{1-k}},$$

$$w(x,t) = \left\{ C\exp\left[\frac{\beta(k-1)}{2(k+1)}(t \pm x)\right] - \frac{1}{\beta\sqrt{b}}\left[a + \tfrac{1}{2}(1-k)be^{\beta t}\right]\right\}^{\frac{2}{1-k}},$$

where C is an arbitrary constant.

⊙ *Reference*: A. D. Polyanin, A. V. Vyazmin, A. I. Zhurov, and D. A. Kazenin (1998).

7. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + \dfrac{\beta^2}{k^2+4}w + \left(a^2e^{2\beta t} + abke^{\beta t} - b^2\right)w^{-3}, \qquad k \neq 0.$

Functional separable solutions:

$$w(x,t) = \pm\sqrt{C\exp\left(\beta t + \frac{\beta k x}{\sqrt{k^2+4}}\right) + \frac{\sqrt{k^2+4}}{\beta}\left(\frac{2a}{k}e^{\beta t} + b\right)},$$

$$w(x,t) = \pm\sqrt{C\exp\left(\beta t - \frac{\beta k x}{\sqrt{k^2+4}}\right) + \frac{\sqrt{k^2+4}}{\beta}\left(\frac{2a}{k}e^{\beta t} + b\right)},$$

$$w(x,t) = \pm\sqrt{C\exp\left(\beta t + \frac{\beta k x}{\sqrt{k^2+4}}\right) - \frac{\sqrt{k^2+4}}{\beta}\left(\frac{2a}{k}e^{\beta t} + b\right)},$$

$$w(x,t) = \pm\sqrt{C\exp\left(\beta t - \frac{\beta k x}{\sqrt{k^2+4}}\right) - \frac{\sqrt{k^2+4}}{\beta}\left(\frac{2a}{k}e^{\beta t} + b\right)},$$

where C is an arbitrary constant.

⊙ *Reference*: A. D. Polyanin, A. V. Vyazmin, A. I. Zhurov, and D. A. Kazenin (1998).

8. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} - \dfrac{\beta^2}{k^2-4}w + \left(a^2e^{2\beta t} + abke^{\beta t} + b^2\right)w^{-3}, \quad |k| > 2.$

Functional separable solutions:

$$w(x,t) = \pm\sqrt{C\exp\left(\beta t + \frac{\beta k x}{\sqrt{k^2-4}}\right) + \frac{\sqrt{k^2-4}}{\beta}\left(\frac{2a}{k}e^{\beta t} + b\right)},$$

$$w(x,t) = \pm\sqrt{C\exp\left(\beta t - \frac{\beta k x}{\sqrt{k^2-4}}\right) + \frac{\sqrt{k^2-4}}{\beta}\left(\frac{2a}{k}e^{\beta t} + b\right)},$$

$$w(x,t) = \pm\sqrt{C\exp\left(\beta t + \frac{\beta k x}{\sqrt{k^2-4}}\right) - \frac{\sqrt{k^2-4}}{\beta}\left(\frac{2a}{k}e^{\beta t} + b\right)},$$

$$w(x,t) = \pm\sqrt{C\exp\left(\beta t - \frac{\beta k x}{\sqrt{k^2-4}}\right) - \frac{\sqrt{k^2-4}}{\beta}\left(\frac{2a}{k}e^{\beta t} + b\right)},$$

where C is an arbitrary constant.

⊙ *Reference*: A. D. Polyanin, A. V. Vyazmin, A. I. Zhurov, and D. A. Kazenin (1998).

9. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} - ae^{\beta x} w^k.$

This is a special case of equation 7.4.1.6 with $f(w) = -aw^k$.

Functional separable solutions:

$$w(x,t) = \left\{ C\exp\left[\frac{\beta(k-1)}{4(k+1)}(x \pm t)\right] + \frac{\sqrt{a}}{\beta}(1-k)e^{\beta x/2} \right\}^{\frac{2}{1-k}},$$

$$w(x,t) = \left\{ C\exp\left[\frac{\beta(k-1)}{4(k+1)}(x \pm t)\right] - \frac{\sqrt{a}}{\beta}(1-k)e^{\beta x/2} \right\}^{\frac{2}{1-k}},$$

where C is an arbitrary constant.

10. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} - aw - be^{\beta x} w^k.$

Functional separable solutions:

$$w(x,t) = \left\{ C\exp\left[\frac{k-1}{4\beta(k+1)}\left(\pm\sqrt{[\beta^2-(k-1)^2a][\beta^2-(k+3)^2a]}\,t \right.\right.\right.$$
$$\left.\left.\left. + [\beta^2+(k-1)(k+3)a]\,x\right)\right] + (k-1)\sqrt{\frac{b}{\beta^2-(k-1)^2a}}\,e^{\beta x/2} \right\}^{\frac{2}{1-k}},$$

$$w(x,t) = \left\{ C\exp\left[\frac{k-1}{4\beta(k+1)}\left(\pm\sqrt{[\beta^2-(k-1)^2a][\beta^2-(k+3)^2a]}\,t \right.\right.\right.$$
$$\left.\left.\left. + [\beta^2+(k-1)(k+3)a]\,x\right)\right] - (k-1)\sqrt{\frac{b}{\beta^2-(k-1)^2a}}\,e^{\beta x/2} \right\}^{\frac{2}{1-k}},$$

where C is an arbitrary constant.

11. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} - e^{\beta x}(a + be^{\beta x})w^k.$

Functional separable solutions:

$$w(x,t) = \left\{ C\exp\left[\frac{\beta(k-1)}{2(k+1)}(x \pm t)\right] + \frac{1}{\beta\sqrt{b}}\left[a + \tfrac{1}{2}(1-k)be^{\beta x}\right] \right\}^{\frac{2}{1-k}},$$

$$w(x,t) = \left\{ C\exp\left[\frac{\beta(k-1)}{2(k+1)}(x \pm t)\right] - \frac{1}{\beta\sqrt{b}}\left[a + \tfrac{1}{2}(1-k)be^{\beta x}\right] \right\}^{\frac{2}{1-k}},$$

where C is an arbitrary constant.

12. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + ce^{ax+bt} w^k.$

This is a special case of equation 7.4.1.8 with $f(w) = cw^k$.

7.1.3. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f\left(x, t, w, \dfrac{\partial w}{\partial x}\right)$

1. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{a}{x^n}\dfrac{\partial}{\partial x}\left(x^n \dfrac{\partial w}{\partial x}\right) + bw^m, \qquad a > 0.$

This equation can be rewritten in the equivalent form

$$\frac{\partial^2 w}{\partial t^2} = a\left(\frac{\partial^2 w}{\partial x^2} + \frac{n}{x}\frac{\partial w}{\partial x}\right) + bw^m.$$

For $n = 1$ and $n = 2$, this equation describes nonlinear waves with axial and central symmetry, respectively.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^2 w\big(\pm C_1^{k-1} x,\ \pm C_1^{k-1} t + C_2\big),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Functional separable solution:

$$w(x, t) = \left\{\frac{b(1-m)^2}{2a(2+n-nm)}\big[a(t+C)^2 - x^2\big]\right\}^{\frac{1}{1-m}}, \tag{1}$$

where C is an arbitrary constant.

3°. Solution (1) is a special case of the wider family of exact solutions

$$w = w(r), \qquad r^2 = A\big[a(t+C)^2 - x^2\big],$$

where the sign of A must coincide with that of the expression in square brackets, and the function $w = w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{n+1}{r}w'_r = \frac{b}{Aa}w^m. \tag{2}$$

The books by Polyanin and Zaitsev (1995, 2003) give more than 20 exact solutions to equation (2) for specific values of the parameters n and m.

4°. There is a self-similar solution of the form $w = t^{\frac{2}{1-m}} f(\xi)$, where $\xi = x/t$.

2. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + bw^m\dfrac{\partial w}{\partial x}.$

This is a special case of equation 7.4.2.3 with $f(w) = bw^m$.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1 w\big(C_1^m x + C_2,\ \pm C_1^m t + C_3\big),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Traveling-wave solution:

$$w(x,t)=\left[\frac{bm(x+\lambda t+C)}{(m+1)(a-\lambda^2)}\right]^{-1/m}, \tag{1}$$

where C and λ are arbitrary constants.

Solution (1) is a special case of the wider class of traveling-wave solutions

$$\int \frac{dw}{A+bw^{m+1}}=\frac{x+\lambda t+C}{(m+1)(\lambda^2-a)},$$

where A, C, and λ are arbitrary constants.

3°. There is a self-similar solution of the form $w=t^{-1/m}f(x/t)$.

3. $\dfrac{\partial^2 w}{\partial t^2}=a\dfrac{\partial^2 w}{\partial x^2}+b\left(\dfrac{\partial w}{\partial x}\right)^2+cw+s.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1=w(\pm x+C_1,\pm t+C_2)+C_3\cosh(kt)+C_4\sinh(kt) \quad \text{if } c=k^2>0,$$
$$w_2=w(\pm x+C_1,\pm t+C_2)+C_3\cos(kt)+C_4\sin(kt) \quad \text{if } c=-k^2<0,$$

where $C_1,\ldots,C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Generalized separable solution quadratic in x:

$$w(x,t)=-\frac{c}{4b}(\pm x+C_1t+C_2)^2+\frac{1}{2b}(a-C_1^2)-\frac{s}{c}+U(t),$$
$$U(t)=\begin{cases}C_3\cosh(kt)+C_4\sinh(kt) & \text{if } c=k^2>0,\\ C_3\cos(kt)+C_4\sin(kt) & \text{if } c=-k^2<0.\end{cases}$$

3°. For other solutions, see 7.4.2.4 with $f(t)=s$.

4. $\dfrac{\partial^2 w}{\partial t^2}=a\dfrac{\partial^2 w}{\partial x^2}+b\left(\dfrac{\partial w}{\partial x}\right)^2+cw+st^n.$

This is a special case of equation 7.4.2.4 with $f(t)=st^n$.

5. $\dfrac{\partial^2 w}{\partial t^2}=a\dfrac{\partial^2 w}{\partial x^2}+b\left(\dfrac{\partial w}{\partial x}\right)^2+cw+sx^n.$

This is a special case of equation 7.4.2.5 with $f(x)=sx^n$.

6. $\dfrac{\partial^2 w}{\partial t^2}=a\dfrac{\partial^2 w}{\partial x^2}+c\left(\dfrac{\partial w}{\partial x}\right)^2+bcw^2+kw+s.$

This is a special case of equation 7.4.2.10 with $f(t)=c$, $g(t)=k$, and $h(t)=s$.

Let A be a root of the quadratic equation $bcA^2 + kA + s = 0$.

1°. Suppose that $2Abc + k - ab = \sigma^2 > 0$. Then there are generalized separable solutions

$$w(x,t) = A + \big[C_1 \exp(\sigma t) + C_2 \exp(-\sigma t)\big] \exp\big(\pm x\sqrt{-b}\,\big),$$

where C_1 and C_2 are arbitrary constants.

2°. If $2Abc + k - ab = -\sigma^2 < 0$, there are generalized separable solutions

$$w(x,t) = A + \big[C_1 \cos(\sigma t) + C_2 \sin(\sigma t)\big] \exp\big(\pm x\sqrt{-b}\,\big).$$

For more complicated solutions, see 7.4.2.10.

⊙ *References for equation* 7.1.3.6: V. A. Galaktionov (1995, the case $a = c$ was considered), V. F. Zaitsev and A. D. Polyanin (1996, p. 448).

7. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + bx^n\left(\dfrac{\partial w}{\partial x}\right)^2 + cx^m + st^k.$

This is a special case of equation 7.4.2.8 with $f(x) = bx^n$, $g(x) = cx^m$, and $h(t) = st^k$.

8. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + ct^n\left(\dfrac{\partial w}{\partial x}\right)^2 + bct^n w^2 + st^m w + pt^k.$

This is a special case of equation 7.4.2.10 with $f(t) = ct^n$, $g(t) = st^m$, and $h(t) = pt^k$.

9. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + bt^n\left(\dfrac{\partial w}{\partial x}\right)^2 + ct^k x\dfrac{\partial w}{\partial x}.$

There is a generalized separable solution quadratic in x:

$$w = \varphi(t)x^2 + \psi(t)x + \chi(t).$$

10. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + bw\left(\dfrac{\partial w}{\partial x}\right)^2 + cw^3 + sw.$

1°. Multiplicative separable solutions with $bc < 0$:

$$w = \begin{cases} \left[C_1 \exp(kt) + C_2 \exp(-kt)\right] \exp\left(\pm\sqrt{-\dfrac{c}{b}}\,x\right) & \text{if } s - \dfrac{ac}{b} = k^2 > 0, \\ \left[C_1 \cos(kt) + C_2 \sin(kt)\right] \exp\left(\pm\sqrt{-\dfrac{c}{b}}\,x\right) & \text{if } s - \dfrac{ac}{b} = -k^2 < 0, \end{cases}$$

where C_1 and C_2 are arbitrary constants.

Remark. The more general equation

$$w_{tt} = aw_{xx} + f(w)\big(bw_x^2 + cw^2\big) + sw,$$

where $f(w)$ is an arbitrary function, has the same solutions.

2°. Generalized separable solution with $bc < 0$ (generalizes the solutions of Item 1°):

$$w = \varphi(t)\exp\bigl(x\sqrt{|c/b|}\,\bigr) + \psi(t)\exp\bigl(-x\sqrt{|c/b|}\,\bigr),$$

where the functions $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are determined by the autonomous system of ordinary differential equations

$$\varphi''_{tt} = \left(s - \frac{ac}{b}\right)\varphi + 4c\varphi^2\psi,$$
$$\psi''_{tt} = \left(s - \frac{ac}{b}\right)\psi + 4c\varphi\psi^2.$$

3°. Generalized separable solution with $bc > 0$:

$$w = \varphi(t)\cos\bigl(x\sqrt{c/b}\,\bigr) + \psi(t)\sin\bigl(x\sqrt{c/b}\,\bigr),$$

where the functions $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are determined by the autonomous system of ordinary differential equations

$$\varphi''_{tt} = \left(s - \frac{ac}{b}\right)\varphi + c(\varphi^2 + \psi^2)\varphi,$$
$$\psi''_{tt} = \left(s - \frac{ac}{b}\right)\psi + c(\varphi^2 + \psi^2)\psi.$$

7.1.4. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = f(x)\dfrac{\partial^2 w}{\partial x^2} + g\left(x, t, w, \dfrac{\partial w}{\partial x}\right)$

1. $\dfrac{\partial^2 w}{\partial t^2} = a(x+\beta)^n \dfrac{\partial^2 w}{\partial x^2} + bw^m, \qquad a > 0.$

This equation describes the propagation of nonlinear waves in an inhomogeneous medium.

1°. Functional separable solution for $n \neq 2$:

$$w(x,t) = \Bigl\{ s\bigl[a(2-n)^2(t+C)^2 - 4(x+\beta)^{2-n}\bigr]\Bigr\}^{\frac{1}{1-m}}, \qquad s = \frac{b(1-m)^2}{2a(2-n)(nm-3n+4)},$$

where C is an arbitrary constant.

2°. Functional separable solution (generalizes the solution of Item 1°):

$$w = w(r), \qquad r^2 = k\left[\frac{1}{4}(t+C)^2 - \frac{(x+\beta)^{2-n}}{a(2-n)^2}\right],$$

where k and the expression in square brackets must have like signs, and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{2(1-n)}{2-n}\frac{1}{r}w'_r = \frac{4b}{k}w^m. \tag{1}$$

The substitution $\xi = r^{\frac{n}{2-n}}$ leads to the Emden–Fowler equation

$$w''_{\xi\xi} = \frac{4b(2-n)^2}{kn^2}\xi^{\frac{4(1-n)}{n}}w^m. \tag{2}$$

The book by Polyanin and Zaitsev (2003) presents more than 20 exact solutions to equation (2) for specific values of the parameters n and m.

Special case. For $n = 1$, the general solution of equation (1) is written in explicit form as

$$\int \left[C_1 + \frac{8b}{k(m+1)} w^{m+1}\right]^{-1/2} dw = \pm r + C_2,$$

where C_1 and C_2 are arbitrary constants.

3°. Solution for $n = 2$:

$$w = w(y), \quad y = At + B\ln|x + \beta|,$$

where A and B are arbitrary constants, and the function $w = w(y)$ is determined by the autonomous ordinary differential equation

$$(aB^2 - A^2)w''_{yy} - aBw'_y + bw^m = 0. \tag{3}$$

The solution of equation (3) with $A = \pm B\sqrt{a}$ is given by

$$w(y) = \left[\frac{b(1-m)}{aB} y + C\right]^{\frac{1}{1-m}},$$

where C is an arbitrary constant.

For $A \neq \pm B\sqrt{a}$, the substitution $U(w) = \dfrac{aB^2 - A^2}{aB} w'_y$ brings (3) to the Abel equation

$$UU'_w - U = \frac{b(A^2 - aB^2)}{a^2B^2} w^m,$$

whose general solutions for $m = -2, -1, -\frac{1}{2}, 0, 1$ can be found in Polyanin and Zaitsev (2003).

4°. There is a self-similar solution of the form $w = t^{\frac{2}{1-m}} f(\xi)$, where $\xi = (x + \beta)t^{\frac{2}{n-2}}$.

⊙ *Reference for equation* 7.1.4.1: V. F. Zaitsev and A. D. Polyanin (1996, p. 444).

2. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ax^n \dfrac{\partial w}{\partial x}\right) + bw^m, \qquad a > 0.$

This equation describes the propagation of nonlinear waves in an inhomogeneous medium.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1 w\left(C_1^{\frac{m-1}{2-n}} x, \pm C_1^{\frac{m-1}{2}} t + C_2\right),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Functional separable solution for $n \neq 2$:

$$w(x,t) = \left\{s\left[a(2-n)^2(t+C)^2 - 4x^{2-n}\right]\right\}^{\frac{1}{1-m}}, \qquad s = \frac{b(1-m)^2}{2a(2-n)(4-n-nm)},$$

where C is an arbitrary constant.

3°. Functional separable solution (generalizes the solution of Item 2°):

$$w = w(r), \qquad r^2 = k\left[\frac{1}{4}(t+C)^2 - \frac{x^{2-n}}{a(2-n)^2}\right],$$

where k and the expression in square brackets must have like signs, and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{2}{2-n}\frac{1}{r}w'_r = \frac{4b}{k}w^m.$$

The substitution $\xi = r^{\frac{n}{n-2}}$ leads to the Emden–Fowler equation

$$w''_{\xi\xi} = \frac{4b(2-n)^2}{kn^2}\xi^{-\frac{4}{n}}w^m. \tag{1}$$

The book by Polyanin and Zaitsev (2003) presents more than 20 exact solutions to equation (1) for specific values of the parameters n and m.

4°. Solution for $n = 2$:

$$w = w(z), \quad z = At + B\ln|x|,$$

where A and B are arbitrary constants, and the function $w = w(z)$ is determined by the autonomous ordinary differential equation

$$(aB^2 - A^2)w''_{zz} + aBw'_z + bw^m = 0. \tag{2}$$

The solution of equation (2) with $A = \pm B\sqrt{a}$ is given by

$$w(z) = \left[\frac{b(m-1)}{aB}z + C\right]^{\frac{1}{1-m}},$$

where C is an arbitrary constant.

For $A \neq \pm B\sqrt{a}$, the substitution $U(w) = \dfrac{A^2 - aB^2}{aB}w'_z$ brings (2) to the Abel equation

$$UU'_w - U = \frac{b(A^2 - aB^2)}{a^2B^2}w^m,$$

whose exact solutions for $m = -2, -1, -\frac{1}{2}, 0, 1$ can be found in Polyanin and Zaitsev (1995, 2003).

5°. There is a self-similar solution of the form $w = t^{\frac{2}{1-m}}f(\xi)$, where $\xi = xt^{\frac{2}{n-2}}$.

⊙ *Reference for equation* 7.1.4.2: V. F. Zaitsev and A. D. Polyanin (1996, pp. 445–446).

3. $\dfrac{\partial^2 w}{\partial t^2} = ax^n\dfrac{\partial^2 w}{\partial x^2} + bx^{n-1}w^m\dfrac{\partial w}{\partial x}, \qquad a > 0.$

This is a special case of equation 7.4.3.5 with $f(w) = bw^m$.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the functions

$$w_1 = w(C_1^2 x,\ \pm C_1^{2-n} t + C_2),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Functional separable solution for $n \neq 2$:

$$w = w(z), \quad z = \left|a(2-n)^2(t+C)^2 - 4x^{2-n}\right|^{1/2},$$

where C is an arbitrary constant, and the function $w = w(z)$ is determined by the ordinary differential equation

$$w''_{zz} + \frac{2}{a(2-n)z}\left[a(1-n) + bw^m\right]w'_z = 0. \tag{1}$$

The substitution $u(w) = zw'_z$ leads equation (1) to a first-order separable ordinary differential equation. Integrating yields a solution in implicit form:

$$\int \frac{dw}{anw - \dfrac{2b}{m+1}w^{m+1} + C_1} = \frac{1}{a(2-n)}\ln z + C_2,$$

where C_1 and C_2 are arbitrary constants.

3°. There is a self-similar solution of the form

$$w = U(\zeta), \quad \zeta = xt^{\frac{2}{n-2}}.$$

4°. Solution for $n = 2$:

$$w = w(\xi), \quad z = At + B\ln|x| + C,$$

where A, B, and C are arbitrary constants, and the function $w = w(\xi)$ is determined by the autonomous ordinary differential equation

$$(aB^2 - A^2)w''_{\xi\xi} + B(bw^m - a)w'_\xi = 0.$$

Integrating yields

$$\int \frac{dw}{bw^{m+1} - a(m+1)w + C_1} = -\frac{B\xi}{(m+1)(aB^2 - A^2)}.$$

4. $\dfrac{\partial^2 w}{\partial t^2} = ax^n\dfrac{\partial^2 w}{\partial x^2} + bx^{n-1}w^m\dfrac{\partial w}{\partial x} + cw^k, \qquad a > 0.$

This is a special case of equation 7.4.3.6 with $f(w) = bw^m$ and $g(w) = cw^k$.

5. $\dfrac{\partial^2 w}{\partial t^2} = ae^{\lambda x}\dfrac{\partial^2 w}{\partial x^2} + cw^m, \qquad a > 0.$

This is an equation of the propagation of nonlinear waves in an inhomogeneous medium. This is a special case of equation 7.4.3.9 with $b = 0$ and $f(w) = cw^m$.

6. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ae^{\lambda x}\dfrac{\partial w}{\partial x}\right) + cw^m.$

This is a special case of equation 7.4.3.9 with $b = a\lambda$ and $f(w) = cw^m$.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1 w\Big(x + \frac{1-m}{\lambda}\ln C_1,\ \pm C_1^{\frac{m-1}{2}} t + C_2\Big),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Functional separable solution for $m \neq \pm 1$ and $\lambda \neq 0$:

$$w = \left[-\frac{c(m-1)^2}{2k(1+m)}(r + C_1)^2\right]^{\frac{1}{1-m}}, \qquad r^2 = 4k\left[\frac{e^{-\lambda x}}{a\lambda^2} - \frac{1}{4}(t + C_2)^2\right],$$

where C_1, C_2, and k are arbitrary constants.

3°. Functional separable solution for $\lambda \neq 0$ (generalizes the solution of Item 2°):

$$w = w(r), \qquad r^2 = 4k\left[\frac{e^{-\lambda x}}{a\lambda^2} - \frac{1}{4}(t + C)^2\right],$$

where the function $w(r)$ is determined by the autonomous ordinary differential equation

$$w''_{rr} + ck^{-1}w^m = 0.$$

Integrating yields the general solution in implicit form

$$\int\left[C_1 - \frac{2c}{k(m+1)}w^{m+1}\right]^{-1/2} dw = C_2 \pm r,$$

where C_1 and C_2 are arbitrary constants.

4°. There is an exact solution of the form

$$w(x,t) = |t|^{\frac{2}{1-m}} F(z), \qquad z = x + \frac{2}{\lambda}\ln|t|.$$

7. $\dfrac{\partial^2 w}{\partial t^2} = ae^{\lambda x}\dfrac{\partial^2 w}{\partial x^2} + be^{\lambda x}\dfrac{\partial w}{\partial x} + cw^m, \qquad a > 0.$

Functional separable solution:

$$w = w(z), \qquad z = \left[4ke^{-\lambda x} - ak\lambda^2(t + C)^2\right]^{1/2}, \qquad k = \pm 1,$$

where C is an arbitrary constant, and the function $w = w(z)$ is determined by the ordinary differential equation

$$w''_{zz} + \frac{2(a\lambda - b)}{a\lambda}\frac{1}{z}w'_z + \frac{c}{ak\lambda^2}w^m = 0. \tag{1}$$

This equation has the exact solution

$$w(z) = \left\{ \frac{2k\lambda\big[a\lambda(m-3) + 2b(1-m)\big]}{c(1-m)^2 z^2} \right\}^{\frac{1}{m-1}}.$$

For $b = a\lambda$, the general solution of equation (1) is given in implicit form by

$$\int \left[C_1 - \frac{2c}{ak\lambda^2(m+1)} w^{m+1} \right]^{-1/2} dw = \pm z + C_2,$$

where C_1 and C_2 are arbitrary constants.

For $b \neq \frac{1}{2}a\lambda$, the substitution $\xi = z^{\frac{2b-a\lambda}{a\lambda}}$ brings (1) to the Emden–Fowler equation

$$w''_{\xi\xi} + \frac{ac}{k(2b-a\lambda)^2} \xi^{\frac{4(a\lambda-b)}{2b-a\lambda}} w^m = 0. \tag{2}$$

The book by Polyanin and Zaitsev (2003) presents more than 20 exact solutions to equation (2) for specific values of the parameter m.

8. $\dfrac{\partial^2 w}{\partial t^2} = ae^{\lambda x} \dfrac{\partial^2 w}{\partial x^2} + be^{\lambda x} w^n \dfrac{\partial w}{\partial x}, \qquad a > 0.$

This is a special case of equation 7.4.3.10 with $f(w) = bw^n$.

7.1.5. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = aw^n \dfrac{\partial^2 w}{\partial x^2} + f(x, w)$

1. $\dfrac{\partial^2 w}{\partial t^2} = aw \dfrac{\partial^2 w}{\partial x^2}.$

This is a special case of equation 7.1.5.5 with $n = 1$.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^2 C_2^2 w(\pm C_1^{-1} x + C_3, \pm C_2 t + C_4),$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Solutions:

$$w = C_1 xt + C_2 x + C_3 t + C_4,$$

$$w = \frac{3x^2 + C_1 x + C_2}{a(t + C_3)^2} + C_4 (x + C_5)(t + C_3)^3,$$

where $C_1, \ldots, C_5$ are arbitrary constants. The first solution is degenerate and the second one is a generalized separable solution.

3°. Solution:

$$w = U(z) + 4aC_1^2 t^2 + 4aC_1 C_2 t, \qquad z = x + aC_1 t^2 + aC_2 t,$$

where C_1 and C_2 are arbitrary constants and the function $U(z)$ is determined by the autonomous ordinary differential equation

$$(U - aC_2^2) U''_{zz} - 2C_1 U'_z = 8C_1^2.$$

4°. Generalized separable solution:

$$w = (x^2 + C_1 x + C_2) f(t) + (C_3 x + C_4) f(t) \int \frac{dt}{f^2(t)},$$

where $C_1, \ldots, C_4$ are arbitrary constants, and the function $f = f(t)$ is determined by the autonomous ordinary differential equation $f''_{tt} = 2af^2$.

5°. For other solutions, see 7.1.5.5 with $n = 1$.

⊙ *Reference for equation* 7.1.5.1: A. D. Polyanin and V. F. Zaitsev (2002, p. 129).

2. $\dfrac{\partial^2 w}{\partial t^2} = aw\dfrac{\partial^2 w}{\partial x^2} + b.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = \pm C_1^{-2} w(\pm C_1^2 x + C_2, C_1 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Solutions:

$$w = (C_1 t + C_2)x + \tfrac{1}{2}bt^2 + C_3 t + C_4,$$
$$w = \frac{3x^2}{at^2} + \Big(C_1 t^3 + \frac{C_2}{t^2}\Big)x + C_3 t^3 + \frac{C_4}{t^2} - \frac{1}{4}bt^2.$$

The first solution is degenerate and the second one is a generalized separable solution (another arbitrary constant can be added, since the equation is invariant under translation in t).

3°. Self-similar solution:

$$w(x,t) = t^2 u(\xi), \quad \xi = xt^{-2},$$

where the function $u = u(\xi)$ is determined by the ordinary differential equation

$$2u - 2\xi u'_\xi + 4\xi^2 u''_{\xi\xi} = auu''_{\xi\xi} + b.$$

4°. Solution:

$$w = U(z) + 4aC_1^2 t^2 + 4aC_1 C_2 t, \qquad z = x + aC_1 t^2 + aC_2 t,$$

where C_1 and C_2 are arbitrary constants and the function $U(z)$ is determined by the autonomous ordinary differential equation

$$(aU - a^2 C_2^2)U''_{zz} - 2aC_1 U'_z = 8aC_1^2 - b.$$

5°. The second solution in Item 2° is a special case of the generalized separable solution

$$w(x,t) = f(t)x^2 + g(t)x + h(t).$$

3. $\dfrac{\partial^2 w}{\partial t^2} = aw^4\dfrac{\partial^2 w}{\partial x^2} + bx^n w^5.$

This is a special case of equation 7.4.4.2 with $f(x) = bx^n$.

4. $\dfrac{\partial^2 w}{\partial t^2} = aw^4\dfrac{\partial^2 w}{\partial x^2} + be^{\lambda x} w^5.$

This is a special case of equation 7.4.4.2 with $f(x) = be^{\lambda x}$.

5. $\dfrac{\partial^2 w}{\partial t^2} = aw^n \dfrac{\partial^2 w}{\partial x^2}, \qquad a > 0.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = (C_2/C_1)^{2/n} w(\pm C_1 x + C_3, \pm C_2 t + C_4),$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Multiplicative separable solution:

$$w(x,t) = k(x + C_1)^{\frac{2}{n}} (At + C_2)^{-\frac{2}{n}}, \qquad k = \left[\frac{A^2(n+2)}{a(2-n)}\right]^{\frac{1}{n}}, \tag{1}$$

where A, C_1, and C_2 are arbitrary constants.

3°. Expression (1) is a special case of a wider family of multiplicative separable solutions

$$w = f(x)g(t),$$

where the functions $f = f(x)$ and $g = g(t)$ are determined by solving the equations

$$g''_{tt} - a\lambda g^{n+1} = 0, \tag{2}$$
$$f''_{xx} - \lambda f^{1-n} = 0. \tag{3}$$

The general solutions of equations (2) and (3) can be written out in implicit form:

$$\int \left(C_1 + \frac{2a\lambda}{n+2} g^{n+2}\right)^{-1/2} dg = C_2 \pm t,$$
$$\int \left(C_3 + \frac{2\lambda}{2-n} f^{2-n}\right)^{-1/2} df = C_4 \pm x,$$

where $C_1, \ldots, C_4$ are arbitrary constants.

In particular, with $C_1 = 0$, it follows that

$$g(t) = (At + C)^{-2/n}, \qquad A = \pm\sqrt{\frac{a\lambda n^2}{2(n+2)}}.$$

4°. There are also solutions with the following forms:

$$w(x,t) = (t + A)^{-\frac{2k+2}{n}} F(z), \quad z = (x + B)(t + A)^k;$$
$$w(x,t) = e^{-2\lambda t} U(y), \quad y = (x + A)e^{\lambda n t};$$
$$w(x,t) = (At + B)^{-2/n} V(\xi), \quad \xi = x + k\ln(At + B) + C,$$

where A, B, C, k, and λ are arbitrary constants.

7.1.6. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(w^n \dfrac{\partial w}{\partial x}\right)$

1. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right)$.

This is a special case of equation 7.1.6.4 with $n = 1$.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^2 C_2^2 w(\pm C_1^{-1}x + C_3, \pm C_2 t + C_4),$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Solutions:

$$w(x,t) = \tfrac{1}{2}aA^2t^2 + Bt + Ax + C,$$
$$w(x,t) = \tfrac{1}{12}aA^{-2}(At + B)^4 + Ct + D + x(At + B),$$
$$w(x,t) = \frac{1}{a}\left(\frac{x + A}{t + B}\right)^2,$$
$$w(x,t) = (At + B)\sqrt{Cx + D},$$
$$w(x,t) = \pm\sqrt{A(x + a\lambda t) + B} + a\lambda^2,$$

where A, B, C, D, and λ are arbitrary constants.

3°. Generalized separable solution quadratic in x:

$$w(x,t) = f(t)x^2 + g(t)x + h(t),$$

where the functions $f = f(t)$, $g = g(t)$, and $h = h(t)$ are determined by the autonomous system of ordinary differential equations

$$f''_{tt} = 6af^2,$$
$$g''_{tt} = 6afg,$$
$$h''_{tt} = 2afh + ag^2.$$

A particular solution of this system is given by

$$f = \frac{1}{at^2}, \quad g = \frac{C_1}{t^2} + C_2t^3, \quad h = \frac{aC_1^2}{4t^2} + \frac{C_3}{t} + C_4t^2 + \frac{1}{2}aC_1C_2t^3 + \frac{1}{54}aC_2^2t^8,$$

where $C_1, \ldots, C_4$ are arbitrary constants. Another arbitrary constant can be inserted in this solution through the shift in t.

4°. Solution:

$$w = U(z) + 4aC_1^2t^2 + 4aC_1C_2t, \qquad z = x + aC_1t^2 + aC_2t,$$

where C_1 and C_2 are arbitrary constants and the function $U(z)$ is determined by the first-order ordinary differential equation

$$(U - aC_2^2)U'_z - 2C_1U = 8C_1^2z + C_3.$$

By appropriate translations in both variables, the equation can be made homogeneous, and, hence, the equation is integrable by quadrature.

5°. Solution in implicit form:

$$x^2 = at^2w + C\Big(\frac{t}{aw}\Big)^{4/5}, \qquad t^2 = \frac{x^2}{aw} + C\Big(\frac{x}{a^2w^2}\Big)^{8/7},$$

where C is an arbitrary constant.

6°. For other exact solutions and linearization of this equation, see equation 7.4.4.6 with $f(w) = aw$.

⊙ *References for equation* 7.1.6.1: S. Tomotika and K. Tamada (1950), P. J. Olver and P. Rosenau (1986), M. F. Foursov and E. M. Vorob'ev (1996), G. I. Burde (2001), V. F. Zaitsev and A. D. Polyanin (2001), A. D. Polyanin and V. F. Zaitsev (2002, p. 129).

2. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(\dfrac{1}{w}\dfrac{\partial w}{\partial x}\right)$.

This is a special case of equation 7.1.6.4 with $n = -1$.

1°. Multiplicative separable solutions:

$$w(x,t) = (At + B)e^{Cx},$$
$$w(x,t) = (at^2 + At + B)(x + C)^{-2},$$
$$w(x,t) = (-aA^2t^2 + Bt + C)\cosh^{-2}(Ax + D),$$
$$w(x,t) = (aA^2t^2 + Bt + C)\sinh^{-2}(Ax + D),$$
$$w(x,t) = (aA^2t^2 + Bt + C)\cos^{-2}(Ax + D),$$

where A, B, C, and D are arbitrary constants.

2°. Traveling-wave solution in implicit form:

$$\lambda^2 w = ak^2 \ln|w| + C_1(kx + \lambda t) + C_2,$$

where C_1, C_2, k, and λ are arbitrary constants.

3°. For other exact solutions and linearization of this equation, see equation 7.4.4.6 with $f(w) = a/w$.

3. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(\dfrac{1}{\sqrt{w}}\dfrac{\partial w}{\partial x}\right)$.

This is a special case of equation 7.1.6.4 with $n = -1/2$.

1°. Solutions:

$$w(x,t) = \big(\tfrac{1}{2}A^2ax^2 + Bx + Aat + C\big)^2,$$
$$w(x,t) = \big[\tfrac{1}{12}A^{-2}a^{-1}(Ax + B)^4 + Cx + D + t(Ax + B)\big]^2,$$
$$w(x,t) = a^2\left(\frac{t + A}{x + B}\right)^4,$$
$$w(x,t) = (Ax + B)^2(Ct + D),$$
$$w(x,t) = \big[\pm\sqrt{A(t + \lambda x) + B} + a\lambda^2\big]^2,$$

where A, B, C, D, and λ are arbitrary constants.

2°. The substitution $w = u^2$ leads to an equation of the form 7.1.6.1:

$$\frac{\partial^2 u}{\partial x^2} = \frac{1}{a}\frac{\partial}{\partial t}\left(u\frac{\partial u}{\partial t}\right).$$

3°. For other exact solutions and linearization of this equation, see equation 7.4.4.6 with $f(w) = aw^{-1/2}$.

4. $\dfrac{\partial^2 w}{\partial t^2} = a^2\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right)$.

This equation is encountered in wave and gas dynamics. This is a special case of equation 7.4.4.6 with $f(w) = a^2 w^n$; consequently, the equation can be linearized.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the functions

$$w_1 = (C_2/C_1)^{2/n} w(\pm C_1 x + C_3, \pm C_2 t + C_4),$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Degenerate solution:

$$w = (At + B)(Cx + D)^{\frac{1}{n+1}},$$

where A, B, C, and D are arbitrary constants.

3°. Multiplicative separable solution:

$$w = f(x)g(t),$$

where $f = f(x)$ and $g = g(t)$ are defined implicitly by

$$\int\left(C_1 + \frac{2\lambda}{n+2}f^{n+2}\right)^{-1/2} f^n\,df = C_2 \pm x, \tag{1}$$

$$\int\left(C_3 + \frac{2a^2\lambda}{n+2}g^{n+2}\right)^{-1/2} dg = C_4 \pm t, \tag{2}$$

and $C_1, \ldots, C_4$ and λ are arbitrary constants.

The functions $f = f(x)$ and $g = g(t)$ defined by (1) and (2) can be represented in explicit form if $C_1 = 0$ and $C_3 = 0$. To the special case $C_1 = C_3 = 0$ there corresponds

$$w(x, t) = \left(\frac{\pm bx + c}{abt + s}\right)^{2/n}, \tag{3}$$

where b, c, and s are arbitrary constants.

4°. Traveling-wave solution:

$$w = w(z), \quad z = x \pm \lambda t,$$

where $w = w(z)$ is defined implicitly by (A and B are arbitrary constants)

$$\lambda^2 w - \frac{a^2}{n+1}w^{n+1} = Az + B. \tag{4}$$

If $n = -\frac{1}{2}$, 1, 2, or 3, equation (4) can be solved for w to give an explicit expression of $w = w(z)$.

5°. Self-similar solution:

$$w = w(\xi), \quad \xi = \frac{x + A}{t + B},$$

where the function $w(\xi)$ is determined by the first-order ordinary differential equation (C is an arbitrary constant):

$$\left(\xi^2 - a^2 w^n\right) w'_\xi = C. \tag{5}$$

To the special case $C = 0$ there corresponds the solution $w = (\xi/a)^{2/n}$; see formula (3). If $C \neq 0$, by treating w in (5) as the independent variable, one obtains a Riccati equation for $\xi = \xi(w)$:

$$C\xi'_w = \xi^2 - a^2 w^n. \tag{6}$$

The general solution of equation (6) is expressed in terms of Bessel functions; see Kamke (1977) and Polyanin and Zaitsev (1995, 2003).

6°. There are more complicated self-similar solutions of the form

$$w = (t + \beta)^{2k} F(z), \quad z = \frac{x + \alpha}{(t + \beta)^{nk+1}},$$

where α, β, and k are arbitrary constants, and the function $F = F(z)$ is determined by solving the generalized-homogeneous ordinary differential equation

$$2k(2k-1)F + (nk+1)(nk-4k+2)zF'_z + (nk+1)^2 z^2 F''_{zz} = a^2 (F^n F'_z)'_z.$$

Its order can be reduced.

7°. Generalized self-similar solution (μ is an arbitrary constant):

$$w = e^{-2\mu t}\varphi(y), \quad y = xe^{\mu n t},$$

where the function $\varphi = \varphi(y)$ is determined by solving the generalized-homogeneous ordinary differential equation

$$4\mu^2\varphi + \mu^2 n(n-4)y\varphi'_y + (\mu n)^2 y^2 \varphi''_{yy} = a^2(\varphi^n \varphi'_y)'_y.$$

Its order can be reduced.

8°. Solution (A, b, and c are arbitrary constants):

$$w = (\pm t + A)^{-2/n}\psi(u), \quad u = x + b\ln(\pm t + A) + c,$$

where the function $\psi = \psi(u)$ is determined by the autonomous ordinary differential equation

$$\frac{2(n+2)}{n^2}\psi - \frac{b(n+4)}{n}\psi'_u + b^2\psi''_{uu} = a^2(\psi^n \psi'_u)'_u. \tag{7}$$

Note two special cases where the equation obtained is integrable by quadrature. For $n = -2$, equation (7) admits a first integral that represents a separable equation. For $n = -4$, with the change of variable $G(\psi) = (\psi'_u)^2$, equation (7) can be reduced to a first-order linear equation.

In the general case, the change of variable $H(\psi) = \psi'_u$ brings (7) to a first-order equation.

9°. For $n \neq -1$, the transformation

$$\tau = x, \quad \zeta = t, \quad V = w^{n+1}$$

brings the original equation to an equation of the similar form

$$\frac{\partial^2 V}{\partial \tau^2} = a^{-2} \frac{\partial}{\partial \zeta} \left(V^{-\frac{n}{n+1}} \frac{\partial V}{\partial \zeta} \right).$$

For $n = -1$, the transformation

$$\tau = x, \quad \zeta = t, \quad V = \ln w$$

brings the original equation to an equation of the form 7.2.4.3:

$$\frac{\partial^2 V}{\partial \tau^2} = a^{-2} \frac{\partial}{\partial \zeta} \left(e^V \frac{\partial V}{\partial \zeta} \right).$$

10°. For other exact solutions of this equation, see equation 7.4.4.6 with $f(w) = aw^n$.

⊙ *References for equation* 7.1.6.4: W. F. Ames, R. J. Lohner, and E. Adams (1981), N. H. Ibragimov (1994, pp. 211–212), V. F. Zaitsev and A. D. Polyanin (1996, pp. 131–132; 2001).

7.1.7. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = a \dfrac{\partial}{\partial x} \left(w^n \dfrac{\partial w}{\partial x} \right) + bw^k$

1. $\dfrac{\partial^2 w}{\partial t^2} = a \dfrac{\partial}{\partial x} \left(w \dfrac{\partial w}{\partial x} \right) + b.$

This is a special case of equation 7.1.7.6 with $n = 1$, $k = 0$ and is a special case of equation 12.2.1.3 with $F(u, v) = au^2 + b$.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^{-2} w(\pm C_1^2 x + C_2, C_1 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Traveling-wave solution in implicit form:

$$ak^2 w^2 - 2\lambda^2 w = -b(kx + \lambda t)^2 + C_1(kx + \lambda t) + C_2,$$

where C_1, C_2, k, and λ are arbitrary constants.

3°. Self-similar solution:

$$w(x, t) = t^2 u(\xi), \quad \xi = xt^{-2},$$

where the function $u = u(\xi)$ is determined by the ordinary differential equation

$$2u - 2\xi u'_\xi + 4\xi^2 u''_{\xi\xi} = a(uu'_\xi)'_\xi + b.$$

4°. Solution:

$$w = U(z) + 4aC_1^2 t^2 + 4aC_1 C_2 t, \quad z = x + aC_1 t^2 + aC_2 t,$$

where C_1 and C_2 are arbitrary constants and the function $U(z)$ is determined by the first-order ordinary differential equation

$$(aU - a^2 C_2^2) U'_z - 2aC_1 U = (8aC_1^2 - b)z + C_3.$$

By appropriate translations in both variables, the equation can be made homogeneous, and, hence, the equation is integrable by quadrature.

5°. Generalized separable solution quadratic in x:

$$w(x,t) = f(t)x^2 + g(t)x + h(t),$$

where the functions $f = f(t)$, $g = g(t)$, and $h = h(t)$ are determined by the autonomous system of ordinary differential equations

$$f''_{tt} = 6af^2,$$
$$g''_{tt} = 6afg,$$
$$h''_{tt} = 2afh + ag^2 + b.$$

A particular solution of this system is given by

$$f = \frac{1}{at^2}, \quad g = \frac{C_1}{t^2} + C_2 t^3, \quad h = \frac{aC_1^2}{4t^2} + \frac{C_3}{t} + C_4 t^2 + \frac{1}{2}aC_1C_2t^3 + \frac{1}{54}aC_2^2t^8 + \frac{1}{9}bt^2\big(3\ln|t| - 1\big),$$

where $C_1, \ldots, C_4$ are arbitrary constants. Another arbitrary constant, C_5, can be inserted in the solution, by substituting $t + C_5$ for t, since the system is translation invariant in t.

⊙ *References for equation* 7.1.7.1: A. D. Polyanin and V. F. Zaitsev (2004, pp. 205–206), V. A. Galaktionov and S. R. Svirshchevskii (2007, p. 252).

2. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) + bw.$

This is a special case of equation 7.1.7.6 with $n = k = 1$.

1°. Generalized separable solution:

$$w = \varphi(t)(x + C_1)^2 + \psi(t),$$

where C_1 is an arbitrary constant and the functions $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are determined by the system of ordinary differential equations

$$\varphi'' = 6a\varphi^2 + b\varphi,$$
$$\psi'' = 2a\varphi\psi + b\psi.$$

A particular solution of this system is

$$\varphi = -\frac{b}{6a}, \quad \psi = \begin{cases} C_2\cosh\big(\sqrt{\frac{2}{3}b}\,t\big) + C_3\sinh\big(\sqrt{\frac{2}{3}b}\,t\big) & \text{if } b > 0, \\ C_2\cos\big(\sqrt{\frac{2}{3}|b|}\,t\big) + C_3\sin\big(\sqrt{\frac{2}{3}|b|}\,t\big) & \text{if } b < 0. \end{cases}$$

2°. Generalized separable solution:

$$w = \varphi(t)(x + C_1)^2 + \psi(t)\sqrt{x + C_1},$$

where C_1 is an arbitrary constant and the functions $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are determined by the system of ordinary differential equations

$$\varphi'' = 6a\varphi^2 + b\varphi,$$
$$\psi'' = \tfrac{15}{4}a\varphi\psi + b\psi.$$

A particular solution of this system is

$$\varphi = -\frac{b}{6a}, \quad \psi = \begin{cases} C_2\cosh\big(\sqrt{\frac{3}{8}b}\,t\big) + C_3\sinh\big(\sqrt{\frac{3}{8}b}\,t\big) & \text{if } b > 0, \\ C_2\cos\big(\sqrt{\frac{3}{8}|b|}\,t\big) + C_3\sin\big(\sqrt{\frac{3}{8}|b|}\,t\big) & \text{if } b < 0. \end{cases}$$

3. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(\dfrac{1}{\sqrt{w}}\dfrac{\partial w}{\partial x}\right) + b\sqrt{w}.$

This is a special case of equation 7.1.7.6 with $n = -\frac{1}{2}$, $k = \frac{1}{2}$ and is a special case of equation 7.1.8.4 with $n = -\frac{1}{2}$ and $c = 0$.

1°. Generalized separable solution:

$$w = [f(x)t^2 + g(x)t + h(x)]^2,$$

where the functions $f = f(x)$, $g = g(x)$, and $h = h(x)$ are determined by the system of ordinary differential equations

$$\begin{aligned} 2af''_{xx} + bf - 12f^2 &= 0,\\ 2ag''_{xx} + bg - 12fg &= 0,\\ 2ah''_{xx} + bh - 4fh - 2g^2 &= 0. \end{aligned}$$

The first equation has two constant particular solutions, $f = 0$ and $f = \frac{1}{12}c$. In these cases, the other two equations are linear and have constant coefficients and, hence, are easy to integrate—their solutions are expressed in terms of exponentials or sines and cosines.

2°. Multiplicative separable solution:

$$w = \varphi(t)\psi^2(x),$$

where the functions $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are determined by the autonomous system of ordinary differential equations

$$\varphi''_{tt} = C_1\sqrt{\varphi}, \qquad 2a\psi''_{xx} + b\psi = C_1\psi^2,$$

with C_1 being an arbitrary constant. The general solutions to the equations for the functions φ and ψ can be written out in implicit form. A particular solution is $\varphi = \frac{1}{144}C_1^2(t + C_2)^4$.

4. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + bw.$

This is a special case of equation 7.1.7.6 with $k = 1$.

1°. Multiplicative separable solutions:

$$\begin{aligned} w &= \left(A_1e^{\lambda t} + A_2e^{-\lambda t}\right)\left(B_1x + B_2\right)^{\frac{1}{n+1}} && \text{if} \quad b = \lambda^2 > 0,\\ w &= \left[A_1\cos(\lambda t) + A_2\sin(\lambda t)\right]\left(B_1x + B_2\right)^{\frac{1}{n+1}} && \text{if} \quad b = -\lambda^2 < 0, \end{aligned}$$

where A_1, A_2, B_1, and B_2 are arbitrary constants.

2°. Multiplicative separable solution:

$$w = \varphi(x)\psi(t),$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(t)$ are determined by the autonomous ordinary differential equations (K is an arbitrary constant)

$$\begin{aligned} a(\varphi^n\varphi'_x)'_x + K\varphi &= 0,\\ \psi''_{tt} - b\psi + K\psi^{n+1} &= 0. \end{aligned}$$

5. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + bw^{n+1}.$

This is a special case of equation 7.1.7.6 with $k = n + 1$.

1°. Multiplicative separable solutions:

$$w = \big(A_1 t + A_2\big)\big[B_1\cos(kx) + B_2\sin(kx)\big]^{\frac{1}{n+1}} \quad \text{if} \quad b(n+1)/a = k^2 > 0,$$
$$w = \big(A_1 t + A_2\big)\big(B_1 e^{kx} + B_2 e^{-kx}\big)^{\frac{1}{n+1}} \quad \text{if} \quad b(n+1)/a = -k^2 < 0,$$

where A_1, A_2, B_1, and B_2 are arbitrary constants.

2°. Multiplicative separable solution:

$$w = \varphi(x)\psi(t),$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(t)$ are determined by the autonomous ordinary differential equations (K is an arbitrary constant)

$$a(\varphi^n\varphi'_x)'_x + b\varphi^{n+1} + K\varphi = 0,$$
$$\psi''_{tt} + K\psi^{n+1} = 0.$$

6. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + bw^k.$

1°. Suppose $w(x, t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^2 w(\pm C_1^{k-n-1}x + C_2, \pm C_1^{k-1}t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solution:

$$w(x, t) = w(z), \quad z = \beta x + \lambda t,$$

where β and λ are arbitrary constants and the function $w = w(z)$ is determined by the autonomous ordinary differential equation

$$[(a\beta^2 w^n - \lambda^2)w'_z]'_z + bw^k = 0,$$

whose general solution can be represented in implicit form.

3°. Self-similar solution with $k \neq 1$:

$$w(x, t) = t^{\frac{2}{1-k}}U(\xi), \quad \xi = xt^{\frac{k-n-1}{1-k}},$$

where the function $U = U(\xi)$ is determined by the ordinary differential equation

$$\frac{2(1+k)}{(1-k)^2}U + \frac{(k-n-1)(2k-n+2)}{(1-k)^2}\xi U'_\xi + \frac{(k-n-1)^2}{(1-k)^2}\xi^2 U''_{\xi\xi} = a(U^n U'_\xi)'_\xi + bU^k.$$

4°. For $k = 1$ and $k = n + 1$ see also equations 7.1.7.4 and 7.1.7.5.

7.1.8. Equations of the Form

$$\frac{\partial^2 w}{\partial t^2} = a\frac{\partial}{\partial x}\left(w^n \frac{\partial w}{\partial x}\right) + b_1 w^{k_1} + b_2 w^{k_2} + b_3 w^{k_3}$$

▷ *Equations of this form admit traveling-wave solutions* $w = w(\beta x + \lambda t)$.

1. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(\dfrac{1}{\sqrt{w}}\dfrac{\partial w}{\partial x}\right) + b + c\sqrt{w}.$

Generalized separable solution:

$$w = [f(x)t^2 + g(x)t + h(x)]^2,$$

where the functions $f = f(x)$, $g = g(x)$, and $h = h(x)$ are determined by the system of ordinary differential equations

$$\begin{aligned} 2af''_{xx} + cf - 12f^2 &= 0,\\ 2ag''_{xx} + cg - 12fg &= 0,\\ 2ah''_{xx} + ch + b - 4fh - 2g^2 &= 0. \end{aligned}$$

The first equation has two constant particular solutions, $f = 0$ and $f = \frac{1}{12}c$. In these cases, the other two equations are linear and have constant coefficients and, hence, are easy to integrate—their solutions are expressed in terms of exponentials or sines and cosines.

Remark. The constants a, b, and c in the original equation can be replaced by arbitrary functions $a = a(x)$, $b = b(x)$, and $c = c(x)$.

2. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(\dfrac{1}{\sqrt{w}}\dfrac{\partial w}{\partial x}\right) + b + cw + d\sqrt{w}.$

1°. Generalized separable solution for $c > 0$:

$$w = \left[f(x)\exp\left(\tfrac{1}{2}\sqrt{c}\,t\right) + g(x)\exp\left(-\tfrac{1}{2}\sqrt{c}\,t\right) + h(x)\right]^2,$$

where the functions $f = f(x)$, $g = g(x)$, and $h = h(x)$ are determined by the system of ordinary differential equations

$$\begin{aligned} 2af''_{xx} + \tfrac{3}{2}cfh + df &= 0,\\ 2ag''_{xx} + \tfrac{3}{2}cgh + dg &= 0,\\ 2ah''_{xx} + ch^2 + dh + b + 2cfg &= 0. \end{aligned}$$

2°. Generalized separable solution for $c < 0$:

$$w = \left[f(x)\cos\left(\tfrac{1}{2}\sqrt{|c|}\,t\right) + g(x)\sin\left(\tfrac{1}{2}\sqrt{|c|}\,t\right) + h(x)\right]^2,$$

where the functions $f = f(x)$, $g = g(x)$, and $h = h(x)$ are determined by the system of ordinary differential equations

$$\begin{aligned} 2af''_{xx} + \tfrac{3}{2}cfh + df &= 0,\\ 2ag''_{xx} + \tfrac{3}{2}cgh + dg &= 0,\\ 2ah''_{xx} + ch^2 + dh + b + \tfrac{1}{2}c(\varphi^2 + \psi^2) &= 0. \end{aligned}$$

Remark. The constants a, b, and d in the original equation can be replaced by arbitrary functions $a = a(x)$, $b = b(x)$, and $d = d(x)$.

3. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(w^{-2/3}\dfrac{\partial w}{\partial x}\right) + b + cw^{1/3}.$

Generalized separable solution:

$$w = [f(x)t + g(x)]^3,$$

where the functions $f = f(x)$ and $g = g(x)$ are determined by the system of ordinary differential equations

$$3af''_{xx} + cf - 6f^3 = 0,$$
$$3ag''_{xx} + cg + b - 6f^2 g = 0.$$

Remark. The constants a, b, and c in the original equation can be replaced by arbitrary functions $a = a(x)$, $b = b(x)$, and $c = c(x)$.

⊙ *Reference*: V. A. Galaktionov and S. R. Svirshchevskii (2007, p. 282).

4. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + bw^{n+1} + cw.$

1°. Multiplicative separable solutions for $c = \lambda^2 > 0$:

$$w = \left(A_1 e^{\lambda t} + A_2 e^{-\lambda t}\right)\left[B_1\cos(kx) + B_2\sin(kx)\right]^{\frac{1}{n+1}} \quad \text{if} \quad b(n+1)/a = k^2 > 0,$$
$$w = \left(A_1 e^{\lambda t} + A_2 e^{-\lambda t}\right)\left(B_1 e^{kx} + B_2 e^{-kx}\right)^{\frac{1}{n+1}} \quad \text{if} \quad b(n+1)/a = -k^2 < 0,$$

where A_1, A_2, B_1, and B_2 are arbitrary constants.

2°. Multiplicative separable solutions for $c = -\lambda^2 < 0$:

$$w = \left[A_1\cos(\lambda t) + A_2\sin(\lambda t)\right]\left[B_1\cos(kx) + B_2\sin(kx)\right]^{\frac{1}{n+1}} \quad \text{if} \quad b(n+1)/a = k^2 > 0,$$
$$w = \left[A_1\cos(\lambda t) + A_2\sin(\lambda t)\right]\left(B_1 e^{kx} + B_2 e^{-kx}\right)^{\frac{1}{n+1}} \quad \text{if} \quad b(n+1)/a = -k^2 < 0,$$

where A_1, A_2, B_1, and B_2 are arbitrary constants.

3°. Multiplicative separable solution:

$$w = \varphi(x)\psi(t),$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(t)$ are determined by the autonomous ordinary differential equations (K is an arbitrary constant)

$$a(\varphi^n\varphi'_x)'_x + b\varphi^{n+1} + K\varphi = 0,$$
$$\psi''_{tt} - c\psi + K\psi^{n+1} = 0.$$

5. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) - bw^{-2n-1} + c.$

1°. Functional separable solutions with $n \neq -1$:

$$\frac{a}{n+1}w^{n+1} = \pm a\sqrt{\frac{b}{n}}\,t - \frac{c}{2}x^2 + Ax + B,$$

where A and B are arbitrary constants and $bn > 0$.

2°. Functional separable solutions with $n = -1$ and $b < 0$:

$$a\ln|w| = \pm a\sqrt{-b}\,t - \frac{c}{2}x^2 + Ax + B,$$

7.1.9. Other Equations

1. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) + b\left(\dfrac{\partial w}{\partial x}\right)^2 + cw + d.$

1°. Generalized separable solution:

$$w = \varphi_0(t) + \varphi_1(t)x + \varphi_2(t)x^2,$$

where the functions $\varphi_n = \varphi_n(t)$ are determined by the system of ordinary differential equations

$$\varphi_0' = 2a\varphi_0\varphi_2 + (a+b)\varphi_1^2 + c\varphi_0 + d,$$
$$\varphi_1' = 2(3a+2b)\varphi_1\varphi_2 + c\varphi_1,$$
$$\varphi_2' = 2(3a+2b)\varphi_2^2 + c\varphi_2.$$

This system is easy to integrate in reverse order, starting from the last equation.

2°. For $d = 0$, there is the multiplicative separable solution:

$$w = \varphi(t)\psi(x),$$

where the functions $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are determined by the ordinary differential equations

$$\varphi'' - c\varphi + A\varphi^2 = 0,$$
$$a\psi\psi'' + (a+b)(\psi')^2 + A\psi = 0,$$

with A being an arbitrary constant.

3°. There is the traveling-wave solution, $w = w(kx + \lambda t)$.

4°. For $c = 0$, see equation 7.1.9.2 with $n = 2$, where the constants b and c must be renamed.

⊙ *Reference for equation* 7.1.9.1: V. A. Galaktionov and S. R. Svirshchevskii (2007, p. 256).

2. $\dfrac{\partial^2 w}{\partial t^2} = aw\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^n + c.$

This is a special case of equation 12.2.1.3 with $F(u, v) = bu^n + c$.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^{-2} w(\pm C_1^2 x + C_2, C_1 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Self-similar solution:

$$w(x, t) = t^2 u(\xi), \quad \xi = xt^{-2},$$

where the function $u = u(\xi)$ is determined by the ordinary differential equation

$$2u - 2\xi u_\xi' + 4\xi^2 u_{\xi\xi}'' = a(uu_\xi')_\xi' + b(u_\xi')^n + c.$$

3°. Solution:

$$w = U(z) + 4aC_1^2 t^2 + 4aC_1C_2 t, \quad z = x + aC_1 t^2 + aC_2 t,$$

where C_1 and C_2 are arbitrary constants and the function $U(z)$ is determined by the autonomous ordinary differential equation

$$(aU - a^2C_2^2)U_{zz}'' + b(U_z')^n - 2aC_1U_z' = 8aC_1^2 - c.$$

3. $\dfrac{\partial^2 w}{\partial t^2} = w^2\dfrac{\partial^2 w}{\partial x^2} - \dfrac{1}{2}w\left(\dfrac{\partial w}{\partial x}\right)^2 + aw + b.$

1°. Generalized separable solution:

$$w = \varphi_2(t)x^2 + \varphi_1(t)x + \varphi_0(t),$$

where the functions $\varphi_n(t)$ are determined by the autonomous system of ordinary differential equations

$$\begin{aligned}
\varphi_2'' &= \varphi_2\left(2\varphi_0\varphi_2 - \tfrac{1}{2}\varphi_1^2\right) + a\varphi_2,\\
\varphi_1'' &= \varphi_1\left(2\varphi_0\varphi_2 - \tfrac{1}{2}\varphi_1^2\right) + a\varphi_1,\\
\varphi_0'' &= \varphi_0\left(2\varphi_0\varphi_2 - \tfrac{1}{2}\varphi_1^2\right) + a\varphi_0 + b.
\end{aligned}$$

Remark. The parameters a and b in the equation concerned can be replaced by arbitrary functions, $a = a(t)$ and $b = b(t)$.

2°. There is the traveling-wave solution, $w = w(kx + \lambda t)$.

⊙ *Reference for equation* 7.1.9.3: V. A. Galaktionov and S. R. Svirshchevskii (2007, p. 22).

4. $\dfrac{\partial^2 w}{\partial t^2} = aw^2\dfrac{\partial^2 w}{\partial x^2} - \dfrac{1}{2}aw\left(\dfrac{\partial w}{\partial x}\right)^2 + \dfrac{1}{2}aw^3 + bw + c.$

For $a = 2$, $b = c = 0$, this equation describes short-wave excitations of a nonlinear model, where each atom in a lattice interacts with its neighbors by anharmonic forces.

1°. Generalized separable solution:

$$w = \varphi_1(t) + \varphi_2(t)\cos x + \varphi_3(t)\sin x,$$

where the functions $\varphi_n = \varphi_n(t)$ are determined by the system of ordinary differential equations

$$\begin{aligned}
\varphi_1'' &= \tfrac{1}{2}a\varphi_1(\varphi_1^2 - \varphi_2^2 - \varphi_3^2) + b\varphi_1 + c,\\
\varphi_2'' &= \tfrac{1}{2}a\varphi_2(\varphi_1^2 - \varphi_2^2 - \varphi_3^2) + b\varphi_2,\\
\varphi_3'' &= \tfrac{1}{2}a\varphi_3(\varphi_1^2 - \varphi_2^2 - \varphi_3^2) + b\varphi_3.
\end{aligned}$$

Remark. The parameters a, b, and c in the equation concerned can be replaced by arbitrary functions, $a = a(t)$, $b = b(t)$, and $c = c(t)$.

2°. There is the traveling-wave solution, $w = w(kx + \lambda t)$.

3°. For $c = 0$, there is the multiplicative separable solution

$$w = \varphi(t)\psi(x),$$

where the functions $\varphi = \varphi(t)$ and $\psi = \psi(x)$ are determined by the ordinary differential equations

$$\begin{aligned}
\varphi_{tt}'' - b\varphi + aC\varphi^3 &= 0,\\
\psi^2\psi_{xx}'' - \tfrac{1}{2}\psi(\psi_x')^2 + \tfrac{1}{2}\psi^3 + C\psi &= 0,
\end{aligned}$$

with C being an arbitrary constant.

⊙ *References for equation* 7.1.9.4: Y. Kivshar (1994), V. A. Galaktionov and S. R. Svirshchevskii (2007, pp. 251–252).

5. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[(a_0 + a_1 w + a_2 w^2)\dfrac{\partial w}{\partial x}\right] + b_0 + b_1 w.$

Generalized separable solution (degenerate solution):

$$w = \varphi(t)x + \psi(t),$$

where the functions $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are determined by the autonomous system of ordinary differential equations

$$\varphi''_{tt} = 2a_2\varphi^3 + b_1\varphi,$$
$$\psi''_{tt} = 2a_2\varphi^2\psi + b_1\psi + a_1\varphi^2 + b_0.$$

⊙ *Reference*: V. A. Galaktionov and S. R. Svirshchevskii (2007, p. 373).

6. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[\left(aw + \dfrac{b}{\sqrt{w}}\right)\dfrac{\partial w}{\partial x}\right] + cw.$

Multiplicative separable solution:

$$w = \varphi(t)x^2,$$

where the function $\varphi = \varphi(t)$ is determined by the second-order autonomous ordinary differential equation

$$\varphi''_{tt} = 6a\varphi^2 + c\varphi.$$

⊙ *Reference*: V. A. Galaktionov and S. R. Svirshchevskii (2007, p. 373).

7. $\dfrac{\partial^2 w}{\partial t^2} = ax^n w^m \dfrac{\partial^2 w}{\partial x^2}, \qquad a > 0.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^2 w\big(C_2^2 x,\ \pm C_1^m C_2^{2-n} t + C_3\big),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Multiplicative separable solution:

$$w(x,t) = kx^{\frac{2-n}{m}}(C_1 t + C_2)^{-\frac{2}{m}}, \qquad k = \left[\frac{2C_1^2(m+2)}{a(2-n)(2-n-m)}\right]^{\frac{1}{m}}. \tag{1}$$

3°. Expression (1) is a special case of a wider family of multiplicative separable solutions

$$w = f(x)g(t),$$

where the functions $f = f(x)$ and $g = g(t)$ are determined by solving the equations

$$g''_{tt} - \lambda g^{m+1} = 0, \tag{2}$$
$$f''_{xx} - (\lambda/a)x^{-n} f^{1-m} = 0. \tag{3}$$

The general solution of equation (2) can be written out in implicit form as

$$\int\left(C_1 + \frac{2\lambda}{m+2}g^{m+2}\right)^{-1/2} dg = C_2 \pm t,$$

where C_1 and C_2 are arbitrary constants.

In particular, with $C_1 = 0$, it follows that

$$g(t) = (At + C)^{-2/m}, \qquad A = \pm\sqrt{\frac{\lambda m^2}{2(m+2)}}.$$

The books by Polyanin and Zaitsev (1995, 2003) give more than 20 exact solutions to the Emden–Fowler equation (3) for specific values of the parameter m.

4°. There is a self-similar solution of the form

$$w = t^{\frac{(n-2)k-2}{m}} F(y), \quad y = xt^k,$$

where k is an arbitrary constant.

5°. The transformation

$$u(z,t) = \frac{1}{x} w(x,t), \quad z = \frac{1}{z}$$

leads to an equation of the similar form

$$\frac{\partial^2 u}{\partial t^2} = az^{4-n-m} u^m \frac{\partial^2 u}{\partial z^2}. \tag{4}$$

In the special case $n = 4 - m$, equation (4) is greatly simplified to become

$$\frac{\partial^2 u}{\partial t^2} = au^m \frac{\partial^2 u}{\partial z^2}$$

and admits a traveling-wave solution $u = u(kz + \mu t)$; see also equation 7.1.5.5.

8. $\dfrac{\partial^2 w}{\partial t^2} = ae^{\lambda x} w^m \dfrac{\partial^2 w}{\partial x^2}, \qquad a > 0.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w\Big(x + \frac{1}{\lambda} \ln \frac{C_1^m}{C_2^2},\ C_2 t + C_3\Big),$$

where C_1, C_2, C_3, and λ are arbitrary constants, is also a solution of the equation.

2°. Generalized traveling-wave solution:

$$w(x,t) = U(z), \quad z = x + \frac{2}{\lambda} \ln|t|,$$

where the function $U(z)$ is determined by the ordinary differential equation

$$(a\lambda^2 e^{\lambda z} U^m - 4)U''_{zz} + 2\lambda U'_z = 0.$$

3°. For other solutions, see equation 7.4.5.1 with $f(x) = ae^{\lambda x}$.

9. $\dfrac{\partial^2 w}{\partial t^2} = a \dfrac{\partial}{\partial x}\left(x^n w^m \dfrac{\partial w}{\partial x}\right), \qquad a > 0.$

This is a special case of equation 7.4.5.2 with $f(x) = ax^n$.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^2 w\big(C_2^2 x,\ \pm C_1^m C_2^{2-n} t + C_3\big),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Multiplicative separable solution:

$$w(x,t) = kx^{\frac{2-n}{m}}(C_1 t + C_2)^{-\frac{2}{m}}, \qquad k = \left[\frac{2C_1^2(m+2)}{a(2-n)(m-n+2)}\right]^{\frac{1}{m}}. \tag{1}$$

3°. Expression (1) is a special case of a wider family of multiplicative separable solutions

$$w = f(x)g(t),$$

where the functions $f = f(x)$ and $g = g(t)$ are determined by solving the equations

$$g''_{tt} - \lambda g^{m+1} = 0, \tag{2}$$

$$a(x^n f^{m+1} f'_x)'_x - \lambda f = 0. \tag{3}$$

The general solution of equation (2) can be written out in implicit form as

$$\int \left(C_1 + \frac{2\lambda}{m+2} f^{m+2}\right)^{-1/2} df = C_2 \pm t,$$

where C_1 and C_2 are arbitrary constants.

In particular, with $C_1 = 0$, it follows that

$$f(t) = (At + C)^{-2/m}, \qquad A = \pm\sqrt{\frac{\lambda m^2}{2(m+2)}}.$$

For $n \neq 1$ and $m \neq -1$, the transformation

$$z = x^{1-n}, \quad \varphi = u^{m+1}$$

brings (3) to the Emden–Fowler equation

$$\varphi''_{zz} = \frac{\lambda(m+1)}{a(1-n)^2} z^{\frac{n}{1-n}} \varphi^{\frac{1}{m+1}}. \tag{4}$$

The book by Polyanin and Zaitsev (2003) presents more than 20 exact solutions to equation (4) for specific values of the parameter m.

4°. There is a self-similar solution of the form

$$w = (t+b)^{\frac{(n-2)k-2}{m}} F(y), \quad y = xt^k,$$

where b and k are arbitrary constants.

5°. Suppose $m \neq -1$ and $2m - 2n - nm + 3 \neq 0$. The transformation

$$w(x,t) = x^{\frac{1-n}{m+1}} u(\xi, t), \quad \xi = x^{\frac{2m-2n-nm+3}{m+1}}$$

leads to an equation of the similar form

$$\frac{\partial^2 u}{\partial t^2} = A\frac{\partial}{\partial \xi}\left(\xi^{\frac{3m-3n-2nm+4}{2m-2n-nm+3}} u^m \frac{\partial u}{\partial \xi}\right), \tag{5}$$

where $A = a\left(\dfrac{2m-2n-nm+3}{m+1}\right)^2$.

In the special case $n = \dfrac{3m+4}{2m+3}$, equation (5) is greatly simplified and coincides, up to notation, with equation 7.1.6.4:

$$\frac{\partial^2 u}{\partial t^2} = A\frac{\partial}{\partial \xi}\left(u^m \frac{\partial u}{\partial \xi}\right).$$

10. $\dfrac{\partial^2 w}{\partial t^2} = k(ax^2+bx+c)^m w^{4-2m}\dfrac{\partial^2 w}{\partial x^2}.$

This is a special case of equation 7.4.5.4 with $f(u) = ku^{-2m}$.

1°. The transformation

$$w(x,t) = u(z,t)\sqrt{ax^2+bx+c}, \qquad z = \int \frac{dx}{ax^2+bx+c}$$

leads to an equation of the form 7.4.4.8:

$$\frac{\partial^2 u}{\partial t^2} = ku^{4-2m}\frac{\partial^2 u}{\partial z^2} + k(ac-\tfrac{1}{4}b^2)u^{5-2m},$$

which has a traveling-wave solution $u = u(z+\lambda t)$ and a multiplicative separable solution $u = f(t)g(z)$.

2°. By the transformation

$$w(x,t) = \big[v(\xi,t)\big]^{\frac{1}{2m+3}}, \qquad \xi = \int \frac{dx}{(ax^2+bx+c)^m} \tag{1}$$

the original equation can be reduced to the divergence form

$$\frac{\partial^2 v}{\partial t^2} = \frac{\partial}{\partial \xi}\left[F(\xi)v^{\frac{4-2m}{2m-3}}\frac{\partial v}{\partial \xi}\right], \tag{2}$$

where the function $F(\xi)$ is defined parametrically by

$$F(\xi) = \frac{k}{(ax^2+bx+c)^m}, \qquad \xi = \int \frac{dx}{(ax^2+bx+c)^m}. \tag{3}$$

Note some special cases of equation (2) where $F = F(\xi)$ of (3) can be represented in explicit form:

$$\frac{\partial^2 v}{\partial t^2} = k\frac{\partial}{\partial \xi}\left(\frac{\cos^2\xi}{v^2}\frac{\partial v}{\partial \xi}\right), \qquad m=1,\ a=1,\ b=0,\ c=1;$$

$$\frac{\partial^2 v}{\partial t^2} = k\frac{\partial}{\partial \xi}\left(\frac{\cosh^2\xi}{v^2}\frac{\partial v}{\partial \xi}\right), \qquad m=1,\ a=-1,\ b=0,\ c=1;$$

$$\frac{\partial^2 v}{\partial t^2} = k\frac{\partial}{\partial \xi}\left(\frac{v^{-3/2}}{\cos\xi}\frac{\partial v}{\partial \xi}\right), \qquad m=\tfrac{1}{2},\ a=-1,\ b=0,\ c=1.$$

11. $w\dfrac{\partial^2 w}{\partial t^2} = w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2 + aw\dfrac{\partial w}{\partial x} + bw^2.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1\exp(C_2e^{-ax})w(x+C_3, t+C_4),$$

where C_1, C_2, C_3, and C_4 are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solutions:

$$w = C\exp\bigl(kx \pm \sqrt{ak+b}\,t\bigr),$$

where C and k are arbitrary constants ($ak + b \ge 0$).

3°. Multiplicative separable solution:

$$w = \varphi(t)\psi(x),$$

where

$$\varphi(t) = \begin{cases} C_1\exp(\sqrt{K}\,t) + C_2\exp(-\sqrt{K}\,t) & \text{if } K > 0, \\ C_1\cos(\sqrt{|K|}\,t) + C_2\cos(\sqrt{|K|}\,t) & \text{if } K < 0, \\ C_1 t + C_2 & \text{if } K = 0, \end{cases}$$

$$\psi(x) = C_3\exp\left(C_4 e^{-ax} + \frac{K-b}{a}x\right),$$

where C_1, C_2, C_3, C_4, and K are arbitrary constants.

4°. Solution:

$$w = e^{kx+\lambda t}u(z), \qquad z = x + \beta t,$$

where k, β, and λ are arbitrary constants and the function $u = u(z)$ is determined by the second-order autonomous ordinary differential equation

$$(1-\beta^2)uu''_{zz} - (u'_z)^2 + (a - 2\beta\lambda)uu'_z + (b + ak - \lambda^2)u^2 = 0.$$

To $k = \lambda = 0$ there corresponds a traveling-wave solution.

5°. The substitution

$$w = e^{\lambda x}u$$

leads to an equation of the similar form

$$u\frac{\partial^2 u}{\partial t^2} = u\frac{\partial^2 u}{\partial x^2} - \left(\frac{\partial u}{\partial x}\right)^2 + au\frac{\partial u}{\partial x} + (b + a\lambda)u^2.$$

Consequently, if $w = f(x, t; a, b)$ is a solution of the original equation, then the function

$$w = e^{\lambda x}f(x, t; a, b + a\lambda),$$

where λ is an arbitrary constant, is also a solution of the equation.

6°. The substitution

$$w = A\exp\left(-\frac{b}{a}x + v\right), \qquad v = v(x, t)$$

leads to the equation

$$\frac{\partial^2 v}{\partial t^2} + \left(\frac{\partial v}{\partial t}\right)^2 = \frac{\partial^2 v}{\partial x^2} + a\frac{\partial v}{\partial x}.$$

This equation has a generalized separable solution of the form

$$v = f(x)t^2 + g(x)t + h(x),$$

where the functions $f = f(x)$, $g = g(x)$, and $h = h(x)$ are determined by the autonomous system of ordinary differential equations

$$f''_{xx} + af'_x - 4f^2 = 0,$$
$$g''_{xx} + ag'_x - 4fg = 0,$$
$$h''_{xx} + ah'_x - 2f - g^2 = 0.$$

12. $\dfrac{\partial w}{\partial t}\dfrac{\partial^2 w}{\partial t^2} = aw\dfrac{\partial^2 w}{\partial x^2} + bw\dfrac{\partial w}{\partial x} + cw^2 + pw + q.$

Let λ be a root of the quadratic equation

$$c\lambda^2 + p\lambda + q = 0$$

and

$$D = b^2 - 4a\left(2c + \frac{p}{\lambda}\right)$$

is the discriminant of the quadratic equation

$$a\mu^2 + b\mu + 2c + \frac{p}{\lambda} = 0.$$

Generalized separable solutions:

$$w = \lambda + f(x)g(t),$$

where

$$f(x) = \begin{cases} \exp\Big(-\dfrac{b}{2a}\,x\Big)\Big[C_1\exp\Big(\dfrac{\sqrt{D}}{2a}\,x\Big) + C_2\exp\Big(\dfrac{-\sqrt{D}}{2a}\,x\Big)\Big] & \text{if } D > 0; \\ \exp\Big(-\dfrac{b}{2a}\,x\Big)(C_1 x + C_2) & \text{if } D = 0; \\ \exp\Big(-\dfrac{b}{2a}\,x\Big)\Big[C_1\cos\Big(\dfrac{\sqrt{|D|}}{2a}\,x\Big) + C_2\sin\Big(\dfrac{\sqrt{|D|}}{2a}\,x\Big)\Big] & \text{if } D < 0, \end{cases}$$

C_1 and C_2 are arbitrary constants, and the function $g = g(t)$ is determined by the ordinary differential equation $g_t' g_{tt}'' = -\big(2c + \frac{p}{\lambda}\big)\,g^2$. A particular solution of the last equation is $g = \exp[-(2c + p/\lambda)^{1/3}t]$ and the general solution is

$$\int [C_3 - (2c + p/\lambda)g^3]^{-1/3}dg = t + C_4.$$

⊙ *Reference*: V. A. Galaktionov and S. R. Svirshchevskii (2007, p. 358).

13. $\dfrac{\partial w}{\partial t}\dfrac{\partial^2 w}{\partial t^2} = -2aw\dfrac{\partial^2 w}{\partial x^2} + a\left(\dfrac{\partial w}{\partial x}\right)^2 + bw^2 + c.$

Additive separable solution:

$$w = f(x) + C_1 g(t),$$

where

$$f(x) = \begin{cases} \sqrt{\dfrac{c}{b}}\sin\left(\sqrt{-\dfrac{b}{a}}\,x + C_2\right) & \text{if } ab < 0 \text{ and } bc > 0, \\ C_2\exp\left(\sqrt{\dfrac{b}{a}}\,x\right) + \dfrac{c}{4bC_2}\exp\left(-\sqrt{\dfrac{b}{a}}\,x\right) & \text{if } ab > 0, \end{cases}$$

C_1 and C_2 are arbitrary constants, and the function $g = g(t)$ is determined by the ordinary differential equation $g_t' g_{tt}'' = bg^2$. A particular solution of the last equation is $g = \exp(b^{1/3}t)$ and the general solution is

$$\int (bg^3 + C_3)^{-1/3}dg = t + C_4.$$

⊙ *Reference*: V. A. Galaktionov and S. R. Svirshchevskii (2007, pp. 358–359).

14. $\dfrac{\partial w}{\partial t}\dfrac{\partial^2 w}{\partial t^2} = w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2 + aw\dfrac{\partial w}{\partial x} + bw^2.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 \exp(C_2 e^{-ax}) w(x + C_3, t + C_4),$$

where C_1, C_2, C_3, and C_4 are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solutions:

$$w = C_1 \exp\big[kx + (ak + b)^{1/3} t\big] \quad \text{if} \quad b \text{ is any number},$$
$$w = C_1 \exp\big(-ax - a^{2/3} t\big) + C_2 \quad \text{if} \quad b = 0,$$

where C_1, C_2, and k are arbitrary constants.

3°. Generalized separable solution:

$$w = \exp\left(-\frac{a^2 + b}{a} x + C_1 e^{-ax}\right)\left(C_2 e^{ax} + C_3 \varphi(t)\right),$$

where C_1, C_2, and C_3 are arbitrary constants, and the function $\varphi = \varphi(t)$ is determined by the ordinary differential equation $\varphi'_t \varphi''_{tt} = -a^2 \varphi^2$. A particular solution of the last equation is $\varphi = \exp(-a^{2/3} t)$ and the general solution is

$$\int (C_3 - a^2 \varphi^3)^{-1/3} d\varphi = t + C_4.$$

⊙ *Reference*: V. A. Galaktionov and S. R. Svirshchevskii (2007, p. 357).

4°. Multiplicative separable solution:

$$w = \varphi(t)\psi(x),$$

where the functions $\varphi = \varphi(t)$ and $\psi = \psi(x)$ are determined by the second-order autonomous ordinary differential equations

$$\varphi'_t \varphi''_{tt} - K\varphi^2 = 0, \tag{1}$$
$$\psi\psi''_{xx} - (\psi'_x)^2 + a\psi\psi'_x + (b - K)\psi^2 = 0, \tag{2}$$

with K being an arbitrary constant.

For $K = 0$, we have the degenerate solution with $\varphi = C_1 t + C_2$. For $K \neq 0$, a particular solution of equation (1) is $\varphi = e^{K^{1/3} t}$ and the general solution is

$$\int (K\varphi^3 + C_1)^{-1/3} d\varphi = t + C_2,$$

where C_1 and C_2 are arbitrary constants.

The general solution of equation (2) is

$$\psi = C_3 \exp\left(C_4 e^{-ax} + \frac{K - b}{a} x\right),$$

where C_3 and C_4 are arbitrary constants.

5°. Solution:

$$w = e^{kx+\lambda t}u(z), \qquad z = x + \beta t,$$

where k, β, and λ are arbitrary constants and the function $u = u(z)$ is determined by the second-order autonomous ordinary differential equation

$$[\beta^3 u'_z + (\beta^2\lambda - 1)u]u''_{zz} = -(2\beta^2\lambda + 1)(u'_z)^2 + (a - 3\beta\lambda^2)uu'_z + (b + ak - \lambda^3)u^2.$$

To $k = \lambda = 0$ there corresponds a traveling-wave solution.

6°. The substitution

$$w = e^{\lambda x}u$$

leads to an equation of the similar form

$$\frac{\partial u}{\partial t}\frac{\partial^2 u}{\partial t^2} = u\frac{\partial^2 u}{\partial x^2} - \left(\frac{\partial u}{\partial x}\right)^2 + au\frac{\partial u}{\partial x} + (b + a\lambda)u^2.$$

Consequently, if $w = f(x, t; a, b)$ is a solution of the original equation, then the function

$$w = e^{\lambda x}f(x, t; a, b + a\lambda),$$

where λ is an arbitrary constant, is also a solution of the equation.

By applying the above property with $\lambda = -b/a$ to the second equation from Item 2°, we get the solution

$$w = C_1 \exp\left[(\lambda - a)x - a^{2/3}t\right] + C_2 \exp(\lambda x), \qquad \lambda = -b/a,$$

where C_1 and C_2 are arbitrary constants.

7°. The substitution

$$w = A\exp\left(-\frac{b}{a}x + v\right), \qquad v = v(x, t)$$

leads to the equation

$$\frac{\partial v}{\partial t}\left[\frac{\partial^2 v}{\partial t^2} + \left(\frac{\partial v}{\partial t}\right)^2\right] = \frac{\partial^2 v}{\partial x^2} + a\frac{\partial v}{\partial x}.$$

This equation has the generalized separable solution

$$v = (C_1 t + C_2)e^{-ax} + \frac{C_1^3}{6a^2}e^{-3ax}.$$

7.2. Equations with Exponential Nonlinearities

7.2.1. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + be^{\beta w} + ce^{\gamma w}$

1. $\dfrac{\partial^2 w}{\partial t^2} = a^2\dfrac{\partial^2 w}{\partial x^2} + be^{\beta w}.$

This is a special case of equation 7.4.1.1 with $f(w) = be^{\beta w}$.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the functions

$$w_1 = w(\pm C_1 x + C_2,\ \pm C_1 t + C_3) + \frac{2}{\beta}\ln|C_1|,$$

$$w_2 = w(x\cosh\lambda + at\sinh\lambda,\ t\cosh\lambda + a^{-1}x\sinh\lambda),$$

where C_1, C_2, C_3, and λ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solutions:

$$w(x,t) = \frac{1}{\beta}\ln\left[\frac{2(B^2 - a^2A^2)}{b\beta(Ax + Bt + C)^2}\right],$$

$$w(x,t) = \frac{1}{\beta}\ln\left[\frac{2(a^2A^2 - B^2)}{b\beta\cosh^2(Ax + Bt + C)}\right],$$

$$w(x,t) = \frac{1}{\beta}\ln\left[\frac{2(B^2 - a^2A^2)}{b\beta\sinh^2(Ax + Bt + C)}\right],$$

$$w(x,t) = \frac{1}{\beta}\ln\left[\frac{2(B^2 - a^2A^2)}{b\beta\cos^2(Ax + Bt + C)}\right],$$

where A, B, and C are arbitrary constants.

3°. Functional separable solutions:

$$w(x,t) = \frac{1}{\beta}\ln\left(\frac{8a^2C}{b\beta}\right) - \frac{2}{\beta}\ln\left|(x + A)^2 - a^2(t + B)^2 + C\right|,$$

$$w(x,t) = -\frac{2}{\beta}\ln\left[C_1e^{\lambda x} \pm \frac{\sqrt{2b\beta}}{2a\lambda}\sinh(a\lambda t + C_2)\right],$$

$$w(x,t) = -\frac{2}{\beta}\ln\left[C_1e^{\lambda x} \pm \frac{\sqrt{-2b\beta}}{2a\lambda}\cosh(a\lambda t + C_2)\right],$$

$$w(x,t) = -\frac{2}{\beta}\ln\left[C_1e^{a\lambda t} \pm \frac{\sqrt{-2b\beta}}{2a\lambda}\sinh(\lambda x + C_2)\right],$$

$$w(x,t) = -\frac{2}{\beta}\ln\left[C_1e^{a\lambda t} \pm \frac{\sqrt{2b\beta}}{2a\lambda}\cosh(\lambda x + C_2)\right],$$

where A, B, C, C_1, C_2, and λ are arbitrary constants.

4°. The change of the independent variables

$$z = x - at, \quad y = x + at$$

leads to the Liouville equation 7.5.1.2:

$$\frac{\partial^2 w}{\partial z\partial y} = -\tfrac{1}{4}a^{-2}b\exp(\beta w).$$

Hence, the general solution of the original equation is expressed as

$$w(x,t) = \frac{1}{\beta}\big[f(z) + g(y)\big] - \frac{2}{\beta}\ln\left|k\int\exp\big[f(z)\big]\,dz - \frac{b\beta}{8a^2k}\int\exp\big[g(y)\big]\,dy\right|,$$
$$z = x - at, \qquad y = x + at,$$

where $f = f(z)$ and $g = g(y)$ are arbitrary functions and k is an arbitrary constant.

⊙ *References for equation* 7.2.1.1: J. Liouville (1853), R. K. Bullough and P. J. Caudrey (1980), V. F. Zaitsev and A. D. Polyanin (1996, p. 435).

2. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + ae^{\beta w} + be^{2\beta w}.$

1°. Traveling-wave solution for $b\beta > 0$:

$$w(x,t) = -\frac{1}{\beta}\ln\left\{-\frac{b}{a} + C_1\exp\left[a\sqrt{\frac{\beta}{b}}\,\bigl(x\sinh C_2 \pm t\cosh C_2\bigr)\right]\right\},$$

where C_1 and C_2 are arbitrary constants.

2°. Traveling-wave solution (generalizes the solution of Item 1°):

$$w(x,t) = -\frac{1}{\beta}\ln\left[\frac{a\beta}{C_1^2 - C_2^2} + C_3\exp(C_1x + C_2t) + \frac{a^2\beta^2 + b\beta(C_1^2 - C_2^2)}{4C_3(C_1^2 - C_2^2)^2}\exp(-C_1x - C_2t)\right],$$

where C_1, C_2, and C_3 are arbitrary constants.

3°. Traveling-wave solution:

$$w(x,t) = -\frac{1}{\beta}\ln\left[\frac{a\beta}{C_2^2 - C_1^2} + \frac{\sqrt{a^2\beta^2 + b\beta(C_2^2 - C_1^2)}}{C_2^2 - C_1^2}\,\sin(C_1x + C_2t + C_3)\right].$$

⊙ *Reference for equation* 7.2.1.2: A. D. Polyanin and V. F. Zaitsev (2004, p. 214).

3. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + ae^{\beta w} - be^{-\beta w}.$

The substitution

$$w(x,t) = u(x,t) + k, \quad k = \frac{1}{2\beta}\ln\frac{b}{a}$$

leads to an equation of the form 7.3.1.1:

$$\frac{\partial^2 u}{\partial t^2} = \frac{\partial^2 u}{\partial x^2} + 2\sqrt{ab}\,\sinh(\beta u).$$

4. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + ae^{\beta w} - be^{-2\beta w}.$

1°. Functional separable solution:

$$w(x,t) = \frac{1}{\beta}\ln[\varphi(x) + \psi(t)],$$

where the functions $\psi(t)$ and $\varphi(x)$ are determined by the first-order autonomous ordinary differential equations

$$(\varphi_x')^2 = -2a\beta\varphi^3 + C_1\varphi^2 - C_2\varphi + C_3 - b\beta,$$
$$(\psi_t')^2 = 2a\beta\psi^3 + C_1\psi^2 + C_2\psi + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants. Solving these equations for the derivatives, one obtains separable equations.

2°. The transformation

$$t = (a^2b\beta^3)^{-1/6}(\xi + \eta), \quad x = (a^2b\beta^3)^{-1/6}(\xi - \eta), \quad w = \frac{1}{\beta}U + \frac{1}{3\beta}\ln\frac{b}{a}$$

leads to an equation of the form 7.5.1.3:

$$\frac{\partial^2 U}{\partial\xi\partial\eta} = e^U - e^{-2U}.$$

3°. The equation can be integrated with the inverse scattering method.

⊙ *References for equation* 7.2.1.4: A. V. Mikhailov (1979), A. P. Fordy and J. A. Gibbons (1980), F. Calogero and A. Degasperis (1982), A. M. Grundland and E. Infeld (1992), R. Z. Zhdanov (1994), V. K. Andreev, O. V. Kaptsov, V. V. Pukhnachov, and A. A. Rodionov (1999).

7.2.2. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f(x, t, w)$

1. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + ae^{\beta t}e^{\lambda w}.$

This is a special case of equation 7.4.1.7 with $f(w) = ae^{\lambda w}$.

1°. Solutions:

$$w(x,t) = -\frac{\beta}{\lambda}t - \frac{2}{\lambda}\ln\left(C_1 + C_2 x \pm \sqrt{C_2^2 + \tfrac{1}{2}\lambda a}\, t\right),$$
$$w(x,t) = -\frac{\beta}{\lambda}t - \frac{2}{\lambda}\ln\left(C_1 e^{-\sigma t} + C_2 e^{\sigma x} - \frac{\lambda a}{8\sigma^2 C_1}e^{\sigma t}\right),$$

where C_1, C_2, and σ are arbitrary constants.

2°. The substitution $\lambda U = \lambda w + \beta t$ leads to an equation of the form 7.2.1.1:

$$\frac{\partial^2 U}{\partial t^2} = \frac{\partial^2 U}{\partial x^2} + a\lambda e^{\lambda U}.$$

2. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + ae^{\beta x}e^{\lambda w}.$

This is a special case of equation 7.4.1.6 with $f(w) = ae^{\lambda w}$.

1°. Solutions:

$$w(x,t) = -\frac{\beta}{\lambda}x - \frac{2}{\lambda}\ln\left(C_1 + C_2 t \pm \sqrt{C_2^2 - \tfrac{1}{2}\lambda a}\, x\right),$$
$$w(x,t) = -\frac{\beta}{\lambda}x - \frac{2}{\lambda}\ln\left(C_1 e^{-\sigma x} + C_2 e^{\sigma t} + \frac{\lambda a}{8\sigma^2 C_1}e^{\sigma x}\right),$$

where C_1, C_2, and σ are arbitrary constants.

2°. The substitution $\lambda U = \lambda w + \beta x$ leads to an equation of the form 7.2.1.1:

$$\frac{\partial^2 U}{\partial t^2} = \frac{\partial^2 U}{\partial x^2} + a\lambda e^{\lambda U}.$$

3. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + ce^{ax+bt}e^{\lambda w}.$

This is a special case of equation 7.4.1.8 with $f(w) = ce^{\lambda w}$.

4. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + \beta e^{\lambda w} + (\alpha t + \gamma)e^{2\lambda w}.$

Functional separable solutions:

$$w(x,t) = -\frac{1}{\lambda}\ln\left\{C\exp\left[-\frac{\beta^2\lambda}{2\alpha}(t \pm x)\right] - \frac{1}{\beta}(\alpha t + \gamma) + \frac{\alpha^2}{\beta^3\lambda}\right\},$$

where C is an arbitrary constant.

⊙ *Reference*: A. D. Polyanin, A. V. Vyazmin, A. I. Zhurov, and D. A. Kazenin (1998).

5. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + \beta e^{\lambda w} + (\alpha x + \gamma)e^{2\lambda w}.$

Functional separable solutions:

$$w(x,t) = -\frac{1}{\lambda}\ln\left\{C\exp\left[\frac{\beta^2\lambda}{2\alpha}(x \pm t)\right] - \frac{1}{\beta}(\alpha x + \gamma) - \frac{\alpha^2}{\beta^3\lambda}\right\},$$

where C is an arbitrary constant.

6. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + \beta e^{\lambda w} + (\alpha e^{kt} + \gamma)e^{2\lambda w}.$

1°. Functional separable solutions for $k^2\gamma - \beta^2\lambda \neq 0$:

$$w(x,t) = -\frac{1}{\lambda}\ln\left[C\exp\left(\pm\frac{k^2\gamma - \beta^2\lambda}{2k\gamma}x + \frac{k^2\gamma + \beta^2\lambda}{2k\gamma}t\right) + \frac{\alpha\beta\lambda}{k^2\gamma - \beta^2\lambda}e^{kt} - \frac{\gamma}{\beta}\right],$$

where C is an arbitrary constant.

2°. Generalized traveling-wave solutions for $k^2\gamma - \beta^2\lambda = 0$:

$$w(x,t) = -\frac{1}{\lambda}\ln\left[Ce^{kt} + \frac{\alpha k}{2\beta}(t \pm x)e^{kt} - \frac{\lambda\beta}{k^2}\right].$$

⊙ *Reference*: A. D. Polyanin, A. V. Vyazmin, A. I. Zhurov, and D. A. Kazenin (1998).

7. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + k\beta e^{\lambda w} + (\alpha e^{kt} + \lambda\beta^2)e^{2\lambda w}.$

Generalized traveling-wave solutions:

$$w(x,t) = -\frac{1}{\lambda}\ln\left[Ce^{kt} + \frac{\alpha}{2\beta}(t \pm x)e^{kt} - \frac{\lambda\beta}{k}\right],$$

where C is an arbitrary constant.

8. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + \beta e^{\lambda w} + (\alpha e^{kx} + \gamma) e^{2\lambda w}.$

1°. Functional separable solutions for $k^2\gamma + \beta^2\lambda \neq 0$:

$$w(x,t) = -\frac{1}{\lambda}\ln\left[C\exp\left(\pm\frac{k^2\gamma+\beta^2\lambda}{2k\gamma}t + \frac{k^2\gamma-\beta^2\lambda}{2k\gamma}x\right) - \frac{\alpha\beta\lambda}{k^2\gamma+\beta^2\lambda}e^{kx} - \frac{\gamma}{\beta}\right],$$

where C is an arbitrary constant.

2°. Generalized traveling-wave solutions for $k^2\gamma + \beta^2\lambda = 0$:

$$w(x,t) = -\frac{1}{\lambda}\ln\left[Ce^{kx} + \frac{\alpha k}{2\beta}(x \pm t)e^{kx} + \frac{\lambda\beta}{k^2}\right].$$

⊙ *Reference for equation* 7.2.2.8: A. D. Polyanin, A. V. Vyazmin, A. I. Zhurov, and D. A. Kazenin (1998).

9. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} - k\beta e^{\lambda w} - (\alpha e^{kx} + \lambda\beta^2) e^{2\lambda w}.$

Functional separable solutions:

$$w(x,t) = -\frac{1}{\lambda}\ln\left[Ce^{kx} + \frac{\alpha}{2\beta}(x \pm t)e^{kx} - \frac{\lambda\beta}{k}\right],$$

where C is an arbitrary constant.

10. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + \beta e^{kt} e^{\lambda w} + (\alpha e^{2kt} + \gamma) e^{2\lambda w}.$

Functional separable solutions:

$$w(x,t) = -\frac{1}{\lambda}\ln\left[C\exp\left(\pm\frac{4k^2\alpha-\beta^2\lambda}{4k\alpha}x - \frac{\beta^2\lambda}{4k\alpha}t\right) + \frac{\beta\gamma\lambda}{4k^2\alpha-\beta^2\lambda}e^{-kt} - \frac{\alpha}{\beta}e^{kt}\right],$$

where C is an arbitrary constant.

11. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + \beta e^{kx} e^{\lambda w} + (\alpha e^{2kx} + \gamma) e^{2\lambda w}.$

Functional separable solutions:

$$w(x,t) = -\frac{1}{\lambda}\ln\left[C\exp\left(\pm\frac{4k^2\alpha+\beta^2\lambda}{4k\alpha}t + \frac{\beta^2\lambda}{4k\alpha}x\right) - \frac{\beta\gamma\lambda}{4k^2\alpha+\beta^2\lambda}e^{-kx} - \frac{\alpha}{\beta}e^{kx}\right],$$

where C is an arbitrary constant.

⊙ *Reference*: A. D. Polyanin, A. V. Vyazmin, A. I. Zhurov, and D. A. Kazenin (1998).

7.2.3. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = f(x)\dfrac{\partial^2 w}{\partial x^2} + g\left(x, t, w, \dfrac{\partial w}{\partial x}\right)$

1. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + be^{\lambda w}\dfrac{\partial w}{\partial x}.$

This is a special case of equation 7.4.2.3 with $f(w) = be^{\lambda w}$.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the functions

$$w_1 = w\big(C_1 x + C_2,\ \pm C_1 t + C_3\big) + \frac{1}{\lambda}\ln C_1,$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Traveling-wave solution:

$$w = -\frac{1}{\lambda}\ln\left[\frac{\exp(Ax + A\mu t + B) - b}{A(a-\mu^2)}\right],$$

where μ, A, and B are arbitrary constants.

3°. There is an exact solution of the form

$$w(x,t) = F(z) - \frac{1}{\lambda}\ln|t|, \quad z = \frac{x}{t}.$$

2. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + ce^{\lambda w}, \qquad a > 0.$

This is a special case of equation 7.2.3.5 with $b = an$.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the functions

$$w_1 = w\big(C_1^{\frac{2}{2-n}} x,\ \pm C_1 t + C_2\big) + \frac{2}{\lambda}\ln C_1,$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Functional separable solution for $n \neq 2$ and $\lambda \neq 0$:

$$w = -\frac{1}{\lambda}\ln\left\{\frac{2c\lambda(2-n)}{n}\left[\frac{x^{2-n}}{a(2-n)^2} - \frac{1}{4}(t+C)^2\right]\right\}.$$

3°. Functional separable solution for $n \neq 2$ (generalizes the solution of Item 2°):

$$w = w(r), \qquad r^2 = 4k\left[\frac{x^{2-n}}{a(2-n)^2} - \frac{1}{4}(t+C)^2\right],$$

where C and k are arbitrary constants ($k \neq 0$) and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{A}{r}w'_r + ck^{-1}e^{\lambda w} = 0, \qquad A = \frac{2}{2-n}.$$

4°. There is an exact solution of the form

$$w(x,t) = F(z) - \frac{2}{\lambda}\ln|t|, \quad z = x|t|^{\frac{2}{n-2}}.$$

3. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{a}{x^n}\dfrac{\partial}{\partial x}\left(x^n \dfrac{\partial w}{\partial x}\right) + ce^{\lambda w}, \qquad a > 0.$

For $n = 1$ and $n = 2$, the equation describes the propagation of nonlinear waves with axial and central symmetry, respectively.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the functions

$$w_1 = w\big(C_1 x,\ \pm C_1 t + C_2\big) + \frac{2}{\lambda}\ln C_1,$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Functional separable solution for $n \neq 0$ and $\lambda \neq 0$:

$$w = -\frac{1}{\lambda}\ln\left\{\frac{c\lambda}{2an}\left[x^2 - a(t + C)^2\right]\right\}.$$

3°. Functional separable solution (generalizes the solution of Item 2°):

$$w = w(r), \qquad r^2 = k\left[x^2 - a(t + C)^2\right],$$

where C and k are arbitrary constants ($k \neq 0$) and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{n+1}{r}w'_r + \frac{c}{ak}e^{\lambda w} = 0.$$

4°. There is an exact solution of the form

$$w(x, t) = F(z) - \frac{2}{\lambda}\ln|t|, \quad z = \frac{x}{t}.$$

4. $\dfrac{\partial^2 w}{\partial t^2} = a(x + \beta)^n \dfrac{\partial^2 w}{\partial x^2} + ce^{\lambda w}, \qquad a > 0.$

This is an equation of the propagation of nonlinear waves in an inhomogeneous medium. The substitution $z = x + \beta$ leads to a special case of equation 7.2.3.5 with $b = 0$:

$$\frac{\partial^2 w}{\partial t^2} = az^n \frac{\partial^2 w}{\partial z^2} + ce^{\lambda w}.$$

5. $\dfrac{\partial^2 w}{\partial t^2} = ax^n \dfrac{\partial^2 w}{\partial x^2} + bx^{n-1}\dfrac{\partial w}{\partial x} + ce^{\lambda w}, \qquad a > 0.$

1°. Suppose $w(x, t)$ is a solution of this equation. Then the functions

$$w_1 = w\big(C_1^2 x,\ \pm C_1^{2-n} t + C_2\big) + \frac{4 - 2n}{\lambda}\ln C_1,$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Functional separable solution for $n \neq 2$:

$$w = w(\xi), \qquad \xi = \tfrac{1}{4}a(2-n)^2(t+C)^2 - x^{2-n}.$$

Here, C is an arbitrary constant, and the function $w = w(\xi)$ is determined by the ordinary differential equation

$$\xi w''_{\xi\xi} + Aw'_\xi = Be^{\lambda w}, \tag{1}$$

where

$$A = \frac{a(4-3n)+2b}{2a(2-n)}, \quad B = \frac{c}{a(2-n)^2}.$$

For $A \neq 1$, an exact solution of equation (1) is given by

$$w(\xi) = \frac{1}{\lambda}\ln\left(\frac{1-A}{\lambda B\xi}\right).$$

For $A = 1$, which corresponds to $b = \frac{1}{2}an$, exact solutions of equation (1) are expressed as

$$w(\xi) = \frac{1}{\lambda}\ln\left[\frac{2a(2-n)^2}{c\lambda\xi(\ln|\xi|+q)^2}\right],$$
$$w(\xi) = \frac{1}{\lambda}\ln\left[\frac{2ap^2(2-n)^2}{c\lambda\xi\cos^2(p\ln|\xi|+q)}\right],$$
$$w(\xi) = \frac{1}{\lambda}\ln\left[\frac{-2ap^2(2-n)^2}{c\lambda\xi\cosh^2(p\ln|\xi|+q)}\right],$$

where p and q are arbitrary constants.

For $A \neq 1$, the substitution $\xi = kz^{\frac{1}{1-A}}$ $(k = \pm 1)$ brings (1) to the generalized Emden–Fowler equation

$$w''_{zz} = \frac{kB}{(1-A)^2}z^{\frac{2A-1}{1-A}}e^{\lambda w}. \tag{2}$$

In the special case $A = \frac{1}{2}$, which corresponds to $b = a(n-1)$, solutions of equation (2) are given by

$$w(z) = \frac{1}{\lambda}\ln\left[\frac{-a(2-n)^2}{2kc\lambda(z+q)^2}\right],$$
$$w(z) = \frac{1}{\lambda}\ln\left[\frac{ap^2(2-n)^2}{2kc\lambda\cosh^2(pz+q)}\right],$$
$$w(z) = \frac{1}{\lambda}\ln\left[\frac{-ap^2(2-n)^2}{2kc\lambda\cos^2(pz+q)}\right],$$

where p and q are arbitrary constants.

3°. Solution for $n = 2$:

$$w = w(y), \quad y = At + B\ln|x| + C,$$

where A, B, and C are arbitrary constants, and the function $w = w(y)$ is determined by the autonomous ordinary differential equation

$$(aB^2 - A^2)w''_{yy} + (b-a)Bw'_y + ce^{\lambda w} = 0. \tag{3}$$

Solution of equation (3) with $A = \pm B\sqrt{a}$:

$$w(y) = -\frac{1}{\lambda}\ln\left[\frac{c\lambda}{B(b-a)}y + C_1\right].$$

Solutions of equation (3) with $b = a$:

$$w(y) = \frac{1}{\lambda}\ln\left[\frac{2(A^2 - aB^2)}{c\lambda(y+q)^2}\right],$$

$$w(y) = \frac{1}{\lambda}\ln\left[\frac{2p^2(aB^2 - A^2)}{c\lambda\cosh^2(py+q)}\right],$$

$$w(y) = \frac{1}{\lambda}\ln\left[\frac{2p^2(A^2 - aB^2)}{c\lambda\cos^2(py+q)}\right],$$

where p and q are arbitrary constants.

6. $\dfrac{\partial^2 w}{\partial t^2} = ax^n\dfrac{\partial^2 w}{\partial x^2} + bx^{n-1}e^{\lambda w}\dfrac{\partial w}{\partial x}, \qquad a > 0.$

This is a special case of equation 7.4.3.5 with $f(w) = be^{\lambda w}$.

7. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ae^{\lambda x}\dfrac{\partial w}{\partial x}\right) + ce^{\mu w}, \qquad a > 0.$

This is a special case of equation 7.2.3.9 with $b = a\lambda$.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the functions

$$w_1 = w\left(x - \frac{2}{\lambda}\ln|C_1|,\ \pm C_1 t + C_2\right) + \frac{2}{\mu}\ln|C_1|,$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Functional separable solution for $\lambda \neq 0$:

$$w = w(r), \qquad r^2 = 4k\left[\frac{e^{-\lambda x}}{a\lambda^2} - \frac{1}{4}(t + C_1)^2\right],$$

where C_1 and k are arbitrary constants ($k \neq 0$) and the function $w(r)$ is determined by the autonomous ordinary differential equation

$$w''_{rr} + ck^{-1}e^{\mu w} = 0.$$

Its general solution is expressed as

$$w = \begin{cases} -\dfrac{1}{\mu}\ln\left[-\dfrac{c\mu}{2k}(r + C_3)^2\right] & \text{if } ck\mu < 0, \\ -\dfrac{1}{\mu}\ln\left[-\dfrac{c\mu}{2kC_2^2}\sin^2(C_2 r + C_3)\right] & \text{if } ck\mu < 0, \\ -\dfrac{1}{\mu}\ln\left[-\dfrac{c\mu}{2kC_2^2}\sinh^2(C_2 r + C_3)\right] & \text{if } ck\mu < 0, \\ -\dfrac{1}{\mu}\ln\left[\dfrac{c\mu}{2kC_2^2}\cosh^2(C_2 r + C_3)\right] & \text{if } ck\mu > 0, \end{cases}$$

where C_2 and C_3 are arbitrary constants.

3°. There is an exact solution of the form

$$w(x,t) = F(z) - \frac{2}{\mu}\ln|t|, \qquad z = x + \frac{2}{\lambda}\ln|t|.$$

8. $\dfrac{\partial^2 w}{\partial t^2} = ae^{\lambda x}\dfrac{\partial^2 w}{\partial x^2} + ce^{\mu w}, \qquad a > 0.$

This is an equation of the propagation of nonlinear waves in an inhomogeneous medium. This is a special case of equation 7.2.3.9 with $b = 0$.

9. $\dfrac{\partial^2 w}{\partial t^2} = ae^{\lambda x}\dfrac{\partial^2 w}{\partial x^2} + be^{\lambda x}\dfrac{\partial w}{\partial x} + ce^{\mu w}, \qquad a > 0.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w\Big(x - \frac{2}{\lambda}\ln|C_1|,\ \pm C_1 t + C_2\Big) + \frac{2}{\mu}\ln|C_1|,$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Functional separable solution:

$$w = w(z), \quad z = \big[4ke^{-\lambda x} - ak\lambda^2(t+C)^2\big]^{1/2}, \qquad k = \pm 1,$$

where C is an arbitrary constant and the function $w = w(z)$ is determined by the ordinary differential equation

$$w''_{zz} + \frac{2(a\lambda - b)}{a\lambda}\frac{1}{z}w'_z + \frac{c}{ak\lambda^2}e^{\mu w} = 0. \tag{1}$$

A solution of equation (1) has the form

$$w(z) = \frac{1}{\mu}\ln\left[\frac{2k\lambda(a\lambda - 2b)}{c\mu z^2}\right].$$

Note some other exact solutions of equation (1):

$$w(z) = \frac{1}{\mu}\ln\left[\frac{-2ak\lambda^2}{c\mu(z+B)^2}\right] \qquad \text{if } b = a\lambda,$$

$$w(z) = \frac{1}{\mu}\ln\left[\frac{2aA^2k\lambda^2}{c\mu\cosh^2(Az+B)}\right] \qquad \text{if } b = a\lambda,$$

$$w(z) = \frac{1}{\mu}\ln\left[\frac{-2aA^2k\lambda^2}{c\mu\sinh^2(Az+B)}\right] \qquad \text{if } b = a\lambda,$$

$$w(z) = \frac{1}{\mu}\ln\left[\frac{-2aA^2k\lambda^2}{c\mu\cos^2(Az+B)}\right] \qquad \text{if } b = a\lambda,$$

$$w(z) = \frac{1}{\mu}\ln\left[\frac{8ABak\lambda^2}{c\mu(Az^2+B)^2}\right] \qquad \text{if } b = \tfrac{1}{2}a\lambda,$$

where A and B are arbitrary constants.

10. $\dfrac{\partial^2 w}{\partial t^2} = ae^{\lambda x}\dfrac{\partial^2 w}{\partial x^2} + be^{\lambda x+\mu w}\dfrac{\partial w}{\partial x}, \qquad a > 0.$

This is a special case of equation 7.4.3.10 with $f(w) = be^{\mu w}$.

11. $\dfrac{\partial^2 w}{\partial t^2} = ae^{\lambda x}\dfrac{\partial^2 w}{\partial x^2} + be^{\lambda x+\mu w}\dfrac{\partial w}{\partial x} + ce^{\beta w}, \qquad a > 0.$

This is a special case of equation 7.4.3.11 with $f(w) = be^{\mu w}$ and $g(w) = ce^{\beta w}$.

7.2.4. Other Equations

1. $\dfrac{\partial^2 w}{\partial t^2} = ae^{\lambda w}\dfrac{\partial^2 w}{\partial x^2}, \qquad a > 0.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w(C_1 C_2^{\lambda} x + C_3, \pm C_1 t + C_4,) - 2\ln|C_2|,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation.

2°. Solutions:

$$w(x,t) = Axt + Bx + Ct + D,$$

$$w(x,t) = \frac{1}{\lambda}\ln\left[\frac{B^2}{a}\frac{(x+A)^2}{\cosh^2(Bt+C)}\right], \qquad w(x,t) = \frac{1}{\lambda}\ln\left[\frac{1}{aA^2}\frac{\cosh^2(Ax+B)}{(t+C)^2}\right],$$

$$w(x,t) = \frac{1}{\lambda}\ln\left[\frac{C^2}{aA^2}\frac{\sinh^2(Ax+B)}{\cosh^2(Ct+D)}\right], \qquad w(x,t) = \frac{1}{\lambda}\ln\left[\frac{C^2}{aA^2}\frac{\cosh^2(Ax+B)}{\sinh^2(Ct+D)}\right],$$

$$w(x,t) = \frac{1}{\lambda}\ln\left[\frac{C^2}{aA^2}\frac{\cos^2(Ax+B)}{\cosh^2(Ct+D)}\right], \qquad w(x,t) = \frac{1}{\lambda}\ln\left[\frac{C^2}{aA^2}\frac{\cosh^2(Ax+B)}{\cos^2(Ct+D)}\right],$$

$$w(x,t) = \frac{1}{\lambda}\ln\left[\frac{4BC\beta^2(x+A)^2}{a(Be^{\beta t}+Ce^{-\beta t})^2}\right], \qquad w(x,t) = \frac{1}{\lambda}\ln\left[\frac{(Ae^{\beta x}+Be^{-\beta x})^2}{4aAB\beta^2(t+C)^2}\right],$$

where A, B, C, D, and β are arbitrary constants. The first solution is degenerate, while the others are representable as the sum of functions with different arguments.

3°. Self-similar solution:

$$w = w(z), \quad z = \frac{x+A}{t+B},$$

where the function $w(z)$ is determined by the ordinary differential equation

$$(ae^{\lambda w} - z^2)w''_{zz} - zw'_z = 0,$$

whose order can be reduced with the transformation $\xi = z^{-2}e^{\lambda w}$, $U(\xi) = zw'_z$.

4°. Solution:

$$w = \frac{2(k-1)}{\lambda}\ln(t+C_1) + f(\zeta), \quad \zeta = \frac{x+C_2}{(t+C_1)^k},$$

where C_1, C_2, and k are arbitrary constants, and the function $f = f(\zeta)$ is determined by the ordinary differential equation

$$k^2\zeta^2 f''_{\zeta\zeta} + k(k+1)\zeta f'_\zeta - \frac{2(k-1)}{\lambda} = ae^{\lambda f} f''_{\zeta\zeta}.$$

5°. There are exact solutions of the following forms:

$$w(x,t) = F(\eta) - \frac{2}{\lambda}\ln|t|, \quad \eta = x + k\ln|t|;$$

$$w(x,t) = H(\rho) - \frac{2}{\lambda}t, \quad \rho = xe^t,$$

where k is an arbitrary constant.

⊙ *Reference for equation* 7.2.4.1: V. F. Zaitsev and A. D. Polyanin (1996, pp. 458–459).

2. $\dfrac{\partial^2 w}{\partial t^2} = ae^{\lambda w}\dfrac{\partial^2 w}{\partial x^2} + be^{\beta w}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1^{\beta-\lambda}x + C_2, \pm C_1^{\beta}t + C_3) + 2\ln|C_1|,$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solution:

$$w = u(z), \qquad z = k_2x + k_1t,$$

where k_1 and k_2 are arbitrary constants, and the function $u(z)$ is determined by the autonomous ordinary differential equation

$$(k_1^2 - ak_2^2e^{\lambda u})u''_{zz} = be^{\beta u}.$$

Its solution can be written out in implicit form as

$$\int \frac{du}{\sqrt{F(u)}} = C_1 \pm z, \qquad F(u) = 2b\int \frac{e^{\beta u}\,du}{k_1^2 - ak_2^2e^{\lambda u}} + C_2,$$

where C_1 and C_2 are arbitrary constants.

3°. Solution:

$$w = U(\xi) - \frac{2}{\beta}\ln|t|, \qquad \xi = x|t|^{\frac{\lambda-\beta}{\beta}},$$

where the function $U(\xi)$ is determined by the ordinary differential equation

$$\frac{2}{\beta} + \frac{(\lambda-\beta)(\lambda-2\beta)}{\beta^2}\xi U'_\xi + \frac{(\lambda-\beta)^2}{\beta^2}\xi^2U''_{\xi\xi} = ae^{\lambda U}U''_{\xi\xi} + be^{\beta U}.$$

3. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ae^{\lambda w}\dfrac{\partial w}{\partial x}\right), \qquad a > 0.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w(C_1C_2^{\lambda}x + C_3, \pm C_1t + C_4,) - 2\ln|C_2|,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation.

2°. Additive separable solutions:

$$w(x,t) = \frac{1}{\lambda}\ln|Ax + B| + Ct + D, \tag{1}$$

$$w(x,t) = \frac{2}{\lambda}\ln|Ax + B| - \frac{2}{\lambda}\ln|\pm A\sqrt{a}\,t + C|, \tag{2}$$

$$w(x,t) = \frac{1}{\lambda}\ln(aA^2x^2 + Bx + C) - \frac{2}{\lambda}\ln(aAt + D), \tag{3}$$

$$w(x,t) = \frac{1}{\lambda}\ln(Ax^2 + Bx + C) + \frac{1}{\lambda}\ln\left[\frac{p^2}{aA\cos^2(pt+q)}\right], \tag{4}$$

$$w(x,t) = \frac{1}{\lambda}\ln(Ax^2 + Bx + C) + \frac{1}{\lambda}\ln\left[\frac{p^2}{aA\sinh^2(pt+q)}\right], \tag{5}$$

$$w(x,t) = \frac{1}{\lambda}\ln(Ax^2 + Bx + C) + \frac{1}{\lambda}\ln\left[\frac{-p^2}{aA\cosh^2(pt+q)}\right], \tag{6}$$

where A, B, C, D, p, and q are arbitrary constants. Expressions (1) to (6) exhaust all solutions that can be representable in the form of the sum of functions with different arguments.

3°. Traveling-wave solution:

$$w = w(z), \quad z = x \pm \mu t,$$

where $w = w(z)$ is defined implicitly by (A and B are arbitrary constants)

$$\lambda\mu^2 w - ae^{\lambda w} = Az + B.$$

4°. Self-similar solution:

$$w = u(\xi), \quad \xi = \frac{x + A}{t + B}.$$

Here, A and B are arbitrary constants, and the function $u = u(\xi)$ is determined by the ordinary differential equation

$$(\xi^2 u'_\xi)'_\xi = (ae^{\lambda u} u'_\xi)'_\xi,$$

which admits the first integral

$$\left(\xi^2 - ae^{\lambda u}\right) u'_\xi = C. \tag{7}$$

To the special case $C = 0$ there corresponds a solution of the form (2). For $C \neq 0$, treating u in (7) as the independent variable, one obtains a Riccati equation for $\xi = \xi(u)$,

$$C\xi'_u = \xi^2 - ae^{\lambda u},$$

which is considered in the book by Polyanin and Zaitsev (2003).

5°. Solution:

$$w = \frac{2(k-1)}{\lambda} \ln(t + C_1) + f(\zeta), \quad \zeta = \frac{x + C_2}{(t + C_1)^k},$$

where C_1, C_2, and k are arbitrary constants, and the function $f = f(\zeta)$ is determined by the ordinary differential equation

$$k^2\zeta^2 f''_{\zeta\zeta} + k(k+1)\zeta f'_\zeta - \frac{2(k-1)}{\lambda} = a(e^{\lambda f} f'_\zeta)'_\zeta.$$

6°. There are exact solutions of the following forms:

$$w(x,t) = F(\eta) - \frac{2}{\lambda} \ln|t|, \quad \eta = x + k \ln|t|;$$
$$w(x,t) = H(\zeta) - \frac{2}{\lambda} t, \quad \eta = xe^t,$$

where k is an arbitrary constant.

7°. For other solutions, see equation 7.4.4.6 with $f(w) = ae^{\lambda w}$.

⊙ *References for equation* 7.2.4.3: W. F. Ames, R. J. Lohner, and E. Adams (1981), A. D. Polyanin and V. F. Zaitsev (2002, p. 141).

4. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + ae^{\lambda w}.$

This is a special case of equation 7.2.4.5 with $\beta = \lambda$. For $a = 0$ see equation 7.2.4.3.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the functions

$$w_1 = w(\pm x + C_1,\ C_2 t + C_3) + \frac{1}{\lambda}\ln C_2^2,$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Degenerate solutions in additive form:

$$w = \theta(x) + C_1 t,$$

where

$$\begin{aligned}
&\theta = \frac{1}{\lambda}\ln\left|C_2\cos\left(\sqrt{a\lambda}\,x\right) + C_3\sin\left(\sqrt{a\lambda}\,x\right)\right| && \text{if } a\lambda > 0,\\
&\theta = \frac{1}{\lambda}\ln\left|C_2\exp\left(\sqrt{|a\lambda|}\,x\right) + C_3\exp\left(-\sqrt{|a\lambda|}\,x\right)\right| && \text{if } a\lambda < 0,\\
&\theta = \frac{1}{\lambda}\ln|x + C_2| + C_3 && \text{if } a = 0,\\
&\theta = \tfrac{1}{2}ax^2 + C_2 x + C_3 && \text{if } \lambda = 0;
\end{aligned}$$

C_1, C_2, and C_3 are arbitrary constants.

3°. Nondegenerate solutions in additive form:

$$w = \varphi(x) + \psi(t),$$

where the functions $\varphi(x)$ and $\psi(t)$ are expressed as

$$\varphi(x) = \begin{cases}
\dfrac{1}{\lambda}\ln\left|\dfrac{C}{a} + A_1\cos\left(\sqrt{a\lambda}\,x\right) + A_2\sin\left(\sqrt{a\lambda}\,x\right)\right| & \text{if } a\lambda > 0,\\
\dfrac{1}{\lambda}\ln\left|\dfrac{C}{a} + A_1\exp\left(\sqrt{|a\lambda|}\,x\right) + A_2\exp\left(-\sqrt{|a\lambda|}\,x\right)\right| & \text{if } a\lambda < 0,
\end{cases}$$

$$\psi(t) = \begin{cases}
-\dfrac{1}{\lambda}\ln\left[\dfrac{C\lambda}{2B_1^2}\sin^2(B_1 t + B_2)\right] & \text{if } C\lambda > 0,\\
-\dfrac{1}{\lambda}\ln\left[\dfrac{C\lambda}{2B_1^2}\sinh^2(B_1 t + B_2)\right] & \text{if } C\lambda > 0,\\
-\dfrac{1}{\lambda}\ln\left[\dfrac{C\lambda}{2}(t + B_2)^2\right] & \text{if } C\lambda > 0,\\
-\dfrac{1}{\lambda}\ln\left[-\dfrac{C\lambda}{2B_1^2}\cosh^2(B_1 t + B_2)\right] & \text{if } C\lambda < 0,
\end{cases}$$

where A_1, A_2, B_1, B_2, and C are arbitrary constants.

5. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ae^{\lambda w}\dfrac{\partial w}{\partial x}\right) + be^{\beta w}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1^{\beta-\lambda}x + C_2, \pm C_1^{\beta}t + C_3) + 2\ln|C_1|,$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solution:

$$w = u(z), \qquad z = k_2x + k_1t,$$

where k_1 and k_2 are arbitrary constants, and the function $u(z)$ is determined by the autonomous ordinary differential equation

$$k_1^2u''_{zz} - ak_2^2(e^{\lambda u}u'_z)'_z = be^{\beta u}.$$

The substitution $\Theta(u) = (u'_z)^2$ leads to the first-order linear equation

$$(k_1^2 - ak_2^2e^{\lambda u})\Theta'_u - 2ak_2^2\lambda e^{\lambda u}\Theta = 2be^{\beta u}.$$

3°. Solution:

$$w = U(\xi) - \frac{2}{\beta}\ln|t|, \qquad \xi = x|t|^{\frac{\lambda-\beta}{\beta}},$$

where the function $U(\xi)$ is determined by the ordinary differential equation

$$\frac{2}{\beta} + \frac{(\lambda-\beta)(\lambda-2\beta)}{\beta^2}\xi U'_\xi + \frac{(\lambda-\beta)^2}{\beta^2}\xi^2U''_{\xi\xi} = (ae^{\lambda U}U'_\xi)'_\xi + be^{\beta U}.$$

6. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + b - ce^{-2\lambda w}.$

Functional separable solution:

$$w = \frac{1}{\lambda}\ln\left(\sqrt{c\lambda}\,t - \frac{b\lambda}{2a}x^2 + C_1x + C_2\right),$$

where C_1 and C_2 are arbitrary constants.

7. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[(ae^{\lambda w} + be^{2\lambda w})\dfrac{\partial w}{\partial x}\right] + c.$

Additive separable solution:

$$w = \frac{1}{\lambda}\ln x + \varphi(t),$$

where the function $\varphi = \varphi(t)$ is determined by the second-order autonomous ordinary differential equation

$$\varphi''_{tt} = \frac{b}{\lambda}e^{2\lambda\varphi} + c.$$

⊙ *Reference*: V. A. Galaktionov and S. R. Svirshchevskii (2007, p. 373).

8. $\dfrac{\partial^2 w}{\partial t^2} = ae^{\lambda x+\mu t+\beta w}\dfrac{\partial^2 w}{\partial x^2}, \qquad a > 0.$

The substitution $\beta u = \lambda x + \mu t + \beta w$ leads to an equation of the form 7.2.4.1:

$$\frac{\partial^2 u}{\partial t^2} = ae^{\beta u}\frac{\partial^2 u}{\partial x^2}.$$

7.3. Other Equations Involving Arbitrary Parameters

7.3.1. Equations with Hyperbolic Nonlinearities

1. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + b\sinh(\lambda w).$

Sinh-Gordon equation (also known as *hyperbolic sine–Gordon equation*). It arises in some areas of physics. This is a special case of equation 7.4.1.1 with $f(w) = b\sinh(\lambda w)$.

1°. Traveling-wave solutions:

$$w(x,t) = \pm\frac{2}{\lambda}\ln\left[\tan\frac{b\lambda(kx+\mu t+\theta_0)}{2\sqrt{b\lambda(\mu^2-ak^2)}}\right],$$
$$w(x,t) = \pm\frac{4}{\lambda}\operatorname{arctanh}\left[\exp\frac{b\lambda(kx+\mu t+\theta_0)}{\sqrt{b\lambda(\mu^2-ak^2)}}\right],$$

where k, μ, and θ_0 are arbitrary constants. It is assumed that $b\lambda(\mu^2 - ak^2) > 0$ in both formulas.

2°. Functional separable solution:

$$w(x,t) = \frac{4}{\lambda}\operatorname{arctanh}\big[f(t)g(x)\big], \qquad \operatorname{arctanh} z = \frac{1}{2}\ln\frac{1+z}{1-z},$$

where the functions $f = f(t)$ and $g = g(x)$ are determined by the first-order autonomous ordinary differential equations

$$\big(f_t'\big)^2 = Af^4 + Bf^2 + C,$$
$$a\big(g_x'\big)^2 = Cg^4 + (B - b\lambda)g^2 + A,$$

where A, B, and C are arbitrary constants.

3°. For other exact solutions of this equation, see equation 7.4.1.1 with $f(w) = b\sinh(\lambda w)$, Items 2° and 3°.

⊙ *References for equation* 7.3.1.1: A. Grauel (1985), A. M. Grundland and E. Infeld (1992), M. Musette and R. Conte (1994), R. Z. Zhdanov (1994), V. K. Andreev, O. V. Kaptsov, V. V. Pukhnachov, and A. A. Rodionov (1999), C. Hoenselaers (2007).

2. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + a\sinh(\beta w) + b\sinh(2\beta w).$

Double sinh-Gordon equation. Denote: $k = \dfrac{a}{2b}$.

Traveling-wave solutions:

$$w = \pm\frac{1}{\beta}\operatorname{arccosh}\frac{1-k\sin z}{\sin z - k}, \qquad z = \sqrt{2b\beta(1-k^2)}\,(x\sinh C_1 \pm t\cosh C_1 + C_2)$$
if $|k| < 1$;

$$w = \pm\frac{2}{\beta}\operatorname{arctanh}\left(\sqrt{\frac{k+1}{k-1}}\,\tanh\frac{\xi}{2}\right), \quad \xi = \sqrt{2b\beta(k^2-1)}\,(x\sinh C_1 \pm t\cosh C_1 + C_2)$$
if $|k| > 1$,

where C_1 and C_2 are arbitrary constants.

3. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + be^{\beta t}\sinh^k(\lambda w).$

This is a special case of equation 7.4.1.7 with $f(w) = b\sinh^k(\lambda w)$. Hence, for $k = 1$, this equation is reduced to a simpler equation of 7.3.1.1.

4. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + be^{\beta x}\sinh^k(\lambda w).$

This is a special case of equation 7.4.1.6 with $f(w) = b\sinh^k(\lambda w)$. Hence, for $k = 1$, this equation is reduced to a simpler equation of 7.3.1.1.

5. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{a}{x^n}\dfrac{\partial}{\partial x}\left(x^n\dfrac{\partial w}{\partial x}\right) + k\sinh(\lambda w).$

This is a special case of equation 7.4.2.1 with $f(w) = k\sinh(\lambda w)$ and $n = b/a$.

6. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[a\cosh(\lambda w)\dfrac{\partial w}{\partial x}\right], \qquad a > 0.$

This is a special case of equation 7.4.4.6 with $f(w) = a\cosh(\lambda w)$.

7. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[a\sinh(\lambda w)\dfrac{\partial w}{\partial x}\right], \qquad a > 0.$

This is a special case of equation 7.4.4.6 with $f(w) = a\sinh(\lambda w)$.

7.3.2. Equations with Logarithmic Nonlinearities

1. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + bw\ln w + kw.$

This is a special case of equation 7.4.1.1 with $f(w) = bw\ln w + kw$.

Multiplicative separable solution:

$$w(x,t) = \varphi(t)\psi(x),$$

where the functions $\varphi(t)$ and $\psi(x)$ are determined by the autonomous ordinary differential equations

$$\varphi''_{tt} - b\varphi\ln\varphi - k\varphi = 0,$$
$$a\psi''_{xx} + b\psi\ln\psi = 0,$$

whose general solutions can be represented in implicit form.

2. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + bw\ln w + \left(cx^k + st^n\right)w.$

This is a special case of equation 7.4.1.10 with $f(x) = cx^k$ and $g(t) = st^n$.

3. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + bw^k\ln w.$

This is a special case of equation 7.4.1.1 with $f(w) = bw^k\ln w$. For $k = 1$, see also equation 7.4.1.9 with $f(t) = 0$.

4. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + a(x^2 - t^2)\ln^k(\lambda w).$

This is a special case of equation 7.4.1.2 with $f(w) = a\ln^k(\lambda w)$.

5. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + be^{\beta t} w \ln w.$

The transformation

$$w = U(z,\tau), \quad z = \tfrac{1}{2}\beta \exp\left(\tfrac{1}{2}\beta t\right)\sinh\left(\tfrac{1}{2}\beta x\right), \quad \tau = \tfrac{1}{2}\beta \exp\left(\tfrac{1}{2}\beta t\right)\cosh\left(\tfrac{1}{2}\beta x\right)$$

leads to a simpler equation of the form 7.3.2.1:

$$\frac{\partial^2 U}{\partial \tau^2} = \frac{\partial^2 U}{\partial z^2} + bU\ln U.$$

6. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + be^{\beta x} w \ln w.$

The transformation

$$w = U(z,\tau), \quad z = \tfrac{1}{2}\exp\left(\tfrac{1}{2}\beta x\right)\cosh\left(\tfrac{1}{2}\beta t\right), \quad \tau = \tfrac{1}{2}\exp\left(\tfrac{1}{2}\beta x\right)\sinh\left(\tfrac{1}{2}\beta t\right)$$

leads to a simpler equation of the form 7.3.2.1:

$$\frac{\partial^2 U}{\partial \tau^2} = \frac{\partial^2 U}{\partial z^2} + bU\ln U.$$

7. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{a}{x^n}\dfrac{\partial}{\partial x}\left(x^n \dfrac{\partial w}{\partial x}\right) + cw^k \ln w.$

This is a special case of equation 7.4.2.1 with $f(w) = cw^k \ln w$ and $b = an$.

8. $\dfrac{\partial^2 w}{\partial t^2} = ax^n \dfrac{\partial^2 w}{\partial x^2} + b\ln^k(\lambda w).$

This is a special case of equation 7.4.3.2 with $\beta = 0$ and $f(w) = b\ln^k(\lambda w)$.

9. $\dfrac{\partial^2 w}{\partial t^2} = ax^n \dfrac{\partial^2 w}{\partial x^2} + bx^{n-1}\ln^k(\lambda w)\dfrac{\partial w}{\partial x}.$

This is a special case of equation 7.4.3.5 with $f(w) = b\ln^k(\lambda w)$.

10. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[\left(a + \dfrac{b}{w}\right)\dfrac{\partial w}{\partial x}\right] + cw\ln w + kw + \dfrac{bc}{2a}.$

Multiplicative separable solution:

$$w = \varphi(t)\exp\left[-\frac{c}{4a}(x - x_0)^2\right],$$

where x_0 is an arbitrary constant and the function $\varphi = \varphi(t)$ is determined by the second-order autonomous ordinary differential equation

$$\varphi''_{tt} = c\varphi\ln\varphi + (k - \tfrac{1}{2}c)\varphi.$$

⊙ *Reference*: V. A. Galaktionov and S. R. Svirshchevskii (2007, p. 373).

11. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left[\ln^k(\lambda w)\dfrac{\partial w}{\partial x}\right].$

This is a special case of equation 7.4.4.6 with $f(w) = a\ln^k(\lambda w)$.

12. $w\dfrac{\partial^2 w}{\partial t^2} = w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2 + aw\dfrac{\partial w}{\partial x} + bw^2 + cw^2\ln w.$

The substitution

$$w = e^u$$

leads to the equation

$$\frac{\partial^2 u}{\partial t^2} + \left(\frac{\partial u}{\partial t}\right)^2 = \frac{\partial^2 u}{\partial x^2} + a\frac{\partial u}{\partial x} + cu + b.$$

This equation has additive separable and generalized separable solutions.

1°. Additive separable solution:

$$u = f(x) + \ln|g(t)|,$$

where the functions $f = f(x)$ and $g = g(t)$ are determined by the second-order constant-coefficient ordinary differential equations

$$f''_{xx} + af'_x + cf + b = K,$$
$$g''_{tt} = Kg,$$

with K being an arbitrary constant.

2°. Generalized separable solution:

$$u = f(x)t^2 + g(x)t + h(x),$$

where the functions $f = f(x)$, $g = g(x)$, and $h = h(x)$ are determined by the autonomous system of ordinary differential equations

$$f''_{xx} + af'_x + cf - 4f^2 = 0,$$
$$g''_{xx} + ag'_x + cg - 4fg = 0,$$
$$h''_{xx} + ah'_x + ch + b - 2f - g^2 = 0.$$

Remark. The parameters a, b, and c in the original equation can be replaced by arbitrary functions $a = a(x)$, $b = b(x)$, and $c = c(x)$.

13. $w\dfrac{\partial^2 w}{\partial t^2} = w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2 + aw\dfrac{\partial w}{\partial x} + bw^2 + cw^2\ln w + sw^2\ln^2 w.$

The substitution

$$w = e^u$$

leads to the equation

$$\frac{\partial^2 u}{\partial t^2} + \left(\frac{\partial u}{\partial t}\right)^2 = \frac{\partial^2 u}{\partial x^2} + a\frac{\partial u}{\partial x} + su^2 + cu + b.$$

This equation has generalized separable solutions.

1°. Generalized separable solution with $s > 0$:

$$w = f(x)\exp(\sqrt{s}\,t) + g(x)\exp(-\sqrt{s}\,t) + h(x),$$

where the functions $f = f(x)$, $g = g(x)$, and $h = h(x)$ are determined by the autonomous system of ordinary differential equations

$$\begin{aligned} f''_{xx} + af'_x + (c-s)f + 2sfh &= 0,\\ g''_{xx} + ag'_x + (c-s)g + 2sgh &= 0,\\ h''_{xx} + ah'_x + ch + b + s(4fg + h^2) &= 0. \end{aligned}$$

2°. Generalized separable solution with $s < 0$:

$$w = f(x)\cos(\sqrt{|s|}\,t) + g(x)\sin(\sqrt{|s|}\,t) + h(x),$$

where the functions $f = f(x)$, $g = g(x)$, and $h = h(x)$ are determined by the autonomous system of ordinary differential equations

$$\begin{aligned} f''_{xx} + af'_x + (c-s)f + 2sfh &= 0,\\ g''_{xx} + ag'_x + (c-s)g + 2sgh &= 0,\\ h''_{xx} + ah'_x + ch + b + s(f^2 + g^2 + h^2) &= 0. \end{aligned}$$

Remark. The parameters a, b, and c in the original equation can be replaced by arbitrary functions $a = a(x)$, $b = b(x)$, and $c = c(x)$.

14. $w\ln(kw)\dfrac{\partial^2 w}{\partial t^2} = w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2 + aw\dfrac{\partial w}{\partial x} + bw^2 + cw^2\ln w.$

The substitution

$$w = e^u$$

leads to the equation

$$(u + \ln k)\left[\frac{\partial^2 u}{\partial t^2} + \left(\frac{\partial u}{\partial t}\right)^2\right] = \frac{\partial^2 u}{\partial x^2} + a\frac{\partial u}{\partial x} + cu + b.$$

Generalized separable solution:

$$u = f(x)t + g(x),$$

where the functions $f = f(x)$ and $g = g(x)$ are determined by the autonomous system of ordinary differential equations

$$\begin{aligned} f''_{xx} + af'_x + cf &= f^3,\\ g''_{xx} + ag'_x + cg &= (g + \ln k)f^2. \end{aligned}$$

Remark. The parameters a, b, and c in the original equation can be replaced by arbitrary functions $a = a(x)$, $b = b(x)$, and $c = c(x)$.

15. $\dfrac{\partial w}{\partial t}\dfrac{\partial^2 w}{\partial t^2} = w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2 + aw\dfrac{\partial w}{\partial x} + bw^2 + cw^2\ln w.$

The substitution

$$w = e^u$$

leads to the equation

$$\frac{\partial u}{\partial t}\left[\frac{\partial^2 u}{\partial t^2} + \left(\frac{\partial u}{\partial t}\right)^2\right] = \frac{\partial^2 u}{\partial x^2} + a\frac{\partial u}{\partial x} + b + cu.$$

This equation has additive separable and generalized separable solutions.

1°. Additive separable solution:

$$u = f(x) + \ln|g(t)|,$$

where the functions $f = f(x)$ and $g = g(t)$ are determined by the system of ordinary differential equations

$$f''_{xx} + af'_x + cf + b = K,$$
$$g'_t g''_{tt} = Kg^2;$$

K is an arbitrary constant. The first equation is a second-order constant-coefficient ordinary differential equation for f and, hence, is easy to integrate. A particular solution of the second equation is $g = C_1\exp(K^{1/3}t)$ and the general solution is

$$\int (Kg^3 + C_1)^{-1/3}dg = t + C_2,$$

where C_1 and C_2 are arbitrary constants.

2°. Generalized separable solution:

$$u = f(x)t + g(x),$$

where the functions $f = f(x)$ and $g = g(x)$ are determined by the autonomous system of ordinary differential equations

$$f''_{xx} + af'_x + cf = 0,$$
$$g''_{xx} + ag'_x + cg = f^3 - b.$$

This system is easy to integrate, since the former equation is a second-order linear homogeneous ordinary differential equation and the latter equation is a second-order linear nonhomogeneous ordinary differential equation.

Remark. The parameters a, b, c, and s in the original equation can be replaced by arbitrary functions $a = a(x)$, $b = b(x)$, $c = c(x)$, and $s = s(x)$.

7.3.3. Sine-Gordon Equation and Other Equations with Trigonometric Nonlinearities

1. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + b\sin(\lambda w).$

Sine-Gordon equation. It arises in differential geometry and various areas of physics (superconductivity, dislocations in crystals, waves in ferromagnetic materials, laser pulses in two-phase media, meson theory of nuclear forces and others).

Remark. This equation is sometimes called the *Enneper equation*; see historical aspects in Seeger and Wesolowski (1981).

1°. Suppose $w = \varphi(x,t)$ is a solution of the sine-Gordon equation. Then the functions

$$w_1 = \frac{2\pi n}{\lambda} \pm \varphi(C_1 \pm x, C_2 \pm t), \qquad n = 0, \pm 1, \pm 2, \ldots;$$
$$w_2 = \pm\varphi\left(x\cosh\sigma + t\sqrt{a}\,\sinh\sigma,\; x\frac{\sinh\sigma}{\sqrt{a}} + t\cosh\sigma\right),$$

where C_1, C_2, and σ are arbitrary constants, are also solutions of the equation. The plus or minus signs in the first expression are chosen in any sequence.

2°. Traveling-wave solutions:

$$w(x,t) = \frac{4}{\lambda}\arctan\left\{\exp\left[\pm\frac{b\lambda(kx+\mu t+\theta_0)}{\sqrt{b\lambda(\mu^2-ak^2)}}\right]\right\} \qquad \text{if} \quad b\lambda(\mu^2-ak^2) > 0,$$
$$w(x,t) = -\frac{\pi}{\lambda} + \frac{4}{\lambda}\arctan\left\{\exp\left[\pm\frac{b\lambda(kx+\mu t+\theta_0)}{\sqrt{b\lambda(ak^2-\mu^2)}}\right]\right\} \quad \text{if} \quad b\lambda(\mu^2-ak^2) < 0,$$

where k, μ, and θ_0 are arbitrary constants. The first expression corresponds to a *single-soliton solution*.

3°. Functional separable solution:

$$w(x,t) = \frac{4}{\lambda}\arctan\big[f(x)g(t)\big], \tag{1}$$

where the functions $f = f(x)$ and $g = g(t)$ are determined by the first-order autonomous separable ordinary differential equations

$$\begin{aligned} \big(f'_x\big)^2 &= Af^4 + Bf^2 + C, \\ \big(g'_t\big)^2 &= -aCg^4 + (aB+b\lambda)g^2 - aA, \end{aligned} \tag{2}$$

where A, B, and C are arbitrary constants. Note some exact solutions that follow from (1) and (2).

3.1. For $A = 0$, $B = k^2 > 0$, and $C > 0$, we have

$$w(x,t) = \frac{4}{\lambda}\arctan\left[\frac{\mu\sinh(kx+A_1)}{k\sqrt{a}\cosh(\mu t+B_1)}\right], \quad \mu^2 = ak^2 + b\lambda > 0, \tag{3}$$

where k, A_1, and B_1 are arbitrary constants. Formula (3) corresponds to the *two-soliton solution* of Perring–Skyrme (1962).

3.2. For $A = 0$, $B = -k^2 < 0$, and $C > 0$,

$$w(x,t) = \frac{4}{\lambda}\arctan\left[\frac{\mu\sin(kx+A_1)}{k\sqrt{a}\cosh(\mu t+B_1)}\right], \quad \mu^2 = b\lambda - ak^2 > 0,$$

where k, A_1, and B_1 are arbitrary constants.

3.3. For $A = k^2 > 0$, $B = k^2\gamma^2 > 0$, and $C = 0$,

$$w(x,t) = \frac{4}{\lambda}\arctan\left[\frac{\gamma}{\mu}\frac{e^{\mu(t+A_1)} - ak^2e^{-\mu(t+A_1)}}{e^{k\gamma(x+B_1)} + e^{-k\gamma(x+B_1)}}\right], \quad \mu^2 = ak^2\gamma^2 + b\lambda > 0,$$

where k, A_1, B_1, and γ are arbitrary constants.

4°. Two-soliton periodic solution, called a *breather*, is given by ($a = 1$, $b = -1$, and $\lambda = 1$):

$$w = 4\arctan\left[\frac{\sqrt{1-\omega^2}}{\omega\cosh\left(\sqrt{1-\omega^2}\,x\sin\omega t\right)}\right],$$

where ω is an arbitrary constant ($0 < \omega < 1$).

5°. An N-soliton solution is given by ($a = 1$, $b = -1$, and $\lambda = 1$)

$$w(x,t) = \arccos\left[1 - 2\left(\frac{\partial^2}{\partial x^2} - \frac{\partial^2}{\partial t^2}\right)(\ln F)\right],$$

$$F = \det\left[M_{ij}\right], \quad M_{ij} = \frac{2}{a_i + a_j}\cosh\left(\frac{z_i + z_j}{2}\right),$$

$$z_i = \pm\frac{x - \mu_i t + C_i}{\sqrt{1-\mu_i^2}}, \quad a_i = \pm\sqrt{\frac{1-\mu_i}{1+\mu_i}},$$

where μ_i and C_i are arbitrary constants.

6°. For other exact solutions of the original equation, see equation 7.4.1.1 with $f(w) = b\sin(\lambda w)$, Item 3°.

7°. The sine-Gordon equation is integrated by the inverse scattering method; see the book by Novikov, Manakov, Pitaevskii, and Zakharov (1984). Belokolos (1995) obtained a general formula for the solution of the sine-Gordon equation with arbitrary initial and boundary conditions.

8°. The transformation

$$z = x - at, \quad y = x + at$$

leads to an equation of the form 7.5.1.5: $\partial_{zy} w = -\frac{1}{4}a^{-2}\sin w$.

⊙ *References for equation* 7.3.3.1: A. Enneper (1870), R. Steuerwald (1936), A. Seeger, H. Donth, and A. Kochendörfer (1953), J. K. Perring, T. H. R. Skyrme (1962), M. J. Ablowitz, D. J. Kaup, A. C. Newell, and H. Segur (1973), V. E. Zakharov, L. A. Takhtajan, and L. D. Faddeev (1974), G. B. Whitham (1974), G. Liebbrandt (1978), R. K. Bullough and P. J. Caudrey (1980), I. M. Krichever (1980), G. L. Lamb (1980), M. J. Ablowitz and H. Segur (1981), A. Seeger and Z. Wesolowski (1981), S. P. Novikov, S. V. Manakov, L. B. Pitaevskii, and V. E. Zakharov (1984), J. Weiss (1984), M. J. Ablowitz and P. A. Clarkson (1991), R. Beutler (1993), M. Musette and R. Conte (1994).

2. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + b\sin(\lambda w) + c\sin\left(\frac{1}{2}\lambda w\right)$.

Double sine-Gordon equation. It arises in nonlinear optics (propagation of ultrashort pulses in a resonance degenerate medium) and low temperature physics (propagation of spin waves in anisotropic spin liquids).

1°. Traveling-wave solutions:

$$w(x,t) = \frac{4}{\lambda}\arctan\left[\frac{\sqrt{4b^2-c^2}}{2b-c}\,\tanh\frac{\lambda\sqrt{4b^2-c^2}(kx+\mu t+\theta_0)}{4\sqrt{b\lambda(ak^2-\mu^2)}}\right] \quad \text{if} \quad c^2 < 4b^2,$$

$$w(x,t) = \frac{4}{\lambda}\arctan\left[\frac{\sqrt{c^2-4b^2}}{c-2b}\,\tan\frac{\lambda\sqrt{c^2-4b^2}(kx+\mu t+\theta_0)}{4\sqrt{b\lambda(ak^2-\mu^2)}}\right] \quad \text{if} \quad c^2 > 4b^2.$$

Here, k, μ, and θ_0 are arbitrary constants. It is assumed that $b\lambda(ak^2 - \mu^2) > 0$ in both formulas.

2°. Traveling-wave solutions:

$$w(x,t) = A + \frac{4}{\lambda}\arctan\bigl(B_1 e^{\theta} + C_1\bigr) + \frac{4}{\lambda}\arctan\bigl(B_2 e^{\theta} + C_2\bigr), \quad \theta = \mu t \pm kx + \theta_0,$$

where the parameters A, B_1, B_2, C_1, C_2, μ, and k are related by algebraic constraints with the parameters a, b, c, and λ of the original equation; θ_0 is an arbitrary constant.

Note some special cases of interest that arise in applications.

2.1. For $a = 1$, $b = -1$, $c = -\frac{1}{2}$, $\lambda = 1$:

$$w(x,t) = 4\arctan\bigl(e^{\theta-\Delta}\bigr) + 4\arctan\bigl(e^{\theta+\Delta}\bigr); \qquad \Delta = \ln\bigl(\sqrt{5}+2\bigr), \quad k = \mu + \tfrac{5}{4}\mu^{-1}.$$

2.2. For $a = 1$, $b = -1$, $c = -\frac{1}{2}$, $\lambda = 1$:

$$w(x,t) = 2\pi + 4\arctan\bigl(e^{\theta-\Delta}\bigr) - 4\arctan\bigl(e^{\theta+\Delta}\bigr); \qquad \Delta = \ln\bigl(\sqrt{3}+2\bigr), \quad k = \mu + \tfrac{3}{4}\mu^{-1}.$$

2.3. For $a = 1$, $b = 1$, $c = \frac{1}{2}$, $\lambda = 1$:

$$w(x,t) = \delta - 2\pi + 4\arctan\left(\frac{4}{\sqrt{15}}e^{\theta} + \frac{1}{\sqrt{15}}\right); \qquad \delta \text{ is any}, \quad k = \mu + \tfrac{15}{16}\mu^{-1}.$$

2.4. For $a = 1$, $b = 1$, $c = \frac{1}{2}$, $\lambda = 1$:

$$w(x,t) = 2\pi - \delta + 4\arctan\left(\frac{4}{\sqrt{15}}e^{\theta} - \frac{1}{\sqrt{15}}\right); \qquad \delta \text{ is any}, \quad k = \mu + \tfrac{15}{16}\mu^{-1}.$$

⊙ *References for equation* 7.3.3.2: P. B. Burt (1978), R. K. Bullough and P. J. Caudrey (1980), F. Calogero and A. Degasperis (1982).

3. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + b\cos(\lambda w).$

The substitution $w = u + \dfrac{\pi}{2\lambda}$ leads to an equation of the form 7.3.3.1:

$$\frac{\partial^2 u}{\partial t^2} = a\frac{\partial^2 u}{\partial x^2} - b\sin(\lambda u).$$

4. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + be^{\beta t}\sin^k(\lambda w).$

This is a special case of equation 7.4.1.7 with $f(w) = b\sin^k(\lambda w)$. Therefore, for $k = 1$, the equation is reduced to a simpler equation of 7.3.3.1.

5. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + be^{\beta x}\sin^k(\lambda w).$

This is a special case of equation 7.4.1.6 with $f(w) = b\sin^k(\lambda w)$. Therefore, for $k = 1$, the equation is reduced to a simpler equation of 7.3.3.1.

6. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + be^{\beta t}\cos^k(\lambda w).$

This is a special case of equation 7.4.1.7 with $f(w) = b\cos^k(\lambda w)$. Therefore, for $k = 1$, the equation is reduced to a simpler equation of 7.3.3.3.

7. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + be^{\beta x}\cos^k(\lambda w).$

This is a special case of equation 7.4.1.6 with $f(w) = b\cos^k(\lambda w)$. Therefore, for $k = 1$, the equation reduced to a simpler equation of 7.3.3.3.

8. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{a}{x^n}\dfrac{\partial}{\partial x}\left(x^n\dfrac{\partial w}{\partial x}\right) + k\sin(\lambda w).$

This is a special case of equation 7.4.2.1 with $f(w) = k\sin(\lambda w)$ and $b = an$.

9. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[a\cos^n(\lambda w)\dfrac{\partial w}{\partial x}\right], \qquad a > 0.$

This is a special case of equation 7.4.4.6 with $f(w) = a\cos^n(\lambda w)$.

10. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[a\sin^n(\lambda w)\dfrac{\partial w}{\partial x}\right], \qquad a > 0.$

This is a special case of equation 7.4.4.6 with $f(w) = a\sin^n(\lambda w)$.

7.3.4. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} + a\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right]$

1. $\dfrac{\partial^2 w}{\partial t^2} + \dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^{-2}\dfrac{\partial w}{\partial x}\right).$

The transformation

$$\tau = t + \ln|w|, \quad dz = aw^{-2}w_x dt + (w + w_t)dx, \quad u = 1/w \qquad (dz = z_t\,dt + z_x\,dx),$$

where the subscripts denote the corresponding partial derivatives, leads to the linear *telegraph equation*

$$\frac{\partial^2 u}{\partial \tau^2} + \frac{\partial u}{\partial \tau} = a\frac{\partial^2 u}{\partial z^2}.$$

⊙ *References*: C. Rogers and T. Ruggeri (1985), C. Rogers and W. F. Ames (1989).

2. $\dfrac{\partial^2 w}{\partial t^2} + k\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[a(w + b)^n\dfrac{\partial w}{\partial x}\right].$

1°. Solution for $n \neq -1$:

$$w(x, t) = (x + C_2)^{1/(1+n)}(C_1 e^{-kt} + C_2) - b,$$

where C_1 and C_2 are arbitrary constants.

2°. Solution:

$$w(x,t) = (x+C)^{2/n}u(t) - b,$$

where C is an arbitrary constant, and the function $u = u(t)$ is determined by the ordinary differential equation

$$u''_{tt} + ku'_t = \frac{2a(n+2)}{n^2}u^{n+1}.$$

This equation is easy to integrate for $n = -2$ and $n = -1$. For $n = -3/2$ and -3, its exact solutions are given in the handbook by Polyanin and Zaitsev (2003).

3°. Traveling-wave solution in implicit form:

$$\int_0^{w+b} \frac{bu^n - \lambda^2}{k\lambda u + C_1}\,dw = x + \lambda t + C_2,$$

where C_1, C_2, and λ are arbitrary constants.

4°. Solution for $n = -1$:

$$w(x,t) = \frac{2at + C_1e^{-kt} + C_2}{k(x+C_3)^2} - b,$$

where C_1, C_2, and C_3 are arbitrary constants.

5°. Generalized separable solution for $n = 1$:

$$w(x,t) = f(t)x^2 + g(t)x + h(t) - b,$$

where the functions $f(t)$, $g(t)$, and $h(t)$ are determined by the system of ordinary differential equations

$$f''_{tt} + kf'_t = 6af^2,$$
$$g''_{tt} + kg'_t = 6afg,$$
$$h''_{tt} + kh'_t = 2afh + ag^2.$$

3. $\dfrac{\partial^2 w}{\partial t^2} + a\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left(be^{\lambda w}\dfrac{\partial w}{\partial x}\right)$.

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w\big(C_1x + C_2,\ t + C_3\big) - \frac{2}{\lambda}\ln|C_1|,$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = \frac{1}{\lambda}\ln(C_1x + C_2) + C_3e^{-at} + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants.

3°. Additive separable solution:

$$w(x,t) = \frac{1}{\lambda}\ln(\lambda C_1 x^2 + C_2 x + C_3) + u(t),$$

where C_1, C_2, and C_3 are arbitrary constants, and the function $u = u(t)$ is determined by the ordinary differential equation

$$u''_{tt} + au'_t = 2bC_1 e^{\lambda u}.$$

4°. Traveling-wave solution in implicit form:

$$\int \frac{be^{\lambda w} - \lambda^2}{a\lambda w + C_1}\,dw = x + \lambda t + C_2,$$

where C_1, C_2, and λ are arbitrary constants.

⊙ *References for equation* 7.3.4.3: N. H. Ibragimov (1994, pp. 169–170), A. D. Polyanin and V. F. Zaitsev (2002, p. 146).

7.3.5. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} + f(w)\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[g(w)\dfrac{\partial w}{\partial x}\right]$

▷ *Equations of this form admit traveling-wave solutions $w = w(kx + \lambda t)$; to $k = 0$ there corresponds a homogeneous solution dependent on t alone and to $\lambda = 0$, a stationary solution dependent on x alone. For $g(w) =$ const, such equations are encountered in the theory of electric field and nonlinear Ohm laws, where w is the electric field strength.*

1. $\dfrac{\partial^2 w}{\partial t^2} + w^n\dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = C_1 w(\pm C_1^n x + C_2,\ C_1^n t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Traveling-wave solutions in implicit form:

$$\int \frac{(n+1)dw}{w^{n+1} + C_1} = -\frac{a(x-at)}{1-a^2} + C_2 \quad \text{if} \quad n \neq -1,$$
$$\int \frac{dw}{\ln|w| + C_1} = -\frac{a(x-at)}{1-a^2} + C_2 \quad \text{if} \quad n = -1,$$

where C_1, C_2, and a are arbitrary constants ($a \neq 0, \pm 1$).

Special case 1. Traveling-wave solution for $n \neq 0, -1$:

$$w = \left(\frac{n}{n+1}\xi + C\right)^{-1/n}, \quad \xi = \frac{a(x-at)}{1-a^2},$$

where C and a are arbitrary constants ($a \neq 0, \pm 1$).

Special case 2. Traveling-wave solutions for $n = 1$:

$$w = 2C_1 \tanh(C_1\xi + C_2), \qquad w = -2C_1 \tan(C_1\xi + C_2), \qquad \xi = \frac{a(x - at)}{1 - a^2},$$

where C_1, C_2, and a are arbitrary constants; $a \neq 0, \pm 1$.

3°. Self-similar solution:

$$w = t^{-1/n}\varphi(\xi), \quad \xi = \frac{x}{t},$$

where the function $\varphi = \varphi(\xi)$ is determined by the ordinary differential equation

$$(1 - \xi^2)\varphi''_{\xi\xi} + \left[\varphi^n - \frac{2(n+1)}{n}\right]\xi\varphi'_\xi + \frac{1}{n}\varphi^{n+1} + \frac{n+1}{n^2}\varphi = 0.$$

4°. Generalized separable solution for $n = 1$:

$$w = \varphi(x)\left[t + C_1 + C_2\int \frac{dx}{\varphi^2(x)}\right].$$

Here, the function $\varphi = \varphi(x)$ is determined by the autonomous ordinary differential equation $\varphi''_{xx} = \varphi^2$, which has a particular solution $\varphi = 6(x + C)^{-2}$.

⊙ *References for equation* 7.3.5.1: Y. P. Emech and V. B. Taranov (1972), N. H. Ibragimov (1994, pp. 243–244; 1995, pp. 334–337), A. D. Polyanin and V. F. Zaitsev (2002, p. 148).

2. $\dfrac{\partial^2 w}{\partial t^2} + aw^n\dfrac{\partial w}{\partial t} = b\dfrac{\partial^2 w}{\partial x^2}$.

1°. Self-similar solution:

$$w(x, t) = u(z)t^{-1/n}, \quad z = xt^{-1},$$

where the function $u = u(z)$ is determined by the ordinary differential equation

$$n^2(z^2 - b)u''_{zz} + nz(2n + 2 - nau^n)u'_z + u(1 + n - nau^n) = 0.$$

2°. Passing to the new independent variables $\tau = at$ and $z = ab^{-1/2}x$, we arrive at an equation of the form 7.3.5.1:

$$\frac{\partial^2 w}{\partial \tau^2} + w^n\frac{\partial w}{\partial \tau} = \frac{\partial^2 w}{\partial z^2}.$$

3. $\dfrac{\partial^2 w}{\partial t^2} + aw^n\dfrac{\partial w}{\partial t} = b\dfrac{\partial}{\partial x}\left(w^k\dfrac{\partial w}{\partial x}\right)$.

1°. Suppose $w(x, t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^2 w(\pm C_1^{2n-k}x + C_2,\ C_1^{2n}t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Self-similar solution:

$$w(x, t) = u(z)t^{-1/n}, \quad z = xt^{(k-2n)/(2n)},$$

where the function $u = u(z)$ is determined by the ordinary differential equation

$$\left[4bn^2u^k - (2n - k)^2z^2\right]u''_{zz} + 4bkn^2u^{k-1}\left(u'_z\right)^2 + (2n - k)(k - 4 - 4n + 2nau^n)zu'_z = 4u(1 + n - anu^n).$$

⊙ *Reference for equation* 7.3.5.3: N. H. Ibragimov (1994, pp. 243–244).

4. $\dfrac{\partial^2 w}{\partial t^2} + e^w \dfrac{\partial w}{\partial t} = \dfrac{\partial^2 w}{\partial x^2}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1 x + C_2,\ C_1 t + C_3) + \ln C_1,$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Traveling-wave solutions:

$$w(x,t) = -\ln\left\{\frac{1}{C_1}\left[\exp\left(\frac{C_1}{a^2-1}(ax-t)+C_2\right)-1\right]\right\},$$
$$w(x,t) = -\ln\left\{\frac{1}{a^2-1}(ax-t)+C_1\right\},$$

where C_1, C_2, and a are arbitrary constants ($a \neq \pm 1$).

3°. Solutions:

$$w(x,t) = -\ln\left(\frac{t+Cx}{1-C^2} + 2a\sqrt{|t^2-x^2|}\left|\frac{x+t}{x-t}\right|^a\right),$$
$$w(x,t) = -\ln\left(\mp\frac{x}{2} + C(x\pm t) + \frac{1}{4}(x\pm t)\ln\left|\frac{x+t}{x-t}\right|\right),$$

where C and a are arbitrary constants.

⊙ *References for equation* 7.3.5.4: Y. P. Emech and V. B. Taranov (1973), N. H. Ibragimov (1994, pp. 243–244; 1995, pp. 334–335).

5. $\dfrac{\partial^2 w}{\partial t^2} + ae^{\lambda w}\dfrac{\partial w}{\partial t} = b\dfrac{\partial^2 w}{\partial x^2}.$

1°. Solution:

$$w(x,t) = u(z) - \frac{1}{\lambda}\ln t, \quad z = xt^{-1},$$

where the function $u = u(z)$ is determined by the ordinary differential equation

$$\lambda(z^2-b)u''_{zz} + \lambda z(2-ae^{\lambda u})u'_z + 1 - ae^{\lambda u} = 0.$$

2°. Passing to the new variables $\tau = at$, $z = a\beta^{-1/2}x$, and $u = \lambda w$, we arrive at an equation of the form 7.3.5.4:

$$\frac{\partial^2 u}{\partial \tau^2} + e^u \frac{\partial u}{\partial \tau} = \frac{\partial^2 u}{\partial z^2}.$$

6. $\dfrac{\partial^2 w}{\partial t^2} + ae^{\lambda w}\dfrac{\partial w}{\partial t} = b\dfrac{\partial}{\partial x}\left(e^{\mu w}\dfrac{\partial w}{\partial x}\right).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1^{2\lambda-\mu}x + C_2,\ C_1^{2\lambda}t + C_3) + 2\ln C_1,$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Solution:

$$w(x,t) = u(z) - \frac{1}{\lambda}\ln t, \quad z = xt^{(\lambda-2\mu)/(2\mu)},$$

where the function $u = u(z)$ is determined by the ordinary differential equation

$$\left[(\mu-2\lambda)^2 z^2 - 4b\lambda^2 e^{\mu u}\right]u''_{zz} - 4b\mu\lambda^2 e^{\mu u}(u'_z)^2 + (\mu-2\lambda)(\mu-4\lambda+2a\lambda e^{\lambda u})zu'_z + 4\lambda(1-ae^{\lambda u}) = 0.$$

⊙ *Reference for equation* 7.3.5.6: N. H. Ibragimov (1994, pp. 243–244).

7.4. Equations Involving Arbitrary Functions

7.4.1. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f(x,t,w)$

1. $\dfrac{\partial^2 w}{\partial t^2} = \alpha\dfrac{\partial^2 w}{\partial x^2} + f(w)$.

Nonlinear Klein–Gordon equation.

1°. Suppose $w = w(x,t)$ is a solution of the equation in question. Then the functions

$$w_1 = w(\pm x + C_1, \pm t + C_2),$$
$$w_2 = w\big(x\cosh\beta + t\alpha^{1/2}\sinh\beta,\ t\cosh\beta + x\alpha^{-1/2}\sinh\beta\big),$$

where C_1, C_2, and β are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. Traveling-wave solution in implicit form:

$$\int\left[C_1 + \frac{2}{\lambda^2-\alpha k^2}\int f(w)\,dw\right]^{-1/2} dw = kx + \lambda t + C_2, \tag{1}$$

where C_1, C_2, k, and λ are arbitrary constants.

Nesterov (1978) indicated several cases where solution (1) can be written out in explicit form ($\alpha = \mu = 1$):

$$f(w) = -b^2\frac{\tanh w}{\cosh^2 w}, \quad w(z) = \operatorname{arcsinh}\left[\sinh k\,\sin\left(\frac{bz+c}{\cosh k\sqrt{\lambda^2-1}}\right)\right],$$
$$f(w) = -b^2\frac{\tan w}{\cos^2 w}, \quad w(z) = \arcsin\left[\sin k\,\sin\left(\frac{bz+c}{\cos k\sqrt{\lambda^2-1}}\right)\right],$$

where k and c are arbitrary constants. In these cases, the following relationships between the wave speed, λ, and the amplitude, b, correspond to periodic solutions in z with period 2π:

$$\lambda^2 = 1 + b^2\cosh^{-2}k,$$
$$\lambda^2 = 1 + b^2\cos^{-2}k.$$

3°. Functional separable solution:

$$w = w(\xi), \qquad \xi = \tfrac{1}{4}\alpha(t+C_1)^2 - \tfrac{1}{4}(x+C_2)^2,$$

where C_1 and C_2 are arbitrary constants, and the function $w = w(\xi)$ is determined by the ordinary differential equation

$$\xi w''_{\xi\xi} + w'_\xi - \frac{1}{\alpha} f(w) = 0.$$

4°. For exact solutions of the nonlinear Klein–Gordon equation with $f(w) = bw^m$, $f(w) = be^{\beta w}$, $f(w) = b\sinh(\lambda w)$, $f(w) = bw\ln w$, and $f(w) = b\sin(\lambda w)$, see equations 7.1.1.1, 7.2.1.1, 7.3.1.1, 7.3.2.1, and 7.3.3.1, respectively. For solutions of the original equation with some other $f = f(w)$, see Example 30.10 in Subsection 30.3.2.

⊙ *References for equation* 7.4.1.1: P. A. Clarkson, J. B. McLeod, P. J. Olver, and R. Ramani (1986), A. M. Grundland and E. Infeld (1992), R. Z. Zhdanov (1994), A. D. Polyanin and V. F. Zaitsev (2002, pp. 149–150).

2. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + (x^2 - t^2) f(w)$.

1°. Suppose $w = w(x, t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm x, \pm t),$$
$$w_2 = w(x\cosh\beta + t\sinh\beta,\ x\sinh\beta + t\cosh\beta),$$

where β is an arbitrary constant, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. Functional separable solution:

$$w = w(\xi), \qquad \xi = \tfrac{1}{2}\left(x^2 - t^2\right),$$

where the function $w = w(\xi)$ is determined by the ordinary differential equation

$$\xi w''_{\xi\xi} + w'_\xi + \xi f(w) = 0.$$

3°. Self-similar solution:

$$w = w(\tau), \qquad \tau = xt.$$

Here, the function $w = w(\tau)$ is determined by the autonomous ordinary differential equation

$$w''_{\tau\tau} = f(w),$$

whose general solution can be represented in implicit form as

$$\int \left[C_1 + 2F(w)\right]^{-1/2} dw = C_2 \pm \tau, \qquad F(w) = \int f(w)\, dw,$$

where C_1 and C_2 are arbitrary constants.

Remark. This solution is a nonclassical (noninvariant) self-similar solution, since the equation concerned is not invariant to the scaling transformation.

4°. Functional separable solution:

$$w = w(z), \qquad z = \tfrac{1}{2}(x^2 + t^2).$$

Here, the function $w = w(z)$ is determined by the autonomous ordinary differential equation

$$w''_{zz} + f(w) = 0,$$

whose general solution can be represented in implicit form as

$$\int \left[C_1 - 2F(w)\right]^{-1/2} dw = C_2 \pm z, \qquad F(w) = \int f(w)\, dw,$$

where C_1 and C_2 are arbitrary constants.

5°. Functional separable solution (generalizes the solution of Items 3° and 4°):

$$w = w(r), \qquad r = C_1x^2 + C_2xt + C_1t^2 + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants, and the function $w = w(r)$ is determined by the autonomous ordinary differential equation

$$(C_2^2 - 4C_1^2)w''_{rr} = f(w).$$

6°. The transformation

$$w = U(z,\tau), \quad z = \tfrac{1}{2}(x^2 + t^2), \quad \tau = xt$$

leads to a simpler equation of the form 7.4.1.1:

$$\frac{\partial^2 U}{\partial \tau^2} = \frac{\partial^2 U}{\partial z^2} + f(U).$$

⊙ *Reference for equation* 7.4.1.2: A. D. Polyanin and V. F. Zaitsev (2002, pp. 150–151).

3. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + (t^2 - x^2)^n f(w), \qquad n = 2, 3, \ldots.$

This is a special case of equation 7.4.1.16 with $f(y) = y^n$ and $g(z) = z^n$.

4. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f(x + bt, w).$

Solution:

$$w = w(\xi), \qquad \xi = x + bt,$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$(a - b^2)w''_{\xi\xi} + f(\xi, w) = 0.$$

5. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + (x^2 - t^2) f(xt, w).$

1°. Self-similar solution:

$$w = w(\tau), \qquad \tau = xt.$$

Here, the function $w = w(\tau)$ is determined by the ordinary differential equation

$$w''_{\tau\tau} = f(\tau, w).$$

2°. The transformation

$$z = \tfrac{1}{2}(x^2 + t^2), \quad \tau = xt$$

leads to the simpler equation

$$\frac{\partial^2 w}{\partial \tau^2} = \frac{\partial^2 w}{\partial z^2} + f(\tau, w).$$

6. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + e^{\beta x} f(w).$

The transformation

$$w = U(z,\tau), \quad z = \exp\left(\tfrac{1}{2}\beta x\right)\cosh\left(\tfrac{1}{2}\beta t\right), \quad \tau = \exp\left(\tfrac{1}{2}\beta x\right)\sinh\left(\tfrac{1}{2}\beta t\right)$$

leads to a simpler equation of the form 7.4.1.1:

$$\frac{\partial^2 U}{\partial \tau^2} = \frac{\partial^2 U}{\partial z^2} + 4\beta^{-2} f(U).$$

For arbitrary $f = f(U)$, this equation admits a traveling-wave solution $U = U(kz + \lambda\tau)$ and a solution of the form $U = U(z^2 - \tau^2)$.

⊙ *Reference for equation* 7.4.1.6: A. D. Polyanin and V. F. Zaitsev (2002, p. 152).

7. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + e^{\beta t} f(w).$

The transformation

$$w = U(z,\tau), \quad z = \exp\left(\tfrac{1}{2}\beta t\right)\sinh\left(\tfrac{1}{2}\beta x\right), \quad \tau = \exp\left(\tfrac{1}{2}\beta t\right)\cosh\left(\tfrac{1}{2}\beta x\right)$$

leads to a simpler equation of the form 7.4.1.1:

$$\frac{\partial^2 U}{\partial \tau^2} = \frac{\partial^2 U}{\partial z^2} + 4\beta^{-2} f(U).$$

For arbitrary $f = f(U)$, this equation admits a traveling-wave solution $U = U(kz + \lambda\tau)$ and a solution of the form $U = U(z^2 - \tau^2)$.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2002, p. 152).

8. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + e^{ax+bt} f(w).$

1°. There is a solution of the form $w = w(ax + bt)$.

2°. For $b \neq \pm a$, the transformation

$$\xi = ax + bt, \quad \tau = bx + at$$

leads to an equation of the form 7.4.1.6:

$$\frac{\partial^2 w}{\partial \tau^2} = \frac{\partial^2 w}{\partial \xi^2} + \frac{1}{a^2 - b^2} e^{\xi} f(w).$$

3°. For $b = a$, see equation 7.4.1.13 with $f(z) = e^{az}$, and for $b = -a$, see equation 7.4.1.14 with $f(z) = e^{-az}$.

9. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + bw\ln w + f(t)w.$

Multiplicative separable solution:

$$w(x,t) = \varphi(t)\psi(x),$$

where the functions $\varphi(t)$ and $\psi(x)$ are determined by the ordinary differential equations

$$\begin{aligned}\varphi_{tt}'' - \big[b\ln\varphi + f(t) + C\big]\varphi &= 0,\\ a\psi_{xx}'' + \big(b\ln\psi - C\big)\psi &= 0,\end{aligned}$$

and C is an arbitrary constant.

10. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + bw\ln w + \big[f(x) + g(t)\big]w.$

Multiplicative separable solution:

$$w(x,t) = \varphi(t)\psi(x),$$

where the functions $\varphi(t)$ and $\psi(x)$ are determined by the ordinary differential equations

$$\begin{aligned}\varphi_{tt}'' - \big[b\ln\varphi + g(t) + C\big]\varphi &= 0,\\ a\psi_{xx}'' + \big[b\ln\psi + f(x) - C\big]\psi &= 0,\end{aligned}$$

and C is an arbitrary constant.

11. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f(t)w\ln w + \big[bf(t)x + g(t)\big]w.$

Multiplicative separable solution:

$$w(x,t) = e^{-bx}\varphi(t),$$

where the function $\varphi(t)$ is determined by the ordinary differential equation

$$\varphi_{tt}'' = f(t)\varphi\ln\varphi + \big[g(t) + ab^2\big]\varphi.$$

12. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f(x)w\ln w + \big[bf(x)t + g(x)\big]w.$

Multiplicative separable solution:

$$w(x,t) = e^{-bt}\varphi(x),$$

where the function $\varphi(x)$ is determined by the ordinary differential equation

$$a\varphi_{xx}'' + f(x)\varphi\ln\varphi + \big[g(x) - b^2\big]\varphi = 0.$$

13. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + f(t+x)g(w).$

The transformation

$$w = U(\xi,\tau), \quad z = \frac{1}{2}\int_a^{t+x} f(\lambda)\,d\lambda - \frac{1}{2}(t-x), \quad \tau = \frac{1}{2}\int_a^{t+x} f(\lambda)\,d\lambda + \frac{1}{2}(t-x),$$

where a is an arbitrary constant, leads to an equation of the form 7.4.1.1:

$$\frac{\partial^2 U}{\partial \tau^2} = \frac{\partial^2 U}{\partial z^2} + g(U).$$

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2002, p. 153).

14. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + f(t-x)g(w).$

The transformation

$$w = U(z,\tau), \quad z = \frac{1}{2}(t+x) - \frac{1}{2}\int_a^{t-x} f(\sigma)\,d\sigma, \quad \tau = \frac{1}{2}(t+x) + \frac{1}{2}\int_a^{t-x} f(\sigma)\,d\sigma,$$

where a is an arbitrary constant, leads to an equation of the form 7.4.1.1:

$$\frac{\partial^2 U}{\partial \tau^2} = \frac{\partial^2 U}{\partial z^2} + g(U).$$

15. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + f(t+x)g(t-x)e^{\beta w}.$

The transformation

$$w = U(z,\tau), \quad z = \frac{1}{2}\int_a^{t+x} f(\lambda)\,d\lambda - \frac{1}{2}\int_b^{t-x} g(\sigma)\,d\sigma, \quad \tau = \frac{1}{2}\int_a^{t+x} f(\lambda)\,d\lambda + \frac{1}{2}\int_b^{t-x} g(\sigma)\,d\sigma,$$

where a and b are arbitrary constants, leads to an equation of the form 7.2.1.1:

$$\frac{\partial^2 U}{\partial \tau^2} = \frac{\partial^2 U}{\partial z^2} + e^{\beta U}.$$

16. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + f(t+x)g(t-x)h(w).$

The transformation

$$w = U(z,\tau), \quad z = \frac{1}{2}\int_a^{t+x} f(\lambda)\,d\lambda - \frac{1}{2}\int_b^{t-x} g(\sigma)\,d\sigma, \quad \tau = \frac{1}{2}\int_a^{t+x} f(\lambda)\,d\lambda + \frac{1}{2}\int_b^{t-x} g(\sigma)\,d\sigma,$$

where a and b are arbitrary constants, leads to an equation of the form 7.4.1.1:

$$\frac{\partial^2 U}{\partial \tau^2} = \frac{\partial^2 U}{\partial z^2} + h(U).$$

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2002, p. 153).

7.4.2. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f\left(x, t, w, \dfrac{\partial w}{\partial x}\right)$

1. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + \dfrac{b}{x}\dfrac{\partial w}{\partial x} + f(w).$

1°. This is a special case of equation 7.4.3.4 with $n = 0$. This equation can be rewritten in the form

$$\frac{\partial^2 w}{\partial t^2} = \frac{a}{x^m}\frac{\partial}{\partial x}\left(x^m \frac{\partial w}{\partial x}\right) + f(w), \qquad m = \frac{b}{a}.$$

To $m = 1$ and $m = 2$ there correspond nonlinear waves with axial and central symmetry, respectively.

2°. Functional separable solution:

$$w = w(\xi), \quad \xi = \sqrt{ak(t + C)^2 - kx^2},$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$w''_{\xi\xi} + \frac{a + b}{a\xi} w'_\xi = \frac{1}{ak} f(w).$$

2. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f(x)\dfrac{\partial w}{\partial x} + bw \ln w + \big[g(x) + h(t)\big]w.$

Multiplicative separable solution:

$$w(x, t) = \varphi(t)\psi(x),$$

where the functions $\varphi(t)$ and $\psi(x)$ are determined by the ordinary differential equations

$$\varphi''_{tt} - \big[b \ln \varphi + h(t) + C\big]\varphi = 0,$$
$$a\psi''_{xx} + f(x)\psi'_x + \big[b \ln \psi + g(x) - C\big]\psi = 0,$$

and C is an arbitrary constant.

3. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f(w)\dfrac{\partial w}{\partial x}.$

Traveling-wave solution in implicit form:

$$(\lambda^2 - a)\int \frac{dw}{F(w) + C_1} = x + \lambda t + C_2, \qquad F(w) = \int f(w)\, dw,$$

where C_1, C_2, and λ are arbitrary constants. To the stationary solution there correspond $\lambda = 0$.

4. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + cw + f(t).$

1°. Suppose $w(x, t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm x + C_1, t) + C_2 \cosh(kt) + C_3 \sinh(kt) \quad \text{if } c = k^2 > 0,$$
$$w_2 = w(\pm x + C_1, t) + C_2 \cos(kt) + C_3 \sin(kt) \quad \text{if } c = -k^2 < 0,$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Solutions:

$$w(x,t) = U(t) + \Theta(\xi), \quad \xi = \pm x + \lambda t,$$

where λ is an arbitrary constant, and the functions $U(t)$ and $\Theta(\xi)$ are determined by the ordinary differential equations

$$U''_{tt} - cU - f(t) = 0, \tag{1}$$

$$(a-\lambda^2)\Theta''_{\xi\xi} + b\big(\Theta'_\xi\big)^2 + c\Theta = 0. \tag{2}$$

The solution of equation (1) is given by

$$\begin{aligned} U(t) &= C_1\cosh(kt) + C_2\sinh(kt) + \frac{1}{k}\int_0^t f(\tau)\sinh\big[k(t-\tau)\big]\,d\tau \quad \text{if} \quad c = k^2 > 0, \\ U(t) &= C_1\cos(kt) + C_2\sin(kt) + \frac{1}{k}\int_0^t f(\tau)\sin\big[k(t-\tau)\big]\,d\tau \quad \text{if} \quad c = -k^2 < 0, \end{aligned} \tag{3}$$

where C_1 and C_2 are arbitrary constants.

Equation (2) can be solved with the change of variable $z(\Theta) = \big(\Theta'_\xi\big)^2$, which leads to first-order linear equation.

Particular solution of equation (2):

$$\Theta = -\frac{c}{4b}(\xi + C_3)^2 + \frac{1}{2b}(a-\lambda^2).$$

3°. Generalized separable solution quadratic in x:

$$w(x,t) = \varphi(t)x^2 + \psi(t)x + \chi(t), \tag{4}$$

where the functions $\varphi(t)$, $\psi(t)$, and $\chi(t)$ are determined by the system of ordinary differential equations

$$\varphi''_{tt} = 4b\varphi^2 + c\varphi, \tag{5}$$

$$\psi''_{tt} = (4b\varphi + c)\psi, \tag{6}$$

$$\chi''_{tt} = c\chi + b\psi^2 + 2a\varphi + f(t). \tag{7}$$

Equation (5) has the trivial particular solution $\varphi(t) \equiv 0$, to which there corresponds a solution of (4) linear in x. Another particular solution to equation (5) is given by $\varphi = -\frac{1}{4}c/b$.

The general solution of the autonomous equation (5) can be represented in implicit form:

$$\int \big(\tfrac{8}{3}b\varphi^3 + c\varphi^2 + C_1\big)^{-1/2} d\varphi = C_2 \pm t,$$

where C_1 and C_2 are arbitrary constants.

The functions $\psi = \psi(t)$ and $\chi = \chi(t)$ can be found by successively integrating equations (6) and (7), which are linear in ψ and χ, respectively.

Note that equation (6) has a particular solution $\psi = \bar{\varphi}(t)$, where $\bar{\varphi}(t)$ is any nontrivial particular solution to (5). Hence, the general solution to (6) is expressed as

$$\psi(t) = C_3\bar{\varphi}(t) + C_4\bar{\varphi}(t)\int \frac{dt}{\bar{\varphi}^2(t)},$$

where C_3 and C_4 are arbitrary constants.

4°. The substitution

$$w = z(x,t) + U(t),$$

where the function $U(t)$ is defined by formula (3), leads to the simpler equation

$$\frac{\partial^2 z}{\partial t^2} = a\frac{\partial^2 z}{\partial x^2} + b\left(\frac{\partial z}{\partial x}\right)^2 + cz.$$

⊙ *Reference for equation* 7.4.2.4: A. D. Polyanin and V. F. Zaitsev (2002, pp. 154–155).

5. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + cw + f(x).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w(x, \pm t + C_1) + C_2\cosh(kt) + C_3\sinh(kt) \quad \text{if } c = k^2 > 0,$$
$$w_2 = w(x, \pm t + C_1) + C_2\cos(kt) + C_3\sin(kt) \quad \text{if } c = -k^2 < 0,$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Additive separable solution:

$$w(x,t) = \varphi(x) + \psi(t).$$

Here,

$$\psi(t) = \begin{cases} C_1\cosh(kt) + C_2\sinh(kt) & \text{if } c = k^2 > 0, \\ C_1\cos(kt) + C_2\sin(kt) & \text{if } c = -k^2 < 0, \end{cases}$$

where C_1 and C_2 are arbitrary constants, and the function $\varphi(x)$ is determined by the ordinary differential equation

$$a\varphi''_{xx} + b\left(\varphi'_x\right)^2 + c\varphi + f(x) = 0.$$

6. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + b\left(\dfrac{\partial w}{\partial x}\right)^2 + cw\dfrac{\partial w}{\partial x} + kw^2 + f(t)w + g(t).$

Generalized separable solution:

$$w(x,t) = \varphi(t) + \psi(t)\exp(\lambda x),$$

where λ is a root of the quadratic equation $b\lambda^2 + c\lambda + k = 0$, and the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of ordinary differential equations

$$\varphi''_{tt} = k\varphi^2 + f(t)\varphi + g(t), \tag{1}$$
$$\psi''_{tt} = \left[(c\lambda + 2k)\varphi + f(t) + a\lambda^2\right]\psi. \tag{2}$$

In the special case $f(t) = \text{const}$, $g(t) = \text{const}$, equation (1) has exact solutions of the form $\varphi = \text{const}$ and, due to its autonomy, can be integrated by quadrature. Equation (2) is linear in ψ and, hence, with $\varphi = \text{const}$, the general solution to (6) is expressed in terms of exponentials or sine and cosine.

7. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f(t)\left(\dfrac{\partial w}{\partial x}\right)^2 + g(t)w + h(t).$

Generalized separable solution quadratic in x:

$$w(x,t) = \varphi(t)x^2 + \psi(t)x + \chi(t), \tag{1}$$

where the functions $\varphi(t)$, $\psi(t)$, and $\chi(t)$ are determined by the system of ordinary differential equations of the second order with variable coefficients (the arguments of f, g, and h are not specified)

$$\varphi''_{tt} = 4f\varphi^2 + g\varphi, \tag{2}$$
$$\psi''_{tt} = (4f\varphi + g)\psi, \tag{3}$$
$$\chi''_{tt} = g\chi + f\psi^2 + h + 2a\varphi. \tag{4}$$

Equation (2) has the trivial particular solution $\varphi(t) \equiv 0$, to which there corresponds a solution of (1) linear in x.

If a solution $\varphi = \varphi(t)$ of the nonlinear equation (2) has been found, the functions $\psi = \psi(t)$ and $\chi = \chi(t)$ can be obtained by successively solving equations (3) and (4), which are linear in ψ and χ, respectively.

Note that equation (3) has a particular solution $\psi = \bar{\varphi}(t)$, where $\bar{\varphi}(t)$ is any nontrivial particular solution to (2). Hence, the general solution to (3) is expressed as

$$\psi(t) = C_1\bar{\varphi}(t) + C_2\bar{\varphi}(t)\int \frac{dt}{\bar{\varphi}^2(t)},$$

where C_1 and C_2 are arbitrary constants. If the functions f and g are proportional to each other, then a particular solution to equation (2) is given by $\varphi = -\frac{1}{4}g/f = \text{const}$.

8. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f(x)\left(\dfrac{\partial w}{\partial x}\right)^2 + g(x) + h(t).$

Additive separable solution:

$$w(x,t) = \tfrac{1}{2}At^2 + Bt + C + \int_0^t (t-\tau)h(\tau)\,d\tau + \varphi(x).$$

Here, A, B, and C are arbitrary constants, and the function $\varphi(x)$ is determined by the ordinary differential equation

$$a\varphi''_{xx} + f(x)\big(\varphi'_x\big)^2 + g(x) - A = 0.$$

9. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f(x)\left(\dfrac{\partial w}{\partial x}\right)^2 + bw + g(x) + h(t).$

Additive separable solution:

$$w(x,t) = \varphi(t) + \psi(x).$$

Here, the functions $\varphi(t)$ and $\psi(x)$ are determined by the ordinary differential equations

$$\varphi''_{tt} - b\varphi - h(t) = 0,$$
$$a\psi''_{xx} + f(x)(\psi'_x)^2 + b\psi + g(x) = 0.$$

The solution of the first equation for $\varphi(t)$ is expressed as

$$\varphi(t) = C_1\cosh(kt) + C_2\sinh(kt) + \frac{1}{k}\int_0^t h(\tau)\sinh\big[k(t-\tau)\big]\,d\tau \quad \text{if} \quad b = k^2 > 0,$$

$$\varphi(t) = C_1\cos(kt) + C_2\sin(kt) + \frac{1}{k}\int_0^t h(\tau)\sin\big[k(t-\tau)\big]\,d\tau \quad \text{if} \quad b = -k^2 < 0,$$

where C_1 and C_2 are arbitrary constants.

10. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f(t)\left(\dfrac{\partial w}{\partial x}\right)^2 + bf(t)w^2 + g(t)w + h(t).$

1°. Generalized separable solutions:

$$w(x,t) = \varphi(t) + \psi(t)\exp\left(\pm x\sqrt{-b}\right), \qquad b < 0, \tag{1}$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of ordinary differential equations of the second order with variable coefficients (the arguments of f, g, and h are not specified)

$$\varphi''_{tt} = bf\varphi^2 + g\varphi + h, \tag{2}$$

$$\psi''_{tt} = (2bf\varphi + g - ab)\psi. \tag{3}$$

If a solution $\varphi = \varphi(t)$ to equation (2) has been found, the function $\psi = \psi(t)$ can be obtained by solving equation (3) linear in ψ.

If the functions f, g, and h are proportional to each other,

$$g = \alpha f, \quad h = \beta f \qquad (\alpha,\ \beta = \text{const}),$$

particular solutions to equation (2) are expressed as

$$\varphi = k_1, \quad \varphi = k_2, \tag{4}$$

where k_1 and k_2 are roots of the quadratic equation $bk^2 + \alpha k + \beta = 0$. In this case, equation (3) can be rewritten in the form

$$\psi''_{tt} = \left[(2bk_n + \alpha)f - ab\right]\psi, \qquad n = 1,\ 2. \tag{5}$$

Kamke (1977) and Polyanin and Zaitsev (2003) present many exact solutions of the linear equation (5) for various $f = f(t)$. In the special case $f = \text{const}$, the general solution of equation (5) is the sum of exponentials (or sine and cosine).

2°. Generalized separable solution (generalizes the solutions of Item 1°):

$$w(x,t) = \varphi(t) + \psi(t)\left[A\exp\left(x\sqrt{-b}\right) + B\exp\left(-x\sqrt{-b}\right)\right], \qquad b < 0, \tag{6}$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the following system of second-order ordinary differential equations with variable coefficients

$$\varphi''_{tt} = bf\left(\varphi^2 + 4AB\psi^2\right) + g\varphi + h, \tag{7}$$

$$\psi''_{tt} = \left(2bf\varphi + g - ab\right)\psi. \tag{8}$$

We express φ from (8) in terms of ψ and then substitute into (7) to obtain a nonlinear fourth-order equation for ψ; with f, g, $h = \text{const}$, the equation is autonomous and, hence, its order can be reduced.

Note two special cases of solutions (6) that can be expressed in terms of hyperbolic functions:

$$w(x,t) = \varphi(t) + \psi(t)\cosh\left(x\sqrt{-b}\right), \qquad A = \tfrac{1}{2},\ B = \tfrac{1}{2},$$

$$w(x,t) = \varphi(t) + \psi(t)\sinh\left(x\sqrt{-b}\right), \qquad A = \tfrac{1}{2},\ B = -\tfrac{1}{2}.$$

3°. Generalized separable solution (c is an arbitrary constant):

$$w(x,t) = \varphi(t) + \psi(t)\cos\left(x\sqrt{b} + c\right), \qquad b > 0, \tag{9}$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of ordinary differential equations of the second order with variable coefficients

$$\varphi''_{tt} = bf\left(\varphi^2 + \psi^2\right) + g\varphi + h, \tag{10}$$

$$\psi''_{tt} = \left(2bf\varphi + g - ab\right)\psi. \tag{11}$$

⊙ *Reference for equation* 7.4.2.10: V. A. Galaktionov (1995, the case of $f = a$, $g = \text{const}$, and $h = \text{const}$ was considered), V. F. Zaitsev and A. D. Polyanin (1996, pp. 467–468).

11. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f(t)\left(\dfrac{\partial w}{\partial x}\right)^2 + \big[g_1(t)x + g_0(t)\big]\dfrac{\partial w}{\partial x} + h(t)w + p_2(t)x^2 + p_1(t)x + p_0(t).$

There is a generalized separable solution quadratic in x:

$$w(x,t) = \varphi(t)x^2 + \psi(t)x + \chi(t).$$

12. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f(x)\left(\dfrac{\partial w}{\partial x}\right)^k + g(x)\dfrac{\partial w}{\partial x} + bw + h_1(t) + h_2(x).$

Additive separable solution:

$$w(x,t) = \varphi(x) + \psi(t).$$

Here,

$$\psi(t) = \begin{cases} C_1\cosh(kt) + C_2\sinh(kt) + \dfrac{1}{k}\displaystyle\int_0^t \sinh\big[k(t-\tau)\big]h_1(\tau)\,d\tau & \text{if} \quad b = k^2 > 0, \\ C_1\cos(kt) + C_2\sin(kt) + \dfrac{1}{k}\displaystyle\int_0^t \sin\big[k(t-\tau)\big]h_1(\tau)\,d\tau & \text{if} \quad b = -k^2 < 0, \\ C_1 + C_2 t + \displaystyle\int_0^t (t-\tau)h_1(\tau)\,d\tau & \text{if} \quad b = 0, \end{cases}$$

where C_1 and C_2 are arbitrary constants, and the function $\varphi(x)$ is determined by the ordinary differential equation

$$a\varphi''_{xx} + f(x)\big(\varphi'_x\big)^k + g(x)\varphi'_x + b\varphi + h_2(x) = 0.$$

13. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f\left(x, \dfrac{\partial w}{\partial x}\right) + g(t).$

Additive separable solution:

$$w(x,t) = \tfrac{1}{2}At^2 + Bt + C + \int_0^t (t-\tau)g(\tau)\,d\tau + \varphi(x).$$

Here, A, B, and C are arbitrary constants, and the function $\varphi(x)$ is determined by the ordinary differential equation

$$a\varphi''_{xx} + f\big(x, \varphi'_x\big) - A = 0.$$

14. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f\left(x, \dfrac{\partial w}{\partial x}\right) + bw + g(t).$

Additive separable solution:

$$w(x,t) = \varphi(t) + \psi(x).$$

Here, the functions $\varphi(t)$ and $\psi(x)$ are determined by the ordinary differential equations

$$\varphi''_{tt} - b\varphi - g(t) = 0,$$
$$a\psi''_{xx} + f\big(x, \psi'_x\big) + b\psi = 0.$$

The solution of the first equation is expressed as

$$\varphi(t) = C_1\cosh(kt) + C_2\sinh(kt) + \frac{1}{k}\int_0^t g(\tau)\sinh\big[k(t-\tau)\big]\,d\tau \quad \text{if} \quad b = k^2 > 0,$$

$$\varphi(t) = C_1\cos(kt) + C_2\sin(kt) + \frac{1}{k}\int_0^t g(\tau)\sin\big[k(t-\tau)\big]\,d\tau \quad \text{if} \quad b = -k^2 < 0,$$

where C_1 and C_2 are arbitrary constants.

15. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + wf\left(t,\ \dfrac{1}{w}\dfrac{\partial w}{\partial x}\right).$

Multiplicative separable solution:

$$w(x,t) = e^{\lambda x}\varphi(t),$$

where λ is an arbitrary constant, and the function $\varphi(t)$ is determined by the second-order linear ordinary differential equation

$$\varphi''_{tt} = \big[a\lambda^2 + f(t,\lambda)\big]\varphi.$$

7.4.3. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = f(x)\dfrac{\partial^2 w}{\partial x^2} + g\left(x, t, w, \dfrac{\partial w}{\partial x}\right)$

1. $\dfrac{\partial^2 w}{\partial t^2} = (ax^2 + b)\dfrac{\partial^2 w}{\partial x^2} + ax\dfrac{\partial w}{\partial x} + f(w).$

The substitution $z = \displaystyle\int \frac{dx}{\sqrt{ax^2 + b}}$ leads to an equation of the form 7.4.1.1:

$$\frac{\partial^2 w}{\partial t^2} = \frac{\partial^2 w}{\partial z^2} + f(w).$$

2. $\dfrac{\partial^2 w}{\partial t^2} = a(x+\beta)^n\dfrac{\partial^2 w}{\partial x^2} + f(w), \qquad a > 0.$

This equation describes the propagation of nonlinear waves in an inhomogeneous medium. For $n = 0$ see equation 7.4.1.1.

1°. The substitution $y = x + \beta$ leads to a special case of equation 7.4.3.4 with $b = 0$.

2°. Functional separable solution for $n \neq 2$:

$$w = w(r), \qquad r^2 = k\left[\frac{1}{4}(t+C)^2 - \frac{(x+\beta)^{2-n}}{a(2-n)^2}\right],$$

where k and the expression in square brackets must have like signs, and $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{2(1-n)}{2-n}\frac{1}{r}w'_r = \frac{4}{k}f(w). \tag{1}$$

The substitution $\xi = r^{\frac{n}{2-n}}$ leads to the generalized Emden–Fowler equation

$$w''_{\xi\xi} = \frac{4(2-n)^2}{kn^2}\xi^{\frac{4(1-n)}{n}}f(w). \tag{2}$$

The book by Polyanin and Zaitsev (2003) presents a number of exact solutions to equation (2) for various $f = f(w)$.

Special case. For $n = 1$, the general solution of equation (1) is written out in implicit form as

$$\int \left[C_1 + \frac{8}{k}F(w)\right]^{-1/2} dw = \pm r + C_2, \qquad F(w) = \int f(w)\,dw,$$

where C_1 and C_2 are arbitrary constants.

3°. Solution for $n = 2$:

$$w = w(y), \quad y = At + B\ln|x+\beta|,$$

where A and B are arbitrary constants, and the function $w = w(y)$ is determined by the autonomous ordinary differential equation

$$(aB^2 - A^2)w''_{yy} - aBw'_y + f(w) = 0. \tag{3}$$

Solution of equation (3) with $A = \pm B\sqrt{a}$ in implicit form:

$$aB\int \frac{dw}{f(w)} = y + C,$$

where C is an arbitrary constant.

⊙ *Reference for equation* 7.4.3.2: V. F. Zaitsev and A. D. Polyanin (1996, pp. 462–463).

3. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[a(x+\beta)^n \dfrac{\partial w}{\partial x}\right] + f(w), \qquad a > 0.$

This equation describes the propagation of nonlinear waves in an inhomogeneous medium.

1°. Functional separable solution for $n \neq 2$:

$$w = w(r), \qquad r^2 = k\left[\frac{1}{4}(t+C)^2 - \frac{(x+\beta)^{2-n}}{a(2-n)^2}\right],$$

where k and the expression in square brackets must have like signs, and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{2}{2-n}\frac{1}{r}w'_r = \frac{4}{k}f(w).$$

The substitution $\xi = r^{\frac{n}{n-2}}$ leads to the generalized Emden–Fowler equation

$$w''_{\xi\xi} = \frac{4(2-n)^2}{kn^2}\xi^{-\frac{4}{n}} f(w). \tag{1}$$

The book by Polyanin and Zaitsev (2003) presents a number of exact solutions to equation (1) for various $f = f(w)$.

2°. Solution for $n = 2$:

$$w = w(z), \quad z = At + B\ln|x+\beta|,$$

where A and B are arbitrary constants, and the function $w = w(z)$ is determined by the autonomous ordinary differential equation

$$(aB^2 - A^2)w''_{zz} + aBw'_z + f(w) = 0. \tag{2}$$

Solution of equation (2) with $A = \pm B\sqrt{a}$ in implicit form:

$$aB\int \frac{dw}{f(w)} = -z + C,$$

where C is an arbitrary constant.

⊙ *Reference for equation* 7.4.3.3: V. F. Zaitsev and A. D. Polyanin (1996, p. 463).

4. $\dfrac{\partial^2 w}{\partial t^2} = ax^n \dfrac{\partial^2 w}{\partial x^2} + bx^{n-1}\dfrac{\partial w}{\partial x} + f(w), \qquad a > 0.$

1°. Functional separable solution for $n \neq 2$:

$$w = w(\xi), \qquad \xi = \tfrac{1}{4}a(2-n)^2(t+C)^2 - x^{2-n}.$$

Here, C is an arbitrary constant, and the function $w = w(\xi)$ is determined by the ordinary differential equation

$$\xi w''_{\xi\xi} + Aw'_\xi - Bf(w) = 0, \tag{1}$$

where

$$A = \frac{a(4-3n)+2b}{2a(2-n)}, \quad B = \frac{1}{a(2-n)^2}.$$

For $A \neq 1$, the substitution $\xi = kz^{\frac{1}{1-A}}$ $(k = \pm 1)$ brings (1) to the generalized Emden–Fowler equation

$$w''_{zz} - \frac{kB}{(1-A)^2} z^{\frac{2A-1}{1-A}} f(w) = 0. \tag{2}$$

In the special case $A = \frac{1}{2}$, which corresponds to $b = a(n-1)$, the general solution of equation (2) is expressed as

$$\int \left[C_1 + 8kBF(w)\right]^{-1/2} dw = \pm z + C_2, \qquad F(w) = \int f(w)\,dw,$$

where C_1 and C_2 are arbitrary constants.

The books by Polyanin and Zaitsev (1995, 2003) present a number of exact solutions to equation (2) for some $f = f(w)$.

2°. Solution for $n = 2$:

$$w = w(y), \quad y = At + B\ln|x| + C,$$

where A, B, and C are arbitrary constants, and the function $w(y)$ is determined by the autonomous ordinary differential equation

$$(aB^2 - A^2)w''_{yy} + (b-a)Bw'_y + f(w) = 0. \tag{3}$$

Solutions of equation (3) with $A = \pm B\sqrt{a}$ in implicit form:

$$(b-a)B \int \frac{dw}{f(w)} = -y + C_1.$$

Solutions of equation (3) with $b = a$:

$$\int \left[C_1 + \frac{2}{A^2 - aB^2} F(w)\right]^{-1/2} dw = \pm y + C_2, \qquad F(w) = \int f(w)\,dw.$$

For $A \neq \pm B\sqrt{a}$ and $b \neq a$, the substitution $u(w) = \dfrac{aB^2 - A^2}{B(a-b)} w'_y$ brings (3) to the Abel equation

$$uu'_w - u = \frac{A^2 - aB^2}{B^2(a-b)^2} f(w),$$

whose exact solutions for various $f = f(w)$ can be found in Polyanin and Zaitsev (2003).

5. $\dfrac{\partial^2 w}{\partial t^2} = ax^n \dfrac{\partial^2 w}{\partial x^2} + x^{n-1} f(w) \dfrac{\partial w}{\partial x}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w\big(C_1^2 x,\ \pm C_1^{2-n} t + C_2\big),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Functional separable solution for $n \neq 2$:

$$w = w(z), \quad z = \big|a(2-n)^2(t+C)^2 - 4x^{2-n}\big|^{1/2},$$

where C is an arbitrary constant, and the function $w(z)$ is determined by the ordinary differential equation

$$w''_{zz} + \frac{2}{a(2-n)z}\big[a(1-n) + f(w)\big]w'_z = 0. \tag{1}$$

The substitution $u(w) = zw'_z$ brings (1) to a separable first-order equation, the integration of which yields the general solution in implicit form:

$$\int \frac{dw}{anw - 2F(w) + C_1} = \frac{1}{a(2-n)} \ln z + C_2, \qquad F(w) = \int f(w)\,dw,$$

where C_1 and C_2 are arbitrary constants.

3°. Self-similar solution for $n \neq 2$:

$$w = w(\xi), \qquad \xi = x|t|^{\frac{2}{n-2}},$$

where the function $w = w(\xi)$ is determined by the ordinary differential equation

$$\left[a\xi^{n-1} - \frac{4}{(n-2)^2}\xi\right]w''_{\xi\xi} + \left[\xi^{n-2} f(w) + \frac{2(n-4)}{(n-2)^2}\right]w'_\xi = 0.$$

4°. Solution for $n = 2$:

$$w = w(y), \quad y = At + B\ln|x| + C,$$

where A, B, and C are arbitrary constants, and the function $w(y)$ is determined by the autonomous ordinary differential equation

$$(aB^2 - A^2)w''_{yy} + B\big[f(w) - a\big]w'_y = 0,$$

whose solution with $A \neq \pm B\sqrt{a}$ is given by

$$\frac{aB^2 - A^2}{B}\int \frac{dw}{F(w) - aw + C_1} = -y, \qquad F(w) = \int f(w)\,dw.$$

⊙ *Reference for equation* 7.4.3.5: V. F. Zaitsev and A. D. Polyanin (1996, pp. 465–466).

6. $\dfrac{\partial^2 w}{\partial t^2} = ax^n \dfrac{\partial^2 w}{\partial x^2} + x^{n-1} f(w) \dfrac{\partial w}{\partial x} + g(w).$

1°. Functional separable solution for $n \neq 2$:

$$w = w(z), \quad z = \left[ka(2-n)^2(t+C)^2 - 4kx^{2-n}\right]^{1/2}, \qquad k = \pm 1,$$

where C is an arbitrary constant, and the function $w(z)$ is determined by the ordinary differential equation

$$w''_{zz} + \frac{2}{a(2-n)}\left[a(1-n) + f(w)\right]\frac{1}{z}w'_z - \frac{1}{ak(2-n)^2}g(w) = 0.$$

2°. Solution for $n = 2$:

$$w = w(\xi), \quad \xi = At + B\ln|x| + C,$$

where A, B, and C are arbitrary constants, and the function $w(\xi)$ is determined by the autonomous ordinary differential equation

$$(aB^2 - A^2)w''_{\xi\xi} + B\left[f(w) - a\right]w'_\xi + g(w) = 0. \tag{1}$$

Solution of equation (1) with $A = \pm B\sqrt{a}$:

$$B\int \left[f(w) - a\right]\frac{dw}{g(w)} = -\xi + C_1.$$

In the general case, the change of variable $u(w) = w'_\xi$ brings (1) to an Abel equation, whose exact solutions for various $f = f(w)$ and $g = g(w)$ can be found in Polyanin and Zaitsev (2003).

⊙ *Reference for equation* 7.4.3.6: V. F. Zaitsev and A. D. Polyanin (1996, p. 466).

7. $\dfrac{\partial^2 w}{\partial t^2} = ae^{\lambda x}\dfrac{\partial^2 w}{\partial x^2} + f(w), \qquad a > 0.$

This is a special case of equation 7.4.3.9 with $b = 0$.

8. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ae^{\lambda x}\dfrac{\partial w}{\partial x}\right) + f(w), \qquad a > 0.$

This is a special case of equation 7.4.3.9 with $b = a\lambda$.

9. $\dfrac{\partial^2 w}{\partial t^2} = ae^{\lambda x}\dfrac{\partial^2 w}{\partial x^2} + be^{\lambda x}\dfrac{\partial w}{\partial x} + f(w), \qquad a > 0.$

Functional separable solution:

$$w = w(z), \quad z = \left[4ke^{-\lambda x} - ak\lambda^2(t+C)^2\right]^{1/2}, \qquad k = \pm 1,$$

where C is an arbitrary constant and the function $w = w(z)$ is determined by the ordinary differential equation

$$w''_{zz} + \frac{2(a\lambda - b)}{a\lambda}\frac{1}{z}w'_z + \frac{1}{ak\lambda^2}f(w) = 0. \tag{1}$$

For $b = a\lambda$, the solution of equation (1) is expressed as

$$\int \left[C_1 - \frac{2}{ak\lambda^2}F(w)\right]^{-1/2} dw = \pm z + C_2, \qquad F(w) = \int f(w)\,dw,$$

where C_1 and C_2 are arbitrary constants.

For $b \neq \frac{1}{2}a\lambda$, the substitution $\xi = z^{\frac{2b-a\lambda}{a\lambda}}$ brings (1) to the generalized Emden–Fowler equation

$$w''_{\xi\xi} + \frac{a}{k(2b-a\lambda)^2}\xi^{\frac{4(a\lambda-b)}{2b-a\lambda}} f(w) = 0. \tag{2}$$

The books by Polyanin and Zaitsev (1995, 2003) present a number of exact solutions to equation (2) for some $f = f(w)$.

10. $\dfrac{\partial^2 w}{\partial t^2} = ae^{\lambda x}\dfrac{\partial^2 w}{\partial x^2} + e^{\lambda x} f(w)\dfrac{\partial w}{\partial x}$.

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w\big(x + 2C_1,\ \pm e^{\lambda C_1}t + C_2\big),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Functional separable solution for $\lambda \neq 0$:

$$w = w(z), \quad z = \left|4e^{-\lambda x} - a\lambda^2(t+C)^2\right|^{1/2},$$

where C is an arbitrary constant, and the function $w(z)$ is determined by the ordinary differential equation

$$w''_{zz} + \frac{2}{z}\left[1 - \frac{1}{a\lambda}f(w)\right]w'_z = 0. \tag{1}$$

The substitution $u(w) = zw'_z$ brings (1) to a separable first-order equation, the integration of which yields the general solution in implicit form:

$$\int \frac{dw}{2F(w) - a\lambda w + C_1} = \frac{1}{a\lambda}\ln z + C_2, \qquad F(w) = \int f(w)\,dw,$$

where C_1 and C_2 are arbitrary constants.

3°. Generalized self-similar solution:

$$w = w(\xi), \quad \xi = t^2 e^{\lambda x},$$

where the function $w = w(z)$ is determined by the ordinary differential equation

$$(a\lambda^2\xi^2 - 4\xi)w''_{\xi\xi} + \big[\lambda\xi f(w) + a\lambda^2\xi - 2\big]w'_\xi = 0.$$

4°. For $\lambda = 0$, see equation 7.4.2.3.

⊙ *Reference for equation* 7.4.3.10: V. F. Zaitsev and A. D. Polyanin (1996, pp. 466–467).

11. $\dfrac{\partial^2 w}{\partial t^2} = ae^{\lambda x}\dfrac{\partial^2 w}{\partial x^2} + e^{\lambda x} f(w)\dfrac{\partial w}{\partial x} + g(w).$

1°. Functional separable solution for $\lambda \neq 0$:

$$w = w(z), \quad z = \left[4ke^{-\lambda x} - ak\lambda^2(t+C)^2\right]^{1/2}, \qquad k = \pm 1,$$

where C is an arbitrary constant, and the function $w(z)$ is determined by the ordinary differential equation

$$w''_{zz} + \frac{2}{z}\left[1 - \frac{1}{a\lambda}f(w)\right]w'_z + \frac{1}{ak\lambda^2}g(w) = 0.$$

2°. For $\lambda = 0$, there is a traveling-wave solution: $w = w(\alpha x + \beta t)$.

12. $\dfrac{\partial^2 w}{\partial t^2} = f(x)\dfrac{\partial^2 w}{\partial x^2} + g(x)\dfrac{\partial w}{\partial x} + aw\ln w + \big[h(x) + p(t)\big]w.$

Multiplicative separable solution:

$$w(x,t) = \varphi(x)\psi(t),$$

where the functions $\varphi(x)$ and $\psi(t)$ are determined by the ordinary differential equations (C is an arbitrary constant)

$$f(x)\varphi''_{xx} + g(x)\varphi'_x + a\varphi\ln\varphi + \big[C + h(x)\big]\varphi = 0,$$
$$\psi''_{tt} - a\psi\ln\psi + \big[C - p(t)\big]\psi = 0.$$

7.4.4. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = f(w)\dfrac{\partial^2 w}{\partial x^2} + g\left(x, t, w, \dfrac{\partial w}{\partial x}\right)$

1. $\dfrac{\partial^2 w}{\partial t^2} = aw\dfrac{\partial^2 w}{\partial x^2} + f(t)\left(\dfrac{\partial w}{\partial x}\right)^2 + g(t)w + h_2(t)x^2 + h_1(t)x + h_0(t).$

Generalized separable solution quadratic in x:

$$w(x,t) = \varphi(t)x^2 + \psi(t)x + \chi(t),$$

where the functions $\varphi = \varphi(t)$, $\psi = \psi(t)$, $\chi = \chi(t)$ are determined by the system of ordinary differential equations

$$\varphi''_{tt} = 2[2f(t) + a]\varphi^2 + g(t)\varphi + h_2(t),$$
$$\psi''_{tt} = 2[2f(t) + a]\varphi\psi + g(t)\psi + h_1(t),$$
$$\chi''_{tt} = 2a\varphi\chi + f(t)\psi^2 + g(t)\chi + h_0(t).$$

2. $\dfrac{\partial^2 w}{\partial t^2} = aw^4\dfrac{\partial^2 w}{\partial x^2} + f(x)w^5.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = C_1 w\big(x, \pm C_1^2 t + C_2\big),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Suppose $u = u(x)$ is any nontrivial solution of the second-order linear ordinary differential equation

$$au''_{xx} + f(x)u = 0. \tag{1}$$

The transformation

$$\xi = \int \frac{dx}{u^2}, \quad z = \frac{w}{u}$$

brings the original equation to a simpler equation of the form 7.1.5.5 with $n = 4$:

$$\frac{\partial^2 z}{\partial t^2} = az^4 \frac{\partial^2 z}{\partial \xi^2}.$$

For example, this equation has the following solutions (A, B, C, D, and λ are arbitrary constants):

$$z(\xi, t) = A\xi t + B\xi + Ct + D,$$

$$z(\xi, t) = \lambda^{-1/4}(t + C)^{-1/2}\left[\frac{3\lambda}{4A^2 a} + (A\xi + B)^2\right]^{1/2}.$$

The first solution is degenerate and the second one is a special case of a multiplicative separable solution $z(\xi, t) = f(\xi)g(t)$. There is also a traveling-wave solution, $z = z(\alpha\xi + \beta t)$, and a self-similar solution of the form

$$z = t^k \varphi(\zeta), \quad \zeta = \xi t^{-2k-1},$$

where k is an arbitrary constant.

3°. Multiplicative separable solution:

$$w(x, t) = (\pm 2\lambda t + C)^{-1/2} g(x),$$

where C is an arbitrary constant, and the function $g = g(x)$ is determined by the Yermakov's equation

$$ag''_{xx} + f(x)g - 3\lambda^2 g^{-3} = 0. \tag{2}$$

Given a particular solution $u = u(x)$ of the linear equation (1), the general solution of the nonlinear equation (2) is expressed as (e.g., see Polyanin and Zaitsev, 2003):

$$Ag^2 = \frac{3\lambda^2}{a}u^2 + u^2\left(B + A\int \frac{dx}{u^2}\right)^2,$$

where A and B are arbitrary constants ($A \neq 0$).

⊙ *Reference for equation* 7.4.4.2: V. F. Zaitsev and A. D. Polyanin (1996, pp. 468–469).

3. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(w^{-4/3}\dfrac{\partial w}{\partial x}\right) + f(x)w^{-1/3}, \quad a > 0.$

1°. Suppose $w(x, t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^3 w\big(x, \pm C_1^{-2}t + C_2\big),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Suppose $u = u(x)$ is any nontrivial particular solution of the second-order linear ordinary differential equation

$$au''_{xx} - \tfrac{1}{3}f(x)u = 0. \tag{1}$$

The transformation

$$\xi = \int \frac{dx}{u^2}, \quad z = wu^3 \tag{2}$$

brings the original equation to a simpler equation of the form 7.1.6.4 with $n = -4/3$:

$$\frac{\partial^2 z}{\partial t^2} = a\frac{\partial}{\partial \xi}\left(z^{-4/3}\frac{\partial z}{\partial \xi}\right).$$

3°. For $f = b = \text{const}$, the auxiliary equation (1) employed to determine the transformation (2) has the following solution:

$$u(x) = \begin{cases} C_1 \exp(\lambda x) + C_2 \exp(-\lambda x) & \text{if } ab > 0, \\ C_1 \cos(\lambda x) + C_2 \sin(\lambda x) & \text{if } ab < 0, \end{cases}$$

where $\lambda = \left|\frac{1}{3}b/a\right|^{1/2}$ and C_1 and C_2 are arbitrary constants.

For $f(x) = bx^m$ or $f(x) = be^{\beta x}$, the solutions of equation (1) are expressed in terms of Bessel functions.

⊙ *Reference for equation* 7.4.4.3: V. F. Zaitsev and A. D. Polyanin (1996, p. 469).

4. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + f(x)w^{n+1} + g(t)w.$

Multiplicative separable solution:

$$w = \varphi(x)\psi(t),$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(t)$ are determined by the ordinary differential equations (C is an arbitrary constant)

$$a(\varphi^n\varphi'_x)'_x + f(x)\varphi^{n+1} + C\varphi = 0,$$
$$\psi''_{tt} - g(t)\psi + C\psi^{n+1} = 0.$$

5. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + f(x)e^{\lambda w} + g(t).$

Additive separable solution:

$$w = \varphi(x) + \psi(t),$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(t)$ are determined by the ordinary differential equations (C is an arbitrary constant)

$$a(e^{\lambda\varphi}\varphi'_x)'_x + f(x)e^{\lambda\varphi} + C = 0,$$
$$\psi''_{tt} - g(t) + Ce^{\lambda\psi} = 0.$$

By the change of variable $U = e^{\lambda\varphi}$ the first equation is reduced to the linear equation $aU''_{xx} + \lambda f(x)U + \lambda C = 0$.

6. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right].$

This equation is encountered in wave and gas dynamics.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the functions

$$w_1 = w(\pm C_1 x + C_2, C_1 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. The transformation

$$x = \tau, \quad t = z, \quad u = \int f(w)\,dw$$

leads to an equation of the similar form

$$\frac{\partial^2 u}{\partial \tau^2} = \frac{\partial}{\partial z}\left[g(u)\frac{\partial w}{\partial z}\right],$$

where the function $g = g(u)$ is defined parametrically as

$$u = \int f(w)\,dw, \quad g(u) = \frac{1}{f(w)}.$$

3°. Traveling-wave solution:

$$w = w(z), \quad z = x \pm \lambda t,$$

where $w = w(z)$ is defined implicitly by (A and B are arbitrary constants)

$$\lambda^2 w - \int f(w)\,dw = Az + B.$$

4°. Self-similar solution:

$$w = w(\xi), \quad \xi = \frac{x+a}{t+b},$$

where a and b are arbitrary constants, and the function $w(\xi)$ is determined by the ordinary differential equation

$$\big(\xi^2 w'_\xi\big)'_\xi = \big[f(w)w'_\xi\big]'_\xi,$$

which admits the first integral

$$\big[\xi^2 - f(w)\big]w'_\xi = C. \tag{1}$$

To the special case $C = 0$ there corresponds the solution (in implicit form):

$$\xi^2 = f(w).$$

For $C \neq 0$, treating w in (1) as the independent variable, one obtains a Riccati equation for $\xi = \xi(w)$:

$$C\xi'_w = \xi^2 - f(w). \tag{2}$$

The handbook by Polyanin and Zaitsev (2003) presents a large number of solutions to equation (2) for various $f = f(w)$.

By the change of variable $\xi = -Cy'_w/y$, equation (1) is reduced to the second-order linear equation $y''_{ww} = C^{-2}f(w)y$.

5°. Solutions in implicit form:

$$x + t\sqrt{f(w)} = \varphi(w),$$
$$x - t\sqrt{f(w)} = \psi(w),$$

where $\varphi(w)$ and $\psi(w)$ are arbitrary functions.

6°. Solution in parametric form:

$$x = C_1 v^2 + C_2 v + \int f(w)(2C_1 w + C_3)\,dw + C_4,$$
$$t = (2C_1 w + C_3)v + C_2 w + C_5.$$

Here and henceforth, $C_1, \ldots, C_5$ are arbitrary constants.

7°. Solution in parametric form:

$$x = [C_1 F(w) + C_2]v + C_3 F(w) + C_4, \quad F(w) = \int f(w)\,dw,$$
$$t = \frac{1}{2}C_1 v^2 + C_3 v + \int [C_1 F(w) + C_2]\,dw + C_5.$$

8°. Solution in parametric form:

$$x = [C_1 F(w) + C_2]v^2 + C_3 F(w) + C_4 + 2\int \left\{ f(w) \int [C_1 F(w) + C_2]\,dw \right\} dw,$$
$$t = \frac{1}{3}C_1 v^3 + C_3 v + 2v \int [C_1 F(w) + C_2]\,dw + C_5.$$

9°. Solution in parametric form:

$$x = (C_1 e^{\lambda v} + C_2 e^{-\lambda v})H(w) + C_3,$$
$$t = \frac{1}{\lambda}(C_1 e^{\lambda v} - C_2 e^{-\lambda v})\frac{1}{f(w)}H'_w(w) + C_4,$$

where $C_1, \ldots, C_4$ and λ are arbitrary constants, the function $H = H(w)$ is determined by the ordinary differential equation $\mathbf{L}_f[H] - \lambda^2 H = 0$, and the differential operator $\mathbf{L}_f$ is expressed as

$$\mathbf{L}_f[\varphi] \equiv \frac{d}{dw}\left[\frac{1}{f(w)}\frac{d\varphi}{dw}\right]. \tag{3}$$

10°. Solution in parametric form:

$$x = [C_1 \sin(\lambda v) + C_2 \cos(\lambda v)]Z(w) + C_3,$$
$$t = \frac{1}{\lambda}[C_2 \sin(\lambda v) - C_1 \cos(\lambda v)]\frac{1}{f(w)}Z'_w(w) + C_4,$$

where $C_1, \ldots, C_4$ and λ are arbitrary constants, the function $Z = Z(w)$ is determined by the ordinary differential equation $\mathbf{L}_f[Z] + \lambda^2 Z = 0$, and the differential operator $\mathbf{L}_f$ is defined by (3).

11°. Solution in parametric form:

$$x = [2C_1F(w) + C_3]v + C_2F(w) + C_5, \quad F(w) = \int f(w)\,dw,$$
$$t = C_1v^2 + C_2v + \int [2C_1F(w) + C_3]\,dw + C_4.$$

12°. Solution in parametric form:

$$x = \frac{1}{2}C_1v^2 + C_3v + \int f(w)(C_1w + C_2)\,dw + C_5,$$
$$t = (C_1w + C_2)v + C_3w + C_4.$$

13°. Solution in parametric form:

$$x = \frac{1}{3}C_1v^3 + C_3v + 2v\int f(w)(C_1w + C_2)\,dw + C_5,$$
$$t = (C_1w + C_2)v^2 + C_3w + C_4 + 2\int\left\{\int f(w)(C_1w + C_2)\,dw\right\}dw.$$

14°. Solution in parametric form:

$$x = \frac{1}{\lambda}(C_1e^{\lambda v} - C_2e^{-\lambda v})H'_w(w) + C_3,$$
$$t = (C_1e^{\lambda v} + C_2e^{-\lambda v})H(w) + C_4,$$

where $C_1, \ldots, C_4$ and λ are arbitrary constants, and the function $H = H(w)$ is determined by the ordinary differential equation $H''_{ww} - \lambda^2 f(w)H = 0$.

15°. Solution in parametric form:

$$x = \frac{1}{\lambda}[C_2\sin(\lambda v) - C_1\cos(\lambda v)]Z'_w(w) + C_3,$$
$$t = [C_1\sin(\lambda v) + C_2\cos(\lambda v)]Z(w) + C_4,$$

where $C_1, \ldots, C_4$ and λ are arbitrary constants, and the function $Z = Z(w)$ is determined by the ordinary differential equation $Z''_{ww} + \lambda^2 f(w)Z = 0$.

16°. The original equation can be represented as the system of equations

$$f(w)\frac{\partial w}{\partial x} = \frac{\partial v}{\partial t}, \quad \frac{\partial w}{\partial t} = \frac{\partial v}{\partial x}. \tag{4}$$

The hodograph transformation

$$x = x(w, v), \quad t = t(w, v), \tag{5}$$

where w and v are treated as the independent variables and x and t as the dependent ones, brings (4) to the linear system

$$f(w)\frac{\partial t}{\partial v} = \frac{\partial x}{\partial w}, \quad \frac{\partial x}{\partial v} = \frac{\partial t}{\partial w}. \tag{6}$$

Eliminating t, we obtain a linear equation for $x = x(w, v)$:

$$\frac{\partial}{\partial w}\left[\frac{1}{f(w)}\frac{\partial x}{\partial w}\right] - \frac{\partial^2 x}{\partial v^2} = 0. \tag{7}$$

Likewise, from system (6) we obtain another linear equation for $t = t(w, v)$:

$$\frac{\partial^2 t}{\partial w^2} - f(w)\frac{\partial^2 t}{\partial v^2} = 0. \tag{8}$$

The procedure for constructing exact solutions of the original nonlinear equation consists of the following two stages. First, one finds an exact solution of the linear equation (7) for $x = x(w, v)$. Further this solution is substituted into the linear system (6), which is then solved to obtain $t = t(w, v)$ in the form

$$t = \int_{v_0}^{v} \frac{1}{f(w)}\frac{\partial x}{\partial w}(w, \xi)\, d\xi + \int_{w_0}^{w} \frac{\partial x}{\partial v}(\eta, v_0)\, d\eta, \tag{9}$$

where w_0 and v_0 are any numbers. The thus obtained expressions of (5) will give an exact solution of the original equation in parametric form.

Likewise, one can first construct an exact solution to the linear equation (8) for $t = t(w, v)$ and then determine $x = x(w, v)$ from (6).

17°. Solutions of equation (7) with even powers of v:

$$x = \sum_{k=0}^{n} \varphi_k(w) v^{2k}, \tag{10}$$

where the functions $\varphi_k = \varphi_k(w)$ are determined by the recurrence relations

$$\varphi_n(w) = A_n F(w) + B_n, \qquad F(w) = \int f(w)\, dw,$$
$$\varphi_{k-1}(w) = A_k F(w) + B_k + 2k(2k-1)\int f(w)\left\{\int \varphi_k(w)\, dw\right\} dw,$$

where the A_k and B_k are arbitrary constants ($k = n, \ldots, 1$).

The dependence $t = t(w, v)$ is defined by (9) and, together with (10), gives a solution of the original nonlinear equation in parametric form.

18°. Solutions of equation (7) with odd powers of v:

$$x = \sum_{k=0}^{n} \psi_k(w) v^{2k+1}, \tag{11}$$

where the functions $\psi_k = \psi_k(w)$ are determined by the recurrence relations

$$\psi_n(w) = A_n F(w) + B_n, \qquad F(w) = \int f(w)\, dw,$$
$$\psi_{k-1}(w) = A_k F(w) + B_k + 2k(2k+1)\int f(w)\left\{\int \psi_k(w)\, dw\right\} dw,$$

where the A_k and B_k are arbitrary constants ($k = n, \ldots, 1$).

The dependence $t = t(w, v)$ is defined by (9) and, together with (11), gives a solution of the original nonlinear equation in parametric form.

⊙ *References for equation* 7.4.4.6: W. F. Ames, R. J. Lohner, and E. Adams (1981), N. H. Ibragimov (1994, pp. 208–211), V. F. Zaitsev and A. D. Polyanin (2001), A. D. Polyanin and V. F. Zaitsev (2002, pp. 163–166).

7. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + g(w).$

1°. Traveling-wave solution:

$$w = w(z), \quad z = kx + \lambda t,$$

where k and λ are arbitrary constants, and the function $w(z)$ is determined by the autonomous ordinary differential equation

$$\{[k^2 f(w) - \lambda^2]w'_z\}'_z + g(w) = 0.$$

The substitution $U(w) = [k^2 f(w) - \lambda^2]w'_z$ leads to the first-order separable equation

$$UU'_w = -[k^2 f(w) - \lambda^2]g(w).$$

2°. Suppose the function $f = f(w)$ is arbitrary and the function $g = g(w)$ is defined as

$$g(w) = -a^2\frac{f'(w)}{f^3(w)} + b,$$

where a and b are some numbers. Then there is a functional separable solution that can be written in implicit form

$$\int f(w)\,dw = at - \frac{1}{2}bx^2 + C_1 x + C_2,$$

where C_1 and C_2 are arbitrary constants.

3°. Suppose $f(w)$ and $g(w)$ are defined parametrically as

$$f = \frac{Ae^{bz}}{\varphi'_z(z)},$$
$$g = a^2\varphi''_{zz}(z) + Ace^{bz},$$
$$w = \varphi(z),$$

where $\varphi(z)$ is an arbitrary function, z is the parameter, and A, a, b, and c are some numbers. Then the equation has an exact solution

$$w = \varphi(z), \quad z = at + \theta(x),$$

where

$$\theta = \frac{1}{b}\ln\left|C_1\cos\left(\sqrt{bc}\,x\right) + C_2\sin\left(\sqrt{bc}\,x\right)\right| \qquad \text{if } bc > 0,$$
$$\theta = \frac{1}{b}\ln\left|C_1\exp\left(\sqrt{|bc|}\,x\right) + C_2\exp\left(-\sqrt{|bc|}\,x\right)\right| \qquad \text{if } bc < 0,$$
$$\theta = \frac{1}{b}\ln|x + C_1| + C_2 \qquad \text{if } c = 0,$$
$$\theta = \tfrac{1}{2}cx^2 + C_1 x + C_2 \qquad \text{if } b = 0,$$

with C_1 and C_2 being arbitrary constants.

⊙ *Reference for equation* 7.4.4.7: A. D. Polyanin and V. F. Zaitsev (2004, p. 256).

8. $\dfrac{\partial^2 w}{\partial t^2} = f(w)\dfrac{\partial^2 w}{\partial x^2} + g(w)\dfrac{\partial w}{\partial x} + h(w).$

Traveling-wave solution:

$$w = w(z), \quad z = x + \lambda t,$$

where λ is an arbitrary constant, and the function $w(z)$ is determined by the autonomous ordinary differential equation

$$[f(w) - \lambda^2]w''_{zz} + g(w)w'_z + h(w) = 0.$$

By the change variable $u(w) = w'_z$ this equation is reduced to the Abel equation

$$[f(w) - \lambda^2]uu'_w + g(w)u + h(w) = 0. \tag{1}$$

The substitution $\xi = -\displaystyle\int \frac{g(w)\,dw}{f(w) - \lambda^2}$ brings (1) to the canonical form

$$uu'_\xi - u = F(\xi), \tag{2}$$

where the function $F = F(\xi)$ is defined parametrically as

$$F(\xi) = \frac{h(w)}{g(w)}, \qquad \xi = -\int \frac{g(w)\,dw}{f(w) - \lambda^2}.$$

A large number of exact solutions to the Abel equation (2) for various $F = F(\xi)$ can be found in Polyanin and Zaitsev (2003).

9. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + g(w)\dfrac{\partial w}{\partial x} + h(w).$

Traveling-wave solution:

$$w = w(z), \quad z = x + \lambda t,$$

where λ is an arbitrary constant, and the function $w(z)$ is determined by the autonomous ordinary differential equation

$$\{[f(w) - \lambda^2]w'_z\}'_z + g(w)w'_z + h(w) = 0.$$

With the change of variable

$$u(w) = [f(w) - \lambda^2]w'_z,$$

this equation is reduced to the Abel equation

$$uu'_w + g(w)u + h(w)[f(w) - \lambda^2] = 0. \tag{1}$$

The substitution $\xi = -\displaystyle\int g(w)\,dw$ brings (1) to the canonical form

$$uu'_\xi - u = F(\xi), \tag{2}$$

where the function $F = F(\xi)$ is defined parametrically by

$$F(\xi) = \frac{h(w)}{g(w)}[f(w) - \lambda^2], \qquad \xi = -\int g(w)\,dw.$$

A large number of exact solutions to the Abel equation (2) for various $F = F(\xi)$ can be found in Polyanin and Zaitsev (2003).

10. $\dfrac{\partial^2 w}{\partial t^2} = f(w)\dfrac{\partial^2 w}{\partial x^2} + a f'_w(w)\left(\dfrac{\partial w}{\partial x}\right)^2.$

Equations of this form are encountered in the theory of liquid crystals and other applications.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the functions

$$w_1 = w(\pm C_1 x + C_2, C_1 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. In the general case, the equation has exact solutions of the form

$$w(x,t) = w(z), \quad z = kx + \lambda t \quad \text{(traveling-wave solution)},$$
$$w(x,t) = w(\xi), \quad \xi = \frac{x+b}{t+c} \quad \text{(self-similar solution)},$$

where k, λ, b, and c are arbitrary constants.

3°. The structure of other exact solutions for some specific $f(w)$:

$$f(w) = Aw + B, \qquad w(x,t) = \varphi(t)x^2 + \psi(t)x + \chi(t);$$
$$f(w) = Aw^k, \qquad w(x,t) = \varphi(x)\psi(t);$$
$$f(w) = Ae^{\beta w}, \qquad w(x,t) = \varphi(x) + \psi(t).$$

4°. A qualitative analysis of the structure of solutions to the original equation was undertaken in Glassey, Hunter, and Zheng (1997) and Melikyan (1998).

7.4.5. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = f(x,w)\dfrac{\partial^2 w}{\partial x^2} + g\left(x,t,w,\dfrac{\partial w}{\partial x}\right)$

1. $\dfrac{\partial^2 w}{\partial t^2} = f(x)w^m\dfrac{\partial^2 w}{\partial x^2}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^2 w\big(x, \pm C_1^m t + C_2\big),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Multiplicative separable solution:

$$w(x,t) = g(t)h(x),$$

where the functions $g = g(t)$ and $h = h(x)$ are determined by the ordinary differential equations

$$g''_{tt} - \lambda g^{m+1} = 0, \tag{1}$$
$$h''_{xx} - \lambda\big[f(x)\big]^{-1}h^{1-m} = 0, \tag{2}$$

where λ is an arbitrary constant.

The general solution of equation (1) is written out in implicit form:

$$\int \left(C_1 + \frac{2\lambda}{m+2} g^{m+2} \right)^{-1/2} dg = C_2 \pm t,$$

where C_1 and C_2 are arbitrary constants.

In particular, if $C_1 = 0$, it follows that

$$g(t) = (at + C)^{-2/m}, \qquad a = \pm\sqrt{\frac{\lambda m^2}{2(m+2)}}.$$

For $m = 1$, the general solution of equation (2) is expressed as

$$h(x) = \lambda \int_{x_0}^{x} \frac{(x-\xi)}{f(\xi)} d\xi + Ax + B,$$

where A, B, and x_0 are arbitrary constants.

The book by Polyanin and Zaitsev (2003, Sections 2.3 and 2.7) presents a large number of exact solutions to the generalized Emden–Fowler equation (2) for various $f = f(x)$.

3°. The transformation

$$u(z,t) = \frac{1}{x} w(x,t), \quad z = \frac{1}{x}$$

leads to an equation of the similar form

$$\frac{\partial^2 u}{\partial t^2} = z^{4-m} f\left(\frac{1}{z}\right) u^m \frac{\partial^2 u}{\partial z^2}.$$

2. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[f(x) w^m \dfrac{\partial w}{\partial x} \right]$.

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^2 w\big(x, \pm C_1^m t + C_2\big),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Multiplicative separable solution:

$$w(x,t) = g(t)h(x),$$

where the functions $g = g(t)$ and $h = h(x)$ are determined by the ordinary differential equations

$$g''_{tt} - \lambda g^{m+1} = 0, \tag{1}$$
$$[f(x)h^m h'_x]'_x - \lambda h = 0, \tag{2}$$

and λ is an arbitrary constant.

The general solution of equation (1) is written out in implicit form:

$$\int \left(C_1 + \frac{2\lambda}{m+2} g^{m+2} \right)^{-1/2} dg = C_2 \pm t,$$

where C_1 and C_2 are arbitrary constants.

In particular, if $C_1 = 0$, it follows that

$$g(t) = (at + C)^{-2/m}, \qquad a = \pm\sqrt{\frac{\lambda m^2}{2(m+2)}}.$$

The transformation

$$z = \int \frac{dx}{f(x)}, \quad \Phi = h^{m+1}$$

brings (2) to the generalized Emden–Fowler equation

$$\Phi''_{zz} - F(z)\Phi^{\frac{1}{m+1}} = 0, \tag{3}$$

where the function $F = F(z)$ is defined parametrically by

$$F = \lambda(m+1)f(x), \qquad z = \int \frac{dx}{f(x)}.$$

The book by Polyanin and Zaitsev (2003, Sections 2.3 and 2.7) presents a large number of exact solutions to equation (2) for various $F = F(z)$.

3°. The transformation

$$w(x,t) = \big[\psi(x)\big]^{\frac{1}{m+1}} u(\xi,t), \quad \xi = \int \big[\psi(x)\big]^{\frac{m+2}{m+1}} dx, \qquad \psi(x) = \int \frac{dx}{f(x)},$$

leads to an equation of the similar form

$$\frac{\partial^2 u}{\partial t^2} = \frac{\partial}{\partial \xi}\left[\mathcal{F}(\xi)u^m \frac{\partial u}{\partial \xi}\right],$$

where the function $\mathcal{F} = \mathcal{F}(\xi)$ is defined parametrically by

$$\mathcal{F} = f(x)\big[\psi(x)\big]^{\frac{3m+4}{m+1}}, \quad \xi = \int \big[\psi(x)\big]^{\frac{m+2}{m+1}} dx, \qquad \psi(x) = \int \frac{dx}{f(x)}.$$

3. $\dfrac{\partial^2 w}{\partial t^2} = w^4 f\left(\dfrac{w}{x}\right)\dfrac{\partial^2 w}{\partial x^2}$.

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = C_1 w\big(C_1^{-1}x, \pm C_1 t + C_2\big),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. With the transformation

$$u(z,t) = \frac{1}{x}w(x,t), \quad z = \frac{1}{x}$$

one arrives at the simpler equation

$$\frac{\partial^2 u}{\partial t^2} = u^4 f(u)\frac{\partial^2 u}{\partial z^2},$$

which has a traveling-wave solution $u = u(kz + \lambda t)$ and self-similar solutions of the form $u = u(z/t)$.

4. $\dfrac{\partial^2 w}{\partial t^2} = w^4 f\left(\dfrac{w}{\sqrt{ax^2+bx+c}}\right)\dfrac{\partial^2 w}{\partial x^2}.$

The transformation

$$w(x,t) = u(z,t)\sqrt{ax^2+bx+c}, \qquad z = \int \frac{dx}{ax^2+bx+c}$$

leads to an equation of the form 7.4.4.6:

$$\frac{\partial^2 u}{\partial t^2} = u^4 f(u)\frac{\partial^2 u}{\partial z^2} + (ac - \tfrac{1}{4}b^2)u^5 f(u),$$

which has a traveling-wave solution $u = u(kz + \lambda t)$.

7.4.6. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = f(t,w)\dfrac{\partial^2 w}{\partial x^2} + g\left(x,t,w,\dfrac{\partial w}{\partial x}\right)$

1. $\dfrac{\partial^2 w}{\partial t^2} = f(t)\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1^{-2} w\big(C_1 x + C_2,\ t\big),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Degenerate solutions:

$$w(x,t) = (C_1 t + C_2)(C_3 x + C_4)^{1/2},$$
$$w(x,t) = (C_1 t + C_2)x + \int_a^t (t-\tau)(C_1\tau + C_2)^2 f(\tau)\,d\tau + C_3 t + C_4,$$

where $C_1, \ldots, C_4$ and a are arbitrary constants.

3°. Generalized separable solution quadratic in x:

$$w(x,t) = \varphi(t)x^2 + \psi(t)x + \chi(t),$$

where the functions $\varphi = \varphi(t)$, $\psi = \psi(t)$, and $\chi = \chi(t)$ are determined by the system of ordinary differential equations

$$\varphi''_{tt} = 6f(t)\varphi^2,$$
$$\psi''_{tt} = 6f(t)\varphi\psi,$$
$$\chi''_{tt} = 2f(t)\varphi\chi + f(t)\psi^2.$$

4°. Multiplicative separable solution:

$$w(x,t) = \Phi(t)\Psi(x),$$

where the functions $\Phi = \Phi(t)$ and $\Psi = \Psi(x)$ are determined by the ordinary differential equations (C is an arbitrary constant)

$$\Phi''_{tt} = Cf(t)\Phi^2,$$
$$(\Psi\Psi'_x)'_x = C\Psi.$$

The last equation is autonomous and has a particular solution $\Psi = \frac{1}{6}Cx^2$; in the general case, it is integrable by quadrature.

2. $\dfrac{\partial^2 w}{\partial t^2} = f(t)\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) + g(t)w + h_2(t)x^2 + h_1(t)x + h_0(t).$

Generalized separable solution quadratic in x:

$$w(x,t) = \varphi(t)x^2 + \psi(t)x + \chi(t),$$

where the functions $\varphi = \varphi(t)$, $\psi = \psi(t)$, and $\chi = \chi(t)$ are determined by the system of ordinary differential equations

$$\begin{aligned}
\varphi''_{tt} &= 6f(t)\varphi^2 + g(t)\varphi + h_2(t),\\
\psi''_{tt} &= 6f(t)\varphi\psi + g(t)\psi + h_1(t),\\
\chi''_{tt} &= 2f(t)\varphi\chi + f(t)\psi^2 + g(t)\chi + h_0(t).
\end{aligned}$$

3. $\dfrac{\partial^2 w}{\partial t^2} = [a(t)w + b(t)]\dfrac{\partial^2 w}{\partial x^2} + c(t)\left(\dfrac{\partial w}{\partial x}\right)^2 + d(t)w + e(t)x^2 + f(t)x + g(t).$

There is a generalized separable solution quadratic in x:

$$w(x,t) = \varphi(t)x^2 + \psi(t)x + \chi(t).$$

⊙ *Reference*: V. A. Galaktionov (1995); the case of $a = 1$, $b = e = f = 0$, and $c = \text{const}$ was considered.

7.4.7. Other Equations Linear in the Highest Derivatives

1. $\dfrac{\partial^2 w}{\partial t^2} + f(t)\dfrac{\partial w}{\partial t} = g(t)\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w\big(C_1x + C_2,\ t\big) - \frac{2}{\lambda}\ln|C_1|,$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = \frac{1}{\lambda}\ln(C_1x + C_2) + C_3\int F(t)\,dt + C_4, \qquad F(t) = \exp\left[-\int f(t)\,dt\right],$$

where $C_1, \ldots, C_4$ are arbitrary constants.

3°. Additive separable solution:

$$w(x,t) = \frac{1}{\lambda}\ln(\lambda C_1x^2 + C_2x + C_3) + u(t),$$

where C_1, C_2, and C_3 are arbitrary constants, and the function $u = u(t)$ is determined by the ordinary differential equation

$$u''_{tt} + f(t)u'_t = 2C_1g(t)e^{\lambda u}.$$

2. $\dfrac{\partial^2 w}{\partial t^2} + \dfrac{f(w)}{t}\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + g(w).$

Solution:

$$w = w(\xi), \quad \xi = (x + C)^2 - at^2,$$

where C is an arbitrary constant and the function $w(\xi)$ is determined by the ordinary differential equation

$$4a\xi w''_{\xi\xi} + 2a[f(w) + 2]w'_\xi + g(w) = 0.$$

3. $\dfrac{\partial^2 w}{\partial t^2} + f(w)\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[g(w)\dfrac{\partial w}{\partial x}\right].$

1°. Traveling-wave solution in implicit form:

$$\int \frac{k^2 g(w) - \lambda^2}{\lambda F(w) + C_1}\,dw = kx + \lambda t + C_2, \qquad F(w) = \int f(w)\,dw,$$

where C_1, C_2, k, and λ are arbitrary constants.

2°. For exact solutions of this equation for some specific $f(w)$ and $g(w)$, see Baikov, Gazizov, and Ibragimov (1989) and Ibragimov (1994).

4. $\left[a + b\left(\dfrac{\partial w}{\partial t}\right)^k\right]\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2}.$

This equation arises in nonlinear optics and is a special case of equation 7.4.7.10, in which the variables x and t must be renamed.

1°. Additive separable solution:

$$w = C_1 x + C_2 x^2 + \varphi(t),$$

where the function $\varphi = \varphi(t)$ is determined by the ordinary differential equation

$$\begin{aligned} &a\varphi'_t + \frac{b}{k+1}(\varphi'_t)^{k+1} = 2C_2 t + C_3 \quad \text{if} \quad k \neq -1,\\ &a\varphi'_t + \ln|\varphi'_t| = 2C_2 t + C_3 \qquad\quad \text{if} \quad k = -1. \end{aligned}$$

Here, C_1, C_2, and C_3 are arbitrary constants. These equations can be integrated; see Item 2° with $\lambda = 0$.

2°. Solution of the more general form

$$w = C_1 x + C_2 x^2 + \varphi(z), \qquad z = t + \lambda x,$$

where C_1, C_2, and k are arbitrary constants, and the function $\varphi = \varphi(z)$ is determined by the ordinary differential equation $2C_2 = \left[b(\varphi'_z)^k + a - \lambda^2\right]\varphi''_{zz}$. Its general solution can be represented in parametric form

$$z = \frac{b}{2C_2(k+1)}\xi^{k+1} + \frac{a-\lambda^2}{2C_2}\xi + C_3, \qquad \varphi = \frac{b}{2C_2(k+2)}\xi^{k+2} + \frac{a-\lambda^2}{4C_2}\xi^2 + C_4,$$

where C_2 and C_4 are arbitrary constants ($k \neq -1, -2$). If $k \neq -1$ or $k = -2$, the term $\frac{1}{k+1}\xi^{k+1}$ or, respectively, $\frac{1}{k+2}\xi^{k+2}$ in the solution must be replaced by $\ln|\xi|$.

3°. Self-similar solution:

$$w = t\psi(y), \quad y = t/x,$$

where the function $\psi = \psi(y)$ is determined by the ordinary differential equation

$$[a + b(y\psi'_y + \psi)^k - y^2](y\psi''_{yy} + 2\psi'_y) = 0.$$

Equating the expression in square brackets to zero, we have

$$a + b(y\psi'_y + \psi)^k - y^2 = 0.$$

The general solution of this equation is

$$\psi = \frac{C}{y} + \frac{1}{b^{1/k}y}\int (y^2 - a)^{1/k}\,dy,$$

where C is an arbitrary constant.

4°. The Legendre transformation

$$u(\xi, \eta) = x\xi + t\eta - w(x, t), \quad \xi = \frac{\partial w}{\partial x}, \quad \eta = \frac{\partial w}{\partial t},$$

where u is the new dependent variable, and ξ and η are the new independent variables, leads to the linear equation

$$(a + b\eta^k)\frac{\partial^2 u}{\partial \xi^2} = \frac{\partial^2 u}{\partial \eta^2}.$$

5°. Generalized separable solution for $k = 2$:

$$w = \varphi_0(x) + \varphi_1(x)t + \varphi_2(x)t^2,$$

where the functions $\varphi_n(x)$ are determined by the system of ordinary differential equations:

$$\varphi''_0 = 2\varphi_2(a + b\varphi_1^2),$$
$$\varphi''_1 = 8b\varphi_1\varphi_2^2,$$
$$\varphi''_2 = 8b\varphi_2^3.$$

⊙ *References for equation* 7.4.7.4: G. Webb, M. P. Sorensen, M. Brio, A. R. Zakharian, and J. V. Moloney (2004), V. A. Galaktionov and S. R. Svirshchevskii (2007, pp. 285–286).

5. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f\left(x, \dfrac{\partial w}{\partial x}\right) + bw + g(t).$

1°. Suppose $w(x, t)$ is a solution of this equation. Then the functions

$$w_1 = w(x, t) + C_1\cosh(kt) + C_2\sinh(kt) \quad \text{if } b = k^2 > 0,$$
$$w_2 = w(x, t) + C_1\cos(kt) + C_2\sin(kt) \quad \text{if } b = -k^2 < 0,$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Additive separable solution:

$$w(x,t) = \varphi(t) + \psi(x).$$

Here, the functions $\varphi(t)$ and $\psi(x)$ are determined by the ordinary differential equations

$$\varphi''_{tt} - b\varphi - g(t) = 0,$$
$$a\psi''_{xx} + f\left(x, \psi'_x\right) + b\psi = 0.$$

The solution of the first equation is expressed as

$$\varphi(t) = C_1\cosh(kt) + C_2\sinh(kt) + \frac{1}{k}\int_0^t g(\tau)\sinh\left[k(t-\tau)\right]d\tau \quad \text{if} \quad b = k^2 > 0,$$
$$\varphi(t) = C_1\cos(kt) + C_2\sin(kt) + \frac{1}{k}\int_0^t g(\tau)\sin\left[k(t-\tau)\right]d\tau \quad \text{if} \quad b = -k^2 < 0,$$

where C_1 and C_2 are arbitrary constants.

Special case. For $f(x, w_x) = f(w_x)$, there are more complicated solutions of the form $w(x,t) = \varphi(t) + \psi(z)$, where $z = x + \lambda t$.

6. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f\left(x, \dfrac{\partial w}{\partial x}\right) + g\left(t, \dfrac{\partial w}{\partial t}\right).$

Additive separable solution:

$$w(x,t) = \varphi(x) + \psi(t),$$

where the functions $\varphi(x)$ and $\psi(t)$ are determined by the ordinary differential equations (C is an arbitrary constant)

$$a\varphi''_{xx} + f\left(x, \varphi'_x\right) = C,$$
$$\psi''_{tt} - g\left(t, \psi'_t\right) = C.$$

7. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + f\left(x, \dfrac{\partial w}{\partial x}\right) + g\left(t, \dfrac{\partial w}{\partial t}\right) + bw.$

Additive separable solution:

$$w(x,t) = \varphi(x) + \psi(t),$$

where the functions $\varphi(x)$ and $\psi(t)$ are determined by the ordinary differential equations (C is an arbitrary constant)

$$a\varphi''_{xx} + f\left(x, \varphi'_x\right) + b\varphi = C,$$
$$\psi''_{tt} - g\left(t, \psi'_t\right) - b\psi = C.$$

8. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + wf\left(x, \dfrac{1}{w}\dfrac{\partial w}{\partial x}\right) + wg\left(t, \dfrac{1}{w}\dfrac{\partial w}{\partial t}\right) + bw\ln w.$

Multiplicative separable solution:

$$w(x,t) = \varphi(x)\psi(t),$$

where the functions $\varphi(x)$ and $\psi(t)$ are determined by the ordinary differential equations (C is an arbitrary constant)

$$a\varphi''_{xx} + \varphi f\left(x, \varphi'_x/\varphi\right) + b\varphi\ln\varphi + C\varphi = 0,$$
$$\psi''_{tt} - \psi g\left(t, \psi'_t/\psi\right) - b\psi\ln\psi + C\psi = 0.$$

9. $\dfrac{\partial^2 w}{\partial t^2} - a^2\dfrac{\partial^2 w}{\partial x^2} = F\left(x, t, \dfrac{\partial w}{\partial t} + a\dfrac{\partial w}{\partial x}\right).$

The transformation

$$\xi = x + at, \quad \eta = x - at, \quad w = w(\xi, \eta)$$

leads to the equation

$$\frac{\partial^2 w}{\partial \xi \partial \eta} = -\frac{1}{4a^2} F\left(\frac{\xi+\eta}{2}, \frac{\xi-\eta}{2a}, 2a\frac{\partial w}{\partial \xi}\right),$$

whose order can be reduced with the substitution $u = w_\xi$:

$$\frac{\partial u}{\partial \eta} = -\frac{1}{4a^2} F\left(\frac{\xi+\eta}{2}, \frac{\xi-\eta}{2a}, 2au\right).$$

Special case. For $F(x, t, U) = F(U)$, the general solution of the last equation can be represented in implicit form:

$$\int \frac{du}{F(2au)} = -\frac{1}{4a^2}\eta + \varphi(\xi),$$

where $\varphi(\xi)$ is an arbitrary function.

10. $\dfrac{\partial^2 w}{\partial t^2} = f\left(\dfrac{\partial w}{\partial x}\right)\dfrac{\partial^2 w}{\partial x^2}.$

Model equation for dynamics of nonlinear strings (Zabusky, 1962). For $f(z) = -z$, this equation is encountered in aerodynamics (theory of transonic gas flows).

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1^{-1} w(C_1 x + C_2, C_1 t + C_3) + C_4 t + C_5,$$

where $C_1, \ldots, C_5$ are arbitrary constants, is also a solution of the equation.

2°. Degenerate solution:

$$w(x, t) = Axt + Bx + Ct + D,$$

where A, B, C, and D are arbitrary constants.

3°. Additive separable solution:

$$w(x, t) = At^2 + Bt + \varphi(x),$$

where A and B are arbitrary constants, and the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation $2A = f(\varphi'_x)\varphi''_{xx}$. Its general solution can be represented in parametric form

$$x = \frac{1}{2A}\int f(\xi)\, d\xi + C_1, \quad \varphi = \frac{1}{2A}\int \xi f(\xi)\, d\xi + C_2,$$

where C_1 and C_2 are arbitrary constants.

4°. Solution of the more general form

$$w(x,t) = At^2 + Bt + \varphi(z), \qquad z = x + \lambda t,$$

where A, B, and λ are arbitrary constants, and the function $\varphi = \varphi(z)$ is determined by the ordinary differential equation $2A = \left[f(\varphi'_z) - \lambda^2\right]\varphi''_{zz}$. Its general solution can be represented in parametric form

$$z = \frac{1}{2A}\int f(\xi)\,d\xi - \frac{\lambda^2}{2A}\xi + C_1, \qquad \varphi = \frac{1}{2A}\int \xi f(\xi)\,d\xi - \frac{\lambda^2}{4A}\xi^2 + C_2,$$

where C_1 and C_2 are arbitrary constants.

5°. Self-similar solution:

$$w = x\psi(y), \qquad y = x/t,$$

where the function $\psi = \psi(y)$ is determined by the ordinary differential equation

$$[f(y\psi'_y + \psi) - y^2](y\psi''_{yy} + 2\psi'_y) = 0.$$

Equating the expression in square brackets to zero, we have

$$f(y\psi'_y + \psi) - y^2 = 0.$$

The general solution of this equation in parametric form:

$$y = \pm\sqrt{f(\tau)}, \qquad \psi = \frac{1}{2\sqrt{f(\tau)}}\int \frac{\tau f'_\tau(\tau)}{\sqrt{f(\tau)}}\,d\tau + C.$$

6°. The Legendre transformation

$$u(z,\tau) = tz + x\tau - w(x,t), \qquad z = \frac{\partial w}{\partial t}, \qquad \tau = \frac{\partial w}{\partial x},$$

where u is the new dependent variable, and z and τ are the new independent variables, leads to the linear equation

$$\frac{\partial^2 u}{\partial \tau^2} = f(\tau)\frac{\partial^2 u}{\partial z^2}.$$

7°. The substitution $v(x,t) = \dfrac{\partial w}{\partial x}$ leads to an equation of the form 7.4.4.6:

$$\frac{\partial^2 v}{\partial t^2} = \frac{\partial}{\partial x}\left[f(v)\frac{\partial v}{\partial x}\right].$$

8°. Below are exact solutions of the equation for some specific $f = f(U)$.

Special case 1. Let $f(U) = aU$.

1. Generalized separable solution quadratic in x:

$$w = (C_1t + C_2)x^2 + \left[\tfrac{1}{3}aC_1^{-2}(C_1t + C_2)^4 + C_3t + C_4\right]x + \tfrac{1}{63}a^2C_1^{-4}(C_1t + C_2)^7 + \tfrac{1}{6}aC_1C_3t^4 + \tfrac{1}{3}a(C_1C_4 + C_2C_3)t^3 + aC_2C_4t^2 + C_5t + C_6,$$

where $C_1, \ldots, C_6$ are arbitrary constants.

2. Generalized separable solution cubic in x:

$$w = f(t)x^3 + g(t)x^2 + h(t)x + p(t),$$

where the functions $f = f(t)$, $g = g(t)$, $h = h(t)$, $p = p(t)$ are determined by the autonomous system of ordinary differential equations

$$f''_{tt} = 18af^2,$$
$$g''_{tt} = 18afg,$$
$$h''_{tt} = 6afh + 4ag^2,$$
$$p''_{tt} = 2agh.$$

A particular solution of the system of the first three equations is given by

$$f = \frac{1}{3a(t + C_1)^2}, \quad g = \frac{C_2}{(t + C_1)^2} + C_3(t + C_1)^3,$$
$$h = \frac{C_4}{t + C_1} + C_5(t + C_1)^2 + \frac{aC_2^2}{(t + C_1)^2} + 2aC_2C_3(t + C_1)^3 + \frac{2aC_3^2}{27}(t + C_1)^8,$$

where $C_1, \ldots, C_5$ are arbitrary constants. The function $p = p(t)$ is determined from the last equation by integrating the right-hand side twice.

3. There is the solution in multiplicative separable form: $w = \varphi(x)\psi(t)$.

4. For other solutions of the original equation, see equation 9.1.6.10, where y and a must be renamed t and $-a$, respectively.

Special case 2. Let $f(U) = aU^k$.

1+. Multiplicative separable solution:

$$w = \varphi(x)\psi(t),$$

where the functions $\varphi(x)$ and $\psi(t)$ are determined by the autonomous ordinary differential equations

$$(\psi'_t)^2 = \frac{2aC_1}{k + 2}\psi^{k+2} + C_2, \qquad \frac{2}{k + 2}(\varphi'_x)^{k+2} = C_1\varphi^2 + C_3,$$

and C_1, C_2, and C_3 are arbitrary constants. The general solutions to these equations can be written out in implicit form. Below are exact solutions representable in explicit form:

$$\psi(t) = A_1t^{-2/k} \quad \text{if} \quad C_2 = 0, \qquad \varphi(x) = A_2x^{(k+2)/k} \quad \text{if} \quad C_3 = 0.$$

The coefficients A_1 and A_2 are determined by substituting these expressions into the above equations.

2+. Self-similar solution:

$$w = t^\sigma u(\zeta), \quad \zeta = t^\beta x, \quad \sigma = -(k\beta + 2\beta + 2)/k,$$

where β is an arbitrary constant, and the function $u(\zeta)$ is determined by the ordinary differential equation

$$\sigma(\sigma - 1)u + \beta(2\sigma + \beta - 1)\zeta u'_\zeta + \beta^2\zeta^2u''_{\zeta\zeta} = a(u'_\zeta)^k u''_{\zeta\zeta}.$$

3. Conservation laws for $a = 1$:

$$D_t\left(w_t\right) + D_x\left(-\frac{1}{k + 1}w_x^{k+1}\right) = 0,$$
$$D_t\left(w_tw_x\right) + D_x\left(-\frac{1}{k + 2}w_x^{k+2} - \frac{1}{2}w_t^2\right) = 0,$$
$$D_t\left(\frac{1}{2}w_t^2 + \frac{1}{(k + 1)(k + 2)}w_x^{k+2}\right) + D_x\left(-\frac{1}{k + 1}w_tw_x^{k+1}\right) = 0,$$
$$D_t\left(tw_t - w\right) + D_x\left(-\frac{1}{k + 1}tw_x^{k+1}\right) = 0,$$

where $D_t = \frac{\partial}{\partial t}$ and $D_x = \frac{\partial}{\partial x}$.

Special case 3. Let $f(U) = a\exp(\lambda U)$.

Generalized separable solution:

$$w = (x + C_1)\varphi(t) + \psi(x).$$

Here, the functions $\varphi(t)$ and $\psi(x)$ are determined by the ordinary differential equations

$$\varphi''_{tt} = aC_2\exp(\lambda\varphi), \tag{1}$$

$$\exp(\lambda\psi'_x)\psi''_{xx} = C_2(x + C_1), \tag{2}$$

where C_1 and C_2 are arbitrary constants. The general solution of equation (1) is given by

$$\varphi(t) = -\frac{1}{\lambda}\ln\left[\frac{aC_2\lambda}{2\beta^2}\cos^2(\beta t + C_3)\right] \quad \text{if} \quad aC_2\lambda > 0,$$

$$\varphi(t) = -\frac{1}{\lambda}\ln\left[\frac{aC_2\lambda}{2\beta^2}\sinh^2(\beta t + C_3)\right] \quad \text{if} \quad aC_2\lambda > 0,$$

$$\varphi(t) = -\frac{1}{\lambda}\ln\left[-\frac{aC_2\lambda}{2\beta^2}\cosh^2(\beta t + C_3)\right] \quad \text{if} \quad aC_2\lambda < 0,$$

where C_3 and β are arbitrary constants. The general solution of equation (2) is expressed as

$$\psi(x) = \int \ln\left(\tfrac{1}{2}C_2x^2 + C_1C_2x + C_4\right)dx + \frac{\ln\lambda}{\lambda}x + C_5,$$

where C_4 and C_5 are arbitrary constants.

⊙ *References for equation* 7.4.7.10: V. A. Vinokurov and I. G. Nurgalieva (1985), N. H. Ibragimov (1994, pp. 212–218), A. D. Polyanin and V. F. Zaitsev (2002, pp. 172–173; 2004, pp. 262–264).

11. $a\dfrac{\partial^2 w}{\partial t^2} + \dfrac{\partial w}{\partial t} = f\left(\dfrac{\partial w}{\partial x}\right)\dfrac{\partial^2 w}{\partial x^2}, \qquad a \neq 0.$

1°. Suppose $w(x, t)$ is a solution of this equation. Then the function

$$w_1(x, t) = w(t + C_1, x + C_2) + C_3e^{-t/a} + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. Solution:

$$w(x, t) = U(z) + C_1e^{-t/a} + C_2, \qquad z = x + \lambda t,$$

where C_1, C_2, and λ are arbitrary constants, and the function $U(z)$ is determined by the autonomous ordinary differential equation

$$\lambda U'_z = \left[f(U'_z) - a\lambda^2\right]U''_{zz}.$$

Integrating yields its solution in parametric form:

$$U = \frac{1}{\lambda}\int f(\tau)\,d\tau - a\lambda\tau + C_3, \qquad z = \frac{1}{\lambda}\int \frac{f(\tau)}{\tau}\,d\tau - a\lambda\ln|\tau| + C_4,$$

where C_3 and C_4 are arbitrary constants (C_3 can be set equal to zero).

3°. Additive separable solution:

$$w(x, t) = C_1t + C_2 + C_3e^{-t/a} + \varphi(x),$$

where C_1, C_2, and C_3 are arbitrary constants, the function $\varphi(x)$ is determined by the autonomous ordinary differential equation $f(\varphi'_x)\varphi''_{xx} = C_1$. Integrating yields its solution in parametric form:

$$\varphi = \frac{1}{C_1}\int \xi f(\xi)\,d\xi + C_4, \qquad x = \frac{1}{C_1}\int f(\xi)\,d\xi + C_5,$$

where C_4 and C_5 are arbitrary constants (C_4 can be set equal to zero).

4°. The solutions of Items 2° and 3° are special cases of the more general solution

$$w(x,t) = C_1 t + C_2 + C_3 e^{-t/a} + \varphi(z), \qquad z = x + \lambda t,$$

where the function $\varphi(z)$ is determined by the autonomous ordinary differential equation

$$\lambda \varphi_z' + C_1 = \left[f(\varphi_z') - a\lambda^2 \right] \varphi_{zz}''.$$

5°. The contact transformation

$$\bar{t} = t + a \ln|w_x|, \quad \bar{x} = w + a w_t, \quad \bar{w} = x + a w_t / w_x, \quad \bar{w}_{\bar{x}} = 1/w_x, \quad \bar{w}_{\bar{t}} = -w_t/w_x \quad (1)$$

leads to an equation of the similar form

$$a \frac{\partial^2 \bar{w}}{\partial \bar{t}^2} + \frac{\partial \bar{w}}{\partial \bar{t}} = F\left(\frac{\partial \bar{w}}{\partial \bar{x}} \right) \frac{\partial^2 \bar{w}}{\partial \bar{x}^2}, \qquad \text{where} \qquad F(u) = \frac{1}{u^2} f\left(\frac{1}{u} \right).$$

Transformation (1) has an inverse; it is given by

$$t = \bar{t} + a \ln|\bar{w}_{\bar{x}}|, \quad x = \bar{w} + a \bar{w}_{\bar{t}}, \quad w = \bar{x} + a \bar{w}_{\bar{t}} / \bar{w}_{\bar{x}}, \quad w_x = 1/\bar{w}_{\bar{x}}, \quad w_t = -\bar{w}_{\bar{t}} / \bar{w}_{\bar{x}}. \quad (2)$$

The formulas of (2) can be used if the Jacobian function

$$J = \left[(\bar{w}_{\bar{x}} + a \bar{w}_{\bar{x}\bar{t}})^2 - a \bar{w}_{\bar{x}\bar{x}} (\bar{w}_{\bar{t}} + a \bar{w}_{\bar{t}\bar{t}}) \right]$$

is nonzero.

Special case 1. For $f(w_x) = b(w_x)^{-2}$, transformation (1) leads to the linear telegraph equation

$$a \frac{\partial^2 \bar{w}}{\partial \bar{t}^2} + \frac{\partial \bar{w}}{\partial \bar{t}} = b \frac{\partial^2 \bar{w}}{\partial \bar{x}^2}.$$

6°. Conservation laws:

$$D_t\big(a w_t + w\big) + D_x\big[-\Psi'(w_x)\big] = 0,$$
$$D_t\big(a e^{t/a} w_t\big) + D_x\big[-e^{t/a} \Psi'(w_x)\big] = 0,$$
$$D_t\big(a e^{t/a} w_t w_x\big) + D_x\big\{ e^{t/a} \big[\Psi(w_x) - w_x \Psi'(w_x) - \tfrac{1}{2} a (w_t)^2 \big] \big\} = 0,$$

where the prime stands for the differentiation,

$$D_t = \frac{\partial}{\partial t}, \qquad D_x = \frac{\partial}{\partial x}, \qquad \Psi(u) = \int_0^u (u - \zeta) f(\zeta)\, d\zeta + C_1 u + C_2,$$

and C_1 and C_2 are arbitrary constants.

Special case 2. For $f(w_x) = b w_x^n$ $(n \neq 0, -2)$, there is an additional conservation law:

$$D_t\left\{ a e^{t/a} \left[\frac{3n+4}{2} a w_t^2 + w_t\big((n+2)w - n x w_x\big) + (3n+4)\Psi \right] \right\}$$
$$+ D_t\left\{ e^{t/a} \left[\frac{n}{2} a x w_t^2 + \frac{d\Psi}{dw_x} \big(n x w_x - a(3n+4) w_t - (n+2) w \big) - n x \Psi + \Phi \right] \right\} = 0,$$

where

$$\Psi = \frac{b}{(n+1)(n+2)} w_x^{n+2}, \quad \Phi = 0 \qquad \text{if } n \neq -1;$$
$$\Psi = b w_x (\ln|w_x| - 1), \qquad \Phi = 2bw \quad \text{if } n = -1.$$

Special case 3. For $f(w_x) = b e^{k w_x}$, there is an additional conservation law $(k \neq 0)$:

$$D_t\left\{ a e^{t/a} \left[\frac{3}{2} a k w_t^2 + w_t(k w + 2x - k x w_x) + \frac{3b}{k} e^{k w_x} \right] \right\}$$
$$+ D_x\left\{ e^{t/a} \left[\frac{1}{2} a k x w_t^2 - b \left(w + \frac{3}{k} x - x w_x + 3 a w_t \right) e^{k w_x} \right] \right\} = 0.$$

⊙ *References for equation* 7.4.7.11: S. R. Svirshchevskii (1986, 1988), N. H. Ibragimov (1994, pp. 165–166, 168), A. D. Polyanin and V. F. Zaitsev (2004, pp. 264–265).

12. $\left(\dfrac{\partial w}{\partial x}\right)^2 \dfrac{\partial^2 w}{\partial t^2} = \left(\dfrac{\partial w}{\partial t}\right)^2 \dfrac{\partial^2 w}{\partial x^2}.$

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1 w(C_2 x + C_3, C_4 t + C_5) + C_6,$$

where C_1, C_2, C_3, C_4, C_5, and C_6 are arbitrary constants, are also solutions of the equation.

2°. Solutions:

$$w = \Phi(kx + \lambda t),$$
$$w = \Psi(xt),$$

where $\Phi(z)$ and $\Psi(\xi)$ are arbitrary functions and k and λ are arbitrary constants.

3°. General solution:

$$w = F(u), \quad u = \frac{(xZ - G(Z) + t)^2}{Z},$$

where $F(u)$ and $G(Z)$ are arbitrary functions, and $Z = Z(x,t)$ is any solution of the transcendental equation

$$G(Z) - 2ZG'(Z) + xZ - t = 0.$$

⊙ *Reference for equation* 7.4.7.12: Yu. N. Kosovtsov (2008 *a*).

13. $\left(\dfrac{\partial w}{\partial x}\right)^2 \dfrac{\partial^2 w}{\partial t^2} = \left(\dfrac{\partial w}{\partial t}\right)^2 \dfrac{\partial^2 w}{\partial x^2} + f(w)\left(\dfrac{\partial w}{\partial x}\right)^4.$

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the functions

$$w_1 = w(\pm C_1 x + C_2, C_1 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Solutions:

$$x + t\left(\int f(w)\,dw + C_1\right)^{1/2} = \varphi(w),$$
$$x - t\left(\int f(w)\,dw + C_2\right)^{1/2} = \psi(w),$$

where $\varphi(w)$ and $\psi(w)$ are arbitrary functions and C_1 and C_2 are arbitrary constants.

14. $\dfrac{\partial^2 w}{\partial t^2} = f\left(\dfrac{\partial w}{\partial t}, \dfrac{\partial w}{\partial x}\right)\dfrac{\partial^2 w}{\partial x^2}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1^{-1} w\big(C_1 x + C_2,\ C_1 t + C_3\big) + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. The Legendre transformation

$$u(z,\tau) = tz + x\tau - w(x,t), \quad z = \frac{\partial w}{\partial t}, \quad \tau = \frac{\partial w}{\partial x},$$

where u is the new dependent variable, and z and τ are the new independent variables, leads to the linear equation

$$\frac{\partial^2 u}{\partial \tau^2} = f(z,\tau)\frac{\partial^2 u}{\partial z^2}.$$

Exact solutions of this equation for some specific $f(z,\tau)$ can be found in Polyanin (2002).

7.5. Equations of the Form $\dfrac{\partial^2 w}{\partial x \partial y} = F\left(x, y, w, \dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}\right)$

7.5.1. Equations Involving Arbitrary Parameters of the Form $\dfrac{\partial^2 w}{\partial x \partial y} = f(w)$

1. $\dfrac{\partial^2 w}{\partial x \partial y} = a w^n.$

This is a special case of equation 7.5.3.1 with $f(w) = aw^n$.

1°. Suppose $w(x, y)$ is a solution of the equation in question. Then the function

$$w_1 = (C_1 C_2)^{\frac{1}{n-1}} w\big(C_1 x + C_3,\, C_2 y + C_4\big),$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. Solutions:

$$w(x, y) = \left[\frac{a(1-n)^2}{2(1+n)}\right]^{\frac{1}{1-n}} \left(C_1 x + \frac{y}{C_1} + C_2\right)^{\frac{2}{1-n}},$$

$$w(x, y) = \big[a(1-n)^2\big]^{\frac{1}{1-n}} \big(xy + C_1 x + C_2 y + C_1 C_2\big)^{\frac{1}{1-n}}.$$

3°. Traveling-wave solution in implicit form (generalizes the first solution of Item 2°):

$$\int \left(C_2 + \frac{2a}{n+1} w^{n+1}\right)^{-1/2} dw = C_1 x + \frac{y}{C_1} + C_3.$$

4°. Self-similar solution:

$$w = x^{\frac{\beta-1}{n-1}} U(\xi), \quad \xi = y x^{\beta},$$

where β is an arbitrary constant, and the function $U(\xi)$ is determined by the modified Emden–Fowler equation

$$\beta \xi U''_{\xi\xi} + \frac{n\beta - 1}{n-1} U'_{\xi} = a U^n.$$

For exact solutions of this equation, see the book by Polyanin and Zaitsev (2003).

2. $\dfrac{\partial^2 w}{\partial x \partial y} = a e^{\lambda w}.$

Liouville equation. This is a special case of equation 7.5.3.1 with $f(w) = ae^{\lambda w}$.

1°. Suppose $w(x, y)$ is a solution of the equation in question. Then the function

$$w_1 = w\big(C_1 x + C_2,\, C_3 y + C_4\big) + \frac{1}{\lambda} \ln(C_1 C_3),$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. General solution:

$$w = \frac{1}{\lambda}\big[f(x) + g(y)\big] - \frac{2}{\lambda}\ln\left|k\int \exp\big[f(x)\big]\,dx + \frac{a\lambda}{2k}\int \exp\big[g(y)\big]\,dy\right|,$$

where $f = f(x)$ and $g = g(y)$ are arbitrary functions and k is an arbitrary constant.

3°. The Liouville equation is related to the linear equation $\partial_{xy}u = 0$ by the Bäcklund transformation

$$\frac{\partial u}{\partial x} = \frac{\partial w}{\partial x} + \frac{2k}{\lambda}\exp\left[\frac{1}{2}\lambda(w+u)\right],$$
$$\frac{\partial u}{\partial y} = -\frac{\partial w}{\partial y} - \frac{a}{k}\exp\left[\frac{1}{2}\lambda(w-u)\right].$$

4°. The original equation can also be linearized with either of the differential substitutions

$$w = \frac{1}{\lambda}\ln\left(\frac{2}{v^2}\frac{\partial v}{\partial x}\frac{\partial v}{\partial y}\right), \qquad v = v(x,y);$$
$$w = \frac{1}{\lambda}\ln\left(\frac{2}{\cos^2 z}\frac{\partial z}{\partial x}\frac{\partial z}{\partial y}\right), \quad z = z(x,y).$$

5°. Solutions (for $a = \lambda = 1$):

$$w = \ln\left[f(x)g(y)\cosh^{-2}\left(C_1 + C_2\int g(y)\,dy - \frac{1}{2C_2}\int f(x)\,dx\right)\right],$$
$$w = \ln\left[f(x)g(y)\sinh^{-2}\left(C_1 + C_2\int g(y)\,dy + \frac{1}{2C_2}\int f(x)\,dx\right)\right],$$
$$w = \ln\left[f(x)g(y)\cos^{-2}\left(C_1 + C_2\int g(y)\,dy + \frac{1}{2C_2}\int f(x)\,dx\right)\right],$$

where $f(x)$ and $g(y)$ are arbitrary functions, and C_1 and C_2 are arbitrary constants.

⊙ *References for equation* 7.5.1.2: J. Liouville (1853), R. K. Bullough and P. J. Caudrey (1980), S. V. Khabirov (1990), N. H. Ibragimov (1994, pp. 204–206).

3. $\dfrac{\partial^2 w}{\partial x \partial y} = e^{w} - e^{-2w}$.

Tzitzéica equation arises in differential geometry and physics. This is a special case of equation 7.5.3.1 with $f(w) = e^{w} - e^{-2w}$.

1°. Solutions:

$$w = \ln\left[1 - 2\frac{\partial^2(\ln\zeta_k)}{\partial x \partial y}\right], \tag{1}$$

where

$$\zeta_1 = 1 + A\exp\left(kx + \frac{3}{k}y\right),$$

$$\zeta_2 = 1 + A_1\exp\left(k_1x + \frac{3}{k_1}y\right) + A_2\exp\left(k_2x + \frac{3}{k_2}y\right) + A_1A_2\frac{(k_1-k_2)^2(k_1^2-k_1k_2+k_2^2)}{(k_1+k_2)^2(k_1^2+k_1k_2+k_2^2)}\exp\left[(k_1+k_2)x + \left(\frac{3}{k_1}+\frac{3}{k_2}\right)y\right],$$

$$\zeta_3 = 1 + A(k^2x - 3y)\exp\left(kx + \frac{3}{k}y\right) - \frac{A^2k^2}{12}\exp\left(2kx + \frac{6}{k}y\right),$$

$$\zeta_4 = \sin\left(kx - \frac{3}{k}y\right) + \sqrt{3}\left(kx + \frac{3}{k}y\right),$$

and A, A_1, A_2, k, k_1, and k_2 are arbitrary constants.

2°. On passing to the new independent variables $z = x - y$ and $t = x + y$, one obtains an equation of the form 7.2.1.4:

$$\frac{\partial^2 w}{\partial t^2} = \frac{\partial^2 w}{\partial z^2} + e^w - e^{-2w}.$$

3°. The Tzitzéica equation is often written in the form

$$(\ln u)_{xy} = u - u^{-2}, \qquad u = e^w,$$

and can be treated as a consistency condition for the following system of three linear equations for ψ:

$$\psi_{xy} = u\psi, \quad \psi_{xx} = \frac{u_x\psi_x + \lambda\psi_y}{u}, \quad \psi_{yy} = \frac{u_y\psi_y + \lambda^{-1}\psi_x}{u},$$

where λ is an arbitrary parameter.

⊙ *References for equation* 7.5.1.3: G. Tzitzéica (1910), R. K. Dodd, J. C. Eilbeck, J. D. Gibbon, and Morris (1982), S. S. Safin and R. A. Sharipov (1993), O. V. Kaptsov and Yu. V. Shan'ko (1999, other exact solutions are also given there).

4. $\dfrac{\partial^2 w}{\partial x\partial y} = a\sinh w.$

Sinh-Gordon equation. On passing to the new independent variables $z = x - y$ and $t = x + y$, one obtains an equation of the form 7.3.1.1:

$$\frac{\partial^2 w}{\partial t^2} = \frac{\partial^2 w}{\partial z^2} + a\sinh w.$$

⊙ *References*: S. P. Novikov, S. V. Manakov, L. B. Pitaevskii, and V. E. Zakharov (1984), A. Grauel (1985).

5. $\dfrac{\partial^2 w}{\partial x \partial y} = a \sin w.$

Sine-Gordon equation. This is a special case of equation 7.5.3.1 with $f(w) = a \sin w$.

1°. Traveling-wave solution:

$$w(x,y) = \begin{cases} 4 \arctan\left[\exp\left(\sqrt{\dfrac{a}{AB}}\,(Ax + By + C)\right)\right] & \text{if } aAB > 0, \\ 4 \operatorname{arctanh}\left[\exp\left(\sqrt{-\dfrac{a}{AB}}\,(Ax + By + C)\right)\right] & \text{if } aAB < 0, \end{cases}$$

where A, B, and C are arbitrary constants.

2°. Solution:

$$w(x,y) = 4 \arctan\left[\frac{C_1 + C_2}{C_1 - C_2} \frac{\sinh(v_1 - v_2)}{\cosh(v_1 + v_2)}\right], \quad v_k = \frac{1}{2}\left(C_k x - \frac{a}{C_k} y\right), \quad k = 1, 2,$$

where C_1 and C_2 are arbitrary constants.

3°. Self-similar solution:

$$w = U(\xi), \quad \xi = xy,$$

where the function $U = U(\xi)$ is determined by the second-order ordinary differential equation $\xi U''_{\xi\xi} + U'_\xi = a \sin U$.

4°. The Bäcklund transformation

$$\begin{aligned} \frac{\partial u}{\partial x} &= \frac{\partial w}{\partial x} + 2k \sin\left(\frac{w+u}{2}\right), \\ \frac{\partial u}{\partial y} &= -\frac{\partial w}{\partial y} - \frac{2a}{k} \sin\left(\frac{w-u}{2}\right) \end{aligned} \tag{1}$$

brings the original equation to the identical equation

$$\frac{\partial^2 u}{\partial x \partial y} = a \sin u.$$

Given a single exact solution, the formulas of (1) allow us to successively generate other solutions of the sine-Gordon equation.

5°. The sine-Gordon equation has infinitely many conservation laws. The first three of them read as follows:

$$\begin{aligned} &D_x\left(w_y^2\right) + D_y\left(2a \cos w\right) = 0, \\ &D_x\left(w_y^4 - 4w_{yy}^2\right) + D_y\left(4a w_y^2 \cos w\right) = 0, \\ &D_x\left(3w_y^6 - 12 w_y^2 w_{yy}^2 + 16 w_y^3 w_{yyy} + 24 w_{yyy}^2\right) + D_y\left[a(2w_y^4 - 24 w_{yy}^2)\cos w\right] = 0, \end{aligned}$$

where $D_x = \frac{\partial}{\partial x}$ and $D_y = \frac{\partial}{\partial y}$ (analogous laws can be obtained by swapping the independent variables $x \rightleftarrows y$).

6°. The equation in question is related to the equation

$$\frac{\partial^2 z}{\partial x \partial y} = z\sqrt{a^2 - \left(\frac{\partial z}{\partial y}\right)^2}$$

by the transformation

$$z = \frac{\partial w}{\partial x}, \quad \frac{\partial z}{\partial y} = a \sin w.$$

⊙ *References for equation* 7.5.1.5: R. Steuerwald (1936), A. C. Scott, F. Y. Chu, and D. W. McLaughlin (1973), J. L. Lamb (1974), R. K. Dodd and R. K. Bullough (1977), I. M. Krichever (1980), R. K. Bullough and P. J. Caudrey (1980), S. P. Novikov, S. V. Manakov, L. B. Pitaevskii, and V. E. Zakharov (1984), N. H. Ibragimov (1994, pp. 206–208).

6. $\dfrac{\partial^2 w}{\partial x \partial y} = a \sin w + b \sin\left(\frac{1}{2} w\right).$

On passing to the new independent variables $z = x - y$ and $t = x + y$, one obtains an equation of the form 7.3.3.2:

$$\frac{\partial^2 w}{\partial t^2} = \frac{\partial^2 w}{\partial z^2} + a \sin w + b \sin\left(\tfrac{1}{2} w\right).$$

⊙ *Reference*: F. Calogero and A. Degasperis (1982).

7.5.2. Other Equations Involving Arbitrary Parameters

1. $\dfrac{\partial^2 w}{\partial x \partial y} = w \dfrac{\partial w}{\partial x}.$

General solution:

$$w = \frac{g''_{yy}(y)}{g'_y(y)} - \frac{2g'_y(y)}{f(x) + g(y)},$$

where $f(x)$ and $g(y)$ are arbitrary functions.

⊙ *References*: A. R. Forsyth (1906), O. V. Kaptsov (2009).

2. $\dfrac{\partial^2 w}{\partial x \partial y} = a \dfrac{\partial w}{\partial x} \dfrac{\partial w}{\partial y}.$

General solution:

$$w(x, y) = -\frac{1}{a} \ln\big[f(x) + g(y)\big],$$

where $f(x)$ and $g(y)$ are arbitrary functions.

3. $\dfrac{\partial^2 w}{\partial x \partial y} + a \dfrac{\partial w}{\partial x} \dfrac{\partial w}{\partial y} + b \dfrac{\partial w}{\partial x} + c \dfrac{\partial w}{\partial y} = 0.$

Thomas equation. This equation arises in some problems of chemical engineering and chromatography. The substitution $u = e^{aw}$ leads to the linear equation

$$\frac{\partial^2 u}{\partial x \partial y} + b \frac{\partial u}{\partial x} + c \frac{\partial u}{\partial y} = 0.$$

⊙ *Reference*: H. C. Thomas (1944), G. B. Whitham (1972).

4. $$w\frac{\partial^2 w}{\partial x \partial y} = \frac{\partial w}{\partial x}\frac{\partial w}{\partial y}.$$

General solution:

$$w(x, y) = f(x)g(y),$$

where $f(x)$ and $g(y)$ are arbitrary functions.

5. $$w\frac{\partial^2 w}{\partial x \partial y} = \frac{\partial w}{\partial x}\frac{\partial w}{\partial y} + aw^2.$$

General solution:

$$w(x, y) = e^{axy} f(x)g(y),$$

where $f(x)$ and $g(y)$ are arbitrary functions.

⊙ *Reference*: Yu. N. Kosovtsov (2008 *a*).

6. $$\frac{\partial^2 w}{\partial x \partial y} = aw^n \frac{\partial w}{\partial x}\frac{\partial w}{\partial y}.$$

This is a special case of equation 7.5.3.8 with $f(w) = aw^n$.

7. $$\frac{\partial^2 w}{\partial x \partial y} = ae^{\beta w}\frac{\partial w}{\partial x}\frac{\partial w}{\partial y}.$$

This is a special case of equation 7.5.3.8 with $f(w) = ae^{\beta w}$.

General solution in implicit form:

$$\int \exp\left(-\frac{a}{\beta}e^{\beta w}\right) dw = \varphi(x) + \psi(y),$$

where $\varphi(x)$ and $\psi(y)$ are arbitrary functions.

8. $$\frac{\partial^2 w}{\partial x \partial y} = \frac{2}{w}\frac{\partial w}{\partial x}\left(\frac{\partial w}{\partial y} + 1\right).$$

General solution:

$$w(x, y) = -\frac{F(y)}{F'_y(y)} + \left\{[F'_y(y)]^2\left[G(x) - \int \frac{F''_{yy}(y)\,dy}{F(y)[F'_y(y)]^2}\right]\right\}^{-1},$$

where $F(y)$ and $G(x)$ are arbitrary functions.

⊙ *Reference*: Yu. N. Kosovtsov (2008 *a*).

9. $$\frac{\partial^2 w}{\partial x \partial y} = \left(\frac{\partial w}{\partial x}\right)^2 \frac{\partial w}{\partial y}.$$

This is a special case of equation 7.5.3.12 with $f(z) = z^2$.

General solution:

$$w(x, y) = -\frac{4F'_y(y)}{F(y) + G(x)} + \int \left(\frac{F''_{yy}(y)}{F'_y(y)}\right)^2 dy,$$

where $F(y)$ and $G(x)$ are arbitrary functions.

⊙ *Reference*: Yu. N. Kosovtsov (2008 *a*).

10. $\dfrac{\partial^2 w}{\partial x \partial y} = a\sqrt{\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}}.$

This is a special case of equation 7.5.3.9 with $f(x, y) = \frac{1}{4}a^2$ (the original equation is reduced to a linear one).

11. $w\dfrac{\partial^2 w}{\partial x \partial y} = \sqrt{1 - \left(\dfrac{\partial w}{\partial x}\right)^2}\sqrt{1 - \left(\dfrac{\partial w}{\partial y}\right)^2}.$

1°. Suppose $w(x, y)$ is a solution of the equation in question. Then the function

$$w_1 = C_1^{-1} w\big(C_1 x + C_2,\ C_1 y + C_3\big),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. There are solutions of the following forms:

$$w = w(k_1 x + k_2 y) \quad \text{(traveling-wave solution)},$$
$$w = xU(y/x) \quad \text{(self-similar solution)}.$$

3°. For this and some other integrable nonlinear hyperbolic equations, see Zhiber and Sokolov (2001).

7.5.3. Equations Involving Arbitrary Functions

1. $\dfrac{\partial^2 w}{\partial x \partial y} = f(w).$

1°. Suppose $w(x, y)$ is a solution of this equation. Then the function

$$w_1 = w\big(C_1 x + C_2,\ C_1^{-1} y + C_3\big),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solution:

$$w = w(z), \qquad z = ax + by,$$

where a and b are arbitrary constants, and the function $w(z)$ is determined by the autonomous ordinary differential equation $abw''_{zz} = f(w)$.

3°. Self-similar solution:

$$w = w(\xi), \qquad \xi = xy,$$

where the function $w(\xi)$ is determined by the second-order ordinary differential equation $\xi w''_{\xi\xi} + w'_\xi = f(w)$.

4°. Solution (generalizes the solutions of Items 2° and 3°):

$$w = w(\zeta), \qquad \zeta = axy + bx + cy,$$

where the function $w(\zeta)$ is determined by the second-order ordinary differential equation

$$(a\zeta + bc)w''_{\zeta\zeta} + aw'_\zeta = f(w).$$

5°. On passing to the new independent variables $z = x - y$ and $t = x + y$, we obtain an equation of the form 7.4.1.1:

$$\frac{\partial^2 w}{\partial t^2} = \frac{\partial^2 w}{\partial z^2} + f(w).$$

6°. Conservation laws:

$$D_x\left(\tfrac{1}{2}w_y^2\right) + D_y\left[-F(w)\right] = 0,$$
$$D_x\left[-F(w)\right] + D_y\left(\tfrac{1}{2}w_x^2\right) = 0,$$

where $D_x = \dfrac{\partial}{\partial x}$, $D_y = \dfrac{\partial}{\partial y}$, and $F(w) = \displaystyle\int f(w)\,dw$.

2. $\dfrac{\partial^2 w}{\partial x \partial y} = f(x)g(y)e^{\beta w}$.

The transformation

$$\xi = \int f(x)\,dx, \quad \eta = \int g(y)\,dy$$

leads to an equation of the form 7.5.1.2:

$$\frac{\partial^2 w}{\partial \xi \partial \eta} = e^{\beta w}.$$

3. $\dfrac{\partial^2 w}{\partial x \partial y} = f(x)g(y)h(w)$.

The transformation

$$\xi = \int f(x)\,dx, \quad \eta = \int g(y)\,dy$$

leads to an equation of the form 7.5.3.1:

$$\frac{\partial^2 w}{\partial \xi \partial \eta} = h(w).$$

4. $\dfrac{\partial^2 w}{\partial x \partial y} = f(x)g(w)\dfrac{\partial w}{\partial y}$.

1°. Functional separable solution in implicit form:

$$\int \frac{dw}{G(w)} = \varphi(y) + \int f(x)\,dx, \qquad \text{where} \quad G(w) = \int g(w)\,dw.$$

Here, $\varphi(y)$ is an arbitrary function.

2°. Integrating the original equation with respect to y, we arrive at a first-order partial differential equation:

$$\frac{\partial w}{\partial x} = f(x)\int g(w)\,dw + \psi(x),$$

where $\psi(x)$ is an arbitrary function.

5. $\dfrac{\partial^2 w}{\partial x \partial y} = f(x,w)\dfrac{\partial w}{\partial y} + g(x,y).$

Integrating the original equation with respect to y, we arrive at a first-order partial differential equation:

$$\frac{\partial w}{\partial x} = \int_a^w f(x,\tau)\,d\tau + \int_b^y g(x,s)\,ds + \psi(x),$$

where $\psi(x)$ is an arbitrary function, and a and b are arbitrary constants. The equation obtained can be treated as an ordinary differential equation for $w = w(x)$ with parameter y.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2002, p. 177).

6. $\dfrac{\partial^2 w}{\partial x \partial y} = a\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y} + f(x,y)\dfrac{\partial w}{\partial x} + g(x,y)\dfrac{\partial w}{\partial y} + h(x,y).$

The substitution $u = e^{-aw}$ leads to the linear equation

$$\frac{\partial^2 u}{\partial x \partial y} = f(x,y)\frac{\partial u}{\partial x} + g(x,y)\frac{\partial u}{\partial y} - ah(x,y)u.$$

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2004, p. 272).

7. $\dfrac{\partial^2 w}{\partial x \partial y} + \dfrac{\partial}{\partial x}\Big[A(x,y)e^{w}\Big] - \dfrac{\partial}{\partial y}\Big[B(x,y)e^{-w}\Big] + C(x,y) = 0.$

Consider the auxiliary first-order system

$$e^{-u} = (\ln z)_x + b, \tag{1}$$
$$u_y + ke^{u} = (\ln z)_y + a, \tag{2}$$

where

$$k = b_y + ab - c, \tag{3}$$

and a, b, and c are some functions of two variables x and y.

Eliminating u from (1)–(2), one obtains the linear equation

$$z_{xy} + az_x + bz_y + cz = 0. \tag{4}$$

Eliminating z from (1)–(2) yields the linear equation

$$u_{xy} + (ke^{u})_x - (e^{-u})_y + k - h = 0, \tag{5}$$

where

$$h = a_x + ab - c, \qquad k - h = b_y - a_x. \tag{6}$$

Whenever a solution to equation (4) is known, one gets a solution to equation (5) by formula (1). Conversely, a solution to the linear equation (4) is obtained from a solution to equation (5) by integrating the first-order equations (1)–(2) with respect to the unknown z.

With the change of variable $w = u + \ln B$, the original equation can be reduced to

$$u_{xy} + (ABe^{u})_x - (e^{-u})_y + C + (\ln B)_{xy} = 0.$$

With the notation $k = AB$ and $h = AB - C - (\ln B)_{xy}$, one gets equation (5). Thus, in view of (3) and (6), the functional coefficients of the original nonlinear equation and the coefficients of the linear equation (4) are related by the two constraints

$$\begin{aligned} AB &= b_y + ab - c, \\ AB - C - (\ln B)_{xy} &= a_x + ab - c, \end{aligned} \tag{7}$$

which can be treated, for example, as a linear system for the functions b and c with given functions A, B, and C. The function a is set arbitrarily; in particular, one can set $a \equiv 0$ and in this case, system (7) is easily solvable starting from the second equation.

⊙ *References*: M. E. Goursat (1898), O. V. Kaptsov (2009).

8. $\dfrac{\partial^2 w}{\partial x \partial y} = f(w)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}$.

1°. The substitution

$$u = \int F(w)\,dw, \qquad F(w) = \exp\left[-\int f(w)\,dw\right]$$

leads to the constant coefficient linear equation

$$\frac{\partial^2 u}{\partial x \partial y} = 0.$$

2°. General solution in implicit form:

$$\int \exp\left[-\int f(w)\,dw\right] dw = \varphi(x) + \psi(y),$$

where $\varphi(x)$ and $\psi(y)$ are arbitrary functions.

⊙ *Reference for equation* 7.5.3.8: A. D. Polyanin and V. F. Zaitsev (2004, p. 272).

9. $\dfrac{\partial^2 w}{\partial x \partial y} = 2\sqrt{f(x,y)\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}}$.

Goursat equation. Introduce functions $u = u(x, y)$ and $v = v(x, y)$ by the differential relations

$$u = \sqrt{\frac{\partial w}{\partial x}}, \qquad v = \sqrt{\frac{\partial w}{\partial y}}.$$

On differentiating these relations with respect to y and x, respectively, and eliminating w using the original equation, one arrives at the system

$$\frac{\partial u}{\partial y} = v\sqrt{f(x,y)}, \qquad \frac{\partial v}{\partial x} = u\sqrt{f(x,y)}.$$

Eliminating v yields a linear equation for $u = u(x, y)$:

$$\frac{\partial^2 u}{\partial x \partial y} = g(x,y)\frac{\partial u}{\partial y} + f(x,y)u, \qquad \text{where} \quad g(x,y) = \frac{1}{2}\frac{\partial}{\partial x}\ln f(x,y).$$

⊙ *Reference*: E. I. Ganzha (2000).

10. $\dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial x\partial y} = f(x)g(w)\dfrac{\partial w}{\partial y}.$

1°. Functional separable solution in implicit form:

$$\int \frac{dw}{\sqrt{G(w)}} = \varphi(y) \pm \int \sqrt{2f(x)}\,dx, \qquad \text{where} \quad G(w) = \int g(w)\,dw.$$

Here, $\varphi(y)$ is an arbitrary function.

2°. Integrating the original equation with respect to y, we have

$$\left(\frac{\partial w}{\partial x}\right)^2 = 2f(x)\int g(w)\,dw + \psi(x),$$

where $\psi(x)$ is an arbitrary function. The equation obtained can be treated as a first-order ordinary differential equation in x for which the constant of integration will be dependent on y.

⊙ *Reference for equation* 7.5.3.10: A. D. Polyanin and V. F. Zaitsev (2002, p. 178).

11. $\dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial x\partial y} = f(x,w)\dfrac{\partial w}{\partial y} + g(x,y).$

Integrating the original equation with respect to y, one arrives at a first-order partial differential equation:

$$\left(\frac{\partial w}{\partial x}\right)^2 = 2\int_a^w f(x,\tau)\,d\tau + 2\int_b^y g(x,s)\,ds + \psi(x),$$

where $\psi(x)$ is an arbitrary function and a and b are arbitrary constants. The equation obtained can be treated as an ordinary differential equation for $w = w(x)$ with parameter y.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2002, p. 178).

12. $\dfrac{\partial^2 w}{\partial x\partial y} = f\left(\dfrac{\partial w}{\partial x}\right)\dfrac{\partial w}{\partial y}.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the function

$$w_1 = w\big(x + C_1,\ \varphi(y)\big) + C_2,$$

where C_1 and C_2 are arbitrary constants and $\varphi(y)$ is an arbitrary function, is also a solution of the equation.

2°. Functional separable solution:

$$w = U(z), \qquad z = x + \varphi(y),$$

where $\varphi(y)$ is an arbitrary function and the function $U(z)$ is defined parametrically by

$$z = \int \frac{d\xi}{\xi f(\xi)} + C_1, \quad U = \int \frac{d\xi}{f(\xi)} + C_2,$$

and C_1 and C_2 are arbitrary constants.

3°. First integral:

$$\int_a^{w_x} \frac{du}{f(u)} = w + \theta(x),$$

where $w_x = \frac{\partial w}{\partial x}$.

13. $\dfrac{\partial^2 w}{\partial x \partial y} = \dfrac{\partial w}{\partial x} f\left(\dfrac{\partial w}{\partial x} + aw\right).$

Generalized separable solution:

$$w(x, y) = \varphi(y) + C \exp\left[-ax + \int f(a\varphi(y))\, dy\right],$$

where $\varphi(y)$ is an arbitrary function and C is an arbitrary constant.

⊙ *Reference*: I. Tsyfra (1997).

14. $\dfrac{\partial^2 w}{\partial x \partial y} = f\left(\dfrac{\partial w}{\partial x} + aw\right) \dfrac{\partial^2 w}{\partial x^2}.$

Generalized separable solution:

$$w(x, y) = \varphi(y) + C \exp\left[-ax - a \int f(a\varphi(y))\, dy\right],$$

where $\varphi(y)$ is an arbitrary function and C is an arbitrary constant.

15. $w \dfrac{\partial^2 w}{\partial x \partial y} = F\left(\dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}\right).$

1°. Suppose $w(x, y)$ is a solution of the equation in question. Then the function

$$w_1 = C_1^{-1} w\big(C_1 x + C_2,\ C_1 y + C_3\big),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. There are solutions of the following forms:

$$\begin{aligned} &w = w(k_1 x + k_2 y) && \text{(traveling-wave solution)},\\ &w = xU(y/x) && \text{(self-similar solution)}. \end{aligned}$$

16. $f\left(x, \dfrac{\partial w}{\partial x}\right) \dfrac{\partial^2 w}{\partial x \partial y} = g(x, w) \dfrac{\partial w}{\partial y} + h(x, y).$

Integrating the original equation with respect to y, one arrives at a first-order partial differential equation:

$$\int_a^{w_x} f(x, \lambda)\, d\lambda = \int_b^w g(x, \tau)\, d\tau + \int_c^y h(x, s)\, ds + \psi(x),$$

where w_x is the partial derivative of w with respect to x, $\psi(x)$ is an arbitrary function, and a, b, and c are arbitrary constants. The equation obtained can be treated as an ordinary differential equation for $w = w(x)$ with parameter y.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2002, p. 178).

▷ *Some more complicated equations of hyperbolic type are considered in Chapter 11.*

Chapter 8
Second-Order Hyperbolic Equations with Two or More Space Variables

8.1. Equations with Two Space Variables Involving Power-Law Nonlinearities

8.1.1. Equations of the Form

$$\frac{\partial^2 w}{\partial t^2} = \frac{\partial}{\partial x}\left[f(x)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(y)\frac{\partial w}{\partial y}\right] + aw^p$$

1. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + b\dfrac{\partial^2 w}{\partial y^2} + cw^p.$

This is a special case of equation 8.4.1.1 with $f(w) = cw^p$.

2. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right) + cw^p.$

This is a special case of equation 8.4.1.2 with $f(w) = cw^p$.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1 w\Big(C_1^{\frac{p-1}{2-n}}x,\ C_1^{\frac{p-1}{2-m}}y,\ \pm C_1^{\frac{p-1}{2}}t + C_2\Big),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Solution for $n \neq 2$, $m \neq 2$, and $p \neq 1$:

$$w = \left[\frac{1}{2c(p-1)}\left(\frac{1+p}{1-p} + \frac{2}{2-n} + \frac{2}{2-m}\right)\right]^{\frac{1}{p-1}}\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} - \frac{1}{4}(t+C)^2\right]^{\frac{1}{1-p}}.$$

3°. Solution for $n \neq 2$ and $m \neq 2$ (generalizes the solution of Item 2°):

$$w = w(r), \qquad r^2 = 4k\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} - \frac{1}{4}(t+C)^2\right],$$

where C and k are arbitrary constants ($k \neq 0$) and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{A}{r}w'_r + ck^{-1}w^p = 0, \qquad A = \frac{2(4-n-m)}{(2-n)(2-m)}.$$

4°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,t) = U(\xi,t), \quad \xi^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2}\right],$$
$$w(x,y,t) = V(x,\eta), \quad \eta^2 = \pm 4\left[\frac{y^{2-m}}{b(2-m)^2} - \frac{1}{4}(t+C)^2\right],$$
$$w(x,y,t) = W(y,\zeta), \quad \zeta^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} - \frac{1}{4}(t+C)^2\right],$$
$$w(x,y,t) = |t|^{\frac{2}{1-p}} F(z_1,z_2), \quad z_1 = x|t|^{\frac{2}{n-2}}, \quad z_2 = y|t|^{\frac{2}{m-2}}.$$

3. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ax^n \dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\lambda y}\dfrac{\partial w}{\partial y}\right) + cw^p.$

This is a special case of equation 8.4.1.3 with $f(w) = cw^p$.

1°. Suppose $w(x,y,t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1 w\Big(C_1^{\frac{p-1}{2-n}} x,\ y + \frac{1-p}{\lambda}\ln C_1,\ \pm C_1^{\frac{p-1}{2}} t + C_2\Big),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Solution for $n \neq 2$, $\lambda \neq 0$, and $p \neq 1$:

$$w = \left[\frac{1}{2c(p-1)}\left(\frac{1+p}{1-p} + \frac{2}{2-n}\right)\right]^{\frac{1}{p-1}} \left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\lambda y}}{b\lambda^2} - \frac{1}{4}(t+C)^2\right]^{\frac{1}{1-p}}.$$

3°. Solution for $n \neq 2$ and $\lambda \neq 0$ (generalizes the solution of Item 2°):

$$w = w(r), \qquad r^2 = 4k\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\lambda y}}{b\lambda^2} - \frac{1}{4}(t+C)^2\right],$$

where C and k are arbitrary constants ($k \neq 0$) and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{A}{r}w'_r + ck^{-1}w^p = 0, \qquad A = \frac{2}{2-n}.$$

4°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,t) = U(\xi,t), \quad \xi^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\lambda y}}{b\lambda^2}\right],$$
$$w(x,y,t) = V(x,\eta), \quad \eta^2 = \pm 4\left[\frac{e^{-\lambda y}}{b\lambda^2} - \frac{1}{4}(t+C)^2\right],$$
$$w(x,y,t) = W(y,\zeta), \quad \zeta^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} - \frac{1}{4}(t+C)^2\right],$$
$$w(x,y,t) = |t|^{\frac{2}{1-p}} F(z_1,z_2), \quad z_1 = x|t|^{\frac{2}{n-2}}, \quad z_2 = y + \frac{2}{\lambda}\ln|t|.$$

4. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ae^{\beta x}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\lambda y}\dfrac{\partial w}{\partial y}\right) + cw^p.$

This is a special case of equation 8.4.1.4 with $f(w) = cw^p$.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1 w\Big(x + \frac{1-p}{\beta}\ln C_1,\ y + \frac{1-p}{\lambda}\ln C_1,\ \pm C_1^{\frac{p-1}{2}}t + C_2\Big),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Solution for $p \neq \pm 1$, $\beta \neq 0$, and $\lambda \neq 0$:

$$w = \left[-\frac{c(p-1)^2}{2k(1+p)}(r + C_1)^2\right]^{\frac{1}{1-p}}, \qquad r^2 = 4k\left[\frac{e^{-\beta x}}{a\beta^2} + \frac{e^{-\lambda y}}{b\lambda^2} - \frac{1}{4}(t + C_2)^2\right],$$

where C_1, C_2, and k are arbitrary constants.

3°. Solution for $\beta \neq 0$ and $\lambda \neq 0$ (generalizes the solution of Item 2°):

$$w = w(r), \qquad r^2 = 4k\left[\frac{e^{-\beta x}}{a\beta^2} + \frac{e^{-\lambda y}}{b\lambda^2} - \frac{1}{4}(t + C)^2\right],$$

where the function $w(r)$ is determined by the autonomous ordinary differential equation

$$w''_{rr} + ck^{-1}w^p = 0.$$

Integrating yields its general solution in implicit form:

$$\int\left[C_1 - \frac{2c}{k(p+1)}w^{p+1}\right]^{-1/2} dw = C_2 \pm r,$$

where C_1 and C_2 are arbitrary constants.

4°. There are "two-dimensional" solutions of the following forms:

$$w(x, y, t) = U(\xi, t), \quad \xi^2 = 4\left(\frac{e^{-\beta x}}{a\beta^2} + \frac{e^{-\lambda y}}{b\lambda^2}\right),$$

$$w(x, y, t) = V(x, \eta), \quad \eta^2 = \pm 4\left[\frac{e^{-\lambda y}}{b\lambda^2} - \frac{1}{4}(t + C)^2\right],$$

$$w(x, y, t) = W(y, \zeta), \quad \zeta^2 = \pm 4\left[\frac{e^{-\beta x}}{a\beta^2} - \frac{1}{4}(t + C)^2\right],$$

$$w(x, y, t) = |t|^{\frac{2}{1-p}}F(z_1, z_2), \quad z_1 = x + \frac{2}{\beta}\ln|t|, \quad z_2 = y + \frac{2}{\lambda}\ln|t|.$$

8.1.2. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + b\dfrac{\partial}{\partial y}\left(w^k\dfrac{\partial w}{\partial y}\right)$

1. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + b\dfrac{\partial}{\partial y}\left(w\dfrac{\partial w}{\partial y}\right).$

This is a special case of equation 8.1.3.1 with $c = 0$.

2. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(w\dfrac{\partial w}{\partial y}\right).$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = C_2^2 w(\pm C_1 x + C_3, \pm C_1 y + C_4, \pm C_1 C_2 t + C_5),$$
$$w_2 = w(x\cos\beta + y\sin\beta, -x\sin\beta + y\cos\beta,\ t),$$

where $C_1, \ldots, C_5$ and β are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solutions:

$$w = \frac{\lambda^2 \pm \sqrt{A(k_1 x + k_2 y + \lambda t) + B}}{k_1^2 + k_2^2},$$

where A, B, k_1, k_2, and λ are arbitrary constants.

3°. Generalized separable solution linear in space variables:

$$w(x, y, t) = (A_1 t + B_1)x + (A_2 t + B_2)y + \tfrac{1}{12}(A_1^2 + A_2^2)t^4 + \tfrac{1}{3}(A_1 B_1 + A_2 B_2)t^3 + \tfrac{1}{2}(B_1^2 + B_2^2)t^2 + Ct + D,$$

where A_1, A_2, B_1, B_2, C, and D are arbitrary constants.

4°. Solutions:

$$w(x, y, t) = \tfrac{3}{4}t^{-2}\left[(x + C_1)^2 + (y + C_2)^2\right],$$
$$w(x, y, t) = t^{-2}\left(x\sin\lambda + y\cos\lambda + C_1\right)^2,$$
$$w(x, y, t) = \frac{1}{C_1^2 + C_2^2}\left(\frac{C_1 x + C_2 y + C_3}{t + C_4}\right)^2,$$
$$w(x, y, t) = \frac{C_2^2 (x + C_4)^2}{(C_1 y + C_2 t + C_3)^2 + C_1^2 (x + C_4)^2},$$
$$w(x, y, t) = t\left[C_1 \ln\left(x^2 + y^2\right) + C_2\right]^{1/2},$$
$$w(x, y, t) = t\left[C_1 \exp\left(\lambda x\right)\sin\left(\lambda y + C_2\right) + C_3\right]^{1/2},$$

where $C_1, \ldots, C_4$ and λ are arbitrary constants.

5°. "Two-dimensional" solution in multiplicative separable form (generalizes the last two solutions of Item 4°):

$$w(x, y, t) = (C_1 t + C_2)\sqrt{|U(x, y)|},$$

where the function $U = U(x, y)$ is determined by the Laplace equation

$$\frac{\partial^2 U}{\partial x^2} + \frac{\partial^2 U}{\partial y^2} = 0.$$

For solutions of this linear equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

6°. There is a generalized separable solution quadratic in space variables:

$$w(x,y,t) = f(t)x^2 + g(t)xy + h(t)y^2,$$

where the functions $f(t)$, $g(t)$, and $h(t)$ are determined by the autonomous system of ordinary differential equations

$$f''_{tt} = 6f^2 + 2fh + g^2, \tag{1}$$
$$g''_{tt} = 6(f+h)g, \tag{2}$$
$$h''_{tt} = 6h^2 + 2fh + g^2. \tag{3}$$

A particular solution of system (1)–(3) is given by

$$h(t) = f(t), \quad g(t) = \pm 2f(t), \quad \text{where} \quad f''_{tt} = 12f^2$$

(the general solution for f can be written out in implicit form).

7°. There is a generalized separable solution of the form (generalizes the solution of Item 6°)

$$w(x,y,t) = f(t)x^2 + g(t)xy + h(t)y^2 + \varphi(t)x + \psi(t)y + \chi(t),$$

where the functions $f(t)$, $g(t)$, $h(t)$, $\varphi(t)$, $\psi(t)$, and $\chi(t)$ are determined by the autonomous system of ordinary differential equations

$$f''_{tt} = 6f^2 + 2fh + g^2, \quad \varphi''_{tt} = 2(3f+h)\varphi + 2g\psi,$$
$$g''_{tt} = 6(f+h)g, \quad \psi''_{tt} = 2g\varphi + 2(f+3h)\psi,$$
$$h''_{tt} = 6h^2 + 2fh + g^2, \quad \chi''_{tt} = \varphi^2 + \psi^2 + 2(f+h)\chi.$$

The first three equations for f, g, and h are solved independently of the other three (see Item 6°).

8°. There is a "two-dimensional" solution in multiplicative separable form

$$w(x,y,t) = (At+B)^{-2}\Theta(x,y).$$

9°. For other solutions, see equation 8.1.2.6 with $a = b = n = 1$ and equation 8.1.2.7 with $a = b = n = m = 1$.

⊙ *Reference for equation* 8.1.2.2: A. D. Polyanin and V. F. Zaitsev (2002, p. 181).

3. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(\dfrac{1}{\sqrt{w}}\dfrac{\partial w}{\partial x}\right) + b\dfrac{\partial}{\partial y}\left(\dfrac{1}{\sqrt{w}}\dfrac{\partial w}{\partial y}\right).$

This is a special case of equation 8.1.2.7 with $n = k = -1/2$ and equation 8.4.2.3 with $f(w) = aw^{-1/2}$ and $g(w) = bw^{-1/2}$.

1°. Suppose $w(x,y,t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^4 w(\pm C_1C_2x + C_3, \pm C_1C_2y + C_4, \pm C_2t + C_5),$$
$$w_2 = w(x\cos\beta + y\sqrt{a/b}\,\sin\beta, -x\sqrt{b/a}\,\sin\beta + y\cos\beta,\ t),$$

where $C_1, \ldots, C_5$ and β are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solutions:

$$w(x,y,t)=\left(\frac{aC_1^2+bC_2^2}{C_3^2}\pm\sqrt{C_1x+C_2y+C_3t+C_4}\right)^2,$$

where $C_1,\ldots,C_4$ are arbitrary constants.

3°. Solutions:

$$w(x,y,t)=t^4\left(\frac{\sin\lambda}{\sqrt{a}}x+\frac{\cos\lambda}{\sqrt{b}}y+C_1\right)^{-4},$$

$$w(x,y,t)=\left(\tfrac{2}{3}ab\right)^2t^4(bx^2+ay^2)^{-2},$$

$$w(x,y,t)=(aC_1^2+bC_2^2)^2\left(\frac{t+C_4}{C_1x+C_2y+C_3}\right)^4,$$

$$w(x,y,t)=\frac{\left[a(C_1y+C_2t+C_3)^2+bC_1^2(x+C_4)^2\right]^2}{C_2^4(x+C_4)^4},$$

$$w(x,y,t)=t\left[C_1\ln\left(bx^2+ay^2\right)+C_2\right]^2,$$

$$w(x,y,t)=t\left[C_1\exp\left(\lambda\sqrt{b}\,x\right)\sin\left(\lambda\sqrt{a}\,y+C_2\right)+C_3\right]^2,$$

where $C_1,\ldots,C_4$ and λ are arbitrary constants.

4°. "Two-dimensional" solution in multiplicative separable form (generalizes the last two solutions of Item 3°):

$$w(x,y,t)=(C_1t+C_2)U^2(\xi,\eta),\quad \xi=\frac{x}{\sqrt{a}},\quad \eta=\frac{y}{\sqrt{b}},$$

where the function $U=U(\xi,\eta)$ is determined by the Laplace equation

$$\frac{\partial^2U}{\partial\xi^2}+\frac{\partial^2U}{\partial\eta^2}=0.$$

For solutions of this linear equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

5°. "Two-dimensional" generalized separable solution quadratic in t:

$$w(x,y,t)=\left[f(\xi,\eta)t+g(\xi,\eta)\right]^2,\quad \xi=\frac{x}{\sqrt{a}},\quad \eta=\frac{y}{\sqrt{b}},$$

where the functions $f=f(\xi,\eta)$ and $g=g(\xi,\eta)$ are determined by the system of differential equations

$$\frac{\partial^2f}{\partial\xi^2}+\frac{\partial^2f}{\partial\eta^2}=0, \tag{1}$$

$$\frac{\partial^2g}{\partial\xi^2}+\frac{\partial^2g}{\partial\eta^2}=f^2. \tag{2}$$

Equation (1) is the Laplace equation, and (2) is a Helmholtz equation (wherever f is known). For these linear equations, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

6°. There is a "two-dimensional" generalized separable solution of the form

$$w(x,y,t)=\left[f_2(x,y)t^2+f_1(x,y)t+f_0(x,y)\right]^2.$$

7°. For other solutions, see equation 8.1.2.6 with $n=-1/2$ and equation 8.1.2.7 with $n=m=-1/2$.

4. $\dfrac{\partial^2 w}{\partial t^2} = a\left[\dfrac{\partial}{\partial x}\left(\dfrac{1}{w}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(\dfrac{1}{w}\dfrac{\partial w}{\partial y}\right)\right].$

This is a special case of equation 8.1.2.7 with $a = b$, $n = k = -1$ and equation 8.4.2.3 with $f(w) = a/w$ and $g(w) = b/w$.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^2 w(\pm C_1 C_2 x + C_3, \pm C_1 C_2 y + C_4, \pm C_2 t + C_5),$$
$$w_2 = w(x\cos\beta + y\sin\beta, -x\sin\beta + y\cos\beta,\ t),$$

where $C_1, \ldots, C_5$ and β are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solution in implicit form:

$$a(k_1^2 + k_2^2)\ln|w| - \lambda^2 w = A(k_1 x + k_2 y + \lambda t) + B,$$

where A, B, k_1, k_2, and λ are arbitrary constants.

3°. Solutions:

$$w(x, y, t) = (C_1 t + C_2)e^{Ax+By},$$
$$w(x, y, t) = (C_1 t + C_2)\exp\big[A(x^2 - y^2)\big],$$
$$w(x, y, t) = (C_1 t + C_2)\exp\big[Ae^{\lambda x}\sin(\lambda y + B)\big],$$
$$w(x, y, t) = \frac{a[(Ay + Bt + C_1)^2 + A^2(x + C_2)^2]}{B^2(x + C_2)^2},$$
$$w(x, y, t) = \frac{at^2 + At + B}{(x\sin\lambda + y\cos\lambda + C)^2},$$
$$w(x, y, t) = \frac{at^2 + At + B}{(\sin y + Ce^x)^2},$$
$$w(x, y, t) = \frac{C_1^2(at^2 + At + B)}{e^{2x}\sinh^2(C_1 e^{-x}\sin y + C_2)},$$
$$w(x, y, t) = \frac{C_1^2(-at^2 + At + B)}{e^{2x}\cosh^2(C_1 e^{-x}\sin y + C_2)},$$
$$w(x, y, t) = \frac{C_1^2(at^2 + At + B)}{e^{2x}\cos^2(C_1 e^{-x}\sin y + C_2)},$$

where A, B, C, C_1, C_2, and λ are arbitrary constants.

4°. "Two-dimensional" solution in multiplicative separable form (generalizes the first three solutions of Item 3°):

$$w(x, y, t) = (C_1 t + C_2)e^{U(x,y)},$$

where the function $U = U(x, y)$ is determined by the Laplace equation

$$\frac{\partial^2 U}{\partial x^2} + \frac{\partial^2 U}{\partial y^2} = 0.$$

For solutions of this linear equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

5°. "Two-dimensional" solution in multiplicative separable form (generalizes the last four solutions of Item 3°):

$$w(x,y,t) = (\tfrac{1}{2}Aat^2 + Bt + C)e^{\Theta(x,y)},$$

where A, B, and C are arbitrary constants, and the function $\Theta(x,y)$ is a solution of the stationary equation

$$\frac{\partial^2\Theta}{\partial x^2} + \frac{\partial^2\Theta}{\partial y^2} = Ae^{\Theta},$$

which occurs in combustion theory. For solutions of this equation, see 9.2.1.1.

6°. For other solutions, see equation 8.1.2.6 with $a = b$, $n = -1$ and equation 8.1.2.7 with $a = b$, $n = m = -1$.

⊙ *References for equation* 8.1.2.4: V. A. Baikov (1990), N. Ibragimov (1994, p. 225), A. D. Polyanin and V. F. Zaitsev (2002, p. 182).

5. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + b\dfrac{\partial}{\partial y}\left(w^n\dfrac{\partial w}{\partial y}\right)$.

This is a special case of equation 8.4.2.1 with $g(w) = bw^n$.

1°. Suppose $w(x,y,t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^{-2}w(\pm C_2x + C_3, \pm C_1^nC_2y + C_4, \pm C_2t + C_5),$$
$$w_2 = w(x\cosh\lambda + ta^{1/2}\sinh\lambda,\ y,\ xa^{-1/2}\sinh\lambda + t\cosh\lambda),$$

where $C_1, \ldots, C_5$ and λ are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. Solutions:

$$w(x,y,t) = y^{\frac{1}{n+1}}\left[\varphi(x - t\sqrt{a}\,) + \psi(x + t\sqrt{a}\,)\right],$$
$$w(x,y,t) = \left[y\varphi(x - t\sqrt{a}\,) + \psi(x - t\sqrt{a}\,)\right]^{\frac{1}{n+1}},$$
$$w(x,y,t) = \left[y\varphi(x + t\sqrt{a}\,) + \psi(x + t\sqrt{a}\,)\right]^{\frac{1}{n+1}},$$

where $\varphi(z_1)$ and $\psi(z_2)$ are arbitrary functions.

3°. Solutions:

$$w(x,y,t) = y^{\frac{2}{n}}\left(C_1x \pm t\sqrt{aC_1^2 + b} + C_2\right)^{-\frac{2}{n}},$$
$$w(x,y,t) = \left[\frac{2a}{b(n+2)}\right]^{\frac{1}{n}} y^{\frac{2}{n}}\left[a(t + C_1)^2 - (x + C_2)^2\right]^{-\frac{1}{n}},$$
$$w(x,y,t) = \left[\frac{1}{bC_2^2}\left(\frac{C_1x + C_2y + C_3}{t + C_4}\right)^2 - \frac{aC_1^2}{bC_2^2}\right]^{\frac{1}{n}},$$
$$w(x,y,t) = \left[\frac{C_2^2}{bC_1^2} - \frac{a}{bC_1^2}\left(\frac{C_1y + C_2t + C_3}{x + C_4}\right)\right]^{\frac{1}{n}},$$

where $C_1, \ldots, C_4$ are arbitrary constants.

4°. Solutions in implicit form:

$$2\lambda\sqrt{a}\,(y+\lambda t)+(t\sqrt{a}\pm x)(bw^n-\lambda^2)=\psi(w),$$

where $\psi(w)$ is an arbitrary function and λ is an arbitrary constant.

5°. Solution:

$$w(x,y,t)=V(z)y^{2/n},\quad z=x^2-at^2,$$

where the function $V=V(z)$ is determined by the ordinary differential equation

$$2an^2(zV_z''+V_z')+b(n+2)V^{n+1}=0.$$

6°. "Two-dimensional" solution in multiplicative separable form:

$$w(x,y,t)=u(x,t)y^{2/n},$$

where the function $u=u(x,t)$ is determined by the differential equation

$$\frac{\partial^2 u}{\partial t^2}=a\frac{\partial^2 u}{\partial x^2}+\frac{2b(n+2)}{n^2}u^{n+1}.$$

For $n=-1$ and $n=-2$, this equation is linear.

Remark. The first solution of Item 2°, the first two solutions of Item 3°, and the solutions of Items 5° and 6° are special cases of a multiplicative separable solution $w=u(x,t)\theta(y)$, where $\theta=\theta(y)$ is determined by the autonomous ordinary differential equation $(\theta^n\theta_y')_y'=C\theta$.

7°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,t)=F(y,r),\quad r=x^2-at^2;$$
$$w(x,y,t)=|t|^{2\lambda}G(\xi,\eta),\quad \xi=\frac{x}{t},\quad \eta=\frac{y}{|t|^{n\lambda+1}};$$
$$w(x,y,t)=|t|^{-2/n}H(y,z),\quad z=x/t;$$
$$w(x,y,t)=|y|^{2/n}U(z_1,z_2),\quad z_1=t+k_1\ln|y|,\quad z_2=x+k_2\ln|y|;$$
$$w(x,y,t)=\exp\Big(-\frac{2y}{n+1}\Big)V(\rho_1,\rho_2),\quad \rho_1=t\exp\Big(-\frac{ny}{n+1}\Big),\quad \rho_2=x\exp\Big(-\frac{ny}{n+1}\Big),$$

where k_1, k_2, and λ are arbitrary constants.

8°. There is an exact solution of the form

$$w(x,y,t)=W(z),\quad z=(x^2-at^2)y^{-2}.$$

9°. For other solutions, see equation 8.1.2.7, in which n should be set equal to zero and k should be renamed n.

⊙ *References for equation* 8.1.2.5: N. Ibragimov (1994, pp. 222–225), A. D. Polyanin and V. F. Zaitsev (2002, pp. 281–282).

6. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + b\dfrac{\partial}{\partial y}\left(w^n\dfrac{\partial w}{\partial y}\right).$

This is a special case of equation 8.1.2.7 with $n = k$.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the functions

$$w_1 = (C_2/C_1)^{2/n} w(\pm C_1 x + C_3, \pm C_1 y + C_4, \pm C_2 t + C_5),$$
$$w_2 = w(x\cos\beta + y\sqrt{a/b}\,\sin\beta, -x\sqrt{b/a}\,\sin\beta + y\cos\beta,\ t),$$

where $C_1, \ldots, C_5$ and β are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Solutions:

$$w(x, y, t) = t^{-\frac{2}{n}}\left(\frac{\sin\lambda}{\sqrt{a}}x + \frac{\cos\lambda}{\sqrt{b}}y + C_1\right)^{\frac{2}{n}},$$

$$w(x, y, t) = \left[\frac{n+2}{2ab(n+1)}\right]^{\frac{1}{n}} t^{-\frac{2}{n}}(bx^2 + ay^2)^{\frac{1}{n}},$$

$$w(x, y, t) = \frac{1}{(aC_1^2 + bC_2^2)^{1/n}}\left(\frac{C_1 x + C_2 y + C_3}{t + C_4}\right)^{2/n},$$

$$w(x, y, t) = \frac{C_2^{2/n}(x + C_4)^{2/n}}{\left[a(C_1 y + C_2 t + C_3)^2 + bC_1^2(x + C_4)^2\right]^{1/n}},$$

$$w(x, y, t) = t\left[C_1 \ln\left(bx^2 + ay^2\right) + C_2\right]^{\frac{1}{n+1}},$$

$$w(x, y, t) = t\left[C_1 \exp\left(\lambda\sqrt{b}\,x\right)\sin\left(\lambda\sqrt{a}\,y + C_2\right) + C_3\right]^{\frac{1}{n+1}},$$

where $C_1, \ldots, C_4$ and λ are arbitrary constants.

3°. Traveling-wave solution in implicit form:

$$\frac{ak_1^2 + bk_2^2}{n+1}w^{n+1} - \lambda^2 w = C_1(k_1 x + k_2 y + \lambda t) + C_2,$$

where C_1, C_2, k_1, k_2, and λ are arbitrary constants.

4°. "Two-dimensional" solution in multiplicative separable form (generalizes the fifth and sixth solutions of Item 2°):

$$w(x, y, t) = (C_1 t + C_2)\left[U(\xi, \eta)\right]^{\frac{1}{n+1}}, \quad \xi = \sqrt{b}\,x, \quad \eta = \sqrt{a}\,y,$$

where the function $U = U(\xi, \eta)$ is determined by the Laplace equation

$$\frac{\partial^2 U}{\partial \xi^2} + \frac{\partial^2 U}{\partial \eta^2} = 0.$$

For solutions of this linear equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

5°. "Two-dimensional" solution in multiplicative separable form (generalizes the first and second solutions of Item 2°):

$$w(x,y,t) = f(t)\Theta(x,y),$$

where the function $f(t)$ is determined by the autonomous ordinary differential equation

$$f''_{tt} = \lambda f^{n+1}, \tag{1}$$

λ is an arbitrary constant, and the function $\Theta = \Theta(x,y)$ is a solution of the two-dimensional stationary equation

$$a\frac{\partial}{\partial x}\left(\Theta^n\frac{\partial\Theta}{\partial x}\right) + b\frac{\partial}{\partial y}\left(\Theta^n\frac{\partial\Theta}{\partial y}\right) - \lambda\Theta = 0. \tag{2}$$

A particular solution to equation (1) is given by (C is an arbitrary constant):

$$f = (C \pm kt)^{-2/n}, \quad k = n\sqrt{\frac{\lambda}{2(n+2)}}.$$

6°. There are solutions of the following forms:

$w(x,y,t) = F(r,t), \quad r = bx^2 + ay^2$ "two-dimensional" solution;

$w(x,y,t) = t^{2\lambda}G(\xi,\eta), \quad \xi = \dfrac{x}{t^{n\lambda+1}}, \quad \eta = \dfrac{y}{t^{n\lambda+1}}$ "two-dimensional" solution;

$w(x,y,t) = y^{2/n}H(z,t), \quad z = y/x$ "two-dimensional" solution;

$w(x,y,t) = |t|^{-2/n}U(z_1,z_2), \quad z_1 = x + k_1\ln|t|, \quad z_2 = y + k_2\ln|t|$ "two-dimensional" solution;

$w(x,y,t) = e^{-2t}V(\rho_1,\rho_2), \quad \rho_1 = xe^{nt}, \quad \rho_2 = ye^{nt}$ "two-dimensional" solution;

$w(x,y,t) = W(\theta), \quad \theta = (bx^2 + ay^2)t^{-2}$ "one-dimensional" solution,

where k_1, k_2, and λ are arbitrary constants.

7°. For other solutions, see equation 8.1.2.7 with $k = n$.

⊙ *References for equation* 8.1.2.6: N. Ibragimov (1994, pp. 222–225), A. D. Polyanin and V. F. Zaitsev (2002, p. 183).

7. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + b\dfrac{\partial}{\partial y}\left(w^k\dfrac{\partial w}{\partial y}\right)$.

This is a special case of equation 8.4.2.3 with $f(w) = aw^n$ and $g(w) = bw^k$.

1°. Suppose $w(x,y,t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^{-2}w(\pm C_1^n C_2 x + C_3, \pm C_1^k C_2 y + C_4, \pm C_2 t + C_5),$$

where $C_1, \ldots, C_5$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solution in implicit form:

$$\frac{a\beta_1^2}{n+1}w^{n+1}+\frac{b\beta_2^2}{k+1}w^{k+1}-\lambda^2 w=C_1(\beta_1 x+\beta_2 y+\lambda t)+C_2,$$

where C_1, C_2, β_1, β_2, and λ are arbitrary constants.

3°. Solutions in implicit form:

$$\left(\frac{C_1x+C_2y+C_3}{t+C_4}\right)^2=aC_1^2w^n+bC_2^2w^k,$$
$$a\left(\frac{C_1y+C_2t+C_3}{x+C_4}\right)^2w^n+bC_1^2w^k=C_2^2,$$
$$b\left(\frac{C_1x+C_2t+C_3}{y+C_4}\right)^2w^k+aC_1^2w^n=C_2^2,$$

where $C_1, \ldots, C_4$ are arbitrary constants.

4°. "Two-dimensional" solution (c_1 and c_2 are arbitrary constants):

$$w(x,y,t)=u(z,t),\quad z=c_1x+c_2y,$$

where the function $u=u(z,t)$ is determined by a differential equation of the form 7.4.4.6:

$$\frac{\partial^2u}{\partial t^2}=\frac{\partial}{\partial z}\left[\varphi(u)\frac{\partial u}{\partial z}\right],\quad \varphi(u)=ac_1^2u^n+bc_2^2u^k,$$

which can be reduced to a linear equation.

5°. "Two-dimensional" solution (s_1 and s_2 are arbitrary constants):

$$w(x,y,t)=v(x,\xi),\quad \xi=s_1y+s_2t,$$

where the function $v=v(x,\xi)$ is determined by a differential equation of the form 9.4.4.8:

$$a\frac{\partial}{\partial x}\left(v^n\frac{\partial v}{\partial x}\right)+\frac{\partial}{\partial z}\left[\psi(v)\frac{\partial v}{\partial z}\right]=0,\quad \psi(v)=bs_1^2v^k-s_2^2,$$

which can be reduced to a linear equation.

6°. There is a "two-dimensional" solution of the form (generalizes the solutions of Items 3° and 4°):

$$w(x,y,t)=U(z_1,z_2),\quad z_1=a_1x+b_1y+c_1t,\quad z_2=a_2x+b_2y+c_2t.$$

7°. There are exact solutions of the following forms:

$w(x,y,t)=t^{2\lambda}F(\xi,\eta),\quad \xi=\dfrac{x}{t^{n\lambda+1}},\quad \eta=\dfrac{y}{t^{k\lambda+1}}$ "two-dimensional" solution;

$w(x,y,t)=x^{2/n}G(\zeta,t),\quad \zeta=x^{-k/n}y$ "two-dimensional" solution;

$w(x,y,t)=e^{-2t}H(z_1,z_2),\quad z_1=xe^{nt},\quad z_2=ye^{kt}$ "two-dimensional" solution;

$w(x,y,t)=(x/t)^{2/n}U(\theta),\quad \theta=x^{-k/n}yt^{k/n-1}$ "one-dimensional" solution;

where λ is an arbitrary constant.

⊙ *References for equation* 8.1.2.7: N. Ibragimov (1994, pp. 222–225), A. D. Polyanin and V. F. Zaitsev (2002, pp. 284–285).

8.1.3. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[g(w)\dfrac{\partial w}{\partial y}\right]$

1. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial}{\partial y}\left[(bw + c)\dfrac{\partial w}{\partial y}\right].$

This is a special case of equation 8.4.2.1 with $g(w) = bw + c$.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^{-2} w(\pm C_2 x + C_3, \pm C_1 C_2 y + C_4, \pm C_2 t + C_5) + \frac{c(1 - C_1^2)}{bC_1^2},$$

$$w_2 = w(x\cosh\lambda + ta^{1/2}\sinh\lambda,\ y,\ xa^{-1/2}\sinh\lambda + t\cosh\lambda),$$

where $C_1, \ldots, C_5$ and λ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Solutions:

$$w(x, y, t) = |y|^{1/2}\left[\varphi(x - t\sqrt{a}\,) + \psi(x + t\sqrt{a}\,)\right] - \frac{c}{b},$$

$$w(x, y, t) = \left|y\varphi(x - t\sqrt{a}\,) + \psi(x - t\sqrt{a}\,)\right|^{1/2} - \frac{c}{b},$$

$$w(x, y, t) = \left|y\varphi(x + t\sqrt{a}\,) + \psi(x + t\sqrt{a}\,)\right|^{1/2} - \frac{c}{b},$$

where $\varphi(z_1)$ and $\psi(z_2)$ are arbitrary functions.

3°. Solutions:

$$w(x, y, t) = A\sqrt{C_1 x + C_2 y + C_3 t + C_4} + \frac{C_3^2 - aC_1^2}{bC_2^2} - \frac{c}{b},$$

$$w(x, y, t) = \frac{(y + C_1)^2}{\left(C_2 x \pm t\sqrt{aC_2^2 + b} + C_3\right)^2} - \frac{c}{b},$$

$$w(x, y, t) = \frac{2a(y + C_1)^2}{3b\left[a(t + C_2)^2 - (x + C_3)^2\right]} - \frac{c}{b},$$

$$w(x, y, t) = \frac{1}{bC_2^2}\left(\frac{C_1 x + C_2 y + C_3}{t + C_4}\right)^2 - \frac{aC_1^2}{bC_2^2} - \frac{c}{b},$$

$$w(x, y, t) = \frac{C_2^2 - aC_1^2}{b}\left(\frac{y + C_4}{C_1 x + C_2 t + C_3}\right)^2 - \frac{c}{b},$$

$$w(x, y, t) = \frac{C_2^2}{bC_1^2} - \frac{a}{bC_1^2}\left(\frac{C_1 y + C_2 t + C_3}{x + C_4}\right)^2 - \frac{c}{b},$$

where $A, C_1, \ldots, C_4$ are arbitrary constants (the first solution is of the traveling-wave type).

4°. Solutions in implicit form:

$$2\lambda\sqrt{a}\,(y + \lambda t) + (t\sqrt{a} \pm x)(bw + c - \lambda^2) = \varphi(w),$$

where $\varphi(w)$ is an arbitrary function and λ is an arbitrary constant.

5°. Solution:

$$w = u(z) - 4abC_1^2x^2, \qquad z = y + bC_1x^2 + C_2t,$$

where C_1 and C_2 are arbitrary constants and the function $u(z)$ is determined by the first-order ordinary differential equation

$$(bu + c - C_2^2)u'_z + 2abC_1u = 8a^2bC_1^2z + C_3.$$

With appropriate translations in both variables, the equation can be made homogeneous, which means that the equation is integrable by quadrature.

6°. Solution:

$$w = v(r) - 4abC_1^2x^2 + 4bC_2^2t^2, \qquad r = y + bC_1x^2 + bC_2t^2,$$

where C_1 and C_2 are arbitrary constants and the function $v(r)$ is determined by the first-order ordinary differential equation

$$(bv + c)v'_r + 2b(aC_1 - C_2)v = 8b(a^2C_1^2 + C_2^2)r + C_3.$$

With appropriate translations in both variables, the equation can be made homogeneous, which means that the equation is integrable by quadrature.

7°. Solution (generalizes the solutions of Items 5° and 6°):

$$w = U(\xi) + A_1x^2 + A_2t^2 + A_3xt + A_4x + A_5t, \qquad \xi = y + b(B_1x^2 + B_2t^2 + B_3xt + B_4x + B_5t),$$

where B_1, B_2, B_3, B_4, and B_5 are arbitrary constants, and the coefficients A_n are expressed in terms of B_n as

$$\begin{aligned} A_1 &= b(B_3^2 - 4aB_1^2),\\ A_2 &= b(4B_2^2 - aB_3^2),\\ A_3 &= 4bB_3(B_2 - aB_1),\\ A_4 &= 2b(B_3B_5 - 2aB_1B_4),\\ A_5 &= 2b(2B_2B_5 - aB_3B_4), \end{aligned}$$

and the function $U(\xi)$ is determined by the first-order ordinary differential equation

$$(bU + c + ab^2B_4^2 - b^2B_5^2)U'_\xi + 2b(aB_1 - B_2)U = 2(A_2 - aA_1)\xi + C_1.$$

With appropriate translations in both variables, the equation can be made homogeneous, which means that the equation is integrable by quadrature.

8°. Generalized separable solution linear in y:

$$w = F(x,t)y + G(x,t),$$

where the functions F and G are determined by the system of differential equations

$$\frac{\partial^2F}{\partial t^2} - a\frac{\partial^2F}{\partial x^2} = 0, \tag{1}$$

$$\frac{\partial^2G}{\partial t^2} - a\frac{\partial^2G}{\partial x^2} = bF^2. \tag{2}$$

Equation (1) is a linear homogeneous wave equation. Given $F = F(x,t)$, (2) represents a linear nonhomogeneous wave equation.

The general solution of system (1)–(2) is given by

$$F(x,t) = \varphi_1(\xi) + \varphi_2(\eta),$$

$$G(x,t) = \psi_1(\xi) + \psi_2(\eta) - \frac{b}{4a}\eta\int\varphi_1^2(\xi)\,d\xi - \frac{b}{4a}\xi\int\varphi_2^2(\eta)\,d\eta - \frac{b}{2a}\int\varphi_1(\xi)\,d\xi\int\varphi_2(\eta)\,d\eta,$$

$$\xi = x + t\sqrt{a}, \quad \eta = x - t\sqrt{a},$$

where $\varphi_1(\xi)$, $\varphi_2(\eta)$, $\psi_1(\xi)$, and $\psi_2(\eta)$ are arbitrary functions.

9°. "Two-dimensional" generalized separable solution quadratic in y (generalizes the second to sixth solutions of Item 3°):

$$w = f(x,t)y^2 + g(x,t)y + h(x,t),$$

where the functions $f = f(x,t)$, $g = g(x,t)$, and $h = h(x,t)$ are determined by the system of differential equations

$$\begin{aligned} f_{tt} &= af_{xx} + 6bf^2, \\ g_{tt} &= ag_{xx} + 6bfg, \\ h_{tt} &= ah_{xx} + bg^2 + 2bfh + 2cf. \end{aligned}$$

Here, the subscripts denote partial derivatives.

10°. "Two-dimensional" solution:

$$w = V(\eta,t) - 4abC_1^2x^2 - 4abC_1C_2x, \qquad \eta = y + bC_1x^2 + bC_2x,$$

where C_1 and C_2 are arbitrary constants and the function $V(\eta,t)$ is determined by the differential equation

$$\frac{\partial^2 V}{\partial t^2} = \frac{\partial}{\partial \eta}\left[(bV + c + ab^2C_2^2)\frac{\partial V}{\partial \eta}\right] + 2abC_1\frac{\partial V}{\partial \eta} - 8a^2bC_1^2.$$

11°. "Two-dimensional" solution:

$$w = W(x,\zeta) + 4bC_1^2t^2 + 4bC_1C_2t, \qquad \zeta = y + bC_1t^2 + bC_2t,$$

where C_1 and C_2 are arbitrary constants and the function $W(\zeta,t)$ is determined by the differential equation

$$a\frac{\partial^2 W}{\partial x^2} + \frac{\partial}{\partial \zeta}\left[(bW + c - b^2C_2^2)\frac{\partial W}{\partial \zeta}\right] - 2bC_1\frac{\partial W}{\partial \zeta} - 8bC_1^2 = 0.$$

12°. Solution:

$$w = R(\rho) - 4aC_1\varphi(\xi), \qquad \rho = y + bC_1\left(x - t\sqrt{a}\right) + \int \varphi(\xi)\,d\xi, \qquad \xi = x + t\sqrt{a},$$

where C_1 is an arbitrary constant, $\varphi(\xi)$ is an arbitrary function, and the function $R(\rho)$ is determined by the simple ordinary differential equation $[(bR + c)R'_\rho]'_\rho = 0$. Integrating yields a solution of the original equation in the form

$$b(w + 4aC_1\varphi)^2 + 2c(w + 4aC_1\varphi) = C_2y + bC_1C_2\left(x - t\sqrt{a}\right) + C_2\int \varphi\,d\xi + C_3, \qquad \varphi = \varphi(\xi).$$

13°. Solution (obtained in the same way as in Item 12°):

$$b(w + 4aC_1\psi)^2 + 2c(w + 4aC_1\psi) = C_2y + bC_1C_2\left(x + t\sqrt{a}\right) + C_2\int \psi\,d\eta + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants, $\psi = \psi(\eta)$ is an arbitrary function, and $\eta = x - t\sqrt{a}$.

14°. Solution:

$$w = U(z) - \frac{A^2}{2\sqrt{a}\,b}xt + \frac{A^2}{2b}t^2 - \frac{2\sqrt{a}\,AB}{b}t - \frac{1}{b}(A\eta + 4aB)\psi(\eta),$$
$$z = y + \frac{A}{8a}\left(x^2 + 2\sqrt{a}\,xt - 3at^2\right) + B(x + \sqrt{a}\,t) + \int \psi(\eta)\,d\eta, \quad \eta = x - t\sqrt{a}, \tag{3}$$

where A and B are arbitrary constants, $\psi(\eta)$ is an arbitrary function, and the function $U(z)$ is determined by the first-order ordinary differential equation (C is an arbitrary constant)

$$(bU + c)U'_z + AU - \frac{A^2}{b}z + C = 0.$$

With appropriate translations in both variables, the equation can be made homogeneous, which means it is integrable by quadrature.

Another solution can be obtained by substituting $-t$ for t in (3).

15°. There are solutions of the following forms:

$w(x, y, t) = F(y, r), \quad r = x^2 - at^2$ "two-dimensional" solution;

$w(x, y, t) = t^{2\lambda}G(\xi, \eta) - \dfrac{c}{b}, \quad \xi = \dfrac{x}{t}, \quad \eta = \dfrac{y}{t^{\lambda+1}}$ "two-dimensional" solution;

$w(x, y, t) = H(z), \quad z = (x^2 - at^2)y^{-2}$ "one-dimensional" solution;

where λ is an arbitrary constant.

16°. The substitution $u = w + (c/b)$ leads to a special case of equation 8.1.2.5 with $n = 1$.

17°. For other solutions, see equation 8.4.2.3 with $f(w) = a$ and $g(w) = bw + c$.

⊙ *References for equation* 8.1.3.1: A. D. Polyanin and V. F. Zaitsev (2004, pp. 285–288).

2. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[(aw + b)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[(aw + b)\dfrac{\partial w}{\partial y}\right].$

The substitution $U = aw + b$ leads to an equation of the form 8.1.2.2:

$$\frac{\partial^2 U}{\partial t^2} = \frac{\partial}{\partial x}\left(U\frac{\partial U}{\partial x}\right) + \frac{\partial}{\partial y}\left(U\frac{\partial U}{\partial y}\right).$$

3. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[(a_1 w + b_1)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[(a_2 w + b_2)\dfrac{\partial w}{\partial y}\right].$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1 x + C_2, \pm C_1 y + C_3, \pm C_1 t + C_4),$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solution:

$$w(x, y, t) = A\sqrt{k_1 x + k_2 y + \lambda t + B} + \frac{\lambda^2 - b_1 k_1^2 - b_2 k_2^2}{a_1 k_1^2 + a_2 k_2^2},$$

where A, B, k_1, k_2, and λ are arbitrary constants.

3°. Generalized separable solution linear in space variables:

$$w(x,y,t) = (A_1t + B_1)x + (A_2t + B_2)y + \tfrac{1}{12}(a_1A_1^2 + a_2A_2^2)t^4 + \tfrac{1}{3}(a_1A_1B_1 + a_2A_2B_2)t^3 + \tfrac{1}{2}(a_1B_1^2 + a_2B_2^2)t^2 + Ct + D,$$

where A_1, A_2, B_1, B_2, C, and D are arbitrary constants.

4°. Solutions:

$$w(x,y,t) = \frac{1}{a_1C_1^2 + a_2C_2^2}\left(\frac{C_1x + C_2y + C_3}{t + C_4}\right)^2 - \frac{b_1C_1^2 + b_2C_2^2}{a_1C_1^2 + a_2C_2^2},$$

$$w(x,y,t) = \frac{(C_2^2 - b_2C_1^2)(x + C_4)^2 - b_1(C_1y + C_2t + C_3)^2}{a_2C_1^2(x + C_4)^2 + a_1(C_1y + C_2t + C_3)^2},$$

$$w(x,y,t) = \frac{(C_2^2 - b_1C_1^2)(y + C_4)^2 - b_2(C_1x + C_2t + C_3)^2}{a_1C_1^2(y + C_4)^2 + a_2(C_1x + C_2t + C_3)^2},$$

where $C_1, \ldots, C_4$ are arbitrary constants.

5°. There is a generalized separable solution of the form

$$w(x,y,t) = f(t)x^2 + g(t)xy + h(t)y^2 + \varphi(t)x + \psi(t)y + \chi(t).$$

6°. For other solutions, see equation 8.4.2.3 with $f(w) = a_1w + b_1$ and $g(w) = a_2w + b_2$.

4. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(\dfrac{1}{aw + b}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(\dfrac{1}{aw + b}\dfrac{\partial w}{\partial y}\right).$

The substitution $U = aw + b$ leads to an equation of the form 8.1.2.4:

$$\frac{\partial^2 U}{\partial t^2} = \frac{\partial}{\partial x}\left(\frac{1}{U}\frac{\partial U}{\partial x}\right) + \frac{\partial}{\partial y}\left(\frac{1}{U}\frac{\partial U}{\partial y}\right).$$

5. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[(a_1w^n + b_1)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[(a_2w^n + b_2)\dfrac{\partial w}{\partial y}\right].$

1°. Suppose $w(x,y,t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1x + C_2, \pm C_1y + C_3, \pm C_1t + C_4),$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solutions:

$$w(x,y,t) = \big(C_1x + C_2y + \lambda t + C_3\big)^{\frac{1}{n+1}}, \qquad \lambda = \pm\sqrt{b_1C_1^2 + b_2C_2^2},$$

where C_1, C_2, and C_3 are arbitrary constants.

3°. Solutions:

$$w(x,y,t)=\left[\frac{1}{a_1C_1^2+a_2C_2^2}\left(\frac{C_1x+C_2y+C_3}{t+C_4}\right)^2-\frac{b_1C_1^2+b_2C_2^2}{a_1C_1^2+a_2C_2^2}\right]^{1/n},$$

$$w(x,y,t)=\left[\frac{(C_2^2-b_2C_1^2)(x+C_4)^2-b_1(C_1y+C_2t+C_3)^2}{a_2C_1^2(x+C_4)^2+a_1(C_1y+C_2t+C_3)^2}\right]^{1/n},$$

$$w(x,y,t)=\left[\frac{(C_2^2-b_1C_1^2)(y+C_4)^2-b_2(C_1x+C_2t+C_3)^2}{a_1C_1^2(y+C_4)^2+a_2(C_1x+C_2t+C_3)^2}\right]^{1/n},$$

where $C_1,\ldots,C_4$ are arbitrary constants.

4°. For other solutions, see equation 8.4.2.3 with $f(w)=a_1w^n+b_1$ and $g(w)=a_2w^n+b_2$.

⊙ *Reference for equation* 8.1.3.5: A. D. Polyanin, V. F. Zaitsev (2004, p. 289).

8.1.4. Other Equations

1. $\dfrac{\partial^2 w}{\partial t^2}=(\alpha+\beta w)\left(\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}\right)+\gamma w^2+\delta w+\varepsilon.$

1°. Suppose $w(x,y,t)$ is a solution of this equation. Then the functions

$$w_1=w(\pm x+C_1,\pm y+C_2,\pm t+C_3),$$
$$w_2=w(x\cos\beta+y\sin\beta,-x\sin\beta+y\cos\beta,\,t),$$

where C_1, C_2, C_3, and β are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. "Two-dimensional" generalized separable solution:

$$w(x,y,t)=f(t)+g(t)\Theta(x,y). \tag{1}$$

Here, the function $\Theta(x,y)$ satisfies the two-dimensional Helmholtz equation

$$\Delta\Theta+\kappa\Theta=0,\qquad \Delta=\frac{\partial^2}{\partial x^2}+\frac{\partial^2}{\partial y^2},$$

where $\kappa=\gamma/\beta$ ($\beta\neq0$). For solutions of this linear equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002). The functions $f(t)$ and $g(t)$ in (1) are determined from the autonomous system of nonlinear ordinary differential equations

$$f''_{tt}=\gamma f^2+\delta f+\varepsilon, \tag{2}$$
$$g''_{tt}=(\gamma f+\delta-\alpha\kappa)g. \tag{3}$$

Equation (2) is independent of $g(t)$. Particular solutions of the equation are given by $f=\text{const}$, where f satisfies the quadratic equation $\gamma f^2+\delta f+\varepsilon=0$. For $\gamma=0$, (2) is a constant-coefficient linear equation. For $\gamma\neq0$, the general solution of (2) can be written out in implicit form as

$$\int\frac{df}{\sqrt{\frac{2}{3}\gamma f^3+\delta f^2+2\varepsilon f+C_1}}=C_2\pm t,$$

where C_1 and C_2 are arbitrary constants. Equation (3) is linear in $g(t)$. For particular solutions of the form $f=\text{const}$, it is a constant-coefficient linear equation.

3°. There is a "two-dimensional" solution of the form

$$w(x,y,t)=U(z_1,z_2),\quad z_1=a_1x+b_1y+c_1t,\quad z_2=a_2x+b_2y+c_2t,$$

where the a_n, b_n, and c_n are arbitrary constants ($n=1,\,2$). To the special case $U=U(z_1)$ there corresponds a traveling wave solution.

2. $\dfrac{\partial^2 w}{\partial t^2} = \alpha w\left(\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2}\right) - \alpha\left[\left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2\right] - \beta.$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-2} w(\pm C_1^2 x + C_2, \pm C_1^2 y + C_3, C_1 t + C_4),$$
$$w_2 = w(x\cos\beta + y\sin\beta, -x\sin\beta + y\cos\beta,\ t),$$

where $C_1, \ldots, C_4$ and β are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. There are generalized separable solutions of the form

$$w(x, y, t) = f(t) + g(t)\varphi(x) + h(t)\psi(y).$$

In particular, if $\varphi''_{xx} = \nu\varphi$ and $\psi''_{yy} = -\nu\psi$, where ν is an arbitrary constant, we have (A_1, A_2, B_1, and B_2 are arbitrary constants)

$$\varphi(x) = A_1\cosh\mu x + A_2\sinh\mu x, \quad \psi(y) = B_1\cos\mu y + B_2\sin\mu y \qquad (\nu = \mu^2 > 0),$$
$$\varphi(x) = A_1\cos\mu x + A_2\sin\mu x, \qquad \psi(y) = B_1\cosh\mu y + B_2\sinh\mu y \quad (\nu = -\mu^2 < 0).$$

The functions $f(t)$, $g(t)$, and $h(t)$ are determined by the autonomous system of ordinary differential equations

$$f''_{tt} = \alpha\nu(A_1^2 - sA_2^2)g^2 - \alpha\nu(B_1^2 + sB_2^2)h^2 - \beta,$$
$$g''_{tt} = \alpha\nu f g,$$
$$h''_{tt} = -\alpha\nu f h,$$

where $s = \operatorname{sign}\nu$.

3°. There are generalized separable solutions of the form

$$w(x, y, t) = f(t) + g(t)\varphi(x) + h(t)\psi(y) + u(t)\theta(x)\chi(y). \tag{1}$$

For $\varphi''_{xx} = 4\nu\varphi$, $\psi''_{yy} = -4\nu\psi$, $\theta''_{xx} = \nu\theta$, and $\chi''_{yy} = -\nu\chi$, where ν is an arbitrary constant, one should set in (1):

if $\nu = \mu^2 > 0$	if $\nu = -\mu^2 < 0$
$\varphi(x) = A_1\cosh 2\mu x + A_2\sinh 2\mu x$	$\varphi(x) = A_1\cos 2\mu x + A_2\sin 2\mu x$
$\psi(y) = B_1\cos 2\mu y + B_2\sin 2\mu y$	$\psi(y) = B_1\cosh 2\mu y + B_2\sinh 2\mu y$
$\theta(x) = C_1\cosh\mu x + C_2\sinh\mu x$	$\theta(x) = C_1\cos\mu x + C_2\sin\mu x$
$\chi(y) = D_1\cos\mu y + D_2\sin\mu y$	$\chi(y) = D_1\cosh\mu y + D_2\sinh\mu y$

The functions $f(t)$, $g(t)$, $h(t)$, and $u(t)$ are determined by the following system of ordinary differential equations ($s = \operatorname{sign}\nu$):

$$f''_{tt} = -4\alpha\nu(A_1^2 - sA_2^2)g^2 + 4\alpha\nu(B_1^2 + sB_2^2)h^2 - \beta,$$
$$g''_{tt} = -4\alpha\nu f g + \alpha\nu a_1(D_1^2 + sD_2^2)u^2,$$
$$h''_{tt} = 4\alpha\nu f h - \alpha\nu a_2(C_1^2 - sC_2^2)u^2,$$
$$u''_{tt} = -2\alpha\nu(a_3 g - a_4 h)u.$$

The arbitrary constants A_1, A_2, B_1, B_2, C_1, C_2, D_1, and D_2 are related by the two constraints

$$2A_1C_1C_2 = A_2(C_1^2 + sC_2^2), \quad 2B_1D_1D_2 = B_2(D_1^2 - sD_2^2).$$

The coefficients a_1, a_2, a_3, and a_4 are expressed as

$$a_1 = \frac{C_1^2 + sC_2^2}{2A_1}, \quad a_2 = \frac{D_1^2 - sD_2^2}{2B_1}, \quad a_3 = A_2\frac{C_1^2 - sC_2^2}{C_1C_2}, \quad a_4 = B_2\frac{D_1^2 + sD_2^2}{D_1D_2},$$

with $A_1 \neq 0$, $B_1 \neq 0$, $C_1C_2 \neq 0$, and $D_1D_2 \neq 0$.

If $A_1 = 0$ ($A_2 \neq 0$), then one should set $a_1 = C_1C_2/A_2$. If $B_1 = 0$ ($B_2 \neq 0$), then $a_2 = D_1D_2/B_2$. If $C_1 = 0$ ($C_2 \neq 0$), then $a_3 = -A_1$. If $C_2 = 0$ ($C_1 \neq 0$), then $a_3 = A_1$. If $D_1 = 0$ ($D_2 \neq 0$), then $a_4 = -B_1$. If $D_2 = 0$ ($D_1 \neq 0$), then $a_4 = B_1$.

4°. There is a generalized separable solution of the form

$$w(x, y, t) = f(t)x^2 + g(t)xy + h(t)y^2 + \varphi(t)x + \psi(t)y + \chi(t).$$

In the special case $\varphi(t) = \psi(t) \equiv 0$, the functions $f(t)$, $g(t)$, $h(t)$, and $\chi(t)$ are determined by the autonomous system of ordinary differential equations

$$f_{tt}'' = \alpha(2fh - 2f^2 - g^2), \quad h_{tt}'' = \alpha(2fh - 2h^2 - g^2),$$
$$g_{tt}'' = -2\alpha g(f + h), \quad \chi_{tt}'' = 2\alpha(f + h)\chi - \beta.$$

5°. There is a "two-dimensional" solution of the form

$$w(x, y, t) = U(z_1, z_2), \quad z_1 = a_1x + b_1y + c_1t, \quad z_2 = a_2x + b_2y + c_2t,$$

where the a_n, b_n, and c_n are arbitrary constants ($n = 1, 2$). To the special case $U = U(z_1)$ there corresponds a traveling wave solution.

3. $\dfrac{\partial^2 w}{\partial t^2} = a_1\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + a_2\dfrac{\partial}{\partial y}\left(w^k\dfrac{\partial w}{\partial y}\right) + bw^p.$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^2 w(\pm C_1^{p-n-1}x + C_2, \pm C_1^{p-k-1}y + C_3, \pm C_1^{p-1}t + C_4),$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. There are "two-dimensional" solutions of the following forms:

$$w(x, y, t) = F(\xi, \eta), \quad \xi = \alpha_1x + \alpha_2y + \alpha_3t, \quad \eta = \beta_1x + \beta_2y + \beta_3t;$$
$$w(x, y, t) = t^{\frac{2}{1-p}}U(z_1, z_2), \quad z_1 = xt^{\frac{p-n-1}{1-p}}, \quad z_2 = yt^{\frac{p-k-1}{1-p}}.$$

4. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} - \left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2.$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = \frac{D^2}{(A_1B_2 - A_2B_1)^2}w(A_1x + B_1y + C_1, A_2x + B_2y + C_2, Dt + C_3) + C_4x + C_5y + C_6t + C_7,$$

where A_k, B_k, C_n, and D are arbitrary constants, are also solutions of the equation ($A_1B_2 - A_2B_1 \neq 0$).

2°. There are generalized separable solutions of the form:

$$w = \sum_{i,j=0}^{i+j\le 4} \varphi_{i,j}(t)x^i y^j.$$

Special case 1. There is a solution containing only even powers:

$$w = \psi_1(t) + \psi_2(t)x^2 + \psi_3(t)y^2 + \psi_4(t)x^2y^2 + \psi_5(t)x^4 + \psi_6(t)y^4,$$

where the functions $\psi_n = \psi_n(t)$ are determined by the system of ordinary differential equations

$$\begin{aligned}
\psi_1'' &= 4\psi_2\psi_3,\\
\psi_2'' &= 4\psi_2\psi_4 + 24\psi_3\psi_5,\\
\psi_3'' &= 24\psi_2\psi_6 + 4\psi_3\psi_4,\\
\psi_4'' &= -12\psi_4^2 + 144\psi_5\psi_6,\\
\psi_5'' &= 24\psi_4\psi_5,\\
\psi_6'' &= 24\psi_4\psi_6.
\end{aligned}$$

⊙ *Reference*: V. A. Galaktionov and S. R. Svirshchevskii (2007, p. 306).

3°. Additive separable solution:

$$w = f(x,y) - \frac{1}{2}At^2 - Bt - C,$$

where A, B, and C are arbitrary constants and the function $f = f(x,y)$ is determined by an equation of the form 11.2.2.2:

$$\left(\frac{\partial^2 f}{\partial x\partial y}\right)^2 - \frac{\partial^2 f}{\partial x^2}\frac{\partial^2 f}{\partial y^2} = A.$$

4°. Multiplicative separable solution:

$$w = \frac{\theta(x,y)}{(t+C)^2},$$

where C is an arbitrary constant and the function $\theta = \theta(x,y)$ is determined by an equation of the form 11.2.3.1 with $f(x) = -6$ and $g(x) = 0$:

$$\left(\frac{\partial^2 \theta}{\partial x\partial y}\right)^2 - \frac{\partial^2 \theta}{\partial x^2}\frac{\partial^2 \theta}{\partial y^2} = -6\theta.$$

This equation is a special case of equation 11.2.3.5.

5°. Generalized separable solution:

$$w = f(x,t)y^2 + g(x,t)y + h(x,t),$$

where the functions $f = f(x,t)$, $g = g(x,t)$, and $h = h(x,t)$ are determined by the system of differential equations

$$\begin{aligned}
f_{tt} &= 2ff_x - 4f_x^2,\\
g_{tt} &= 2fg_x - 4f_xg_x,\\
h_{tt} &= 2fh_x - g_x^2.
\end{aligned}$$

6°. Solution:

$$w(x,y,t) = u(z,t), \quad z = ax^2 + bxy + cy^2 + kx + sy,$$

where a, b, c, k, and s are arbitrary constants and the function $u = u(z,t)$ is determined by the differential equation

$$u_{tt} = 2\big[(4ac-b^2)z + as^2 + ck^2 - bks\big]u_z u_{zz} + (4ac-b^2)(u_z)^2.$$

Special case 2. In particular, if $b = c = k = 0$, we have the equation $u_{tt} = 2as^2 u_z u_{zz}$, which admits exact solutions of the forms

$$u = \varphi_0(t) + \varphi_1(t)z + \varphi_2(t)z^2 + \varphi_3(t)z^3,$$
$$u = \psi_1(t) + \psi_2(t)z^{3/2} + \psi_3(t)z^3.$$

8.2. Equations with Two Space Variables Involving Exponential Nonlinearities

8.2.1. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[f(x)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[g(y)\dfrac{\partial w}{\partial y}\right] + ae^{\lambda w}$

1. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + b\dfrac{\partial^2 w}{\partial y^2} + ce^{\lambda w}.$

This is a special case of equation 8.4.1.1 with $f(w) = ce^{\lambda w}$.

2. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right) + ce^{\lambda w}.$

This is a special case of equation 8.4.1.2 with $f(w) = ce^{\lambda w}$.

1°. Suppose $w(x,y,t)$ is a solution of the equation in question. Then the functions

$$w_1 = w\Big(C_1^{\frac{2}{2-n}}x,\ C_1^{\frac{2}{2-m}}y,\ \pm C_1 t + C_2\Big) + \frac{2}{\lambda}\ln C_1,$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Solution for $n \neq 2$, $m \neq 2$, and $\lambda \neq 0$:

$$w = -\frac{1}{\lambda}\ln\left\{\frac{2c\lambda(2-n)(2-m)}{4-nm}\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} - \frac{1}{4}(t+C)^2\right]\right\}.$$

3°. Solution for $n \neq 2$ and $m \neq 2$ (generalizes the solution of Item 2°):

$$w = w(r), \qquad r^2 = 4k\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} - \frac{1}{4}(t+C)^2\right],$$

where C and k are arbitrary constants ($k \neq 0$) and the function $w(r)$ is determined by the ordinary differential equation

$$w_{rr}'' + \frac{A}{r}w_r' + ck^{-1}e^{\lambda w} = 0, \qquad A = \frac{2(4-n-m)}{(2-n)(2-m)}.$$

4°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,t) = U(\xi,t), \quad \xi^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2}\right],$$
$$w(x,y,t) = V(x,\eta), \quad \eta^2 = \pm 4\left[\frac{y^{2-m}}{b(2-m)^2} - \frac{1}{4}(t+C)^2\right],$$
$$w(x,y,t) = W(y,\zeta), \quad \zeta^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} - \frac{1}{4}(t+C)^2\right],$$
$$w(x,y,t) = F(z_1,z_2) - \frac{2}{\lambda}\ln|t|, \quad z_1 = x|t|^{\frac{2}{n-2}}, \quad z_2 = y|t|^{\frac{2}{m-2}}.$$

3. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\lambda y}\dfrac{\partial w}{\partial y}\right) + ce^{\beta w}.$

This is a special case of equation 8.4.1.3 with $f(w) = ce^{\beta w}$.

1°. Suppose $w(x,y,t)$ is a solution of the equation in question. Then the functions

$$w_1 = w\Big(C_1^{\frac{2}{2-n}}x,\ y - \frac{2}{\lambda}\ln C_1,\ \pm C_1 t + C_2\Big) + \frac{2}{\beta}\ln C_1,$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Solution for $n \neq 2$, $\beta \neq 0$, and $\lambda \neq 0$:

$$w = -\frac{1}{\beta}\ln\left\{\frac{2c\beta(2-n)}{n}\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\lambda y}}{b\lambda^2} - \frac{1}{4}(t+C)^2\right]\right\}.$$

3°. Solution for $n \neq 2$ and $\lambda \neq 0$ (generalizes the solution of Item 2°):

$$w = w(r), \qquad r^2 = 4k\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\lambda y}}{b\lambda^2} - \frac{1}{4}(t+C)^2\right],$$

where C and k are arbitrary constants ($k \neq 0$) and the function $w(r)$ is determined by the ordinary differential equation

$$w_{rr}'' + \frac{A}{r}w_r' + ck^{-1}e^{\beta w} = 0, \qquad A = \frac{2}{2-n}.$$

4°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,t) = U(\xi,t), \quad \xi^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\lambda y}}{b\lambda^2}\right],$$
$$w(x,y,t) = V(x,\eta), \quad \eta^2 = \pm 4\left[\frac{e^{-\lambda y}}{b\lambda^2} - \frac{1}{4}(t+C)^2\right],$$
$$w(x,y,t) = W(y,\zeta), \quad \zeta^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} - \frac{1}{4}(t+C)^2\right],$$
$$w(x,y,t) = F(z_1,z_2) - \frac{2}{\beta}\ln|t|, \quad z_1 = x|t|^{\frac{2}{n-2}}, \quad z_2 = y + \frac{2}{\lambda}\ln|t|.$$

4. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ae^{\beta x}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\lambda y}\dfrac{\partial w}{\partial y}\right) + ce^{\mu w}.$

This is a special case of equation 8.4.1.4 with $f(w) = ce^{\mu w}$.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the functions

$$w_1 = w\Big(x - \frac{2}{\beta}\ln C_1,\ y - \frac{2}{\lambda}\ln C_1,\ \pm C_1 t + C_2\Big) + \frac{2}{\mu}\ln C_1,$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Solution for $\beta \neq 0$ and $\lambda \neq 0$:

$$w = w(r), \qquad r^2 = 4k\left[\frac{e^{-\beta x}}{a\beta^2} + \frac{e^{-\lambda y}}{b\lambda^2} - \frac{1}{4}(t + C_1)^2\right],$$

where C_1 and k are arbitrary constants ($k \neq 0$) and the function $w(r)$ is determined by the autonomous ordinary differential equation

$$w''_{rr} + ck^{-1}e^{\mu w} = 0.$$

Its general solution is given by

$$w = \begin{cases} -\dfrac{1}{\mu}\ln\left[-\dfrac{c\mu}{2k}(r + C_3)^2\right] & \text{if } ck\mu < 0, \\ -\dfrac{1}{\mu}\ln\left[-\dfrac{c\mu}{2kC_2^2}\sin^2(C_2 r + C_3)\right] & \text{if } ck\mu < 0, \\ -\dfrac{1}{\mu}\ln\left[-\dfrac{c\mu}{2kC_2^2}\sinh^2(C_2 r + C_3)\right] & \text{if } ck\mu < 0, \\ -\dfrac{1}{\mu}\ln\left[\dfrac{c\mu}{2kC_2^2}\cosh^2(C_2 r + C_3)\right] & \text{if } ck\mu > 0, \end{cases}$$

where C_2 and C_3 are arbitrary constants.

3°. There are "two-dimensional" solutions of the following forms:

$$w(x, y, t) = U(\xi, t), \quad \xi^2 = 4\left(\frac{e^{-\beta x}}{a\beta^2} + \frac{e^{-\lambda y}}{b\lambda^2}\right),$$

$$w(x, y, t) = V(x, \eta), \quad \eta^2 = \pm 4\left[\frac{e^{-\lambda y}}{b\lambda^2} - \frac{1}{4}(t + C)^2\right],$$

$$w(x, y, t) = W(y, \zeta), \quad \zeta^2 = \pm 4\left[\frac{e^{-\beta x}}{a\beta^2} - \frac{1}{4}(t + C)^2\right],$$

$$w(x, y, t) = F(z_1, z_2) - \frac{2}{\mu}\ln|t|, \quad z_1 = x + \frac{2}{\beta}\ln|t|, \quad z_2 = y + \frac{2}{\lambda}\ln|t|.$$

8.2.2. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(e^{\beta w}\dfrac{\partial w}{\partial x}\right) + b\dfrac{\partial}{\partial y}\left(e^{\lambda w}\dfrac{\partial w}{\partial y}\right)$

1. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + b\dfrac{\partial}{\partial y}\left(e^{w}\dfrac{\partial w}{\partial y}\right).$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = w(C_1 x + C_3, C_2 y + C_4, \pm C_1 t + C_5) + \ln\frac{C_1^2}{C_2^2},$$
$$w_2 = w(x\cosh\lambda + ta^{1/2}\sinh\lambda,\ y,\ xa^{-1/2}\sinh\lambda + t\cosh\lambda),$$

where $C_1, \ldots, C_5$ and λ are arbitrary constants, are also solutions of the equation.

2°. Solutions:

$$w(x, y, t) = \varphi(x - t\sqrt{a}\,) + \psi(x + t\sqrt{a}\,) + \ln|C_1 y + C_2|,$$
$$w(x, y, t) = \ln\big[y\varphi(x - t\sqrt{a}\,) + \psi(x - t\sqrt{a}\,)\big],$$
$$w(x, y, t) = \ln\big[y\varphi(x + t\sqrt{a}\,) + \psi(x + t\sqrt{a}\,)\big],$$

where C_1 and C_2 are arbitrary constants and $\varphi(z_1)$ and $\psi(z_2)$ are arbitrary functions.

3°. Solutions:

$$w(x, y, t) = \ln\left[\frac{(B^2 - aA^2)(y + D)^2}{b(Ax + Bt + C)^2}\right],$$
$$w(x, y, t) = \ln\left[\frac{(B^2 - aA^2)(y + D)^2}{2\cos^2(Ax + Bt + C)}\right],$$
$$w(x, y, t) = \ln\left[\frac{(aA^2 - B^2)(y + D)^2}{b\cosh^2(Ax + Bt + C)}\right],$$
$$w(x, y, t) = \ln\left[\frac{(B^2 - aA^2)(y + D)^2}{b\sinh^2(Ax + Bt + C)}\right],$$
$$w(x, y, t) = \ln\left(\frac{4aC}{b}\right) - 2\ln\big|(x + A)^2 - a(t + B)^2 + C\big| + 2\ln|y + D|,$$
$$w(x, y, t) = \ln\left[\frac{1}{bB^2}\left(\frac{Ax + By + C}{t + D}\right)^2 - \frac{aA^2}{bB^2}\right],$$
$$w(x, y, t) = \ln\left[\frac{B^2}{bA^2} - \frac{a}{bA^2}\left(\frac{Ay + Bt + C}{x + D}\right)^2\right],$$

where A, B, C, and D are arbitrary constants.

4°. "Two-dimensional" solution:

$$w(x, y, t) = U(x, t) + 2\ln|y + C|,$$

where the function $U = U(x, t)$ is determined by a differential equation of the form 7.2.1.1:

$$\frac{\partial^2 U}{\partial t^2} = a\frac{\partial^2 U}{\partial x^2} + 2be^U.$$

Integrating yields a solution of the original equation in the form

$$w(x,y,t) = f(\xi) + g(\eta) - 2\ln\left|k\int e^{f(\xi)}\,d\xi - \frac{b}{4ak}\int e^{g(\eta)}\,d\eta\right| + 2\ln|y+C|,$$
$$\xi = x - \sqrt{a}\,t, \qquad \eta = x + \sqrt{a}\,t,$$

where $f = f(\xi)$ and $g = g(\eta)$ are arbitrary functions and k is an arbitrary constant.

5°. Solutions in implicit form:

$$2\lambda\sqrt{a}\,(y+\lambda t) + (t\sqrt{a} \pm x)(be^w - \lambda^2) = \varphi(w),$$

where $\varphi(w)$ is an arbitrary function and λ is an arbitrary constant.

6°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,t) = F(y,r), \quad r = x^2 - at^2;$$
$$w(x,y,t) = G(\xi,\eta) - 2k\ln|t|, \quad \xi = xt^{-1}, \quad \eta = y|t|^{k-1};$$
$$w(x,y,t) = H(\zeta_1,\zeta_2) + 2\ln|y|, \quad \zeta_1 = t + k_1\ln|y|, \quad \zeta_2 = x + k_2\ln|y|;$$
$$w(x,y,t) = U(\rho_1,\rho_2) + 2y, \quad \rho_1 = te^y, \quad \rho_2 = xe^y;$$
$$w(x,y,t) = V(\chi) + 2\ln|y/t|, \quad \chi = x/t,$$

where k, k_1, and k_2 are arbitrary constants.

7°. There is an exact solution of the form

$$w(x,y,t) = W(z), \quad z = (x^2 - at^2)y^{-2}.$$

8°. For other exact solutions, see equation 8.4.2.3 with $f(w) = a$ and $g(w) = be^w$.

⊙ *References for equation* 8.2.2.1: N. Ibragimov (1994, pp. 222–225), A. D. Polyanin and V. F. Zaitsev (2002, pp. 294–296).

2. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(e^{\lambda w}\dfrac{\partial w}{\partial x}\right) + b\dfrac{\partial}{\partial y}\left(e^{\lambda w}\dfrac{\partial w}{\partial y}\right).$

1°. Suppose $w(x,y,t)$ is a solution of this equation. Then the functions

$$w_1 = w(C_1x + C_3, \pm C_1y + C_4, C_2t + C_5) + \frac{1}{\lambda}\ln\frac{C_2^2}{C_1^2},$$
$$w_2 = w\big(x\cos\beta + y\sqrt{a/b}\,\sin\beta, -x\sqrt{b/a}\,\sin\beta + y\cos\beta,\ t\big),$$

where $C_1, \ldots, C_5$ and β are arbitrary constants, are also solutions of the equation.

2°. Solutions:

$$w(x,y,t) = C_1t + C_2 + \frac{1}{\lambda}\ln(C_3x + C_4y + C_5);$$
$$w(x,y,t) = C_1t + C_2 + \frac{1}{\lambda}\ln\big[C_3(bx^2 - ay^2) + C_4xy + C_5\big];$$
$$w(x,y,t) = C_1t + C_2 + \frac{1}{\lambda}\ln\big[C_3\ln(bx^2 + ay^2) + C_4\big];$$

$$w(x,y,t) = C_1 t + C_2 + \sqrt{b}\,C_3 x + \frac{1}{\lambda}\ln\cos\bigl(\sqrt{a}\,C_3\lambda y + C_4\bigr);$$

$$w(x,y,t) = C_1 t + C_2 + \frac{1}{\lambda}\ln\bigl[C_3\exp\bigl(\sqrt{b}\,C_4 x\bigr)\cos\bigl(\sqrt{a}\,C_4 y + C_5\bigr) + C_6\bigr];$$

$$w(x,y,t) = \frac{1}{\lambda}\ln\left[\frac{1}{aC_1^2 + bC_2^2}\left(\frac{C_1 x + C_2 y + C_3}{t + C_4}\right)^2\right];$$

$$w(x,y,t) = \frac{1}{\lambda}\ln\left[\frac{C_2^2(x + C_4)^2}{a(C_1 y + C_2 t + C_3)^2 + bC_1^2(x + C_4)^2}\right];$$

$$w(x,y,t) = \frac{1}{\lambda}\ln\left[\frac{bC_1x^2 + C_2xy + Ky^2 + C_3x + C_4y + C_5}{\cos^2(C_1t + C_6)}\right], \quad K = \frac{C_1^2}{b} - aC_1;$$

$$w(x,y,t) = \frac{1}{\lambda}\ln\left[\frac{bC_1x^2 + C_2xy + Ky^2 + C_3x + C_4y + C_5}{\sinh^2(C_1t + C_6)}\right], \quad K = \frac{C_1^2}{b} - aC_1;$$

$$w(x,y,t) = \frac{1}{\lambda}\ln\left[\frac{bC_1x^2 + C_2xy - Ky^2 + C_3x + C_4y + C_5}{\cosh^2(C_1t + C_6)}\right], \quad K = \frac{C_1^2}{b} + aC_1;$$

$$w(x,y,t) = \frac{1}{\lambda}\ln\left[\frac{aC_1^2x^2 + C_2\exp\bigl(\sqrt{b}\,C_3x\bigr)\cos\bigl(\sqrt{a}\,C_3y + C_4\bigr)}{\cos^2(aC_1t + C_5)}\right];$$

$$w(x,y,t) = \frac{1}{\lambda}\ln\left[\frac{bC_1^2y^2 + C_2\exp\bigl(\sqrt{b}\,C_3x\bigr)\cos\bigl(\sqrt{a}\,C_3y + C_4\bigr)}{\cos^2(bC_1t + C_5)}\right];$$

$$w(x,y,t) = \frac{1}{\lambda}\ln\left[\frac{aC_1^2x^2 + C_2\exp\bigl(\sqrt{b}\,C_3x\bigr)\cos\bigl(\sqrt{a}\,C_3y + C_4\bigr)}{\sinh^2(aC_1t + C_5)}\right];$$

$$w(x,y,t) = \frac{1}{\lambda}\ln\left[\frac{bC_1^2y^2 + C_2\exp\bigl(\sqrt{b}\,C_3x\bigr)\cos\bigl(\sqrt{a}\,C_3y + C_4\bigr)}{\sinh^2(bC_1t + C_5)}\right];$$

$$w(x,y,t) = \frac{1}{\lambda}\ln\left[\frac{-aC_1^2x^2 + C_2\exp\bigl(\sqrt{b}\,C_3x\bigr)\cos\bigl(\sqrt{a}\,C_3y + C_4\bigr)}{\cosh^2(aC_1t + C_5)}\right];$$

$$w(x,y,t) = \frac{1}{\lambda}\ln\left[\frac{-bC_1^2y^2 + C_2\exp\bigl(\sqrt{b}\,C_3x\bigr)\cos\bigl(\sqrt{a}\,C_3y + C_4\bigr)}{\cosh^2(bC_1t + C_5)}\right];$$

where $C_1, \ldots, C_6$ are arbitrary constants; the first five solutions are degenerate.

3°. "Two-dimensional" solution (generalizes the first five solutions of Item 2°):

$$w(x,y,t) = C_1 t + C_2 + \frac{1}{\lambda}\ln U(\xi,\eta), \qquad \xi = \frac{x}{\sqrt{a}}, \qquad \eta = \frac{y}{\sqrt{b}},$$

where C_1 and C_2 are arbitrary constants and the function $U = U(\xi,\eta)$ is determined by the Laplace equation

$$\frac{\partial^2 U}{\partial\xi^2} + \frac{\partial^2 U}{\partial\eta^2} = 0.$$

For solutions of this linear equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

4°. "Two-dimensional" solution:

$$w(x,y,t) = f(t) + \frac{1}{\lambda}\ln V(\xi,\eta), \qquad \xi = \frac{x}{\sqrt{a}}, \qquad \eta = \frac{y}{\sqrt{b}},$$

where the function $f = f(t)$ is determined by the autonomous ordinary differential equation

$$f''_{tt} = e^{\lambda f}, \tag{1}$$

and the function $V = V(\xi, \eta)$ is a solution of the Poisson equation

$$\Delta V - \lambda = 0, \qquad \Delta = \frac{\partial^2}{\partial \xi^2} + \frac{\partial^2}{\partial \eta^2}. \tag{2}$$

For this linear equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

The general solution of equation (1) is given by

$$f(t) = \begin{cases} -\dfrac{1}{\lambda} \ln\left[\frac{1}{2}\lambda(t + C_1)^2\right] & \text{if } \lambda > 0, \\ -\dfrac{1}{\lambda} \ln\left[\dfrac{\lambda}{2C_1^2} \cos^2(C_1 t + C_2)\right] & \text{if } \lambda > 0, \\ -\dfrac{1}{\lambda} \ln\left[\dfrac{\lambda}{2C_1^2} \sinh^2(C_1 t + C_2)\right] & \text{if } \lambda > 0, \\ -\dfrac{1}{\lambda} \ln\left[-\dfrac{\lambda}{2C_1^2} \cosh^2(C_1 t + C_2)\right] & \text{if } \lambda < 0. \end{cases}$$

5°. There are "two-dimensional" solutions of the following forms:

$$w(x, y, t) = F(z, t) + \frac{2}{\lambda} \ln x, \quad z = \frac{y}{x};$$
$$w(x, y, t) = G(r, t), \quad r = bx^2 + ay^2;$$
$$w(x, y, t) = H(z_1, z_2) - \frac{2k}{\lambda} \ln|t|, \quad z_1 = x|t|^{k-1}, \quad z_2 = y|t|^{k-1};$$
$$w(x, y, t) = U(\xi, \eta) - \frac{2}{\lambda} \ln|t|, \quad \xi = x + k_1 \ln|t|, \quad \eta = y + k_2 \ln|t|;$$
$$w(x, y, t) = V(\rho_1, \rho_2) - \frac{2}{\lambda} t, \quad \rho_1 = xe^t, \quad \rho_2 = ye^t,$$

where k, k_1, and k_2 are arbitrary constants.

6°. There are "one-dimensional" solutions of the following forms:

$$w(x, y, t) = W(z) + \frac{2}{\lambda} \ln\left|\frac{x}{t}\right|, \quad z = \frac{y}{x};$$
$$w(x, y, t) = R(\zeta), \quad \zeta = \frac{bx^2 + ay^2}{t^2}.$$

7°. For other exact solutions, see equation 8.4.2.3 with $f(w) = ae^{\lambda w}$ and $g(w) = be^{\lambda w}$.

⊙ *References for equation* 8.2.2.2: N. Ibragimov (1994, pp. 222–225), A. D. Polyanin and V. F. Zaitsev (2002, pp. 296–297).

3. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(e^w \dfrac{\partial w}{\partial x}\right) + b\dfrac{\partial}{\partial y}\left(e^{\lambda w}\dfrac{\partial w}{\partial y}\right).$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1 C_2 x + C_3, \pm C_1 C_2^{\lambda} y + C_4, \pm C_1 t + C_5) - 2\ln|C_2|,$$

where $C_1, \ldots, C_5$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solution in implicit form:

$$ak_1^2 e^w + bk_2^2 \lambda^{-1} e^{\lambda w} - \beta^2 w = C_1(k_1 x + k_2 y + \beta t) + C_2,$$

where C_1, C_2, k_1, k_2, and β are arbitrary constants.

3°. Solutions in implicit form:

$$\left(\frac{C_1 x + C_2 y + C_3}{t + C_4}\right)^2 = aC_1^2 e^w + bC_2^2 e^{\lambda w},$$
$$a\left(\frac{C_1 y + C_2 t + C_3}{x + C_4}\right)^2 e^w + bC_1^2 e^{\lambda w} = C_2^2,$$
$$b\left(\frac{C_1 x + C_2 t + C_3}{y + C_4}\right)^2 e^{\lambda w} + aC_1^2 e^w = C_2^2,$$

where $C_1, \ldots, C_4$ are arbitrary constants.

4°. "Two-dimensional" solution (c_1 and c_2 are arbitrary constants):

$$w(x, y, t) = u(z, t), \quad z = c_1 x + c_2 y,$$

where the function $u = u(z, t)$ is determined by a differential equation of the form 7.4.4.6:

$$\frac{\partial^2 u}{\partial t^2} = \frac{\partial}{\partial z}\left[\varphi(u)\frac{\partial u}{\partial z}\right], \quad \varphi(u) = ac_1^2 e^u + bc_2^2 e^{\lambda u},$$

which can be reduced to a linear equation.

5°. "Two-dimensional" solution (s_1 and s_2 are arbitrary constants):

$$w(x, y, t) = v(x, \xi), \quad \xi = s_1 y + s_2 t,$$

where the function $v = v(x, \xi)$ is determined by a differential equation of the form 9.4.4.8:

$$a\frac{\partial}{\partial x}\left(e^v \frac{\partial v}{\partial x}\right) + \frac{\partial}{\partial z}\left[\psi(v)\frac{\partial v}{\partial z}\right] = 0, \quad \psi(v) = bs_1^2 e^{\lambda v} - s_2^2,$$

which can be reduced to a linear equation.

6°. There is a "two-dimensional" solution of the form (generalizes the solutions of Items 3° to 5°):

$$w(x,y,t)=U(z_1,z_2),\quad z_1=a_1x+b_1y+c_1t,\quad z_2=a_2x+b_2y+c_2t.$$

7°. Solution:

$$w(x,y,t)=U(\xi)+2\ln(x/t),\quad \xi=x^{-\lambda}yt^{\lambda-1},$$

where the function $U=U(\xi)$ is determined by the ordinary differential equation

$$\big[a\lambda^2\xi^2e^U+be^{\lambda U}-(\lambda-1)^2\xi^2\big]U''_{\xi\xi}+\lambda\big(a\lambda\xi^2e^U+be^{\lambda U}\big)(U'_\xi)^2 +\xi\big[a\lambda(\lambda-3)e^U-(\lambda-1)(\lambda-2)\big]U'_\xi+2(ae^U-1)=0.$$

8°. "Two-dimensional" solution:

$$w(x,y,t)=u(z,t)+2\ln x,\quad z=x^{-\lambda}y,$$

where the function $u=u(z,t)$ is determined by the differential equation

$$\frac{\partial^2u}{\partial t^2}=\big(a\lambda^2z^2e^u+be^{\lambda u}\big)\frac{\partial^2u}{\partial z^2}+\lambda\big(a\lambda z^2e^u+be^{\lambda u}\big)\left(\frac{\partial u}{\partial z}\right)^2+a\lambda(\lambda-3)ze^u\frac{\partial u}{\partial z}+2ae^u.$$

9°. For other exact solutions, see equation 8.4.2.3 with $f(w)=ae^w$ and $g(w)=be^{\lambda w}$.

⊙ *References for equation* 8.2.2.3: N. H. Ibragimov (1994, pp. 222–225), A. D. Polyanin and V. F. Zaitsev (2004, p. 298).

8.2.3. Other Equations

1. $\dfrac{\partial^2w}{\partial t^2}=\dfrac{\partial}{\partial x}\left[(a_1e^{\lambda w}+b_1)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[(a_2e^{\lambda w}+b_2)\dfrac{\partial w}{\partial y}\right].$

1°. Suppose $w(x,y,t)$ is a solution of this equation. Then the functions

$$w_1=w(\pm C_1x+C_2,\pm C_1y+C_3,\pm C_1t+C_4),$$

where $C_1,\ldots,C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solutions:

$$w(x,y,t)=\frac{1}{\lambda}\ln\big(C_1x+C_2y+\beta t+C_3\big),\quad \beta=\pm\sqrt{b_1C_1^2+b_2C_2^2},$$

where C_1, C_2, and C_3 are arbitrary constants.

3°. Solutions:

$$w(x,y,t)=\frac{1}{\lambda}\ln\left[\frac{1}{a_1C_1^2+a_2C_2^2}\left(\frac{C_1x+C_2y+C_3}{t+C_4}\right)^2-\frac{b_1C_1^2+b_2C_2^2}{a_1C_1^2+a_2C_2^2}\right],$$

$$w(x,y,t)=\frac{1}{\lambda}\ln\left[\frac{(C_2^2-b_2C_1^2)(x+C_4)^2-b_1(C_1y+C_2t+C_3)^2}{a_2C_1^2(x+C_4)^2+a_1(C_1y+C_2t+C_3)^2}\right],$$

$$w(x,y,t)=\frac{1}{\lambda}\ln\left[\frac{(C_2^2-b_1C_1^2)(y+C_4)^2-b_2(C_1x+C_2t+C_3)^2}{a_1C_1^2(y+C_4)^2+a_2(C_1x+C_2t+C_3)^2}\right],$$

where $C_1,\ldots,C_4$ are arbitrary constants.

4°. For other solutions, see equation 8.4.2.3 with $f(w)=a_1e^{\lambda w}+b_1$ and $g(w)=a_2e^{\lambda w}+b_2$.

2. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(e^{\lambda_1 w}\dfrac{\partial w}{\partial x}\right) + b\dfrac{\partial}{\partial y}\left(e^{\lambda_2 w}\dfrac{\partial w}{\partial y}\right) + ce^{\beta w}.$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1^{\beta-\lambda_1}x + C_2, \pm C_1^{\beta-\lambda_2}y + C_3, \pm C_1^{\beta}t + C_4) + 2\ln|C_1|,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. There are "two-dimensional" solutions of the following forms:

$$w(x, y, t) = U(\xi, \eta) - \frac{2}{\beta}\ln|t|, \quad \xi = x|t|^{\frac{\lambda_1-\beta}{\beta}}, \quad \eta = y|t|^{\frac{\lambda_2-\beta}{\beta}};$$
$$w(x, y, t) = V(\eta_1, \eta_2), \quad \eta_1 = a_1x + b_1y + c_1t, \quad \eta_2 = a_2x + b_2y + c_2t.$$

8.3. Nonlinear Telegraph Equations with Two Space Variables

8.3.1. Equations Involving Power-Law Nonlinearities

1. $\dfrac{\partial^2 w}{\partial t^2} + k\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial}{\partial y}\left[(bw + c)\dfrac{\partial w}{\partial y}\right].$

1°. "Two-dimensional" generalized separable solution linear in y:

$$w = f(x, t)y + g(x, t),$$

where the functions f and g are determined by the one-dimensional equations

$$\frac{\partial^2 f}{\partial t^2} + k\frac{\partial f}{\partial t} = a\frac{\partial^2 f}{\partial x^2},$$
$$\frac{\partial^2 g}{\partial t^2} + k\frac{\partial g}{\partial t} = a\frac{\partial^2 g}{\partial x^2} + bf^2.$$

The first equation is a linear homogeneous telegraph equation. Given $f = f(x, t)$, the second one represents a linear nonhomogeneous telegraph equation. For these equations, see the book by Polyanin (2002).

2°. There is a "two-dimensional" generalized separable solution quadratic in y:

$$w = f(x, t)y^2 + g(x, t)y + h(x, t).$$

3°. The substitution $u = w + (c/b)$ leads to the special case of equation 8.3.1.4 with $m = 1$.

2. $\dfrac{\partial^2 w}{\partial t^2} + k\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\left[(a_1w + b_1)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[(a_2w + b_2)\dfrac{\partial w}{\partial y}\right].$

1°. Additive separable solution:

$$w(x, y, t) = Akx + Bky + Ce^{-kt} + k(A^2a_1 + B^2a_2)t + D,$$

where A, B, C, and D are arbitrary constants.

2°. Generalized separable solution linear in the space variables:

$$w(x,y,t) = (A_1e^{-kt} + B_1)x + (A_2e^{-kt} + B_2)y + \frac{1}{2k^2}(a_1A_1^2 + a_2A_2^2)e^{-2kt} - \frac{2}{k}(a_1A_1B_1 + a_2A_2B_2)te^{-kt} + C_1e^{-kt} + \frac{1}{k}(a_1B_1^2 + a_2B_2^2)t + C_2,$$

where A_1, A_2, B_1, B_2, C_1, and C_2 are arbitrary constants.

3°. Traveling-wave solution in implicit form ($k \neq 0$):

$$k\lambda(a_1\beta_1^2 + a_2\beta_2^2)w + [k\lambda(b_1\beta_1^2 + b_2\beta_2^2 - \lambda^2) - C_1(a_1\beta_1^2 + a_2\beta_2^2)]\ln(k\lambda w + C_1) = k^2\lambda^2(\beta_1x + \beta_2y + \lambda t) + C_2,$$

where C_1, C_2, β_1, β_2, and λ are arbitrary constants.

4°. There is a generalized separable solution of the form

$$w(x,y,t) = f(t)x^2 + g(t)xy + h(t)y^2 + \varphi(t)x + \psi(t)y + \chi(t).$$

3. $\dfrac{\partial^2 w}{\partial t^2} + k\dfrac{\partial w}{\partial t} = a\left[\dfrac{\partial}{\partial x}\left(\dfrac{1}{w}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(\dfrac{1}{w}\dfrac{\partial w}{\partial y}\right)\right].$

This is a special case of equation 8.3.1.6 with $n = m = -1$.

1°. Suppose $w(x,y,t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^2 w(\pm C_1x + C_2, \pm C_1y + C_3, t + C_4),$$
$$w_2 = w(x\cos\beta + y\sin\beta,\ -x\sin\beta + y\cos\beta,\ t),$$

where $C_1, \ldots, C_4$ and β are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Solutions:

$$w(x,y,t) = \frac{2at + A + Be^{-kt}}{k(\sin y + Ce^x)^2},$$
$$w(x,y,t) = \frac{C_1^2(2at + A + Be^{-kt})}{ke^{2x}\sinh^2(C_1e^{-x}\sin y + C_2)},$$
$$w(x,y,t) = \frac{C_1^2(-2at + A + Be^{-kt})}{ke^{2x}\cosh^2(C_1e^{-x}\sin y + C_2)},$$
$$w(x,y,t) = \frac{C_1^2(2at + A + Be^{-kt})}{ke^{2x}\cos^2(C_1e^{-x}\sin y + C_2)},$$

where A, B, C, C_1, and C_2 are arbitrary constants.

3°. The exact solutions specified in Item 2° are special cases of a more general solution in the form of the product of functions with different arguments:

$$w(x,y,t) = (Aat + B + Ce^{-kt})e^{\Theta(x,y)},$$

where A, B, and C are arbitrary constants and the function $\Theta(x,y)$ is a solution of the stationary equation

$$\Delta\Theta - Ake^{\Theta} = 0, \qquad \Delta = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2},$$

which occurs in combustion theory. For solutions of this equation, see 9.2.1.1.

⊙ *Reference for equation* 8.3.1.3: N. H. Ibragimov (1994, p. 245).

4. $\dfrac{\partial^2 w}{\partial t^2} + k\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\dfrac{\partial}{\partial y}\left(w^m \dfrac{\partial w}{\partial y}\right).$

This is a special case of equation 8.3.1.6 with $n = 0$.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^{-2} w(\pm x + C_2, \pm C_1^m y + C_3, t + C_4),$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. "Two-dimensional" solution:

$$w(x, y, t) = u(x, t) y^{2/m},$$

where the function $u(x, t)$ is determined by the differential equation

$$\frac{\partial^2 u}{\partial t^2} + k\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial x^2} + \frac{2b(m+2)}{m^2} u^{m+1}.$$

For $m = -2$ and $m = -1$, this equation is linear.

3°. "Two-dimensional" multiplicative separable solution:

$$w(x, y, t) = \begin{cases} U(x, t)|y + C|^{1/(m+1)} & \text{if } m \neq -1, \\ U(x, t)\exp(Cy) & \text{if } m = -1, \end{cases}$$

where C is an arbitrary constant and the function $U(x, t)$ is determined by the telegraph equation

$$\frac{\partial^2 U}{\partial t^2} + k\frac{\partial U}{\partial t} = a\frac{\partial^2 U}{\partial x^2}.$$

For solutions of this linear equation, see the book by Polyanin (2002).

⊙ *Reference for equation* 8.3.1.4: N. H. Ibragimov (1994, pp. 245–246).

5. $\dfrac{\partial^2 w}{\partial t^2} + k\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(w^n \dfrac{\partial w}{\partial x}\right) + b\dfrac{\partial}{\partial y}\left(w^n \dfrac{\partial w}{\partial y}\right).$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-2} w(\pm C_1^n x + C_2, \pm C_1^n y + C_3, t + C_4),$$
$$w_2 = w\big(x\cos\beta + y\sqrt{a/b}\,\sin\beta, -x\sqrt{b/a}\,\sin\beta + y\cos\beta,\ t\big),$$

where $C_1, \ldots, C_4$ and β are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Multiplicative separable solution:

$$w(x, y, t) = F(t)\Phi(x, y),$$

where the function $F(t)$ is determined by the autonomous ordinary differential equation (C is an arbitrary constant)

$$F_{tt}'' + kF_t' = CF^{n+1}, \tag{1}$$

and the function $\Phi(x, y)$ satisfies the stationary equation

$$a\frac{\partial}{\partial x}\left(\Phi^n\frac{\partial\Phi}{\partial x}\right)+b\frac{\partial}{\partial y}\left(\Phi^n\frac{\partial\Phi}{\partial y}\right)=C\Phi. \tag{2}$$

Special case. For $C = 0$, it follows from (1) that $F = Ae^{-kt} + B$, where A and B are arbitrary constants. For $C = 0$, equation (2) is reduced to the Laplace equation

$$\frac{\partial^2\Psi}{\partial\bar{x}^2}+\frac{\partial^2\Psi}{\partial\bar{y}^2}=0, \qquad \text{where } \Psi=\Phi^{n+1},\ \ \bar{x}=\frac{x}{\sqrt{a}},\ \ \bar{y}=\frac{y}{\sqrt{b}}.$$

3°. "Two-dimensional" solution:

$$w(x, y, t) = u(r, t), \quad r=\sqrt{bx^2+ay^2},$$

where the function $u(r, t)$ is determined by the differential equation

$$\frac{\partial^2u}{\partial t^2}+k\frac{\partial u}{\partial t}=\frac{ab}{r}\frac{\partial}{\partial r}\left(ru^n\frac{\partial u}{\partial r}\right).$$

4°. Solution:

$$w(x, y, t) = U(t)(bx^2 + ay^2)^{1/n},$$

where the function $U(t)$ is determined by the autonomous ordinary differential equation

$$U''_{tt}+kU'_t=\frac{4ab(n+1)}{n^2}U^{n+1}.$$

⊙ *Reference for equation* 8.3.1.5: N. H. Ibragimov (1994, p. 245).

6. $\dfrac{\partial^2 w}{\partial t^2}+k\dfrac{\partial w}{\partial t}=a\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right)+b\dfrac{\partial}{\partial y}\left(w^m\dfrac{\partial w}{\partial y}\right)$.

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-2}w(\pm C_1^n x + C_2, \pm C_1^m y + C_3, t + C_4),$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solution in implicit form:

$$\int\frac{a_1\beta_1^2w^n+a_2\beta_2^2w^m-\lambda^2}{k\lambda w+C_1}\,dw=\beta_1x+\beta_2y+\lambda t+C_2,$$

where C_1, C_2, β_1, β_2, and λ are arbitrary constants.

3°. "Two-dimensional" solution:

$$w(x, y, t) = U(\xi, t), \quad \xi=\beta x+\mu y,$$

where β and μ are arbitrary constants, and the function $U = U(\xi, t)$ is determined by the differential equation

$$\frac{\partial^2U}{\partial t^2}+k\frac{\partial U}{\partial t}=\frac{\partial}{\partial\xi}\left[\left(a\beta^2U^n+b\mu^2U^m\right)\frac{\partial U}{\partial\xi}\right].$$

Remark. There is a more general, "two-dimensional" solution of the form

$$w(x, y, t) = V(\xi_1, \xi_2), \quad \xi_1=\beta_1x+\mu_1y+\lambda_1t, \quad \xi_2=\beta_2x+\mu_2y+\lambda_2t,$$

where the β_i, μ_i, and λ_i are arbitrary constants.

4°. "Two-dimensional" solution:

$$w(x,y,t) = y^{2/m}u(z,t), \quad z = xy^{-n/m},$$

where the function $u = u(z,t)$ is determined by the differential equation

$$m^2\left(\frac{\partial^2 u}{\partial t^2} + k\frac{\partial u}{\partial t}\right) = \left(am^2u^n + bn^2z^2u^m\right)\frac{\partial^2 u}{\partial z^2}$$
$$+ nm\left(amu^{n-1} + bnz^2u^{m-1}\right)\left(\frac{\partial u}{\partial z}\right)^2 + bn(n-3m-4)zu^m\frac{\partial u}{\partial z} + 2b(m+2)u^{m+1}.$$

⊙ *Reference for equation* 8.3.1.6: N. H. Ibragimov (1994, pp. 245–246).

8.3.2. Equations Involving Exponential Nonlinearities

1. $\dfrac{\partial^2 w}{\partial t^2} + k\dfrac{\partial w}{\partial t} = a\dfrac{\partial^2 w}{\partial x^2} + b\dfrac{\partial}{\partial y}\left(e^w\dfrac{\partial w}{\partial y}\right).$

This is a special case of equation 8.4.3.10 with $f(t) = k$, $g(t) = a$, $h(t) = b$, and $\lambda = 1$.

1°. Suppose $w(x,y,t)$ is a solution of the equation in question. Then the functions

$$w_1 = w(\pm x + C_2, \pm C_1 y + C_3, t + C_4) - 2\ln|C_1|,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. "Two-dimensional" solution:

$$w(x,y,t) = u(x,t) + \ln|y + C|,$$

where C is an arbitrary constant and the function $u(x,t)$ is determined by the equation

$$\frac{\partial^2 u}{\partial t^2} + k\frac{\partial u}{\partial t} = a\frac{\partial^2 u}{\partial x^2}.$$

For solutions of this linear equation, see the book by Polyanin (2002).

3°. "Two-dimensional" solution:

$$w(x,y,t) = U(x,t) + 2\ln|y + C|,$$

where C is an arbitrary constant and the function $U(x,t)$ is determined by the differential equation

$$\frac{\partial^2 U}{\partial t^2} + k\frac{\partial U}{\partial t} = a\frac{\partial^2 U}{\partial x^2} + 2be^U.$$

⊙ *Reference for equation* 8.3.2.1: N. H. Ibragimov (1994, p. 245).

2. $\dfrac{\partial^2 w}{\partial t^2} + k\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^w \dfrac{\partial w}{\partial x}\right) + b\dfrac{\partial}{\partial y}\left(e^w \dfrac{\partial w}{\partial y}\right).$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1 x + C_2, \pm C_1 y + C_3, t + C_4) - 2\ln|C_1|,$$
$$w_2 = w\big(x\cos\beta + y\sqrt{a/b}\,\sin\beta, -x\sqrt{b/a}\,\sin\beta + y\cos\beta,\ t\big),$$

where $C_1, \ldots, C_4$ and β are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. "Two-dimensional" additive separable solution:

$$w(x, y, t) = \varphi(t) + \ln[\psi(x, y)],$$

where the function $\varphi(t)$ is determined by the autonomous ordinary differential equation (C is an arbitrary constant)

$$\varphi''_{tt} + k\varphi'_t = Ce^{\varphi},$$

and the function $\psi(x, y)$ satisfies the Poisson equation

$$\frac{\partial^2 \psi}{\partial \bar{x}^2} + \frac{\partial^2 \psi}{\partial \bar{y}^2} = C, \qquad \text{where } \bar{x} = \frac{x}{\sqrt{a}},\ \ \bar{y} = \frac{y}{\sqrt{b}}.$$

For solutions of this linear equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

3°. "Two-dimensional" solution:

$$w(x, y, t) = u(r, t), \quad r = \sqrt{bx^2 + ay^2},$$

where the function $u(r, t)$ is determined by the differential equation

$$\frac{\partial^2 u}{\partial t^2} + k\frac{\partial u}{\partial t} = \frac{ab}{r}\frac{\partial}{\partial r}\left(re^u \frac{\partial u}{\partial r}\right).$$

4°. Solution:

$$w(x, y, t) = u(t) + \ln(bx^2 + ay^2),$$

where the function $u(t)$ is determined by the autonomous ordinary differential equation

$$u''_{tt} + ku'_t = 4abe^u.$$

5°. There is a "two-dimensional" solution of the form

$$w(x, y, t) = u(z, t) + 2\ln|x|, \quad z = y/x.$$

⊙ *Reference for equation* 8.3.2.2: N. H. Ibragimov (1994, pp. 245–246).

3. $\dfrac{\partial^2 w}{\partial t^2} + k\dfrac{\partial w}{\partial t} = a\dfrac{\partial}{\partial x}\left(e^w\dfrac{\partial w}{\partial x}\right) + b\dfrac{\partial}{\partial y}\left(e^{\lambda w}\dfrac{\partial w}{\partial y}\right).$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1 x + C_2, \pm C_1^{\lambda} y + C_3, t + C_4) - 2\ln|C_1|,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solution in implicit form:

$$\int \frac{a_1\beta_1^2 e^w + a_2\beta_2^2 e^{\lambda w} - \gamma^2}{k\gamma w + C_1}\,dw = \beta_1 x + \beta_2 y + \gamma t + C_2,$$

where C_1, C_2, β_1, β_2, and γ are arbitrary constants.

3°. "Two-dimensional" solution:

$$w(x, y, t) = U(\xi, t), \quad \xi = \beta x + \mu y,$$

where β and μ are arbitrary constants, and the function $U = U(\xi, t)$ is determined by the differential equation

$$\frac{\partial^2 U}{\partial t^2} + k\frac{\partial U}{\partial t} = \frac{\partial}{\partial \xi}\left[\left(a\beta^2 e^w + b\mu^2 e^{\lambda w}\right)\frac{\partial U}{\partial \xi}\right].$$

Remark. There is a more general, "two-dimensional" solution of the form

$$w(x, y, t) = V(\xi_1, \xi_2), \quad \xi_1 = \beta_1 x + \mu_1 y + \sigma_1 t, \quad \xi_2 = \beta_2 x + \mu_2 y + \sigma_2 t,$$

where the β_i, μ_i, and σ_i are arbitrary constants.

4°. There is a "two-dimensional" solution of the form

$$w(x, y, t) = u(z, t) + 2\ln|x|, \quad z = y|x|^{-\lambda}.$$

⊙ *Reference for equation* 8.3.2.3: N. H. Ibragimov (1994, pp. 245–246).

8.4. Equations with Two Space Variables Involving Arbitrary Functions

8.4.1. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[f(x)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[g(y)\dfrac{\partial w}{\partial y}\right] + h(w)$

1. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + b\dfrac{\partial^2 w}{\partial y^2} + f(w).$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm x + C_1, \pm y + C_2, \pm t + C_3),$$
$$w_2 = w\big(x\cos\beta + y\sqrt{a/b}\,\sin\beta,\ -x\sqrt{b/a}\,\sin\beta + y\cos\beta,\ t\big),$$
$$w_3 = w\big(x\cosh\lambda + ta^{1/2}\sinh\lambda,\ y,\ xa^{-1/2}\sinh\lambda + t\cosh\lambda\big),$$
$$w_4 = w\big(x,\ y\cosh\lambda + tb^{1/2}\sinh\lambda,\ yb^{-1/2}\sinh\lambda + t\cosh\lambda\big),$$

where C_1, C_2, C_3, β, and λ are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. Traveling-wave solution in implicit form:

$$\int \left[C_1 + \frac{2}{\lambda^2 - ak_1^2 - bk_2^2} F(w)\right]^{-1/2} dw = k_1 x + k_2 y + \lambda t + C_2, \qquad F(w) = \int f(w)\, dw,$$

where C_1, C_2, k_1, k_2, and λ are arbitrary constants.

3°. Solution (C_1, C_2, and C_3 are arbitrary constants):

$$w = w(r), \qquad r^2 = A\left[\frac{(x + C_1)^2}{a} + \frac{(y + C_2)^2}{b} - (t + C_3)^2\right].$$

Here, A and the expression in square brackets must have like signs, and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + 2r^{-1} w'_r + A^{-1} f(w) = 0.$$

4°. "Two-dimensional" solution:

$$w = U(\xi, \eta), \quad \xi = \frac{x}{\sqrt{a}C} + \frac{y}{\sqrt{b}}, \quad \eta = (C^2 - 1)\frac{x^2}{a} - 2C\frac{xy}{\sqrt{ab}} - C^2 t^2, \tag{1}$$

where C is an arbitrary constant ($C \neq 0$), and the function $U = U(\xi, \eta)$ is determined by the equation

$$\left(1 + \frac{1}{C^2}\right)\frac{\partial^2 U}{\partial \xi^2} - 4\xi \frac{\partial^2 U}{\partial \xi \partial \eta} + 4C^2(\xi^2 + \eta)\frac{\partial^2 U}{\partial \eta^2} + 2(2C^2 - 1)\frac{\partial U}{\partial \eta} + f(U) = 0. \tag{2}$$

Remark. Relations (1) and equation (2) can be used to obtain other "two-dimensional" solutions by means of the following renaming: $(x, a) \rightleftarrows (y, b)$.

5°. There is a "two-dimensional" solution of the form

$$w(x, y, t) = u(z_1, z_2), \qquad z_1 = C_1 x + C_2 y + \lambda_1 t, \qquad z_2 = C_3 x + C_4 y + \lambda_2 t.$$

2. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ax^n \dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(by^m \dfrac{\partial w}{\partial y}\right) + f(w)$.

1°. Solution for $n \neq 2$ and $m \neq 2$:

$$w = w(r), \qquad r^2 = 4k\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} - \frac{1}{4}(t + C)^2\right],$$

where C and k are arbitrary constants ($k \neq 0$) and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{A}{r} w'_r + k^{-1} f(w) = 0, \qquad A = \frac{2(4 - n - m)}{(2 - n)(2 - m)}.$$

2°. "Two-dimensional" solution for $n \neq 2$ and $m \neq 2$:

$$w = U(\xi, t), \qquad \xi^2 = 4k\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2}\right],$$

where the function $U(\xi, t)$ is determined by the differential equation

$$\frac{\partial^2 U}{\partial t^2} = k\left(\frac{\partial^2 U}{\partial \xi^2} + \frac{B_1}{\xi}\frac{\partial U}{\partial \xi}\right) + f(U), \qquad B_1 = \frac{4 - nm}{(2-n)(2-m)}.$$

3°. "Two-dimensional" solution for $m \neq 2$:

$$w = V(x, \eta), \qquad \eta^2 = 4k\left[\frac{y^{2-m}}{b(2-m)^2} - \frac{1}{4}(t + C)^2\right],$$

where the function $V(x, \eta)$ is determined by the differential equation

$$\frac{\partial}{\partial x}\left(ax^n \frac{\partial w}{\partial x}\right) + k\left(\frac{\partial^2 V}{\partial \eta^2} + \frac{B_2}{\eta}\frac{\partial V}{\partial \eta}\right) + f(V) = 0, \qquad B_2 = \frac{2}{2-m}.$$

4°. "Two-dimensional" solution for $n \neq 2$:

$$w = W(y, \zeta), \qquad \zeta^2 = 4k\left[\frac{x^{2-n}}{a(2-n)^2} - \frac{1}{4}(t + C)^2\right],$$

where the function $W(y, \zeta)$ is determined by the differential equation

$$\frac{\partial}{\partial y}\left(by^m \frac{\partial w}{\partial y}\right) + k\left(\frac{\partial^2 W}{\partial \zeta^2} + \frac{B_3}{\zeta}\frac{\partial W}{\partial \zeta}\right) + f(W) = 0, \qquad B_3 = \frac{2}{2-n}.$$

⊙ *Reference for equation* 8.4.1.2: A. D. Polyanin and A. I. Zhurov (1998), A. D. Polyanin and V. F. Zaitsev (2004, pp. 306).

3. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ax^n \dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\lambda y} \dfrac{\partial w}{\partial y}\right) + f(w).$

1°. Solution for $n \neq 2$ and $\lambda \neq 0$:

$$w = w(r), \qquad r^2 = 4k\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\lambda y}}{b\lambda^2} - \frac{1}{4}(t + C)^2\right],$$

where C and k are arbitrary constants ($k \neq 0$) and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{A}{r}w'_r + k^{-1} f(w) = 0, \qquad A = \frac{2}{2-n}.$$

2°. "Two-dimensional" solution for $n \neq 2$ and $\lambda \neq 0$:

$$w = U(\xi, t), \qquad \xi^2 = 4k\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\lambda y}}{b\lambda^2}\right],$$

where the function $U(\xi, t)$ is determined by the differential equation

$$\frac{\partial^2 U}{\partial t^2} = k\left(\frac{\partial^2 U}{\partial \xi^2} + \frac{B}{\xi}\frac{\partial U}{\partial \xi}\right) + f(U), \qquad B = \frac{n}{2-n}.$$

3°. "Two-dimensional" solution for $\lambda \neq 0$:

$$w = V(x,\eta), \qquad \eta^2 = 4k\left[\frac{e^{-\lambda y}}{b\lambda^2} - \frac{1}{4}(t+C)^2\right],$$

where the function $V(x,\eta)$ is determined by the differential equation

$$\frac{\partial}{\partial x}\left(ax^n\frac{\partial w}{\partial x}\right) + k\frac{\partial^2 V}{\partial \eta^2} + f(V) = 0.$$

4°. "Two-dimensional" solution for $n \neq 2$:

$$w = W(y,\zeta), \qquad \zeta^2 = 4k\left[\frac{x^{2-n}}{a(2-n)^2} - \frac{1}{4}(t+C)^2\right],$$

where the function $W(y,\zeta)$ is determined by the differential equation

$$\frac{\partial}{\partial y}\left(be^{\lambda y}\frac{\partial w}{\partial y}\right) + k\left(\frac{\partial^2 W}{\partial \zeta^2} + \frac{A}{\zeta}\frac{\partial W}{\partial \zeta}\right) + f(W) = 0, \qquad A = \frac{2}{2-n}.$$

4. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ae^{\beta x}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\lambda y}\dfrac{\partial w}{\partial y}\right) + f(w).$

1°. Solution for $\beta \neq 0$ and $\lambda \neq 0$:

$$w = w(r), \qquad r^2 = 4k\left[\frac{e^{-\beta x}}{a\beta^2} + \frac{e^{-\lambda y}}{b\lambda^2} - \frac{1}{4}(t+C)^2\right],$$

where the function $w(r)$ is determined by the autonomous ordinary differential equation

$$w''_{rr} + k^{-1}f(w) = 0.$$

Integrating yields its general solution in implicit form:

$$\int\left[C_1 + 2k^{-1}\int f(w)\,dw\right]^{-1/2} dw = C_2 \pm r,$$

where C_1 and C_2 are arbitrary constants.

2°. "Two-dimensional" solution for $\beta \neq 0$ and $\lambda \neq 0$:

$$w = U(\xi,t), \qquad \xi^2 = 4k\left(\frac{e^{-\beta x}}{a\beta^2} + \frac{e^{-\lambda y}}{b\lambda^2}\right),$$

where the function $U(\xi,t)$ is determined by the differential equation

$$\frac{\partial^2 U}{\partial t^2} = k\left(\frac{\partial^2 U}{\partial \xi^2} - \frac{1}{\xi}\frac{\partial U}{\partial \xi}\right) + f(U).$$

3°. "Two-dimensional" solution for $\lambda \neq 0$:

$$w = V(x,\eta), \qquad \eta^2 = 4k\left[\frac{e^{-\lambda y}}{b\lambda^2} - \frac{1}{4}(t+C)^2\right],$$

where the function $V(x,\eta)$ is determined by the differential equation

$$\frac{\partial}{\partial x}\left(ae^{\beta x}\frac{\partial w}{\partial x}\right)+k\frac{\partial^2 V}{\partial \eta^2}+f(V)=0.$$

4°. "Two-dimensional" solution for $\beta\neq 0$:

$$w=W(y,\zeta),\qquad \zeta^2=4k\left[\frac{e^{-\beta x}}{a\beta^2}-\frac{1}{4}(t+C)^2\right],$$

where the function $W(y,\zeta)$ is determined by the differential equation

$$\frac{\partial}{\partial y}\left(be^{\lambda y}\frac{\partial w}{\partial y}\right)+k\frac{\partial^2 W}{\partial \zeta^2}+f(W)=0.$$

⊙ *References*: A. D. Polyanin and A. I. Zhurov (1998), A. D. Polyanin and V. F. Zaitsev (2002).

5. $\dfrac{\partial^2 w}{\partial t^2}=\dfrac{\partial}{\partial x}\left[f(x)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[g(y)\dfrac{\partial w}{\partial y}\right]+aw\ln w+bw.$

This is a special case of equation 8.4.3.6 with $g(t)=b$ and $h_1(x)=h_2(y)=0$ and a special case of equation 8.4.3.7 with $f(x,y)=f(x)$ and $g(x,y)=g(y)$.

8.4.2. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2}=\dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[g(w)\dfrac{\partial w}{\partial y}\right]+h(w)$

1. $\dfrac{\partial^2 w}{\partial t^2}=a\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial}{\partial y}\left[g(w)\dfrac{\partial w}{\partial y}\right].$

1°. Suppose $w(x,y,t)$ is a solution of this equation. Then the functions

$$w_1=w(\pm C_1x+C_2,\pm C_1y+C_3,\pm C_1t+C_4),$$
$$w_2=w(x\cosh\lambda+ta^{1/2}\sinh\lambda,\ y,\ xa^{-1/2}\sinh\lambda+t\cosh\lambda),$$

where $C_1,\ldots,C_4$ and λ are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. Traveling-wave solution in implicit form:

$$k_2^2\int g(w)\,dw+(ak_1^2-\lambda^2)w=C_1(k_1x+k_2y+\lambda t)+C_2,$$

where C_1, C_2, k_1, k_2, and λ are arbitrary constants.

3°. Solutions in implicit form:

$$\int g(w)\,dw=y\varphi_1\big(x\pm t\sqrt{a}\,\big)+\varphi_2\big(x\pm t\sqrt{a}\,\big);$$
$$2\lambda\sqrt{a}\,(y+\lambda t)+(t\sqrt{a}\pm x)[g(w)-\lambda^2]=\psi(w),$$

where $\varphi_1(z)$, $\varphi_2(z)$, and $\psi(w)$ are arbitrary functions, and λ is an arbitrary constant.

4°. "Two-dimensional" solutions (generalize the solutions of Item 3°):

$$w(x,y,t) = U(\xi,\eta), \quad \xi = y + \lambda t, \quad \eta = x \pm t\sqrt{a},$$

where λ is an arbitrary constant and the function $U = U(\xi,\eta)$ is determined by the first-order partial differential equation

$$\big[g(U) - \lambda^2\big]\frac{\partial U}{\partial \xi} \mp 2\lambda\sqrt{a}\,\frac{\partial U}{\partial \eta} = \varphi(\eta), \tag{1}$$

with $\varphi(\eta)$ being an arbitrary function.

In the special case $\lambda = 0$, equation (1) is an ordinary differential equation in ξ that can be readily integrated to obtain the first group of solutions specified in Item 3°.

In the general case, the characteristic system corresponding to equation (1) has the form (Polyanin, Zaitsev, and Moussiaux, 2002)

$$\frac{d\xi}{g(U) - \lambda^2} = \mp\frac{d\eta}{2\lambda\sqrt{a}} = \frac{dU}{\varphi(\eta)}.$$

Its independent integrals are given by

$$U \pm \Phi(\eta) = C_1, \quad \xi \pm \frac{1}{2\lambda\sqrt{a}}\int g\big(C_1 \mp \Phi(\eta)\big)\,d\eta \mp \frac{\lambda}{2\sqrt{a}}\eta = C_2, \tag{2}$$

where

$$\Phi(\eta) = \frac{1}{2\lambda\sqrt{a}}\int \varphi(\eta)\,d\eta.$$

We first calculate the integral in the second relation of (2) and then, in the resulting expression, substitute the left-hand side of the first relation of (2) for C_1.

The general solution of equation (1) has the form

$$F(C_1, C_2) = 0,$$

where $F(C_1, C_2)$ is an arbitrary function of two variables, and C_1 and C_2 are determined by (2).

To the special case $\varphi(\eta) = 0$ in (1) there corresponds the second group of solutions specified in Item 3°.

5°. "Two-dimensional" solution:

$$w(x,y,t) = u(y,z), \quad z = x^2 - at^2,$$

where the function $u = u(y,z)$ is determined by the differential equation

$$4a\left(z\frac{\partial^2 u}{\partial z^2} + \frac{\partial u}{\partial z}\right) + \frac{\partial}{\partial y}\left[g(u)\frac{\partial u}{\partial y}\right] = 0.$$

6°. Solution:

$$w(x,y,t) = v(\zeta), \quad \zeta = (x^2 - at^2)y^{-2},$$

where the function $v = v(\zeta)$ is determined by the ordinary differential equation

$$2a\zeta v''_{\zeta\zeta} + 2av'_\zeta + 2\zeta^2[g(v)v'_\zeta]'_\zeta + 3\zeta g(v)v'_\zeta = 0.$$

7°. For other exact solutions, see equation 8.4.2.3 with $f(w) = a$.

⊙ *References for equation* 8.4.2.1: A. D. Polyanin and V. F. Zaitsev (2004, pp. 308–309).

2. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[f(w)\dfrac{\partial w}{\partial y}\right].$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1 x + C_2, \pm C_1 y + C_3, \pm C_1 t + C_4),$$
$$w_2 = w(x\cos\beta - y\sin\beta, x\sin\beta + y\cos\beta, t),$$

where $C_1, \ldots, C_4$ and β are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. Traveling-wave solution in implicit form:

$$(k_1^2 + k_2^2)\int f(w)\,dw - \lambda^2 w = C_1(k_1 x + k_2 y + \lambda t) + C_2,$$

where C_1, C_2, k_1, k_2, and λ are arbitrary constants.

3°. Solution:

$$w(x, y, t) = U(\zeta), \quad \zeta = (x^2 + y^2)t^{-2},$$

where the function $U = U(\zeta)$ is determined by the ordinary differential equation

$$2\zeta^2 U''_{\zeta\zeta} + 3\zeta U'_\zeta = 2[\zeta f(U)U'_\zeta]'_\zeta.$$

4°. "Two-dimensional" solution with axial symmetry:

$$w(x, y, t) = u(r, t), \quad r = \sqrt{x^2 + y^2},$$

where the function $u = u(r, t)$ is determined by the differential equation

$$\frac{\partial^2 u}{\partial t^2} = \frac{1}{r}\frac{\partial}{\partial r}\left[r f(u)\frac{\partial u}{\partial r}\right].$$

5°. For other exact solutions, see equation 8.4.2.3 with $f(w) = g(w)$.

3. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[g(w)\dfrac{\partial w}{\partial y}\right].$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the function

$$w_1 = w(\pm C_1 x + C_2, \pm C_1 y + C_3, \pm C_1 t + C_4),$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. Traveling-wave solution in implicit form:

$$\int \left[k_1^2 f(w) + k_2^2 g(w)\right] dw - \lambda^2 w = C_1(k_1 x + k_2 y + \lambda t) + C_2,$$

where C_1, C_2, k_1, k_2, and λ are arbitrary constants.

3°. Solutions in implicit form:

$$\left(\frac{C_1x+C_2y+C_3}{t+C_4}\right)^2 = C_1^2 f(w) + C_2^2 g(w),$$
$$\left(\frac{C_1y+C_2t+C_3}{x+C_4}\right)^2 f(w) + C_1^2 g(w) = C_2^2,$$
$$\left(\frac{C_1x+C_2t+C_3}{y+C_4}\right)^2 g(w) + C_1^2 f(w) = C_2^2,$$

where $C_1, \ldots, C_4$ are arbitrary constants.

4°. Solutions in implicit form:

$$x\frac{\sin\varphi_1(w)}{\sqrt{f(w)}} + y\frac{\cos\varphi_1(w)}{\sqrt{g(w)}} + t = \psi_1(w),$$
$$x\frac{\sin\varphi_2(w)}{\sqrt{f(w)}} + y\frac{\cos\varphi_2(w)}{\sqrt{g(w)}} - t = \psi_2(w),$$

where $\varphi_1(w)$, $\varphi_2(w)$, $\psi_1(w)$, and $\psi_2(w)$ are arbitrary functions.

5°. Solution:

$$w = w(\xi), \quad \xi = \frac{C_1x+C_2y+C_3}{t+C_4},$$

where $C_1, \ldots, C_4$ are arbitrary constants and the function $u(\xi)$ is determined by the ordinary differential equation

$$(\xi^2 w'_\xi)'_\xi = [\varphi(w)w'_\xi]'_\xi, \qquad \varphi(w) = C_1^2 f(w) + C_2^2 g(w),$$

which admits the first integral

$$\left[\xi^2 - C_1^2 f(w) - C_2^2 g(w)\right] w'_\xi = C_5. \tag{1}$$

To the special case $C_5 = 0$ there corresponds the first solution of Item 3°.

For $C_5 \neq 0$, treating w in (1) as the independent variable, one obtains a Riccati equation for $\xi = \xi(w)$:

$$C_5\xi'_w = \xi^2 - C_1^2 f(w) - C_2^2 g(w). \tag{2}$$

For exact solutions of equation (2), which is reduced to a second-order linear equation, see the book by Polyanin and Zaitsev (2003).

6°. Solution:

$$w = u(\eta), \quad \eta = \frac{C_1y+C_2t+C_3}{x+C_4},$$

where $C_1, \ldots, C_4$ are arbitrary constants and the function $u(\eta)$ is determined by the ordinary differential equation

$$C_2^2 u''_{\eta\eta} = [\eta^2 f(u)u'_\eta]'_\eta + C_1^2[g(u)u'_\eta]'_\eta,$$

which admits the first integral

$$[\eta^2 f(u) + C_1^2 g(u) - C_2^2]u'_\eta = C_5. \tag{3}$$

To the special case $C_5 = 0$ there corresponds the second solution of Item 3°.

For $C_5 \neq 0$, treating u in (3) as the independent variable, one obtains a Riccati equation for $\eta = \eta(u)$:

$$C_5\eta'_u = \eta^2 f(u) + C_1^2 g(u) - C_2^2. \tag{4}$$

For exact solutions of equation (4), which is reduced to a second-order linear equation, see the book by Polyanin and Zaitsev (2003).

7°. Solution:

$$w = v(\zeta), \quad \zeta = \frac{C_1x + C_2t + C_3}{y + C_4},$$

where $C_1, \ldots, C_4$ are arbitrary constants, and the function $v(\zeta)$ is determined by the first-order ordinary differential equation

$$[\zeta^2 g(v) + C_1^2 f(v) - C_2^2]v'_\zeta = C_5.$$

To the special case $C_5 = 0$, there corresponds the third solution of Item 3°. The inverse function $\zeta = \zeta(v)$ is determined by the Riccati equation that can be obtained from (4) with the renaming $u \to v$, $\eta \to \zeta$, and $f \rightleftarrows g$.

8°. "Two-dimensional" solution (a and b are arbitrary constants):

$$w(x, y, t) = U(z, t), \quad z = ax + by,$$

where the function $U = U(z, t)$ is determined by a differential equation of the form 7.4.4.6:

$$\frac{\partial^2 U}{\partial t^2} = \frac{\partial}{\partial z}\left[\varphi(U)\frac{\partial U}{\partial z}\right], \quad \varphi(U) = a^2 f(U) + b^2 g(U),$$

which can be reduced to a linear equation.

9°. "Two-dimensional" solution (a and b are arbitrary constants):

$$w(x, y, t) = V(x, \xi), \quad \xi = ay + bt,$$

where the function $V = V(x, \xi)$ is determined by a differential equation of the form 9.4.4.8:

$$\frac{\partial}{\partial x}\left[f(V)\frac{\partial V}{\partial x}\right] + \frac{\partial}{\partial \xi}\left[\psi(V)\frac{\partial V}{\partial \xi}\right] = 0, \quad \psi(V) = a^2 g(V) - b^2,$$

which can be reduced to a linear equation.

10°. "Two-dimensional" solution (a and b are arbitrary constants):

$$w(x, y, t) = W(y, \eta), \quad \eta = ax + bt,$$

where the function $W = W(y, \eta)$ is determined by a differential equation of the form 9.4.4.8:

$$\frac{\partial}{\partial y}\left[g(W)\frac{\partial W}{\partial x}\right] + \frac{\partial}{\partial \eta}\left[\chi(W)\frac{\partial W}{\partial \eta}\right] = 0, \quad \chi(W) = a^2 f(W) - b^2,$$

which can be reduced to a linear equation.

11°. There is a "two-dimensional" solution of the form (generalizes the solutions of Items 8° to 10°):

$$w(x, y, t) = Q(z_1, z_2), \quad z_1 = a_1x + b_1y + c_1t, \quad z_2 = a_2x + b_2y + c_2t.$$

12°. "Two-dimensional" solution:

$$w(x, y, t) = R(\xi, \eta), \quad \xi = xt^{-1}, \quad \eta = yt^{-1},$$

where the function $R = R(\xi, \eta)$ is determined by the differential equation

$$\xi^2\frac{\partial^2 R}{\partial \xi^2} + 2\xi\eta\frac{\partial^2 R}{\partial \xi \partial \eta} + \eta^2\frac{\partial^2 R}{\partial \eta^2} + 2\xi\frac{\partial R}{\partial \xi} + 2\eta\frac{\partial R}{\partial \eta} = \frac{\partial}{\partial \xi}\left[f(R)\frac{\partial R}{\partial \xi}\right] + \frac{\partial}{\partial \eta}\left[g(R)\frac{\partial R}{\partial \eta}\right].$$

13°. For results of the group analysis of the original equation, see Ibragimov (1994).

⊙ *References for equation* 8.4.2.3: A. D. Polyanin and V. F. Zaitsev (2004, pp. 310–312), A. D. Polyanin (2006, http://eqworld.ipmnet.ru/eqarchive/view.php?id=44).

4. $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial}{\partial y}\left[f(w)\dfrac{\partial w}{\partial y}\right] + g(w).$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm x + C_1, \pm y + C_2, \pm t + C_3),$$
$$w_2 = w(x\cosh\lambda + ta^{1/2}\sinh\lambda,\ y,\ xa^{-1/2}\sinh\lambda + t\cosh\lambda),$$

where C_1, C_2, C_3, and λ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solution in implicit form:

$$\int h(w)\left[C_1 - 2\int h(w)g(w)\,dw\right]^{-1/2} dw = k_1x + k_2y + \lambda t + C_2, \qquad h(w) = k_2^2 f(w) + ak_1^2 - \lambda^2,$$

where C_1, C_2, k_1, k_2, and λ are arbitrary constants.

3°. Solutions in implicit form:

$$\int f(w)\left[\varphi\big(x + t\sqrt{a}\,\big) - 2\int f(w)g(w)\,dw\right]^{-1/2} dw = \psi\big(x + t\sqrt{a}\,\big) \pm y,$$
$$\int f(w)\left[\varphi\big(x - t\sqrt{a}\,\big) - 2\int f(w)g(w)\,dw\right]^{-1/2} dw = \psi\big(x - t\sqrt{a}\,\big) \pm y,$$

where $\varphi(z)$ and $\psi(z)$ are arbitrary functions.

4°. There are "two-dimensional" solutions of the following forms:

$$w(x, y, t) = U(y, z), \quad z = x^2 - at^2;$$
$$w(x, y, t) = V(\xi, \eta), \quad \xi = A_1x + B_1y + C_1t, \quad \eta = A_2x + B_2y + C_2t.$$

⊙ *References for equation* 8.4.2.4: A. D. Polyanin and V. F. Zaitsev (2004, p. 312).

5. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[f(w)\dfrac{\partial w}{\partial y}\right] + g(w).$

1°. Suppose the function $f = f(w)$ is arbitrary and the function $g = g(w)$ is defined as

$$g(w) = -a^2\frac{f'(w)}{f^3(w)} + b,$$

where a and b are some numbers. Then there is a functional separable solution, which can be represented in the implicit form

$$\int f(w)\,dw = at + U(x, y),$$

where the function $U = U(x, y)$ is determined by the Poisson equation

$$\frac{\partial^2 U}{\partial x^2} + \frac{\partial^2 U}{\partial y^2} + b = 0.$$

For solutions of this linear equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

Remark. The constant b in the expression of g can be replaced by an arbitrary function $b = b(x, y)$.

2°. Suppose that the determining functions are defined parametrically as

$$f = \frac{Ae^{-bz}}{\varphi'_z(z)},$$
$$g = a^2\varphi''_{zz}(z) - Ace^{-bz},$$
$$w = \varphi(z),$$

where $\varphi(z)$ is an arbitrary function, z is the parameter, and A, a, b, and c are some numbers. Then the equation in question has a functional separable solution of the form

$$w = \varphi(z), \quad z = at + \theta(x, y),$$

where θ is a function that satisfies the equation

$$\Delta\theta = b|\nabla\theta|^2 + c.$$

The substitution

$$\theta = -\frac{1}{b}\ln|u|$$

reduces this equation to the Helmholtz equation

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + bcu = 0.$$

For solutions of this linear equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

8.4.3. Other Equations

1. $\dfrac{\partial^2 w}{\partial t^2} = ax^n\dfrac{\partial^2 w}{\partial x^2} + by^m\dfrac{\partial^2 w}{\partial y^2} + f(w).$

1°. Solution for $n \neq 2$ and $m \neq 2$:

$$w = w(r), \qquad r^2 = \frac{4}{k}\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} - \frac{1}{4}(t+C)^2\right],$$

where C and k are arbitrary constants ($k \neq 0$) and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{A}{r}w'_r + kf(w) = 0, \qquad A = 2\left(\frac{1-n}{2-n} + \frac{1-m}{2-m}\right).$$

2°. There are "two-dimensional" solutions of the following forms:

$$w(x, y, t) = U(\xi, t), \quad \xi^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2}\right],$$
$$w(x, y, t) = V(x, \eta), \quad \eta^2 = \pm 4\left[\frac{y^{2-m}}{b(2-m)^2} - \frac{1}{4}(t+C)^2\right],$$
$$w(x, y, t) = W(y, \zeta), \quad \zeta^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} - \frac{1}{4}(t+C)^2\right].$$

2. $\dfrac{\partial^2 w}{\partial t^2} = ax^n \dfrac{\partial^2 w}{\partial x^2} + be^{\lambda y} \dfrac{\partial^2 w}{\partial y^2} + f(w).$

1°. Solution for $n \neq 2$ and $\lambda \neq 0$:

$$w = w(r), \qquad r^2 = \frac{4}{k}\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\lambda y}}{b\lambda^2} - \frac{1}{4}(t+C)^2\right],$$

where C and k are arbitrary constants ($k \neq 0$) and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{A}{r} w'_r + kf(w) = 0, \qquad A = \frac{2(3-n)}{2-n}.$$

2°. There are "two-dimensional" solutions of the following forms:

$$w = U(\xi, t), \quad \xi^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\lambda y}}{b\lambda^2}\right],$$
$$w = V(x, \eta), \quad \eta^2 = \pm 4\left[\frac{e^{-\lambda y}}{b\lambda^2} - \frac{1}{4}(t+C)^2\right],$$
$$w = W(y, \zeta), \quad \zeta^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} - \frac{1}{4}(t+C)^2\right].$$

3. $\dfrac{\partial^2 w}{\partial t^2} = ae^{\beta x} \dfrac{\partial^2 w}{\partial x^2} + be^{\lambda y} \dfrac{\partial^2 w}{\partial y^2} + f(w).$

1°. Solution for $\beta \neq 0$ and $\lambda \neq 0$:

$$w = w(r), \qquad r^2 = \frac{4}{k}\left[\frac{e^{-\beta x}}{a\beta^2} + \frac{e^{-\lambda y}}{b\lambda^2} - \frac{1}{4}(t+C)^2\right],$$

where C and k are arbitrary constants ($k \neq 0$) and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + 4r^{-1} w'_r + kf(w) = 0.$$

2°. There are "two-dimensional" solutions of the following forms:

$$w = U(\xi, t), \quad \xi^2 = 4\left(\frac{e^{-\beta x}}{a\beta^2} + \frac{e^{-\lambda y}}{b\lambda^2}\right),$$
$$w = V(x, \eta), \quad \eta^2 = \pm 4\left[\frac{e^{-\lambda y}}{b\lambda^2} - \frac{1}{4}(t+C)^2\right],$$
$$w = W(y, \zeta), \quad \zeta^2 = \pm 4\left[\frac{e^{-\beta x}}{a\beta^2} - \frac{1}{4}(t+C)^2\right].$$

4. $\dfrac{\partial^2 w}{\partial t^2} = \big[aw + f(t)\big]\left(\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2}\right) + bw^2 + g(t)w + h(t), \qquad a \neq 0.$

Generalized separable solution:

$$w(x, y, t) = \varphi(t) + \psi(t)\Theta(x, y),$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of ordinary differential equations

$$\varphi''_{tt} = b\varphi^2 + g(t)\varphi + h(t),$$
$$\psi'_{tt} = \big[b\varphi - \beta f(t) + g(t)\big]\psi, \qquad \beta = b/a,$$

and the function $\Theta = \Theta(x, y)$ satisfies the two-dimensional Helmholtz equation

$$\Delta\Theta + \beta\Theta = 0, \qquad \Delta \equiv \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}.$$

For solutions of this linear equation, see Tikhonov and Samarskii (1990) and Polyanin (2002).

5. $\dfrac{\partial^2 w}{\partial t^2} = aw\left(\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2}\right) - a\left[\left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2\right] + f(t).$

1°. Generalized separable solution:

$$w(x, y, t) = \varphi(t) + \psi(t)e^{\beta x + \gamma y},$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of ordinary differential equations

$$\varphi''_{tt} = f(t), \qquad \psi''_{tt} = a(\beta^2 + \gamma^2)\varphi\psi.$$

The solution of the first equation is expressed as (C_1 and C_2 are arbitrary constants)

$$\varphi(t) = \int_0^t (t - \tau)f(\tau)\,d\tau + C_1 t + C_2.$$

The solution of the second equation, which is linear in ψ, can be found in Kamke (1977) and Polyanin and Zaitsev (1995, 2003) for many $f(t)$.

2°. There are generalized separable solutions of the following forms:

$$w(x, y, t) = \varphi(t) + \psi(t)(A_1 \cosh \mu x + A_2 \sinh \mu x) + \chi(t)(B_1 \cos \mu y + B_2 \sin \mu y),$$
$$w(x, y, t) = \varphi(t) + \psi(t)(A_1 \cos \mu x + A_2 \sin \mu x) + \chi(t)(B_1 \cosh \mu y + B_2 \sinh \mu y),$$

where A_1, A_2, B_1, B_2, and μ are arbitrary constants, and the functions $\varphi(t)$, $\psi(t)$, and $\chi(t)$ are determined by solving an appropriate system of second-order ordinary differential equations (not written out here).

3°. There are generalized separable solutions of the form

$$w(x, y, t) = \varphi(t) + \psi(t)F(x) + \chi(t)G(y) + \eta(t)H(x)P(y),$$

where

$$F(x) = A_1 \cos 2\mu x + A_2 \sin 2\mu x, \qquad G(y) = B_1 \cosh 2\mu y + B_2 \sinh 2\mu y,$$
$$H(x) = C_1 \cos \mu x + C_2 \sin \mu x, \qquad P(y) = D_1 \cosh \mu y + D_2 \sinh \mu y.$$

The arbitrary constants $A_1, A_2, B_1, B_2, C_1, C_2, D_1, D_2$, and μ are related by two constraints, and the functions $\varphi(t)$, $\psi(t)$, $\chi(t)$, and $\eta(t)$ satisfy a system of second-order ordinary differential equations (not written out here).

6. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[f_1(x)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[f_2(y)\dfrac{\partial w}{\partial y}\right] + aw\ln w + \big[g(t) + h_1(x) + h_2(y)\big]w.$

Multiplicative separable solution:

$$w(x, y, t) = \varphi(x)\psi(y)\chi(t),$$

where the functions $\varphi = \varphi(x)$, $\psi = \psi(y)$, and $\chi = \chi(t)$ are determined by the ordinary differential equations

$$[f_1(x)\varphi_x']_x' + a\varphi\ln\varphi + [h_1(x) + C_1]\varphi = 0,$$
$$[f_2(y)\psi_y']_y' + a\psi\ln\psi + [h_2(y) + C_2]\psi = 0,$$
$$\chi_{tt}'' - a\chi\ln\chi - [g(t) - C_1 - C_2]\chi = 0,$$

and C_1 and C_2 are arbitrary constants.

7. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[f(x, y)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[g(x, y)\dfrac{\partial w}{\partial y}\right] + kw\ln w.$

Multiplicative separable solution:

$$w(x, y, t) = \varphi(t)\Theta(x, y),$$

where the function $\varphi(t)$ is determined by the ordinary differential equation

$$\varphi_{tt}'' - k\varphi\ln\varphi - A\varphi = 0, \tag{1}$$

A is an arbitrary constant, and the function $\Theta(x, y)$ satisfies the stationary equation

$$\frac{\partial}{\partial x}\left[f(x, y)\frac{\partial\Theta}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(x, y)\frac{\partial\Theta}{\partial y}\right] + k\Theta\ln\Theta - A\Theta = 0.$$

A particular solution of equation (1) is given by (B is an arbitrary constant)

$$\varphi(t) = \exp\left[\frac{k}{4}(t + B)^2 + \frac{k - 2A}{2k}\right],$$

and the general solution can be written out in implicit form as (B and C are arbitrary constants)

$$\int\left[k\varphi^2\ln\varphi + (A - \tfrac{1}{2}k)\varphi^2 + B\right]^{-1/2} d\varphi = C \pm t.$$

8. $\dfrac{\partial^2 w}{\partial t^2} = f_1(x, y)\dfrac{\partial^2 w}{\partial x^2} + f_2(x, y)\dfrac{\partial^2 w}{\partial x\partial y} + f_3(x, y)\dfrac{\partial^2 w}{\partial y^2}$
$+ g_1(x, y)\dfrac{\partial w}{\partial x} + g_2(x, y)\dfrac{\partial w}{\partial y} + \big[h(x, y) + s(t)\big]w + kw\ln w.$

Multiplicative separable solution:

$$w(x, y, t) = \varphi(t)\theta(x, y),$$

where the function $\varphi = \varphi(t)$ is determined by the ordinary differential equation

$$\varphi_{tt}'' - k\varphi\ln\varphi - \big[s(t) + C\big]\varphi = 0,$$

and the function $\theta = \theta(x, y)$ satisfies the stationary equation

$$f_1(x, y)\frac{\partial^2\theta}{\partial x^2} + f_2(x, y)\frac{\partial^2\theta}{\partial x\partial y} + f_3(x, y)\frac{\partial^2\theta}{\partial y^2}$$
$$+ g_1(x, y)\frac{\partial\theta}{\partial x} + g_2(x, y)\frac{\partial\theta}{\partial y} + \big[h(x, y) - C\big]\theta + k\theta\ln\theta = 0.$$

9. $\dfrac{\partial^2 w}{\partial t^2} + f(t)\dfrac{\partial w}{\partial t} = g(t)\dfrac{\partial^2 w}{\partial x^2} + h(t)\dfrac{\partial}{\partial y}\left(w^m \dfrac{\partial w}{\partial y}\right).$

1°. "Two-dimensional" solution:

$$w(x,y,t) = \begin{cases} u(x,t)|y+C|^{1/(m+1)} & \text{if } m \neq -1, \\ u(x,t)\exp(Cy) & \text{if } m = -1, \end{cases}$$

where C is an arbitrary constant and the function $u(x,t)$ is determined by the linear telegraph equation

$$\frac{\partial^2 u}{\partial t^2} + f(t)\frac{\partial u}{\partial t} = g(t)\frac{\partial^2 u}{\partial x^2}.$$

2°. "Two-dimensional" solution:

$$w(x,y,t) = v(x,t)|y+C|^{2/m},$$

where the function $v(x,t)$ is determined by the differential equation

$$\frac{\partial^2 v}{\partial t^2} + f(t)\frac{\partial v}{\partial t} = g(t)\frac{\partial^2 v}{\partial x^2} + \frac{2(m+2)}{m^2}h(t)v^{m+1}.$$

For $m = -2$ and $m = -1$, this equation is linear.

10. $\dfrac{\partial^2 w}{\partial t^2} + f(t)\dfrac{\partial w}{\partial t} = g(t)\dfrac{\partial^2 w}{\partial x^2} + h(t)\dfrac{\partial}{\partial y}\left(e^{\lambda w}\dfrac{\partial w}{\partial y}\right).$

1°. "Two-dimensional" solution:

$$w(x,y,t) = u(x,t) + \frac{1}{\lambda}\ln|y+C|$$

where C is an arbitrary constant and the function $u(x,t)$ is determined by the linear telegraph equation

$$\frac{\partial^2 u}{\partial t^2} + f(t)\frac{\partial u}{\partial t} = g(t)\frac{\partial^2 u}{\partial x^2}.$$

2°. "Two-dimensional" solution:

$$w(x,y,t) = v(x,t) + \frac{2}{\lambda}\ln|y+C|,$$

where C is an arbitrary constant and the function $v(x,t)$ is determined by the differential equation

$$\frac{\partial^2 v}{\partial t^2} + f(t)\frac{\partial v}{\partial t} = g(t)\frac{\partial^2 v}{\partial x^2} + \frac{2}{\lambda}h(t)e^{\lambda v}.$$

8.5. Equations with Three Space Variables Involving Arbitrary Parameters

8.5.1. Equations of the Form

$$\frac{\partial^2 w}{\partial t^2} = \frac{\partial}{\partial x}\left[f(x)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(y)\frac{\partial w}{\partial y}\right] + \frac{\partial}{\partial z}\left[h(z)\frac{\partial w}{\partial z}\right] + aw^p$$

1. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right) + \dfrac{\partial}{\partial z}\left(cz^k\dfrac{\partial w}{\partial z}\right) + sw^p.$

1°. Suppose $w(x, y, z, t)$ is a solution of this equation. Then the functions

$$w_1 = C_1 w\Big(C_1^{\frac{p-1}{2-n}}x,\ C_1^{\frac{p-1}{2-m}}y,\ C_1^{\frac{p-1}{2-k}}z,\ \pm C_1^{\frac{p-1}{2}}t + C_2\Big),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Solution for $n \neq 2$, $m \neq 2$, $k \neq 2$, and $p \neq 1$:

$$w = \left[\frac{A}{2s(p-1)}\right]^{\frac{1}{p-1}}\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} + \frac{z^{2-k}}{c(2-k)^2} - \frac{1}{4}(t+C)^2\right]^{\frac{1}{1-p}},$$
$$A = \frac{1+p}{1-p} + \frac{2}{2-n} + \frac{2}{2-m} + \frac{2}{2-k}.$$

3°. There is a "three-dimensional" solution of the form

$$w(x, y, z, t) = |t|^{\frac{2}{1-p}}F(\rho_1, \rho_2, \rho_3), \quad \rho_1 = x|t|^{\frac{2}{n-2}}, \quad \rho_2 = y|t|^{\frac{2}{m-2}}, \quad \rho_3 = z|t|^{\frac{2}{k-2}}.$$

4°. For other exact solutions, see equation 8.6.1.2 with $f(w) = sw^p$.

2. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ae^{\lambda x}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\mu y}\dfrac{\partial w}{\partial y}\right) + \dfrac{\partial}{\partial z}\left(ce^{\nu z}\dfrac{\partial w}{\partial z}\right) + sw^p.$

1°. Suppose $w(x, y, z, t)$ is a solution of this equation. Then the functions

$$w_1 = C_1 w\Big(x + \frac{1-p}{\lambda}\ln C_1,\ y + \frac{1-p}{\mu}\ln C_1,\ z + \frac{1-p}{\nu}\ln C_1,\ \pm C_1^{\frac{p-1}{2}}t + C_2\Big),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Solution for $p \neq \pm 1$, $\lambda \neq 0$, $\mu \neq 0$, and $\nu \neq 0$:

$$w = \left[-\frac{s(p-1)^2}{2k(1+p)}(r + C_1)^2\right]^{\frac{1}{1-p}}, \quad r^2 = 4k\left[\frac{e^{-\lambda x}}{a\lambda^2} + \frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t + C_2)^2\right],$$

where C_1, C_2, and k are arbitrary constants.

3°. There is a "three-dimensional" solution of the form

$$w(x, y, z, t) = |t|^{\frac{2}{1-p}}F(\rho_1, \rho_2, \rho_3), \quad \rho_1 = x + \frac{2}{\lambda}\ln|t|, \quad \rho_2 = y + \frac{2}{\mu}\ln|t|, \quad \rho_3 = z + \frac{2}{\nu}\ln|t|.$$

4°. For other exact solutions, see equation 8.6.1.3 with $f(w) = sw^p$.

3. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ax^n \dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(by^m \dfrac{\partial w}{\partial y}\right) + \dfrac{\partial}{\partial z}\left(ce^{\nu z} \dfrac{\partial w}{\partial z}\right) + sw^p.$

1°. Suppose $w(x, y, z, t)$ is a solution of this equation. Then the functions

$$w_1 = C_1 w\Big(C_1^{\frac{p-1}{2-n}} x,\ C_1^{\frac{p-1}{2-m}} y,\ z + \frac{1-p}{\nu}\ln C_1,\ \pm C_1^{\frac{p-1}{2}} t + C_2\Big),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Solution for $n \neq 2$, $m \neq 2$, $\nu \neq 0$, and $p \neq 1$:

$$w = \left[\frac{A}{2s(p-1)}\right]^{\frac{1}{p-1}} \left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C)^2\right]^{\frac{1}{1-p}},$$
$$A = \frac{1+p}{1-p} + \frac{2}{2-n} + \frac{2}{2-m}.$$

3°. There is a "three-dimensional" solution of the form

$$w(x, y, z, t) = |t|^{\frac{2}{1-p}} F(\rho_1, \rho_2, \rho_3), \quad \rho_1 = x|t|^{\frac{2}{n-2}}, \quad \rho_2 = y|t|^{\frac{2}{m-2}}, \quad \rho_3 = z + \frac{2}{\nu}\ln|t|.$$

4°. For other exact solutions, see equation 8.6.1.4 with $f(w) = sw^p$.

4. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ax^n \dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\mu y} \dfrac{\partial w}{\partial y}\right) + \dfrac{\partial}{\partial z}\left(ce^{\nu z} \dfrac{\partial w}{\partial z}\right) + sw^p.$

1°. Suppose $w(x, y, z, t)$ is a solution of this equation. Then the functions

$$w_1 = C_1 w\Big(C_1^{\frac{p-1}{2-n}} x,\ y + \frac{1-p}{\mu}\ln C_1,\ z + \frac{1-p}{\nu}\ln C_1,\ \pm C_1^{\frac{p-1}{2}} t + C_2\Big),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Solution for $n \neq 2$, $\mu \neq 0$, $\nu \neq 0$, and $p \neq 1$:

$$w = \left[\frac{1}{2s(p-1)}\left(\frac{1+p}{1-p} + \frac{2}{2-n}\right)\right]^{\frac{1}{p-1}} \left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C)^2\right]^{\frac{1}{1-p}}.$$

3°. There is a "three-dimensional" solution of the form

$$w(x, y, z, t) = |t|^{\frac{2}{1-p}} F(\rho_1, \rho_2, \rho_3), \quad \rho_1 = x|t|^{\frac{2}{n-2}}, \quad \rho_2 = y + \frac{2}{\mu}\ln|t|, \quad \rho_3 = z + \frac{2}{\nu}\ln|t|.$$

4°. For other exact solutions, see equation 8.6.1.5 with $f(w) = sw^p$.

8.5.2. Equations of the Form

$$\frac{\partial^2 w}{\partial t^2} = \frac{\partial}{\partial x}\left[f(x)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(y)\frac{\partial w}{\partial y}\right] + \frac{\partial}{\partial z}\left[h(z)\frac{\partial w}{\partial z}\right] + ae^{\lambda w}$$

1. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right) + \dfrac{\partial}{\partial z}\left(cz^k\dfrac{\partial w}{\partial z}\right) + se^{\lambda w}.$

1°. Suppose $w(x, y, z, t)$ is a solution of this equation. Then the functions

$$w_1 = w\Big(C_1^{\frac{2}{2-n}}x,\ C_1^{\frac{2}{2-m}}y,\ C_1^{\frac{2}{2-k}}z,\ \pm C_1 t + C_2\Big) + \frac{2}{\lambda}\ln C_1,$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Solution for $n \neq 2$, $m \neq 2$, $k \neq 2$, and $\lambda \neq 0$:

$$w = -\frac{1}{\lambda}\ln\left\{\frac{2s\lambda}{A}\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} + \frac{z^{2-k}}{c(2-k)^2} - \frac{1}{4}(t+C)^2\right]\right\},$$
$$A = \frac{2}{2-n} + \frac{2}{2-m} + \frac{2}{2-k} - 1.$$

3°. There is a "three-dimensional" solution of the form

$$w(x, y, z, t) = F(\rho_1, \rho_2, \rho_3) - \frac{2}{\lambda}\ln|t|, \quad \rho_1 = x|t|^{\frac{2}{n-2}}, \quad \rho_2 = y|t|^{\frac{2}{m-2}}, \quad \rho_3 = z|t|^{\frac{2}{k-2}}.$$

4°. For other exact solutions, see equation 8.6.1.2 with $f(w) = se^{\lambda w}$.

2. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ae^{\lambda x}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\mu y}\dfrac{\partial w}{\partial y}\right) + \dfrac{\partial}{\partial z}\left(ce^{\nu z}\dfrac{\partial w}{\partial z}\right) + se^{\beta w}.$

1°. Suppose $w(x, y, z, t)$ is a solution of this equation. Then the functions

$$w_1 = w\Big(x - \frac{2}{\lambda}\ln C_1,\ y - \frac{2}{\mu}\ln C_1,\ z - \frac{2}{\nu}\ln C_1,\ \pm C_1 t + C_2\Big) + \frac{2}{\beta}\ln C_1,$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Solutions for $\lambda \neq 0$, $\mu \neq 0$, $\nu \neq 0$, and $\beta \neq 0$:

$$w(x, y, z, t) = -\frac{1}{\beta}\ln\left[-\frac{s\beta}{2k}(r + C_1)^2\right] \quad \text{if} \quad sk\beta < 0;$$
$$w(x, y, z, t) = -\frac{1}{\beta}\ln\left[-\frac{s\beta}{2kC_1^2}\sin^2(C_1 r + C_2)\right] \quad \text{if} \quad sk\beta < 0;$$
$$w(x, y, z, t) = -\frac{1}{\beta}\ln\left[-\frac{s\beta}{2kC_1^2}\sinh^2(C_1 r + C_2)\right] \quad \text{if} \quad sk\beta < 0;$$
$$w(x, y, z, t) = -\frac{1}{\beta}\ln\left[\frac{s\beta}{2kC_1^2}\cosh^2(C_1 r + C_2)\right] \quad \text{if} \quad sk\beta > 0,$$

where C_1, C_2, and k are arbitrary constants and

$$r^2 = 4k\left[\frac{e^{-\lambda x}}{a\lambda^2} + \frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t + C_3)^2\right],$$

where k and the expression in square brackets must have like signs.

3°. There is a "three-dimensional" solution of the form

$$w(x,y,z,t)=F(\rho_1,\rho_2,\rho_3)-\frac{2}{\beta}\ln|t|,\quad \rho_1=x+\frac{2}{\lambda}\ln|t|,\quad \rho_2=y+\frac{2}{\mu}\ln|t|,\quad \rho_3=z+\frac{2}{\nu}\ln|t|.$$

4°. For other exact solutions, see equation 8.6.1.3 with $f(w)=se^{\beta w}$.

3. $\dfrac{\partial^2 w}{\partial t^2}=\dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right)+\dfrac{\partial}{\partial z}\left(ce^{\nu z}\dfrac{\partial w}{\partial z}\right)+se^{\beta w}.$

1°. Suppose $w(x,y,z,t)$ is a solution of this equation. Then the functions

$$w_1=w\Big(C_1^{\frac{2}{2-n}}x,\ C_1^{\frac{2}{2-m}}y,\ z-\frac{2}{\nu}\ln C_1,\ \pm C_1 t+C_2\Big)+\frac{2}{\beta}\ln C_1,$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Solution for $n\neq 2$, $m\neq 2$, $\nu\neq 0$, and $\beta\neq 0$:

$$w=-\frac{1}{\beta}\ln\left\{\frac{2s\beta}{A}\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{y^{2-m}}{b(2-m)^2}+\frac{e^{-\nu z}}{c\nu^2}-\frac{1}{4}(t+C)^2\right]\right\},$$
$$A=\frac{2}{2-n}+\frac{2}{2-m}-1.$$

3°. There is a "three-dimensional" solution of the form

$$w(x,y,z,t)=F(\rho_1,\rho_2,\rho_3)-\frac{2}{\beta}\ln|t|,\quad \rho_1=x|t|^{\frac{2}{n-2}},\quad \rho_2=y|t|^{\frac{2}{m-2}},\quad \rho_3=z+\frac{2}{\nu}\ln|t|.$$

4°. For other exact solutions, see equation 8.6.1.4 with $f(w)=se^{\beta w}$.

4. $\dfrac{\partial^2 w}{\partial t^2}=\dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(be^{\mu y}\dfrac{\partial w}{\partial y}\right)+\dfrac{\partial}{\partial z}\left(ce^{\nu z}\dfrac{\partial w}{\partial z}\right)+se^{\beta w}.$

1°. Suppose $w(x,y,z,t)$ is a solution of this equation. Then the functions

$$w_1=w\Big(C_1^{\frac{2}{2-n}}x,\ y-\frac{2}{\mu}\ln C_1,\ z-\frac{2}{\nu}\ln C_1,\ \pm C_1 t+C_2\Big)+\frac{2}{\beta}\ln C_1,$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Solution for $n\neq 2$, $\mu\neq 0$, $\nu\neq 0$, and $\beta\neq 0$:

$$w=-\frac{1}{\beta}\ln\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{e^{-\mu y}}{b\mu^2}+\frac{e^{-\nu z}}{c\nu^2}-\frac{1}{4}(t+C)^2\right]+\frac{1}{\beta}\ln\frac{n}{2s\beta(2-n)}.$$

3°. There is a "three-dimensional" solution of the form

$$w(x,y,z,t)=F(\rho_1,\rho_2,\rho_3)-\frac{2}{\beta}\ln|t|,\quad \rho_1=x|t|^{\frac{2}{n-2}},\quad \rho_2=y+\frac{2}{\mu}\ln|t|,\quad \rho_3=z+\frac{2}{\nu}\ln|t|.$$

4°. For other exact solutions, see equation 8.6.1.5 with $f(w)=se^{\beta w}$.

8.5.3. Equations of the Form

$$\frac{\partial^2 w}{\partial t^2} = a\frac{\partial}{\partial x}\left(w^n\frac{\partial w}{\partial x}\right) + b\frac{\partial}{\partial y}\left(w^m\frac{\partial w}{\partial y}\right) + c\frac{\partial}{\partial z}\left(w^k\frac{\partial w}{\partial z}\right) + sw^p$$

1. $\dfrac{\partial^2 w}{\partial t^2} = a_1\dfrac{\partial^2 w}{\partial x^2} + a_2\dfrac{\partial^2 w}{\partial y^2} + a_3\dfrac{\partial}{\partial z}\left(w^k\dfrac{\partial w}{\partial z}\right).$

1°. Suppose $w(x, y, z, t)$ is a solution of this equation. Then the functions

$$\begin{aligned}
w_1 &= C_1^{-2}w(\pm C_2x + C_3, \pm C_2y + C_4, \pm C_1^kC_2z + C_5, \pm C_2t + C_6),\\
w_2 &= w(x\cos\beta + y\sqrt{a_1/a_2}\,\sin\beta, -x\sqrt{a_2/a_1}\,\sin\beta + y\cos\beta,\ z,\ t),\\
w_3 &= w(x\cosh\lambda + ta_1^{1/2}\sinh\lambda,\ y,\ z,\ xa_1^{-1/2}\sinh\lambda + t\cosh\lambda),\\
w_4 &= w(x,\ y\cosh\mu + ta_2^{1/2}\sinh\mu,\ z,\ ya_2^{-1/2}\sinh\mu + t\cosh\mu),
\end{aligned}$$

where $C_1, \ldots, C_6$, β, λ, and μ are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. Solutions:

$$\begin{aligned}
w(x, y, z, t) &= |z|^{\frac{1}{k+1}}\big[Ax^2 + By^2 + (a_1A + a_2B)t^2 + C_1xy + C_2xt + C_3yt\\
&\quad + C_4x + C_5y + C_6t + C_7\big];\\
w(x, y, z, t) &= |z|^{\frac{1}{k+1}}\big[A(a_2x^2 + a_1y^2 - a_1a_2t^2)^{-1/2} + B\big];\\
w(x, y, z, t) &= A|z|^{\frac{1}{k+1}}\exp\big(\lambda_1x + \lambda_2y \pm \gamma t\big) + B, \quad \gamma = \sqrt{a_1\lambda_1^2 + a_2\lambda_2^2};\\
w(x, y, z, t) &= A|z|^{\frac{1}{k+1}}\sin\big(\lambda_1x + C_1\big)\sin\big(\lambda_2y + C_2\big)\sin\big(\gamma t + C_3\big), \quad \gamma = \sqrt{a_1\lambda_1^2 + a_2\lambda_2^2};\\
w(x, y, z, t) &= \left[\frac{1}{a_3C_3^2}\left(\frac{C_1x + C_2y + C_3z + C_4}{t + C_5}\right)^2 - \frac{a_1C_1^2 + a_2C_2^2}{a_3C_3^2}\right]^{1/k};\\
w(x, y, z, t) &= \left[\frac{C_3^2 - a_2C_1^2}{a_3C_2^2} - \frac{a_1}{a_3C_2^2}\left(\frac{C_1y + C_2z + C_3t + C_4}{x + C_5}\right)^2\right]^{1/k};\\
w(x, y, z, t) &= \left[\frac{C_3^2 - a_1C_1^2}{a_3C_2^2} - \frac{a_2}{a_3C_2^2}\left(\frac{C_1x + C_2z + C_3t + C_4}{y + C_5}\right)^2\right]^{1/k};\\
w(x, y, z, t) &= \left[\frac{C_3^2 - a_1C_1^2 - a_2C_2^2}{a_3}\left(\frac{z + C_5}{C_1x + C_2y + C_3t + C_4}\right)^2\right]^{1/k},
\end{aligned}$$

where A, B, $C_1, \ldots, C_7$, λ_1, and λ_2 are arbitrary constants.

3°. Solutions:

$$w = \big|z\varphi(\xi) + \psi(\xi)\big|^{\frac{1}{k+1}}, \qquad \xi = C_1x + C_2y \pm t\sqrt{a_1C_1^2 + a_2C_2^2},$$

where C_1 and C_2 are arbitrary constants, $\varphi(\xi)$ and $\psi(\xi)$ are arbitrary functions.

4°. "Three-dimensional" solution (generalizes the first four solutions of Item 2°):

$$w(x,y,z,t)=|z|^{\frac{1}{k+1}}u(\widehat{x},\widehat{y},t),\quad \widehat{x}=a_1^{-1/2}x,\quad \widehat{y}=a_2^{-1/2}y,$$

where the function $u=u(\widehat{x},\widehat{y},t)$ is determined by the linear wave equation

$$\frac{\partial^2 u}{\partial t^2}=\frac{\partial^2 u}{\partial \widehat{x}^2}+\frac{\partial^2 u}{\partial \widehat{y}^2}.$$

For this equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

5°. Solutions in implicit form:

$$2\lambda\sqrt{a_1C_1^2+a_2C_2^2}\,\big(z+\lambda t\big)\pm\big(C_1x+C_2y\pm t\sqrt{a_1C_1^2+a_2C_2^2}\,\big)\big(a_3w^k-\lambda^2\big)=\Phi(w),$$

where $\Phi(w)$ is an arbitrary function, C_1, C_2, and λ are arbitrary constants.

6°. There are "three-dimensional" solutions of the following forms:

$$\begin{aligned}
&w(x,y,z,t)=|z|^{2/k}F(x,y,t);\\
&w(x,y,z,t)=|t|^{2\lambda}G(\xi,\eta,\zeta),\quad \xi=xt^{-1},\quad \eta=yt^{-1},\quad \zeta=z|t|^{-k\lambda-1};\\
&w(x,y,z,t)=H(r,z,t),\quad r=a_2x^2+a_1y^2;\\
&w(x,y,z,t)=U(\xi,y,z),\quad \xi=x^2-a_1t^2.
\end{aligned}$$

7°. There are "two-dimensional" and "one-dimensional" solutions of the following forms:

$$\begin{aligned}
&w(x,y,z,t)=|t|^{2\lambda}V(\rho,\zeta),\quad \rho=t^{-1}\sqrt{a_2x^2+a_1y^2},\quad \zeta=z|t|^{-k\lambda-1};\\
&w(x,y,z,t)=W(\zeta,z),\quad \zeta=a_2x^2+a_1y^2-a_1a_2t^2;\\
&w(x,y,z,t)=R(\eta),\quad \eta=(a_2x^2+a_1y^2-a_1a_2t^2)z^{-2};\\
&w(x,y,z,t)=|z|^{2/k}Q(p),\quad p=a_2x^2+a_1y^2-a_1a_2t^2,
\end{aligned}$$

where λ is an arbitrary constant.

8°. For other exact solutions, see equation 8.5.3.6 with $n=m=0$.

⊙ *References for equation* 8.5.3.1: N. H. Ibragimov (1994, p. 234), A. D. Polyanin and V. F. Zaitsev (2004, pp. 320–321).

2. $\dfrac{\partial^2 w}{\partial t^2}=a_1\dfrac{\partial^2 w}{\partial x^2}+a_2\dfrac{\partial}{\partial y}\left(w^k\dfrac{\partial w}{\partial y}\right)+a_3\dfrac{\partial}{\partial z}\left(w^k\dfrac{\partial w}{\partial z}\right)$.

1°. Suppose $w(x,y,z,t)$ is a solution of this equation. Then the functions

$$\begin{aligned}
&w_1=C_1^{-2}w(\pm C_2x+C_3,\pm C_1^kC_2y+C_4,\pm C_1^kC_2z+C_5,\pm C_2t+C_6),\\
&w_2=w\big(x,\ y\cos\beta+z\sqrt{a_2/a_3}\,\sin\beta,-y\sqrt{a_3/a_2}\,\sin\beta+z\cos\beta,\ t\big),\\
&w_3=w\big(x\cosh\lambda+ta_1^{1/2}\sinh\lambda,\ y,\ z,\ xa_1^{-1/2}\sinh\lambda+t\cosh\lambda\big),
\end{aligned}$$

where $C_1,\ldots,C_6$, β, and λ are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. Solutions:

$$w(x,y,z,t)=\left[\frac{(C_1x+C_2y+C_3z+C_4)^2-a_1C_1^2(t+C_5)^2}{(a_2C_2^2+a_3C_3^2)(t+C_5)^2}\right]^{1/k},$$

$$w(x,y,z,t)=\left[\frac{C_3^2(x+C_5)^2-a_1(C_1y+C_2z+C_3t+C_4)^2}{(a_2C_1^2+a_3C_2^2)(x+C_5)^2}\right]^{1/k},$$

$$w(x,y,z,t)=\left[\frac{(C_3^2-a_1C_1^2)(y+C_5)^2}{a_2(C_1x+C_2z+C_3t+C_4)^2+a_3C_2^2(y+C_5)^2}\right]^{1/k},$$

$$w(x,y,z,t)=\left[\frac{(C_3^2-a_1C_1^2)(z+C_5)^2}{a_3(C_1x+C_2y+C_3t+C_4)^2+a_2C_2^2(z+C_5)^2}\right]^{1/k},$$

where $C_1,\ldots,C_5$ are arbitrary constants.

3°. Solution:

$$w(x,y,z,t)=\big[\varphi(x+t\sqrt{a_1}\,)+\psi(x-t\sqrt{a_1}\,)\big]u^{\frac{1}{k+1}}(\widehat{y},\widehat{z}),\quad \widehat{y}=a_2^{-1/2}y,\quad \widehat{z}=a_3^{-1/2}z,$$

where $\varphi(\rho_1)$ and $\psi(\rho_2)$ are arbitrary functions and the function $u(\widehat{y},\widehat{z})$ is determined by the Laplace equation

$$\frac{\partial^2u}{\partial\widehat{y}^2}+\frac{\partial^2u}{\partial\widehat{z}^2}=0.$$

For this linear equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

4°. "Three-dimensional" solutions:

$$w=\big|v(\widehat{y},\widehat{z},\zeta)\big|^{\frac{1}{k+1}},\quad \widehat{y}=a_2^{-1/2}y,\quad \widehat{z}=a_3^{-1/2}z,\quad \zeta=x\pm t\sqrt{a_1},$$

where the function $v(\widehat{y},\widehat{z},\zeta)$ is determined by the Laplace equation

$$\frac{\partial^2v}{\partial\widehat{y}^2}+\frac{\partial^2v}{\partial\widehat{z}^2}=0,$$

which is implicitly independent of the cyclic variable ζ (the constants of integration that appear in the solution are arbitrary functions of ζ).

5°. Multiplicative separable solution (generalizes the solution of Item 3°):

$$w(x,y,z,t)=R(x,t)Q(y,z),$$

where the functions $R=R(x,t)$ and $Q=Q(y,z)$ are determined by the differential equations

$$\frac{\partial^2R}{\partial t^2}=a_1\frac{\partial^2R}{\partial x^2}+AR^{k+1},$$
$$a_2\frac{\partial}{\partial y}\left(Q^k\frac{\partial Q}{\partial y}\right)+a_3\frac{\partial}{\partial z}\left(Q^k\frac{\partial Q}{\partial z}\right)=AQ,$$

and A is an arbitrary constant.

6°. There are "three-dimensional" solutions of the following forms:

$$w(x,y,z,t) = t^{2\lambda}F(\xi,\eta,\zeta), \quad \xi = xt^{-1}, \ \ \eta = yt^{-k\lambda-1}, \ \ \zeta = zt^{-k\lambda-1};$$
$$w(x,y,z,t) = G(x,r,t), \qquad r = a_3y^2 + a_2z^2;$$
$$w(x,y,z,t) = H(\xi,y,z), \qquad \xi = x^2 - a_1t^2,$$

where λ is an arbitrary constant.

7°. There are "two-dimensional" and "one-dimensional" solutions of the following forms:

$$w(x,y,z,t) = U(\xi,\rho), \quad \xi = xt^{-1}, \ \ \rho = t^{-k\lambda-1}\sqrt{a_3y^2 + a_2z^2};$$
$$w(x,y,z,t) = V(r,\xi), \quad r = a_3y^2 + a_2z^2, \quad \xi = x^2 - a_1t^2;$$
$$w(x,y,z,t) = W(p,q), \quad p = (a_3y^2 + a_2z^2)t^{-2}, \quad q = xt^{-1};$$
$$w(x,y,z,t) = \Theta(\eta), \qquad \eta = (a_3y^2 + a_2z^2)(x^2 - a_1t^2)^{-1},$$

where λ is an arbitrary constant.

8°. For other exact solutions, see equation 8.5.3.6 with $n = 0$ and $m = k$.

⊙ *References for equation* 8.5.3.2: N. H. Ibragimov (1994, p. 233), A. D. Polyanin and V. F. Zaitsev (2004, pp. 322–323).

3. $\dfrac{\partial^2 w}{\partial t^2} = a_1\dfrac{\partial^2 w}{\partial x^2} + a_2\dfrac{\partial}{\partial y}\left(w^m\dfrac{\partial w}{\partial y}\right) + a_3\dfrac{\partial}{\partial z}\left(w^k\dfrac{\partial w}{\partial z}\right).$

1°. Suppose $w(x,y,z,t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-2}w(\pm C_2x + C_3, \pm C_1^mC_2y + C_4, \pm C_1^kC_2z + C_5, \pm C_2t + C_6),$$
$$w_2 = w(x\cosh\lambda + ta_1^{1/2}\sinh\lambda, \ y, \ z, \ xa_1^{-1/2}\sinh\lambda + t\cosh\lambda),$$

where $C_1, \ldots, C_6$ and λ are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. Multiplicative separable solution:

$$w(x,y,z,t) = \left[\varphi(x + t\sqrt{a_1}\,) + \psi(x - t\sqrt{a_1}\,)\right]|y + C_1|^{\frac{1}{m+1}}|z + C_2|^{\frac{1}{k+1}},$$

where $\varphi(\rho_1)$ and $\psi(\rho_2)$ are arbitrary functions and C_1 and C_2 are arbitrary constants.

3°. There are "three-dimensional" solutions of the following forms:

$$w(x,y,z,t) = t^{2\lambda}F(\xi,\eta,\zeta), \ \ \xi = xt^{-1}, \ \ \eta = yt^{-m\lambda-1}, \ \ \zeta = zt^{-k\lambda-1};$$
$$w(x,y,z,t) = G(r,y,z), \quad r = x^2 - a_1t^2;$$
$$w(x,y,z,t) = y^{2/m}H(x,s,t), \quad s = zy^{-k/m},$$

where λ is an arbitrary constant.

4°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,z,t) = U(p,q), \quad p = (x^2 - a_1t^2)y^{-2}, \quad q = zy^{-1};$$
$$w(x,y,z,t) = y^{2/m}V(r,s), \quad r = x^2 - a_1t^2, \quad s = zy^{-k/m}.$$

5°. For other exact solutions, see equation 8.5.3.6 with $n = 0$.

⊙ *References for equation* 8.5.3.3: N. H. Ibragimov (1994, p. 235), A. D. Polyanin, V. F. Zaitsev (2004, p. 323).

4. $\dfrac{\partial^2 w}{\partial t^2} = a_1\dfrac{\partial}{\partial x}\left(w^k\dfrac{\partial w}{\partial x}\right) + a_2\dfrac{\partial}{\partial y}\left(w^k\dfrac{\partial w}{\partial y}\right) + a_3\dfrac{\partial}{\partial z}\left(w^k\dfrac{\partial w}{\partial z}\right).$

1°. Suppose $w(x, y, z, t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-2} w(\pm C_1^k C_2 x + C_3, \pm C_1^k C_2 y + C_4, \pm C_1^k C_2 z + C_5, \pm C_2 t + C_6),$$
$$w_2 = w\big(x\cos\beta + y\sqrt{a_1/a_2}\,\sin\beta, -x\sqrt{a_2/a_1}\,\sin\beta + y\cos\beta, z, t\big),$$

where $C_1, \ldots, C_6$ and β are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. Solutions:

$$w(x, y, z, t) = (C_1 t + C_2)\big[a_3 C_3 x^2 + a_3 C_4 y^2 - (a_1 C_3 + a_2 C_4) z^2 + C_5\big]^{\frac{1}{k+1}},$$

$$w(x, y, z, t) = (C_1 t + C_2)\left(\frac{C_3}{\sqrt{a_2 a_3 x^2 + a_1 a_3 y^2 + a_1 a_2 z^2}} + C_4\right)^{\frac{1}{k+1}},$$

$$w(x, y, z, t) = \left[\frac{1}{a_1 C_1^2 + a_2 C_2^2 + a_3 C_3^2}\left(\frac{C_1 x + C_2 y + C_3 z + C_4}{t + C_5}\right)^2\right]^{1/k},$$

$$w(x, y, z, t) = \left[\frac{C_3^2 (x + C_5)^2}{a_1 (C_1 y + C_2 z + C_3 t + C_4)^2 + (a_2 C_1^2 + a_3 C_2^2)(x + C_5)^2}\right]^{1/k},$$

$$w(x, y, z, t) = \left[\frac{C_3^2 (y + C_5)^2}{a_2 (C_1 x + C_2 z + C_3 t + C_4)^2 + (a_1 C_1^2 + a_3 C_2^2)(y + C_5)^2}\right]^{1/k},$$

$$w(x, y, z, t) = \left[\frac{C_3^2 (z + C_5)^2}{a_3 (C_1 x + C_2 y + C_3 t + C_4)^2 + (a_1 C_1^2 + a_2 C_2^2)(z + C_5)^2}\right]^{1/k},$$

where $C_1, \ldots, C_5$ are arbitrary constants.

3°. Multiplicative separable solution:

$$w(x, y, z, t) = (C_1 t + C_2)\big[\Theta(\widehat{x}, \widehat{y}, \widehat{z})\big]^{\frac{1}{k+1}}, \quad \widehat{x} = a_1^{-1/2} x, \quad \widehat{y} = a_2^{-1/2} y, \quad \widehat{z} = a_3^{-1/2} z,$$

where the function $\Theta = \Theta(\widehat{x}, \widehat{y}, \widehat{z})$ is determined by the Laplace equation

$$\frac{\partial^2 \Theta}{\partial \widehat{x}^2} + \frac{\partial^2 \Theta}{\partial \widehat{y}^2} + \frac{\partial^2 \Theta}{\partial \widehat{z}^2} = 0.$$

For this linear equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

4°. There are "three-dimensional" solutions of the following forms:

$$w(x, y, z, t) = |t|^{2\lambda} F(\xi, \eta, \zeta), \quad \xi = x|t|^{-k\lambda-1}, \quad \eta = y|t|^{-k\lambda-1}, \quad \zeta = z|t|^{-k\lambda-1};$$
$$w(x, y, z, t) = |z|^{2/k} G(p, q, t), \quad p = xz^{-1}, \quad q = yz^{-1};$$
$$w(x, y, z, t) = H(\rho, z, t), \quad \rho = a_2 x^2 + a_1 y^2,$$

where λ is an arbitrary constant.

5°. There are solutions of the following forms:

$w(x,y,z,t) = U(r,t), \quad r = a_2a_3x^2 + a_1a_3y^2 + a_1a_2z^2$ "two-dimensional" solution;
$w(x,y,z,t) = V(\chi), \quad \chi = (a_2a_3x^2 + a_1a_3y^2 + a_1a_2z^2)t^{-2}$ "one-dimensional" solution.

6°. For other exact solutions, see equation 8.5.3.6 with $n = m = k$.

⊙ *References for equation* 8.5.3.4: N. H. Ibragimov (1994, p. 232), A. D. Polyanin and V. F. Zaitsev (2004, p. 324).

5. $\dfrac{\partial^2 w}{\partial t^2} = a_1\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + a_2\dfrac{\partial}{\partial y}\left(w^n\dfrac{\partial w}{\partial y}\right) + a_3\dfrac{\partial}{\partial z}\left(w^k\dfrac{\partial w}{\partial z}\right).$

1°. Suppose $w(x,y,z,t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-2}w(\pm C_1^n C_2 x + C_3, \pm C_1^n C_2 y + C_4, \pm C_1^k C_2 z + C_5, \pm C_2 t + C_6),$$
$$w_2 = w\big(x\cos\beta + y\sqrt{a_1/a_2}\,\sin\beta, -x\sqrt{a_2/a_1}\,\sin\beta + y\cos\beta, z, t\big),$$

where $C_1, \ldots, C_6$ and β are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

⊙ *Reference*: N. H. Ibragimov (1994).

2°. There are "three-dimensional" solutions of the following forms:

$$w(x,y,z,t) = t^{2\lambda}F(\xi,\eta,\zeta), \quad \xi = xt^{-n\lambda-1}, \quad \eta = yt^{-n\lambda-1}, \quad \zeta = zt^{-k\lambda-1};$$
$$w(x,y,z,t) = G(r,z,t), \quad r = a_2x^2 + a_1y^2;$$
$$w(x,y,z,t) = z^{2/k}H(p,q,t), \quad p = xz^{-n/k}, \quad q = yz^{-n/k},$$

where λ is an arbitrary constant.

3°. There are "two-dimensional" and "one-dimensional" solutions of the following forms:

$$w(x,y,z,t) = U(r,s), \quad r = (a_2x^2 + a_1y^2)t^{-2}, \quad s = zt^{-1};$$
$$w(x,y,z,t) = t^{-2/k}z^{2/k}V(\chi), \quad \chi = (a_2x^2 + a_1y^2)t^{2n/k-2}z^{-2n/k}.$$

4°. For other exact solutions, see equation 8.5.3.6 with $m = n$.

6. $\dfrac{\partial^2 w}{\partial t^2} = a_1\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + a_2\dfrac{\partial}{\partial y}\left(w^m\dfrac{\partial w}{\partial y}\right) + a_3\dfrac{\partial}{\partial z}\left(w^k\dfrac{\partial w}{\partial z}\right).$

This is a special case of equation 8.6.2.6 with $f(w) = a_1w^n$, $g(w) = a_2w^m$, and $h(w) = a_3w^k$.

1°. Suppose $w(x,y,z,t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^{-2}w(\pm C_1^n C_2 x + C_3, \pm C_1^m C_2 y + C_4, \pm C_1^k C_2 z + C_5, \pm C_2 t + C_6),$$

where $C_1, \ldots, C_6$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Multiplicative separable solution:

$$w(x,y,z,t) = (C_1 t + C_2)|x + C_3|^{\frac{1}{n+1}}|y + C_4|^{\frac{1}{m+1}}|z + C_5|^{\frac{1}{k+1}}.$$

3°. Traveling-wave solution in implicit form:

$$\frac{a_1 b_1^2}{n+1}w^{n+1} + \frac{a_2 b_2^2}{m+1}w^{m+1} + \frac{a_3 b_3^2}{k+1}w^{k+1} - \lambda^2 w = C_1(b_1 x + b_2 y + b_3 z + \lambda t) + C_2,$$

where C_1, C_2, b_1, b_2, b_3, and λ are arbitrary constants.

4°. Solutions in implicit form:

$$\left(\frac{C_1 x + C_2 y + C_3 z + C_4}{t + C_5}\right)^2 = a_1 C_1^2 w^n + a_2 C_2^2 w^m + a_3 C_3^2 w^k,$$

$$a_1 w^n \left(\frac{C_1 y + C_2 z + C_3 t + C_4}{x + C_5}\right)^2 + a_2 C_1^2 w^m + a_3 C_2^2 w^k = C_3^2,$$

$$a_2 w^m \left(\frac{C_1 x + C_2 z + C_3 t + C_4}{y + C_5}\right)^2 + a_1 C_1^2 w^n + a_3 C_2^2 w^k = C_3^2,$$

$$a_3 w^k \left(\frac{C_1 x + C_2 y + C_3 t + C_4}{z + C_5}\right)^2 + a_1 C_1^2 w^n + a_2 C_2^2 w^m = C_3^2,$$

where $C_1, \ldots, C_5$ are arbitrary constants.

5°. "Two-dimensional" solution (b_1, b_2, and b_3 are arbitrary constants):

$$w(x,y,z,t) = u(\xi,t), \quad \xi = b_1 x + b_2 y + b_3 z,$$

where the function $u = u(\xi,t)$ is determined by a differential equation of the form 7.4.4.6:

$$\frac{\partial^2 u}{\partial t^2} = \frac{\partial}{\partial \xi}\left[(a_1 b_1^2 u^n + a_2 b_2^2 u^m + a_3 b_3^2 u^k)\frac{\partial u}{\partial \xi}\right],$$

which can be reduced to a linear equation.

6°. "Two-dimensional" solution (c_1, c_2, and c_3 are arbitrary constants):

$$w(x,y,z,t) = v(x,\eta), \quad \eta = c_1 t + c_2 y + c_3 z, \tag{1}$$

where the function $v = v(x,\eta)$ is determined by a differential equation of the form 9.4.4.8:

$$a_1 \frac{\partial}{\partial x}\left(v^n \frac{\partial v}{\partial x}\right) + \frac{\partial}{\partial \eta}\left[\left(a_2 c_2^2 v^m + a_3 c_3^2 v^k - c_1^2\right)\frac{\partial v}{\partial \eta}\right] = 0, \tag{2}$$

which can be reduced to a linear equation.

Formula (1) and equation (2) can be used to obtain two other "two-dimensional" solutions by means of the following cyclic permutations of variables and determining parameters:

$$\begin{array}{ccc} & (x, a_1, n) & \\ \nearrow & & \searrow \\ (z, a_3, k) & \longleftarrow & (y, a_2, m) \end{array}$$

7°. "Two-dimensional" solution (the b_n and c_n are arbitrary constants):

$$w(x,y,z,t) = U(\zeta,\rho), \quad \zeta = b_1 t + b_2 x, \quad \rho = c_1 y + c_2 z,$$

where the function $U = U(\zeta,\rho)$ is determined by a differential equation of the form 9.4.4.8:

$$\frac{\partial}{\partial \zeta}\left[\Phi(U)\frac{\partial U}{\partial \zeta}\right] + \frac{\partial}{\partial \rho}\left[\Psi(U)\frac{\partial U}{\partial \rho}\right] = 0, \quad \Phi(U) = a_1 b_2^2 U^n - b_1^2, \quad \Psi(U) = a_2 c_1^2 U^m + a_3 c_2^2 U^k,$$

which can be reduced to a linear equation.

Remark. The solution specified in Item 7° can be used to obtain other "two-dimensional" solutions by means of cyclic permutations of variables and determining parameters, as shown in Item 6°.

8°. There are "three-dimensional" solutions of the following forms:

$$w(x,y,z,t) = t^{2\lambda}F(\xi,\eta,\zeta), \quad \xi = xt^{-n\lambda-1}, \quad \eta = yt^{-m\lambda-1}, \quad \zeta = zt^{-k\lambda-1};$$
$$w(x,y,z,t) = x^{2/n}G(r,s,t), \quad r = yx^{-m/n}, \quad s = zx^{-k/n},$$

where λ is an arbitrary constant.

9°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,z,t) = H(p,q), \quad p = b_1x + b_2y + b_3z + b_4t, \quad q = c_1x + c_2y + c_3z + c_4t;$$
$$w(x,y,z,t) = t^{-2/n}x^{2/n}U(\rho,\chi), \quad \rho = x^{-m/n}yt^{(m-n)/n}, \quad \chi = x^{-k/n}zt^{(k-n)/n},$$

where the b_n and c_n are arbitrary constants.

⊙ *References for equation* 8.5.3.6: N. H. Ibragimov (1994, p. 236), A. D. Polyanin and V. F. Zaitsev (2004, pp. 325–326).

7. $\dfrac{\partial^2 w}{\partial t^2} = a_1\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + a_2\dfrac{\partial}{\partial y}\left(w^m\dfrac{\partial w}{\partial y}\right) + a_3\dfrac{\partial}{\partial z}\left(w^k\dfrac{\partial w}{\partial z}\right) + bw^p.$

1°. Suppose $w(x,y,z,t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^2 w(\pm C_1^{p-n-1}x + C_2, \pm C_1^{p-m-1}y + C_3, \pm C_1^{p-k-1}z + C_4, \pm C_1^{p-1}t + C_5),$$

where $C_1, \ldots, C_5$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. There is a "three-dimensional" solution of the form

$$w(x,y,z,t) = t^{\frac{2}{1-p}}U(\xi,\eta,\zeta), \quad \xi = xt^{\frac{p-n-1}{1-p}}, \quad \eta = yt^{\frac{p-m-1}{1-p}}, \quad \zeta = zt^{\frac{p-k-1}{1-p}}.$$

8.5.4. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = a\dfrac{\partial}{\partial x}\left(e^{\lambda_1 w}\dfrac{\partial w}{\partial x}\right) + b\dfrac{\partial}{\partial y}\left(e^{\lambda_2 w}\dfrac{\partial w}{\partial y}\right) + c\dfrac{\partial}{\partial z}\left(e^{\lambda_3 w}\dfrac{\partial w}{\partial z}\right) + se^{\beta w}$

1. $\dfrac{\partial^2 w}{\partial t^2} = a_1\dfrac{\partial^2 w}{\partial x^2} + a_2\dfrac{\partial^2 w}{\partial y^2} + a_3\dfrac{\partial}{\partial z}\left(e^w\dfrac{\partial w}{\partial z}\right).$

1°. Suppose $w(x,y,z,t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1x + C_3, \pm C_1y + C_4, \pm C_1C_2z + C_5, \pm C_1t + C_6) - 2\ln|C_2|,$$
$$w_2 = w\big(x\cos\beta + y\sqrt{a_1/a_2}\,\sin\beta, -x\sqrt{a_2/a_1}\,\sin\beta + y\cos\beta,\ z,\ t\big),$$
$$w_3 = w\big(x\cosh\lambda + ta_1^{1/2}\sinh\lambda,\ y,\ z,\ xa_1^{-1/2}\sinh\lambda + t\cosh\lambda\big),$$
$$w_4 = w\big(x,\ y\cosh\mu + ta_2^{1/2}\sinh\mu,\ z,\ ya_2^{-1/2}\sinh\mu + t\cosh\mu\big),$$

where $C_1, \ldots, C_6$, β, λ, and μ are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. Solutions:

$$w(x,y,z,t) = C_1x^2 + C_2y^2 + (a_1C_1 + a_2C_2)t^2 + C_3xy + C_4xt + C_5yt + C_6x + C_7y + C_8t + C_9 + \ln|z|;$$

$$w(x,y,z,t) = C_1(a_2x^2 + a_1y^2 - a_1a_2t^2)^{-1/2} + C_2 + \ln|z|;$$

$$w(x,y,z,t) = C_1\exp\big(\lambda_1x + \lambda_2y \pm \gamma t\big) + C_2 + \ln|z|, \quad \gamma = \sqrt{a_1\lambda_1^2 + a_2\lambda_2^2};$$

$$w(x,y,z,t) = C_1\sin\big(\lambda_1x + C_2\big)\sin\big(\lambda_2y + C_3\big)\sin\big(\gamma t + C_4\big) + \ln|z|, \quad \gamma = \sqrt{a_1\lambda_1^2 + a_2\lambda_2^2};$$

$$w(x,y,z,t) = \ln\left[\frac{1}{a_3C_3^2}\left(\frac{C_1x + C_2y + C_3z + C_4}{t + C_5}\right)^2 - \frac{a_1C_1^2 + a_2C_2^2}{a_3C_3^2}\right];$$

$$w(x,y,z,t) = \ln\left[\frac{C_3^2 - a_2C_1^2}{a_3C_2^2} - \frac{a_1}{a_3C_2^2}\left(\frac{C_1y + C_2z + C_3t + C_4}{x + C_5}\right)^2\right];$$

$$w(x,y,z,t) = \ln\left[\frac{C_3^2 - a_1C_1^2}{a_3C_2^2} - \frac{a_2}{a_3C_2^2}\left(\frac{C_1x + C_2z + C_3t + C_4}{y + C_5}\right)^2\right];$$

$$w(x,y,z,t) = \ln\left[\frac{C_3^2 - a_1C_1^2 - a_2C_2^2}{a_3}\left(\frac{z + C_5}{C_1x + C_2y + C_3t + C_4}\right)^2\right],$$

where the C_n are arbitrary constants.

3°. Solutions:

$$w = \ln|z\varphi(\xi) + \psi(\xi)|, \qquad \xi = C_1x + C_2y \pm t\sqrt{a_1C_1^2 + a_2C_2^2},$$

where C_1 and C_2 are arbitrary constants, and $\varphi(\xi)$ and $\psi(\xi)$ are arbitrary functions.

4°. "Three-dimensional" solution (generalizes the first four solutions of Item 2°):

$$w(x,y,z,t) = u(\widehat{x},\widehat{y},t) + \ln|z|, \quad \widehat{x} = a_1^{-1/2}x, \quad \widehat{y} = a_2^{-1/2}y,$$

where the function $u = u(\widehat{x},\widehat{y},t)$ is determined by the linear wave equation

$$\frac{\partial^2u}{\partial t^2} = \frac{\partial^2u}{\partial\widehat{x}^2} + \frac{\partial^2u}{\partial\widehat{y}^2}.$$

For this equation, see Tikhonov and Samarskii (1990) and Polyanin (2002).

5°. "Two-dimensional" solution:

$$w(x,y,z,t) = U(\xi,t) + 2\ln|z|, \quad \xi = C_1x + C_2y,$$

where C_1 and C_2 are arbitrary constants and the function $U = U(\xi,t)$ is determined by a solvable equation of the form 7.2.1.1:

$$\frac{\partial^2U}{\partial t^2} = (a_1C_1^2 + a_2C_2^2)\frac{\partial^2U}{\partial\xi^2} + 2a_3e^U.$$

6°. "Two-dimensional" solution:

$$w(x,y,z,t) = v(x,\eta) + 2\ln|z|, \quad \eta = C_1y + C_2t, \tag{1}$$

where C_1 and C_2 are arbitrary constants and the function $v = v(\eta, t)$ is determined by the equation

$$(C_1^2 - a_2C_2^2)\frac{\partial^2 v}{\partial \eta^2} = a_1\frac{\partial^2 v}{\partial x^2} + 2a_3e^v. \tag{2}$$

For $\sigma = C_1^2 - a_2C_2^2 > 0$, on dividing by σ, one obtains a solvable equation of the form 7.2.1.1. For $\sigma = C_1^2 - a_2C_2^2 < 0$, the transformation $\eta = \widetilde{\eta}\sqrt{|\sigma|}$, $x = \widetilde{x}\sqrt{a_1}$ leads to a solvable equation of the form 9.2.1.1:

$$\frac{\partial^2 v}{\partial \widetilde{x}^2} + \frac{\partial^2 v}{\partial \widetilde{\eta}^2} = -2a_3e^v.$$

Remark. Relations (1) and equation (2) can be used to obtain another "two-dimensional" solution by means of the following renaming: $(x, a_1) \rightleftarrows (y, a_2)$.

7°. Solutions in implicit form:

$$2\lambda\sqrt{a_1C_1^2 + a_2C_2^2}\,\big(z + \lambda t\big) \pm \big(C_1x + C_2y \pm t\sqrt{a_1C_1^2 + a_2C_2^2}\,\big)\big(a_3e^w - \lambda^2\big) = \Phi(w),$$

where $\Phi(w)$ is an arbitrary function, and C_1, C_2, and λ are arbitrary constants.

8°. There are "three-dimensional" solutions of the following forms:

$$w(x, y, z, t) = F(x, y, t) + 2\ln|z|;$$
$$w(x, y, z, t) = G(\xi_1, \xi_2, \xi_3) - 2k\ln|t|, \quad \xi_1 = xt^{-1}, \quad \xi_2 = yt^{-1}, \quad \xi_3 = z|t|^{k-1};$$
$$w(x, y, z, t) = H(\eta_1, \eta_2, \eta_3) + 2\ln|z|, \quad \eta_1 = t + k_1\ln|z|, \quad \eta_2 = x + k_2\ln|z|, \quad \eta_3 = y + k_3\ln|z|;$$
$$w(x, y, z, t) = E(\zeta_1, \zeta_2, \zeta_3) + 2z, \quad \zeta_1 = te^z, \quad \zeta_2 = xe^z, \quad \zeta_3 = ye^z;$$
$$w(x, y, z, t) = P(r, z, t), \quad r = a_2x^2 + a_1y^2;$$
$$w(x, y, z, t) = Q(\rho, y, z), \quad \rho = x^2 - a_1t^2,$$

where k, k_1, k_2, and k_3 are arbitrary constants.

9°. There are solutions of the following forms:

$$w(x, y, z, t) = U(r, t) + 2\ln|z|, \quad r = a_2x^2 + a_1y^2 \qquad \text{"two-dimensional" solution;}$$
$$w(x, y, z, t) = V(\rho, y) + 2\ln|z|, \quad \rho = x^2 - a_1t^2 \qquad \text{"two-dimensional" solution;}$$
$$w(x, y, z, t) = W(\theta, z), \quad \theta = a_2x^2 + a_1y^2 - a_1a_2t^2 \qquad \text{"two-dimensional" solution;}$$
$$w(x, y, z, t) = R(\xi_1, \xi_2) + 2\ln|z/t|, \quad \xi_1 = xt^{-1}, \quad \xi_2 = yt^{-1} \qquad \text{"two-dimensional" solution;}$$
$$w(x, y, z, t) = S(\theta) + 2\ln|z|, \quad \theta = a_2x^2 + a_1y^2 - a_1a_2t^2 \qquad \text{"one-dimensional" solution;}$$
$$w(x, y, z, t) = T(\chi), \quad \chi = (a_2x^2 + a_1y^2 - a_1a_2t^2)z^{-2} \qquad \text{"one-dimensional" solution.}$$

10°. For other exact solutions, see equation 8.6.2.6 with $f(w) = a_1$, $g(w) = a_2$, and $h(w) = a_3e^w$.

⊙ *References for equation* 8.5.4.1: N. H. Ibragimov (1994, p. 235), A. D. Polyanin and V. F. Zaitsev (2004, pp. 327–328).

2. $\dfrac{\partial^2 w}{\partial t^2} = a_1\dfrac{\partial^2 w}{\partial x^2} + a_2\dfrac{\partial}{\partial y}\left(e^w\dfrac{\partial w}{\partial y}\right) + a_3\dfrac{\partial}{\partial z}\left(e^w\dfrac{\partial w}{\partial z}\right).$

1°. Suppose $w(x, y, z, t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1 x + C_3, \pm C_1 C_2 y + C_4, \pm C_1 C_2 z + C_5, \pm C_1 t + C_6) - 2\ln|C_2|,$$
$$w_2 = w\big(x, y\cos\beta + z\sqrt{a_2/a_3}\,\sin\beta, -y\sqrt{a_3/a_2}\,\sin\beta + z\cos\beta, t\big),$$
$$w_3 = w\big(x\cosh\lambda + ta_1^{1/2}\sinh\lambda,\ y,\ z, xa_1^{-1/2}\sinh\lambda + t\cosh\lambda\big),$$

where $C_1, \ldots, C_6$, β, and λ are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. Solutions:

$$w(x,y,z,t) = \varphi(x+t\sqrt{a_1}\,) + \psi(x-t\sqrt{a_1}\,) + \ln(a_3C_1y^2 + C_2yz - a_2C_1z^2 + C_3y + C_4z + C_5),$$
$$w(x,y,z,t) = \varphi(x+t\sqrt{a_1}\,) + \psi(x-t\sqrt{a_1}\,) + \ln\big[C_1\exp(C_2\sqrt{a_3}\,y)\sin(C_2\sqrt{a_2}\,z + C_3) + C_4\big],$$
$$w(x,y,z,t) = \varphi(x+t\sqrt{a_1}\,) + \psi(x-t\sqrt{a_1}\,) + \ln\big[C_1\exp(C_2\sqrt{a_2}\,z)\sin(C_2\sqrt{a_3}\,y + C_3) + C_4\big],$$
$$w(x,y,z,t) = \ln\left[\frac{(C_1x + C_2y + C_3z + C_4)^2 - a_1C_1^2(t+C_5)^2}{(a_2C_2^2 + a_3C_3^2)(t+C_5)^2}\right],$$
$$w(x,y,z,t) = \ln\left[\frac{C_3^2(x+C_5)^2 - a_1(C_1y + C_2z + C_3t + C_4)^2}{(a_2C_1^2 + a_3C_2^2)(x+C_5)^2}\right],$$
$$w(x,y,z,t) = \ln\left[\frac{(C_3^2 - a_1C_1^2)(y+C_5)^2}{a_2(C_1x + C_2z + C_3t + C_4)^2 + a_3C_2^2(y+C_5)^2}\right],$$
$$w(x,y,z,t) = \ln\left[\frac{(C_3^2 - a_1C_1^2)(z+C_5)^2}{a_3(C_1x + C_2y + C_3t + C_4)^2 + a_2C_2^2(z+C_5)^2}\right],$$

where $\varphi(\rho_1)$ and $\psi(\rho_2)$ are arbitrary functions and $C_1, \ldots, C_5$ are arbitrary constants.

3°. Solution (generalizes the first three solutions of Item 2°):

$$w(x,y,z,t) = \varphi(x + t\sqrt{a_1}\,) + \psi(x - t\sqrt{a_1}\,) + \ln u(\widehat{y}, \widehat{z}), \quad \widehat{y} = a_2^{-1/2}y, \quad \widehat{z} = a_3^{-1/2}z,$$

where $\varphi(\rho_1)$ and $\psi(\rho_2)$ are arbitrary functions and the function $u(\widehat{y}, \widehat{z})$ is determined by the Laplace equation

$$\frac{\partial^2 u}{\partial \widehat{y}^2} + \frac{\partial^2 u}{\partial \widehat{z}^2} = 0. \tag{1}$$

For this linear equation, see Tikhonov and Samarskii (1990) and Polyanin (2002).

4°. "Three-dimensional" solutions:

$$w = \ln\big|v(\widehat{y}, \widehat{z}, \zeta)\big|, \quad \widehat{y} = a_2^{-1/2}y, \quad \widehat{z} = a_3^{-1/2}z, \quad \zeta = x \pm t\sqrt{a_1},$$

where the function $v(\widehat{y}, \widehat{z}, \zeta)$ is determined by the Laplace equation

$$\frac{\partial^2 v}{\partial \widehat{y}^2} + \frac{\partial^2 v}{\partial \widehat{z}^2} = 0,$$

which is implicitly independent of the cyclic variable ζ (the constants of integration that appear in the solution will be arbitrary functions of ζ).

5°. Additive separable solution (generalizes the solution of Item 3°):

$$w(x,y,z,t) = R(\widehat{x},t) + \ln Q(\widehat{y},\widehat{z}), \quad \widehat{x} = a_1^{-1/2}x, \quad \widehat{y} = a_2^{-1/2}y, \quad \widehat{z} = a_3^{-1/2}z,$$

where the functions $R = R(\widehat{x},t)$ and $Q = Q(\widehat{y},\widehat{z})$ are determined by the differential equations

$$\frac{\partial^2 R}{\partial t^2} = \frac{\partial^2 R}{\partial \widehat{x}^2} + Ae^R, \tag{2}$$

$$\frac{\partial^2 Q}{\partial \widehat{y}^2} + \frac{\partial^2 Q}{\partial \widehat{z}^2} = A, \tag{3}$$

and A is an arbitrary constant. The general solution of equation (2) is given in 7.2.1.1. By the substitution $Q = \frac{1}{2}A\widehat{y}^2 + u$, the Helmholtz equation (3) can be reduced to the Laplace equation (1).

6°. There are "three-dimensional" solutions of the following forms:

$$w(x,y,z,t) = F(\xi,\eta,\zeta) - 2\lambda \ln|t|, \quad \xi = xt^{-1}, \quad \eta = y|t|^{\lambda-1}, \quad \zeta = z|t|^{\lambda-1};$$
$$w(x,y,z,t) = G(x,r,t), \quad r = a_3y^2 + a_2z^2;$$
$$w(x,y,z,t) = H(\rho,y,z), \quad \rho = x^2 - a_1t^2,$$

where λ is an arbitrary constant.

7°. There are solutions of the following forms:

$w(x,y,z,t) = E(r,\rho), \quad r = a_3y^2 + a_2z^2, \quad \rho = x^2 - a_1t^2$ "two-dimensional" solution;
$w(x,y,z,t) = U(\chi_1,\chi_2) + 2\ln|y/t|, \quad \chi_1 = x/t, \quad \chi_2 = z/y$ "two-dimensional" solution;
$w(x,y,z,t) = V(p,q), \quad p = (a_3y^2 + a_2z^2)t^{-2}, \quad q = xt^{-1}$ "two-dimensional" solution;
$w(x,y,z,t) = W(\eta), \quad \eta = (a_3y^2 + a_2z^2)(x^2 - a_1t^2)^{-1}$ "one-dimensional" solution.

8°. For other exact solutions, see equation 8.6.2.6 with $f(w) = a_1$, $g(w) = a_2e^w$, and $h(w) = a_3e^w$.

⊙ *References for equation* 8.5.4.2: N. H. Ibragimov (1994, p. 235), A. D. Polyanin and V. F. Zaitsev (2004, pp. 329–330).

3. $\dfrac{\partial^2 w}{\partial t^2} = a_1\dfrac{\partial^2 w}{\partial x^2} + a_2\dfrac{\partial}{\partial y}\left(e^w\dfrac{\partial w}{\partial y}\right) + a_3\dfrac{\partial}{\partial z}\left(e^{kw}\dfrac{\partial w}{\partial z}\right).$

1°. Suppose $w(x,y,z,t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1x + C_3, \pm C_1C_2y + C_4, \pm C_1C_2^kz + C_5, \pm C_1t + C_6) - \ln C_2^2,$$
$$w_2 = w(x\cosh\lambda + ta_1^{1/2}\sinh\lambda,\ y,\ z,\ xa_1^{-1/2}\sinh\lambda + t\cosh\lambda),$$

where $C_1, \ldots, C_6$ and λ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Additive separable solution:

$$w(x,y,z,t) = \varphi(x + t\sqrt{a_1}) + \psi(x - t\sqrt{a_1}) + \ln|y + C_1| + \frac{1}{k}\ln|z + C_2|,$$

where $\varphi(\rho_1)$ and $\psi(\rho_2)$ are arbitrary functions and C_1 and C_2 are arbitrary constants.

3°. There are "three-dimensional" solutions of the following forms:

$$w(x,y,z,t) = F(\xi,\eta,\zeta) - 2\beta\ln|t|, \quad \xi = xt^{-1}, \quad \eta = y|t|^{\beta-1}, \quad \zeta = z|t|^{k\beta-1};$$
$$w(x,y,z,t) = G(r,y,z), \quad r = x^2 - a_1t^2,$$

where β is an arbitrary constant.

4°. There are "two-dimensional" and "one-dimensional" solutions of the following forms:

$$w(x,y,z,t) = F(\rho_1,\rho_2) + 2\ln\left|\frac{y}{t}\right|, \quad \rho_1 = xt^{-1}, \quad \rho_2 = |t|^{k-1}|y|^{-k}z;$$
$$w(x,y,z,t) = U(p,q), \quad p = (x^2 - a_1t^2)y^{-2}, \quad q = zy^{-1};$$
$$w(x,y,z,t) = V(r,s) + 2\ln|y|, \quad r = x^2 - a_1t^2, \quad s = z|y|^{-k};$$
$$w(x,y,z,t) = W(\chi) - \frac{2}{k-1}\ln\left|\frac{y}{z}\right|, \quad \chi = |x^2 - a_1t^2|^{k-1}|y|^{-2k}z^2.$$

5°. For other exact solutions, see equation 8.6.2.6 with $f(w) = a_1$, $g(w) = a_2e^w$, and $h(w) = a_3e^{kw}$.

4. $\dfrac{\partial^2 w}{\partial t^2} = a_1\dfrac{\partial}{\partial x}\left(e^w\dfrac{\partial w}{\partial x}\right) + a_2\dfrac{\partial}{\partial y}\left(e^w\dfrac{\partial w}{\partial y}\right) + a_3\dfrac{\partial}{\partial z}\left(e^w\dfrac{\partial w}{\partial z}\right).$

This is a special case of equation 8.6.2.4 with $f(w) = e^w$.

1°. Suppose $w(x,y,z,t)$ is a solution of the equation in question. Then the functions

$$w_1 = w(\pm C_1C_2x + C_3, \pm C_1C_2y + C_4, \pm C_1C_2z + C_5, \pm C_1t + C_6) - \ln C_2^2,$$
$$w_2 = w\big(x\cos\beta + y\sqrt{a_1/a_2}\,\sin\beta, -x\sqrt{a_2/a_1}\,\sin\beta + y\cos\beta,\ z,\ t\big),$$

where $C_1, \ldots, C_6$ and β are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Solutions:

$$w(x,y,z,t) = C_1t + C_2 + \ln\big[a_3C_3x^2 + a_3C_4y^2 - (a_1C_3 + a_2C_4)z^2 + C_5\big],$$
$$w(x,y,z,t) = C_1t + C_2 + \ln\big[C_3(a_2a_3x^2 + a_1a_3y^2 + a_1a_2z^2)^{-1/2} + C_4\big],$$
$$w(x,y,z,t) = \ln\left[\frac{1}{a_1C_1^2 + a_2C_2^2 + a_3C_3^2}\left(\frac{C_1x + C_2y + C_3z + C_4}{t + C_5}\right)^2\right],$$
$$w(x,y,z,t) = \ln\left[\frac{C_3^2(x + C_5)^2}{a_1(C_1y + C_2z + C_3t + C_4)^2 + (a_2C_1^2 + a_3C_2^2)(x + C_5)^2}\right],$$
$$w(x,y,z,t) = \ln\left[\frac{C_3^2(y + C_5)^2}{a_2(C_1x + C_2z + C_3t + C_4)^2 + (a_1C_1^2 + a_3C_2^2)(y + C_5)^2}\right],$$
$$w(x,y,z,t) = \ln\left[\frac{C_3^2(z + C_5)^2}{a_3(C_1x + C_2y + C_3t + C_4)^2 + (a_1C_1^2 + a_2C_2^2)(z + C_5)^2}\right],$$

where $C_1, \ldots, C_5$ are arbitrary constants.

3°. Additive separable solution:

$$w(x,y,z,t) = C_1 t + C_2 + \ln\Theta(\widehat{x},\widehat{y},\widehat{z}), \quad \widehat{x} = a_1^{-1/2}x, \quad \widehat{y} = a_2^{-1/2}y, \quad \widehat{z} = a_3^{-1/2}z,$$

where the function $\Theta = \Theta(\widehat{x},\widehat{y},\widehat{z})$ is determined by the Laplace equation

$$\frac{\partial^2\Theta}{\partial\widehat{x}^2} + \frac{\partial^2\Theta}{\partial\widehat{y}^2} + \frac{\partial^2\Theta}{\partial\widehat{z}^2} = 0.$$

For this linear equation, see Tikhonov and Samarskii (1990) and Polyanin (2002).

4°. There are "three-dimensional" solutions of the following forms:

$$w(x,y,z,t) = F(\xi,\eta,\zeta) - 2\beta\ln|t|, \quad \xi = x|t|^{\beta-1}, \quad \eta = y|t|^{\beta-1}, \quad \zeta = z|t|^{\beta-1};$$
$$w(x,y,z,t) = G(\rho,z,t), \quad \rho = a_2x^2 + a_1y^2;$$
$$w(x,y,z,t) = H(p,q,t) + 2\ln|z|, \quad p = x/z, \quad q = y/z,$$

where β is an arbitrary constant.

5°. There are solutions of the following forms:

$w(x,y,z,t) = U(r,t)$, $\quad r = a_2a_3x^2 + a_1a_3y^2 + a_1a_2z^2$ "two-dimensional" solution;
$w(x,y,z,t) = V(\chi)$, $\quad \chi = (a_2a_3x^2 + a_1a_3y^2 + a_1a_2z^2)t^{-2}$ "one-dimensional" solution.

6°. For other exact solutions, see equation 8.5.4.6 with $\lambda_1 = \lambda_2 = \lambda_3 = 1$.

⊙ *References for equation* 8.5.4.4: N. H. Ibragimov (1994, p. 232), A. D. Polyanin and V. F. Zaitsev (2004, p. 331).

5. $$\frac{\partial^2 w}{\partial t^2} = a_1\frac{\partial}{\partial x}\left(e^w\frac{\partial w}{\partial x}\right) + a_2\frac{\partial}{\partial y}\left(e^w\frac{\partial w}{\partial y}\right) + a_3\frac{\partial}{\partial z}\left(e^{kw}\frac{\partial w}{\partial z}\right).$$

1°. Suppose $w(x,y,z,t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1C_2x + C_3, \pm C_1C_2y + C_4, \pm C_1C_2^kz + C_5, \pm C_1t + C_6) - \ln C_2^2,$$
$$w_2 = w\big(x\cos\beta + y\sqrt{a_1/a_2}\,\sin\beta,\ -x\sqrt{a_2/a_1}\,\sin\beta + y\cos\beta,\ z,\ t\big),$$

where $C_1, \ldots, C_6$ and β are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. Additive separable solution:

$$w(x,y,z,t) = C_1t + C_2 + \frac{1}{k}\ln|z + C_3| + \ln\Theta(\widehat{x},\widehat{y}), \quad \widehat{x} = a_1^{-1/2}x, \quad \widehat{y} = a_2^{-1/2}y,$$

where the function $\Theta = \Theta(\widehat{x},\widehat{y})$ is determined by the Laplace equation

$$\frac{\partial^2\Theta}{\partial\widehat{x}^2} + \frac{\partial^2\Theta}{\partial\widehat{y}^2} = 0.$$

For this linear equation, see Tikhonov and Samarskii (1990) and Polyanin (2002).

3°. There are "three-dimensional" solutions of the following forms:

$$w = F(\xi,\eta,\zeta) - 2\beta\ln|t|,\quad \xi = x|t|^{\beta-1},\quad \eta = y|t|^{\beta-1},\quad \zeta = z|t|^{k\beta-1};$$
$$w = G(r,z,t),\quad r = a_2x^2 + a_1y^2,$$

where β is an arbitrary constant.

4°. There are "two-dimensional" and "one-dimensional" solutions of the following forms:

$$w = H(\rho_1,\rho_2) + 2\ln|x/t|,\quad \rho_1 = y/x,\quad \rho_2 = |t|^{k-1}|x|^{-k}z;$$
$$w = U(\chi) + \ln\bigl[(a_2x^2 + a_1y^2)t^{-2}\bigr],\quad \chi = (a_2x^2 + a_1y^2)|z|^{-2/k}|t|^{2/k-2}.$$

5°. For other exact solutions, see equation 8.5.4.6 with $\lambda_1 = \lambda_2 = 1$ and $\lambda_3 = k$.

⊙ *References for equation* 8.5.4.5: N. H. Ibragimov (1994, p. 233), A. D. Polyanin and V. F. Zaitsev (2004, p. 332).

6. $$\frac{\partial^2 w}{\partial t^2} = a_1\frac{\partial}{\partial x}\left(e^{\lambda_1 w}\frac{\partial w}{\partial x}\right) + a_2\frac{\partial}{\partial y}\left(e^{\lambda_2 w}\frac{\partial w}{\partial y}\right) + a_3\frac{\partial}{\partial z}\left(e^{\lambda_3 w}\frac{\partial w}{\partial z}\right).$$

1°. Suppose $w(x,y,z,t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1C_2^{\lambda_1}x + C_3, \pm C_1C_2^{\lambda_2}y + C_4, \pm C_1C_2^{\lambda_3}z + C_5, \pm C_1t + C_6) - \ln C_2^2,$$

where $C_1, \ldots, C_6$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Additive separable solution:

$$w(x,y,z,t) = C_1t + C_2 + \frac{1}{\lambda_1}\ln|x + C_3| + \frac{1}{\lambda_2}\ln|y + C_4| + \frac{1}{\lambda_3}\ln|z + C_5|.$$

3°. Traveling-wave solution in implicit form:

$$\frac{a_1k_1^2}{\lambda_1}e^{\lambda_1 w} + \frac{a_2k_2^2}{\lambda_2}e^{\lambda_2 w} + \frac{a_3k_3^2}{\lambda_3}e^{\lambda_3 w} - \beta^2 w = C_1(k_1x + k_2y + k_3z + \beta t) + C_2,$$

where C_1, C_2, k_1, k_2, k_3, and β are arbitrary constants.

4°. Solutions in implicit form:

$$\left(\frac{C_1x + C_2y + C_3z + C_4}{t + C_5}\right)^2 = a_1C_1^2e^{\lambda_1 w} + a_2C_2^2e^{\lambda_2 w} + a_3C_3^2e^{\lambda_3 w},$$
$$a_1e^{\lambda_1 w}\left(\frac{C_1y + C_2z + C_3t + C_4}{x + C_5}\right)^2 + a_2C_1^2e^{\lambda_2 w} + a_3C_2^2e^{\lambda_3 w} = C_3^2,$$
$$a_2e^{\lambda_2 w}\left(\frac{C_1x + C_2z + C_3t + C_4}{y + C_5}\right)^2 + a_1C_1^2e^{\lambda_1 w} + a_3C_2^2e^{\lambda_3 w} = C_3^2,$$
$$a_3e^{\lambda_3 w}\left(\frac{C_1x + C_2y + C_3t + C_4}{z + C_5}\right)^2 + a_1C_1^2e^{\lambda_1 w} + a_2C_2^2e^{\lambda_2 w} = C_3^2,$$

where $C_1, \ldots, C_5$ are arbitrary constants.

5°. "Two-dimensional" solution (k_1, k_2, and k_3 are arbitrary constants):

$$w(x,y,z,t)=u(\xi,t),\quad \xi=k_1x+k_2y+k_3z,$$

where the function $u=u(\xi,t)$ is determined by a differential equation of the form 7.4.4.6:

$$\frac{\partial^2 u}{\partial t^2}=\frac{\partial}{\partial\xi}\left[\varphi(u)\frac{\partial u}{\partial\xi}\right],\quad \varphi(u)=a_1k_1^2e^{\lambda_1 w}+a_2k_2^2e^{\lambda_2 w}+a_3k_3^2e^{\lambda_3 w},$$

which can be reduced to a linear equation.

6°. "Two-dimensional" solution (b_1, b_2, and b_3 are arbitrary constants):

$$w(x,y,z,t)=v(x,\eta),\quad \eta=b_1y+b_2z+b_3t, \tag{1}$$

where the function $v=v(x,\eta)$ is determined by a differential equation of the form 9.4.4.8:

$$a_1\frac{\partial}{\partial x}\left(e^{\lambda_1 v}\frac{\partial v}{\partial x}\right)+\frac{\partial}{\partial\eta}\left[\psi(v)\frac{\partial v}{\partial\eta}\right]=0,\quad \psi(v)=a_2b_1^2e^{\lambda_2 v}+a_3b_2^2e^{\lambda_3 v}-b_3^2, \tag{2}$$

which can be reduced to a linear equation.

Relations (1) and equation (2) can be used to obtain two other "two-dimensional" solutions by means of the following cyclic permutations of variables and determining parameters:

$$\begin{array}{ccc} & (x,a_1,\lambda_1) & \\ \nearrow & & \searrow \\ (z,a_3,\lambda_3) & \longleftarrow & (y,a_2,\lambda_2) \end{array}$$

7°. "Two-dimensional" solution (b_n and c_n are arbitrary constants):

$$w(x,y,z,t)=U(\zeta,\rho),\quad \zeta=b_1t+b_2x,\quad \rho=c_1y+c_2z,$$

where the function $U=U(\zeta,\rho)$ is determined by a differential equation of the form 9.4.4.8:

$$\frac{\partial}{\partial\zeta}\left[\Phi(U)\frac{\partial U}{\partial\zeta}\right]+\frac{\partial}{\partial\rho}\left[\Psi(U)\frac{\partial U}{\partial\rho}\right]=0,\quad \Phi(U)=a_1b_2^2e^{\lambda_1 U}-b_1^2,\quad \Psi(U)=a_2c_1^2e^{\lambda_2 U}+a_3c_2^2e^{\lambda_3 U},$$

which can be reduced to a linear equation.

Remark. The solution specified in Item 7° can be used to obtain other "two-dimensional" solutions by means of cyclic permutations of variables and determining parameters as shown in Item 6°.

8°. There are more complicated "two-dimensional" solutions of the form

$$w(x,y,z,t)=V(z_1,z_2),\quad z_1=b_1x+b_2y+b_3z+b_4t,\quad z_2=c_1x+c_2y+c_3z+c_4t.$$

9°. There is a "two-dimensional" solution of the form

$$w(x,y,z,t)=W(\rho_1,\rho_2)+\frac{2}{\lambda_1}\ln\left|\frac{x}{t}\right|,\quad \rho_1=|t|^{\lambda_2/\lambda_1-1}|x|^{-\lambda_2/\lambda_1}y,\quad \rho_2=|t|^{\lambda_3/\lambda_1-1}|x|^{-\lambda_3/\lambda_1}z.$$

10°. There is a "three-dimensional" solution of the form

$$w(x,y,z,t)=F(\xi,\eta,\zeta)-2\beta\ln|t|,\quad \xi=x|t|^{\beta\lambda_1-1},\quad \eta=y|t|^{\beta\lambda_2-1},\quad \zeta=z|t|^{\beta\lambda_3-1},$$

where β is an arbitrary constant.

⊙ *References for equation* 8.5.4.6: N. H. Ibragimov (1994, p. 235), A. D. Polyanin and V. F. Zaitsev (2004, pp. 332–333).

7. $\dfrac{\partial^2 w}{\partial t^2} = a_1\dfrac{\partial}{\partial x}\left(e^{\lambda_1 w}\dfrac{\partial w}{\partial x}\right) + a_2\dfrac{\partial}{\partial y}\left(e^{\lambda_2 w}\dfrac{\partial w}{\partial y}\right) + a_3\dfrac{\partial}{\partial z}\left(e^{\lambda_3 w}\dfrac{\partial w}{\partial z}\right) + be^{\beta w}.$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1^{\beta-\lambda_1}x + C_2, \pm C_1^{\beta-\lambda_2}y + C_3, \pm C_1^{\beta-\lambda_3}z + C_4, \pm C_1^{\beta}t + C_5) + 2\ln|C_1|,$$

where $C_1, \ldots, C_5$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. There are "three-dimensional" solutions of the following forms:

$$w(x, y, z, t) = U(\xi, \eta, \zeta) - \frac{2}{\beta}\ln|t|, \quad \xi = x|t|^{\frac{\lambda_1-\beta}{\beta}}, \quad \eta = y|t|^{\frac{\lambda_2-\beta}{\beta}}, \quad \zeta = z|t|^{\frac{\lambda_3-\beta}{\beta}},$$

$$w(x, y, z, t) = V(\eta_1, \eta_2, \eta_3), \quad \eta_n = a_n x + b_n y + c_n z + d_n t \quad (n = 1, 2, 3).$$

8.6. Equations with Three or More Space Variables Involving Arbitrary Functions

8.6.1. Equations of the Form

$$\frac{\partial^2 w}{\partial t^2} = \frac{\partial}{\partial x}\left[f_1(x)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[f_2(y)\frac{\partial w}{\partial y}\right] + \frac{\partial}{\partial z}\left[f_3(z)\frac{\partial w}{\partial z}\right] + g(w)$$

1. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} + \dfrac{\partial^2 w}{\partial z^2} + f(w).$

The equation admits translations in any of the variables x, y, z, and t and is invariant under rotations in the three-dimensional space x, y, z as well as under linear transformations preserving the quantity $t^2 - x^2 - y^2 - z^2$.

1°. Traveling-wave solution in implicit form:

$$\int\left[C_1 + \frac{2}{\lambda^2 - k_1^2 - k_2^2 - k_3^2}\int f(w)\,dw\right]^{-1/2} dw = k_1x + k_2y + k_3z + \lambda t + C_2,$$

where C_1, C_2, k_1, k_2, k_3, and λ are arbitrary constants.

2°. Solution:

$$w(x, y, z, t) = w(\rho), \quad \rho^2 = A\big[(x + C_1)^2 + (y + C_2)^2 + (z + C_3)^2 - (t + C_4)^2\big],$$

where the arbitrary constant A and the expression in square brackets must have like signs, and the function $w(\rho)$ is determined by the ordinary differential equation

$$w''_{\rho\rho} + 3\rho^{-1}w'_\rho + A^{-1}f(w) = 0.$$

3°. For the case of axisymmetric solutions, the Laplace operator on the right-hand side of the equation is expressed in cylindrical and spherical coordinates as

$$\frac{\partial^2 w}{\partial x^2} + \frac{\partial^2 w}{\partial y^2} + \frac{\partial^2 w}{\partial z^2} = \frac{1}{r}\frac{\partial}{\partial r}\left(r\frac{\partial w}{\partial r}\right) + \frac{\partial^2 w}{\partial z^2}, \qquad r = \sqrt{x^2 + y^2};$$

$$\frac{\partial^2 w}{\partial x^2} + \frac{\partial^2 w}{\partial y^2} + \frac{\partial^2 w}{\partial z^2} = \frac{1}{r^2}\frac{\partial}{\partial r}\left(r^2\frac{\partial w}{\partial r}\right) + \frac{1}{r^2\sin\theta}\frac{\partial}{\partial\theta}\left(\sin\theta\frac{\partial w}{\partial\theta}\right), \quad r = \sqrt{x^2 + y^2 + z^2}.$$

4°. "Three-dimensional" solution:

$$w = u(\xi,\eta,t), \quad \xi = y + \frac{x}{C}, \quad \eta = (C^2-1)x^2 - 2Cxy + C^2z^2,$$

where C is an arbitrary constant ($C \neq 0$), and the function $u = u(\xi,\eta,t)$ is determined by the equation

$$\frac{\partial^2 u}{\partial t^2} = \left(1+\frac{1}{C^2}\right)\frac{\partial^2 u}{\partial \xi^2} - 4\xi\frac{\partial^2 u}{\partial \xi \partial \eta} + 4C^2(\xi^2+\eta)\frac{\partial^2 u}{\partial \eta^2} + 2(2C^2-1)\frac{\partial u}{\partial \eta} + f(u).$$

5°. "Three-dimensional" solution:

$$w = v(z,\xi,\zeta), \quad \xi = y + \frac{x}{C}, \quad \zeta = (C^2-1)x^2 - 2Cxy - C^2t^2,$$

where C is an arbitrary constant ($C \neq 0$), and the function $v = v(z,\xi,\zeta)$ is determined by the equation

$$\frac{\partial^2 v}{\partial z^2} + \left(1+\frac{1}{C^2}\right)\frac{\partial^2 v}{\partial \xi^2} - 4\xi\frac{\partial^2 v}{\partial \xi \partial \zeta} + 4C^2(\xi^2+\zeta)\frac{\partial^2 v}{\partial \zeta^2} + 2(2C^2-1)\frac{\partial v}{\partial \zeta} + f(v) = 0.$$

Remark. The solutions specified in Items 4° and 5° can be used to obtain other "three-dimensional" solutions by means of the cyclic permutations of the space variables.

6°. "Three-dimensional" solution:

$$w = U(\xi,\eta,t), \quad \xi = Ax + By + Cz, \quad \eta = \sqrt{(Bx-Ay)^2 + (Cy-Bz)^2 + (Az-Cx)^2},$$

where A, B, and C are arbitrary constants and the function $U = U(\xi,\eta,t)$ is determined by the equation

$$\frac{\partial^2 U}{\partial t^2} = (A^2+B^2+C^2)\left(\frac{\partial^2 U}{\partial \xi^2} + \frac{\partial^2 U}{\partial \eta^2} + \frac{1}{\eta}\frac{\partial U}{\partial \eta}\right) + f(U).$$

2. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right) + \dfrac{\partial}{\partial z}\left(cz^k\dfrac{\partial w}{\partial z}\right) + f(w).$

1°. Solution for $n \neq 2$, $m \neq 2$, and $k \neq 2$:

$$w = w(r), \qquad r^2 = \frac{4}{B}\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} + \frac{z^{2-k}}{c(2-k)^2} - \frac{1}{4}(t+C)^2\right],$$

where B and C are arbitrary constants (B and the expression in square brackets must have like signs), and the function $w(r)$ is determined by the ordinary differential equation

$$\frac{d^2 w}{dr^2} + \frac{A}{r}\frac{dw}{dr} + Bf(w) = 0, \qquad A = \frac{2}{2-n} + \frac{2}{2-m} + \frac{2}{2-k}.$$

2°. There are "two-dimensional" solutions of the following forms:

$$w = U(\xi,t), \quad \xi^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} + \frac{z^{2-k}}{c(2-k)^2}\right];$$

$$w = V(x,\eta), \quad \eta^2 = \pm 4\left[\frac{y^{2-m}}{b(2-m)^2} + \frac{z^{2-k}}{c(2-k)^2} - \frac{1}{4}(t+C)^2\right];$$

$$w = W(\zeta,\rho), \quad \zeta^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} - \frac{1}{4}(t+C)^2\right], \quad \rho^2 = 4\left[\frac{y^{2-m}}{b(2-m)^2} + \frac{z^{2-k}}{c(2-k)^2}\right].$$

The second and third solutions can be used to obtain other "two-dimensional" solutions by means of the following cyclic permutations of variables and determining parameters:

$$\begin{array}{ccc} & (x,a,n) & \\ \nearrow & & \searrow \\ (z,c,k) & \longleftarrow & (y,b,m) \end{array}$$

⊙ *Reference for equation* 8.6.1.2: A. D. Polyanin and A. I. Zhurov (1998).

3. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ae^{\lambda x}\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\mu y}\dfrac{\partial w}{\partial y}\right) + \dfrac{\partial}{\partial z}\left(ce^{\nu z}\dfrac{\partial w}{\partial z}\right) + f(w).$

1°. Solution for $\lambda \neq 0$, $\mu \neq 0$, and $\nu \neq 0$:

$$w = w(r), \qquad r^2 = \frac{4}{B}\left[\frac{e^{-\lambda x}}{a\lambda^2} + \frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C_1)^2\right],$$

where B and C_1 are arbitrary constants and the function $w(r)$ is determined by the autonomous ordinary differential equation

$$w''_{rr} + Bf(w) = 0.$$

Integrating yields its solution in implicit form:

$$\int \left[C_2 - 2B\int f(w)\,dw\right]^{-1/2} dw = C_3 \pm r,$$

where C_2 and C_3 are arbitrary constants.

2°. There are "two-dimensional" solutions of the following forms:

$$w = U(\xi,t), \quad \xi^2 = 4\left(\frac{e^{-\lambda x}}{a\lambda^2} + \frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2}\right);$$

$$w = V(x,\eta), \quad \eta^2 = \pm 4\left[\frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C)^2\right];$$

$$w = W(\zeta,\rho), \quad \zeta^2 = \pm 4\left[\frac{e^{-\lambda x}}{a\lambda^2} - \frac{1}{4}(t+C)^2\right], \quad \rho^2 = 4\left(\frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2}\right).$$

The second and third solutions can be used to obtain other "two-dimensional" solutions by means of the following cyclic permutations of variables and determining parameters:

$$\begin{array}{ccc} & (x,a,\lambda) & \\ \nearrow & & \searrow \\ (z,c,\nu) & \longleftarrow & (y,b,\mu) \end{array}$$

⊙ *Reference for equation* 8.6.1.3: A. D. Polyanin and A. I. Zhurov (1998).

4. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ax^n \dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(by^m \dfrac{\partial w}{\partial y}\right) + \dfrac{\partial}{\partial z}\left(ce^{\nu z} \dfrac{\partial w}{\partial z}\right) + f(w).$

1°. Solution for $n \neq 2$, $m \neq 2$, and $\nu \neq 0$:

$$w = w(r), \qquad r^2 = \frac{4}{B}\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C_1)^2\right],$$

where B and C are arbitrary constants and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{A}{r}w'_r + Bf(w) = 0, \qquad A = \frac{2}{2-n} + \frac{2}{2-m}.$$

2°. There are "two-dimensional" solutions of the following forms:

$$w = U(\xi, t), \qquad \xi^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} + \frac{e^{-\nu z}}{c\nu^2}\right];$$
$$w = V_1(x, \eta_1), \quad \eta_1^2 = \pm 4\left[\frac{y^{2-m}}{b(2-m)^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C)^2\right];$$

$$w = V_2(y, \eta_2), \qquad \eta_2^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C)^2\right];$$
$$w = V_3(z, \eta_3), \qquad \eta_3^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} - \frac{1}{4}(t+C)^2\right];$$
$$w = W_1(\zeta_1, \rho_1), \quad \zeta_1^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} - \frac{1}{4}(t+C)^2\right], \quad \rho_1^2 = 4\left[\frac{y^{2-m}}{b(2-m)^2} + \frac{e^{-\nu z}}{c\nu^2}\right];$$
$$w = W_2(\zeta_2, \rho_2), \quad \zeta_2^2 = \pm 4\left[\frac{y^{2-m}}{b(2-m)^2} - \frac{1}{4}(t+C)^2\right], \quad \rho_2^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\nu z}}{c\nu^2}\right];$$
$$w = W_3(\zeta_3, \rho_3), \quad \zeta_3^2 = \pm 4\left[\frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C)^2\right], \quad \rho_3^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2}\right].$$

5. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left(ax^n \dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\mu y} \dfrac{\partial w}{\partial y}\right) + \dfrac{\partial}{\partial z}\left(ce^{\nu z} \dfrac{\partial w}{\partial z}\right) + f(w).$

1°. Solution for $n \neq 2$, $\mu \neq 0$, and $\nu \neq 0$:

$$w = w(r), \qquad r^2 = \frac{4}{B}\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C)^2\right],$$

where B and C are arbitrary constants and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{2}{2-n}\frac{1}{r}w'_r + Bf(w) = 0.$$

2°. There are "two-dimensional" solutions of the following forms:

$$w = U(\xi, t), \qquad \xi^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2}\right];$$

$$w = V_1(x, \eta_1), \qquad \eta_1^2 = \pm 4\left[\frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C)^2\right];$$

$$w = V_2(y, \eta_2), \qquad \eta_2^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C)^2\right];$$

$$w = V_3(z, \eta_3), \qquad \eta_3^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\mu y}}{b\mu^2} - \frac{1}{4}(t+C)^2\right];$$

$$w = W_1(\zeta_1, \rho_1), \quad \zeta_1^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} - \frac{1}{4}(t+C)^2\right], \quad \rho_1^2 = 4\left[\frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2}\right];$$

$$w = W_2(\zeta_2, \rho_2), \quad \zeta_2^2 = \pm 4\left[\frac{e^{-\mu y}}{b\mu^2} - \frac{1}{4}(t+C)^2\right], \quad \rho_2^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\nu z}}{c\nu^2}\right];$$

$$w = W_3(\zeta_3, \rho_3), \quad \zeta_3^2 = \pm 4\left[\frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C)^2\right], \quad \rho_3^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\mu y}}{b\mu^2}\right].$$

6. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[f(x)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[g(y)\dfrac{\partial w}{\partial y}\right] + \dfrac{\partial}{\partial z}\left[h(z)\dfrac{\partial w}{\partial z}\right] + aw\ln w + bw.$

1°. Multiplicative separable solution:

$$w(x, y, z, t) = X(x)Y(y)Z(z)\varphi(t),$$

where the functions $X(x)$, $Y(y)$, $Z(z)$, and $\varphi(t)$ are determined by the ordinary differential equations

$$[f(x)X'_x]'_x + aX\ln X + C_1X = 0,$$
$$[g(y)Y'_y]'_y + aY\ln Y + C_2Y = 0,$$
$$[h(z)Z'_z]'_z + aZ\ln Z + C_3Z = 0,$$
$$\varphi''_{tt} - a\varphi\ln\varphi + (C_1 + C_2 + C_3 - b)\varphi = 0,$$

where C_1, C_2, and C_3 are arbitrary constants. A particular and the general solutions of the last equations can be obtained from the formulas of Item 2°, where A should be set equal to $b - C_1 - C_2 - C_3$.

2°. Multiplicative separable solution:

$$w(x, y, z, t) = \varphi(t)\Theta(x, y, z).$$

Here, the function $\varphi(t)$ is determined by the autonomous ordinary differential equation

$$\varphi''_{tt} - a\varphi\ln\varphi - A\varphi = 0, \tag{1}$$

where A is an arbitrary constant, and the function $\Theta(x, y, z)$ satisfies the stationary equation

$$\frac{\partial}{\partial x}\left[f(x)\frac{\partial\Theta}{\partial x}\right] + \frac{\partial}{\partial y}\left[g(y)\frac{\partial\Theta}{\partial y}\right] + \frac{\partial}{\partial z}\left[h(z)\frac{\partial\Theta}{\partial z}\right] + a\Theta\ln\Theta + (b - A)\Theta = 0.$$

A particular solution of equation (1) is given by

$$\varphi(t) = \exp\left[\frac{a}{4}(t+B)^2 + \frac{a-2A}{2a}\right],$$

where B is an arbitrary constant, and the general solution can be written out in implicit form (C is an arbitrary constant):

$$\int \left[a\varphi^2 \ln\varphi + (A - \tfrac{1}{2}a)\varphi^2 + B\right]^{-1/2} d\varphi = C \pm t.$$

8.6.2. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[f_1(w)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[f_2(w)\dfrac{\partial w}{\partial y}\right] + \dfrac{\partial}{\partial z}\left[f_3(w)\dfrac{\partial w}{\partial z}\right] + g(w)$

1. $\dfrac{\partial^2 w}{\partial t^2} = a_1\dfrac{\partial^2 w}{\partial x^2} + a_2\dfrac{\partial^2 w}{\partial y^2} + \dfrac{\partial}{\partial z}\left[h(w)\dfrac{\partial w}{\partial z}\right].$

1°. Suppose $w(x, y, z, t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1 x + C_2, \pm C_1 y + C_3, \pm C_1 z + C_4, \pm C_1 t + C_5),$$
$$w_2 = w\big(x\cos\beta + y\sqrt{a_1/a_2}\,\sin\beta, -x\sqrt{a_2/a_1}\,\sin\beta + y\cos\beta, z, t\big),$$
$$w_3 = w\big(x\cosh\lambda + ta_1^{1/2}\sinh\lambda,\ y,\ z, xa_1^{-1/2}\sinh\lambda + t\cosh\lambda\big),$$

where $C_1, \ldots, C_5$, β, and λ are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. Solutions in implicit form:

$$\int h(w)\,dw = z\varphi(\eta) + \psi(\eta), \qquad \eta = C_1 x + C_2 y \pm t\sqrt{a_1 C_1^2 + a_2 C_2^2},$$

where C_1 and C_2 are arbitrary constants and $\varphi(\eta)$ and $\psi(\eta)$ are arbitrary functions.

3°. "Two-dimensional" solution (generalizes the solutions of Item 2°):

$$w(x, y, z, t) = U(\xi, \eta), \quad \xi = z + \lambda t, \quad \eta = C_1 x + C_2 y \pm t\sqrt{a_1 C_1^2 + a_2 C_2^2},$$

where C_1, C_2, and λ are arbitrary constants, and the function $U = U(\xi, \eta)$ is determined by the first-order partial differential equation

$$\big[h(U) - \lambda^2\big]\frac{\partial U}{\partial \xi} \mp 2\lambda\sqrt{a_1 C_1^2 + a_2 C_2^2}\,\frac{\partial U}{\partial \eta} = \varphi(\eta), \tag{1}$$

and $\varphi(\eta)$ is an arbitrary function.

In the special case $\lambda = 0$, equation (1) is an ordinary differential equation in ξ and can be easily integrated to obtain solutions of Item 2°.

In the general case, equation (1) can be solved using a characteristic system of ordinary differential equations (see Section 23.1). In the special case $\varphi(\eta) = 0$, the general solution of equation (1) can be written out in implicit form:

$$2\lambda\sqrt{a_1C_1^2 + a_2C_2^2}\,\xi \pm \eta[h(U) - \lambda^2] = \Phi(U),$$

where $\Phi(U)$ is an arbitrary function.

4°. "Three-dimensional" solutions:

$$w = u(y, z, \zeta), \qquad \zeta = x \pm t\sqrt{a_1}, \tag{2}$$

where the function $u(y, z, \zeta)$ is determined by a differential equation of the form 9.4.4.8:

$$a_2\frac{\partial^2 u}{\partial y^2} + \frac{\partial}{\partial z}\left[h(u)\frac{\partial u}{\partial z}\right] = 0, \tag{3}$$

which can be reduced to a linear equation. Equation (3) is implicitly independent of the cyclic variable ζ (the constants of integration that appear in the solution will be arbitrary functions of ζ).

Remark 1. Relations (2) and equation (3) can be used to obtain another "three-dimensional" solution by means of the following renaming: $(x, a_1) \rightleftarrows (y, a_2)$.

5°. "Three-dimensional" solution:

$$w = v(z, \xi, \eta), \quad \xi = \frac{x}{\sqrt{a_1}C} + \frac{y}{\sqrt{a_2}}, \quad \eta = (C^2 - 1)\frac{x^2}{a_1} - 2C\frac{xy}{\sqrt{a_1a_2}} - C^2t^2, \tag{4}$$

where C is an arbitrary constant ($C \neq 0$), and the function $v = v(\xi, \eta)$ is determined by the equation

$$\left(1 + \frac{1}{C^2}\right)\frac{\partial^2 v}{\partial \xi^2} - 4\xi\frac{\partial^2 v}{\partial \xi \partial \eta} + 4C^2(\xi^2 + \eta)\frac{\partial^2 v}{\partial \eta^2} + 2(2C^2 - 1)\frac{\partial v}{\partial \eta} + \frac{\partial}{\partial z}\left[h(v)\frac{\partial v}{\partial z}\right] = 0. \tag{5}$$

Remark 2. Relations (4) and equation (5) can be used to obtain another "three-dimensional" solution by means of the following renaming: $(x, a_1) \rightleftarrows (y, a_2)$.

6°. There are solutions of the following forms:

$w(x, y, z, t) = F(r, z, t)$,	$r = a_2x^2 + a_1y^2$	"three-dimensional" solution;
$w(x, y, z, t) = G(\xi, y, z)$,	$\xi = x^2 - a_1t^2$	"three-dimensional" solution;
$w(x, y, z, t) = H(\zeta, z)$,	$\zeta = a_2x^2 + a_1y^2 - a_1a_2t^2$	"two-dimensional" solution;
$w(x, y, z, t) = U(\eta)$,	$\eta = (a_2x^2 + a_1y^2 - a_1a_2t^2)z^{-2}$	"one-dimensional" solution.

7°. For other exact solutions, see equation 8.6.2.6 with $f(w) = a_1$ and $g(w) = a_2$.

⊙ *References for equation* 8.6.2.1: N. H. Ibragimov (1994, p. 234), A. D. Polyanin and V. F. Zaitsev (2004, pp. 338–339).

2. $\dfrac{\partial^2 w}{\partial t^2} = a_1\dfrac{\partial^2 w}{\partial x^2} + a_2\dfrac{\partial}{\partial y}\left[g(w)\dfrac{\partial w}{\partial y}\right] + a_3\dfrac{\partial}{\partial z}\left[g(w)\dfrac{\partial w}{\partial z}\right].$

1°. Suppose $w(x, y, z, t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1 x + C_2, \pm C_1 y + C_3, \pm C_1 z + C_4, \pm C_1 t + C_5),$$
$$w_2 = w\big(x, y\cos\beta + z\sqrt{a_2/a_3}\,\sin\beta, -y\sqrt{a_3/a_2}\,\sin\beta + z\cos\beta, t\big),$$
$$w_3 = w\big(x\cosh\lambda + ta_1^{1/2}\sinh\lambda,\ y,\ z, xa_1^{-1/2}\sinh\lambda + t\cosh\lambda\big),$$

where $C_1, \ldots, C_5$, β, and λ are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. "Three-dimensional" solutions:

$$w = u(y, z, \zeta), \qquad \zeta = x \pm t\sqrt{a_1},$$

where the function $u(y, z, \zeta)$ is determined by the differential equation

$$a_2\frac{\partial}{\partial y}\left[g(u)\frac{\partial u}{\partial y}\right] + a_3\frac{\partial}{\partial z}\left[g(u)\frac{\partial u}{\partial z}\right] = 0, \tag{1}$$

which is implicitly independent of the cyclic variable ζ (the constants of integration that appear in the solution are arbitrary functions of ζ). The transformation

$$v = \int g(u)\,du, \qquad \overline{y} = \frac{y}{\sqrt{a_2}}, \qquad \overline{z} = \frac{z}{\sqrt{a_3}}$$

brings (1) to the Laplace equation

$$\frac{\partial^2 v}{\partial \overline{y}^2} + \frac{\partial^2 v}{\partial \overline{z}^2} = 0.$$

For solutions of this linear equation, see Tikhonov and Samarskii (1990) and Polyanin (2002).

3°. There are solutions of the following forms:

$w(x, y, z, t) = F(x, r, t)$,	$r = a_3y^2 + a_2z^2$	"three-dimensional" solution;
$w(x, y, z, t) = G(\xi, y, z)$,	$\xi = x^2 - a_1t^2$	"three-dimensional" solution;
$w(x, y, z, t) = H(r, \xi)$,	$r = a_3y^2 + a_2z^2$, $\quad \xi = x^2 - a_1t^2$	"two-dimensional" solution;
$w(x, y, z, t) = U(p, q)$,	$p = (a_3y^2 + a_2z^2)t^{-2}$, $\quad q = xt^{-1}$	"two-dimensional" solution;
$w(x, y, z, t) = V(\eta)$,	$\eta = (a_3y^2 + a_2z^2)(x^2 - a_1t^2)^{-1}$	"one-dimensional" solution.

4°. For other exact solutions, see equation 8.6.2.6 with $f(w) = a_1$, in which $g(w)$ should be renamed $a_2g(w)$ and $h(w)$ renamed $a_3g(w)$.

⊙ *References for equation* 8.6.2.2: N. H. Ibragimov (1994, p. 235), A. D. Polyanin and V. F. Zaitsev (2004, pp. 339–340).

3. $\dfrac{\partial^2 w}{\partial t^2} = a_1\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial}{\partial y}\left[g(w)\dfrac{\partial w}{\partial y}\right] + \dfrac{\partial}{\partial z}\left[h(w)\dfrac{\partial w}{\partial z}\right].$

1°. Suppose $w(x, y, z, t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1 x + C_2, \pm C_1 y + C_3, \pm C_1 z + C_4, \pm C_1 t + C_5),$$
$$w_2 = w(x\cosh\lambda + t a_1^{1/2}\sinh\lambda,\ y,\ z,\ x a_1^{-1/2}\sinh\lambda + t\cosh\lambda),$$

where $C_1, \ldots, C_5$, and λ are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. "Three-dimensional" solutions:

$$w = u(y, z, \zeta), \qquad \zeta = x \pm t\sqrt{a_1},$$

where the function $u(y, z, \zeta)$ is determined by a differential equation of the form 9.4.4.8:

$$\frac{\partial}{\partial y}\left[g(u)\frac{\partial u}{\partial y}\right] + \frac{\partial}{\partial z}\left[h(u)\frac{\partial u}{\partial z}\right] = 0,$$

which can be reduced to a linear equation. The equation obtained is implicitly independent of the cyclic variable ζ (the constants of integration that appear in the solution will be arbitrary functions of ζ).

3°. There are solutions of the following forms:

$w(x, y, z, t) = W(\xi, y, z), \quad \xi = x^2 - a_1 t^2$ "three-dimensional" solution;
$w(x, y, z, t) = U(p, q), \quad p = (x^2 - a_1 t^2)y^{-2}, \quad q = zy^{-1}$ "two-dimensional" solution.

4°. For other exact solutions, see equation 8.6.2.6 with $f(w) = a_1$.

⊙ *References for equation* 8.6.2.3: N. H. Ibragimov (1994, p. 235), A. D. Polyanin and V. F. Zaitsev (2004, p. 340).

4. $\dfrac{\partial^2 w}{\partial t^2} = a_1\dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + a_2\dfrac{\partial}{\partial y}\left[f(w)\dfrac{\partial w}{\partial y}\right] + a_3\dfrac{\partial}{\partial z}\left[f(w)\dfrac{\partial w}{\partial z}\right].$

1°. Suppose $w(x, y, z, t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1 x + C_2, \pm C_1 y + C_3, \pm C_1 z + C_4, \pm C_1 t + C_5),$$
$$w_2 = w\big(x\cos\beta + y\sqrt{a_1/a_2}\,\sin\beta, -x\sqrt{a_2/a_1}\,\sin\beta + y\cos\beta, z, t\big),$$

where $C_1, \ldots, C_5$ and β are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. There are "three-dimensional" solutions of the following forms:

$$w = W(\rho, z, t), \quad \rho = a_2 x^2 + a_1 y^2;$$
$$w = U(\xi, \eta, t), \quad \xi = \frac{x}{\sqrt{a_1}C} + \frac{y}{\sqrt{a_2}}, \quad \eta = (C^2 - 1)\frac{x^2}{a_1} - 2C\frac{xy}{\sqrt{a_1 a_2}} + C^2\frac{z^2}{a_3};$$
$$w = V(\zeta, \theta, t), \quad \zeta = \frac{Ax}{\sqrt{a_1}} + \frac{By}{\sqrt{a_2}} + \frac{Cz}{\sqrt{a_3}},$$
$$\theta = \left(\frac{Bx}{\sqrt{a_1}} - \frac{Ay}{\sqrt{a_2}}\right)^2 + \left(\frac{Cy}{\sqrt{a_2}} - \frac{Bz}{\sqrt{a_3}}\right)^2 + \left(\frac{Az}{\sqrt{a_3}} - \frac{Cx}{\sqrt{a_1}}\right)^2,$$

where A, B, and C are arbitrary constants.

Remark. The first and second solutions above can be used to obtain other "three-dimensional" solutions by means of the following cyclic permutations of variables and determining parameters:

$$\begin{array}{ccc} & (x, a_1) & \\ \nearrow & & \searrow \\ (z, a_3) & \longleftarrow & (y, a_2) \end{array}$$

3°. There are exact solutions of the following forms:

$w(x,y,z,t) = \Phi(r,t), \quad r = a_2a_3x^2 + a_1a_3y^2 + a_1a_2z^2$ "two-dimensional" solution;

$w(x,y,z,t) = \Psi(\chi), \quad \chi = (a_2a_3x^2 + a_1a_3y^2 + a_1a_2z^2)t^{-2}$ "one-dimensional" solution.

4°. For other exact solutions, see equation 8.6.2.6, in which $f(w)$, $g(w)$, and $h(w)$ should be renamed $a_1f(w)$, $a_2f(w)$, and $a_3f(w)$, respectively.

⊙ *Reference for equation* 8.6.2.4: N. H. Ibragimov (1994, p. 232).

5. $\dfrac{\partial^2 w}{\partial t^2} = a_1\dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + a_2\dfrac{\partial}{\partial y}\left[f(w)\dfrac{\partial w}{\partial y}\right] + \dfrac{\partial}{\partial z}\left[h(w)\dfrac{\partial w}{\partial z}\right].$

1°. Suppose $w(x,y,z,t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1x + C_2, \pm C_1y + C_3, \pm C_1z + C_4, \pm C_1t + C_5),$$
$$w_2 = w\big(x\cos\beta + y\sqrt{a_1/a_2}\,\sin\beta, -x\sqrt{a_2/a_1}\,\sin\beta + y\cos\beta, z, t\big),$$

where $C_1, \ldots, C_5$ and β are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. There are solutions of the following forms:

$w(x,y,z,t) = W(\xi,z,t), \quad \xi = a_2x^2 + a_1y^2$ "three-dimensional" solution;

$w(x,y,z,t) = U(p,q), \quad p = (a_2x^2 + a_1y^2)t^{-2}, \quad q = zt^{-1}$ "two-dimensional" solution.

3°. For other exact solutions, see equation 8.6.2.6, in which $f(w)$ should be renamed $a_1f(w)$ and $g(w)$ renamed $a_2f(w)$.

⊙ *Reference for equation* 8.6.2.5: N. H. Ibragimov (1994, p. 233).

6. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[g(w)\dfrac{\partial w}{\partial y}\right] + \dfrac{\partial}{\partial z}\left[h(w)\dfrac{\partial w}{\partial z}\right].$

1°. Suppose $w(x,y,z,t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1x + C_2, \pm C_1y + C_3, \pm C_1z + C_4, \pm C_1t + C_5),$$

where $C_1, \ldots, C_5$ are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. Traveling-wave solution in implicit form:

$$\int \big[k_1^2 f(w) + k_2^2 g(w) + k_3^2 h(w)\big]\,dw - \lambda^2 w = C_1(k_1x + k_2y + k_3z + \lambda t) + C_2,$$

where C_1, C_2, k_1, k_2, k_3, and λ are arbitrary constants.

3°. Solutions in implicit form:

$$\left(\frac{C_1x+C_2y+C_3z+C_4}{t+C_5}\right)^2 = C_1^2f(w)+C_2^2g(w)+C_3^2h(w),$$
$$\left(\frac{C_1y+C_2z+C_3t+C_4}{x+C_5}\right)^2 f(w)+C_1^2g(w)+C_2^2h(w) = C_3^2,$$
$$\left(\frac{C_1x+C_2z+C_3t+C_4}{y+C_5}\right)^2 g(w)+C_1^2f(w)+C_2^2h(w) = C_3^2,$$
$$\left(\frac{C_1x+C_2y+C_3t+C_4}{z+C_5}\right)^2 h(w)+C_1^2f(w)+C_2^2g(w) = C_3^2,$$

where $C_1, \ldots, C_5$ are arbitrary constants.

4°. Solutions in implicit form:

$$x\varphi_1(w)+y\varphi_2(w)+z\varphi_3(w) = \psi(w)+t,$$
$$x\varphi_1(w)+y\varphi_2(w)+z\varphi_3(w) = \psi(w)-t,$$

where $\varphi_1(w)$, $\varphi_2(w)$, and $\psi(w)$ are arbitrary functions, and the function $\varphi_3(w)$ is determined by the normality condition

$$f(w)\varphi_1^2(w)+g(w)\varphi_2^2(w)+h(w)\varphi_3^2(w) = 1.$$

5°. Solution:

$$w = w(\xi), \quad \xi = \frac{C_1x+C_2y+C_3z+C_4}{t+C_5},$$

where $C_1, \ldots, C_5$ are arbitrary constants, and the function $u(\xi)$ is determined by the ordinary differential equation

$$(\xi^2w'_\xi)'_\xi = [\varphi(w)w'_\xi]'_\xi, \qquad \varphi(w) = C_1^2f(w)+C_2^2g(w)+C_3h(w),$$

which admits the first integral

$$\left[\xi^2 - C_1^2f(w) - C_2^2g(w) - C_3^2h(w)\right]w'_\xi = C_6. \tag{1}$$

To the special case $C_6 = 0$ there corresponds the first solution in Item 3°.

For $C_6 \neq 0$, treating w in (1) as the independent variable, we obtain a Riccati equation for $\xi = \xi(w)$:

$$C_6\xi'_w = \xi^2 - C_1^2f(w) - C_2^2g(w) - C_3^2h(w). \tag{2}$$

For exact solutions of equation (2), which can be reduced to a second-order linear equation, see Polyanin and Zaitsev (2003).

6°. Solution:

$$w = u(\eta), \quad \eta = \frac{C_1y+C_2z+C_3t+C_4}{x+C_5}, \tag{3}$$

where $C_1, \ldots, C_5$ are arbitrary constants, and the function $u(\eta)$ is determined by the ordinary differential equation

$$C_3^2u''_{\eta\eta} = [\eta^2f(u)u'_\eta]'_\eta + C_1^2[g(u)u'_\eta]'_\eta + C_2^2[h(u)u'_\eta]'_\eta,$$

which admits the first integral

$$[\eta^2 f(u) + C_1^2 g(u) + C_2^2 h(u) - C_3^2]u'_\eta = C_6. \tag{4}$$

To the special case $C_6 = 0$ there corresponds the second solution in Item 3°.

For $C_6 \neq 0$, treating u in (4) as the independent variable, we obtain a Riccati equation for $\eta = \eta(u)$:

$$C_6\eta'_u = \eta^2 f(u) + C_1^2 g(u) + C_2^2 h(u) - C_3^2. \tag{5}$$

For exact solutions of equation (5), which can be reduced to a second-order linear equation, see Polyanin and Zaitsev (2003).

Formula (3) and equation (5) can be used to obtain two other "one-dimensional" solutions by means of the following cyclic permutations of variables and determining functions:

$$\begin{array}{ccc} & (x, f) & \\ \nearrow & & \searrow \\ (z, h) & \longleftarrow & (y, g) \end{array}$$

7°. "Two-dimensional" solution (k_1, k_2, and k_3 are arbitrary constants):

$$w(x, y, z, t) = u(\xi, t), \quad \xi = k_1 x + k_2 y + k_3 z,$$

where the function $u = u(\xi, t)$ is determined by a differential equation of the form 7.4.4.6:

$$\frac{\partial^2 u}{\partial t^2} = \frac{\partial}{\partial \xi}\left[\varphi(u)\frac{\partial u}{\partial \xi}\right], \quad \varphi(u) = k_1^2 f(u) + k_2^2 g(u) + k_3^2 h(u),$$

which can be reduced to a linear equation.

8°. "Two-dimensional" solution (a, b, and c are arbitrary constants):

$$w(x, y, z, t) = v(x, \eta), \quad \eta = ay + bz + ct,$$

where the function $v = v(x, \eta)$ is determined by a differential equation of the form 9.4.4.8:

$$\frac{\partial}{\partial x}\left[f(v)\frac{\partial v}{\partial x}\right] + \frac{\partial}{\partial \eta}\left[\psi(v)\frac{\partial v}{\partial \eta}\right] = 0, \quad \psi(v) = a^2 g(v) + b^2 h(v) - c^2,$$

which can be reduced to a linear equation.

9°. "Two-dimensional" solution (the a_n and b_n are arbitrary constants):

$$w(x, y, z, t) = U(\zeta, \rho), \quad \zeta = a_1 t + a_2 x, \quad \rho = b_1 y + b_2 z,$$

where the function $U = U(\zeta, \rho)$ is determined by a differential equation of the form 9.4.4.8:

$$\frac{\partial}{\partial \zeta}\left[\Phi(U)\frac{\partial U}{\partial \zeta}\right] + \frac{\partial}{\partial \rho}\left[\Psi(U)\frac{\partial U}{\partial \rho}\right] = 0, \quad \Phi(U) = a_2^2 f(U) - a_1^2, \quad \Psi(U) = b_1^2 g(U) + b_2^2 h(U),$$

which can be reduced to a linear equation.

Remark. The solutions specified in Items 7° and 8° can be used to obtain other "two-dimensional" solutions by means of the cyclic permutations of variables and determining functions as shown in Item 5°.

10°. There are more complicated "two-dimensional" solutions of the form

$$w(x,y,z,t) = V(z_1, z_2), \quad z_1 = a_1x + a_2y + a_3z + a_4t, \quad z_2 = b_1x + b_2y + b_3z + b_4t.$$

11°. "Three-dimensional" solution:

$$w(x,y,z,t) = \Theta(p,q,s), \quad p = x/t, \quad q = y/t, \quad s = z/t,$$

where the function $\Theta = \Theta(p,q,s)$ is determined by the differential equation

$$p^2\frac{\partial^2\Theta}{\partial p^2} + q^2\frac{\partial^2\Theta}{\partial q^2} + r^2\frac{\partial^2\Theta}{\partial r^2} + 2pq\frac{\partial^2\Theta}{\partial p\partial q} + 2pr\frac{\partial^2\Theta}{\partial p\partial r} + 2rq\frac{\partial^2\Theta}{\partial r\partial q}$$
$$+ 2p\frac{\partial\Theta}{\partial p} + 2q\frac{\partial\Theta}{\partial q} + 2r\frac{\partial\Theta}{\partial r} = \frac{\partial}{\partial p}\left[f(\Theta)\frac{\partial\Theta}{\partial p}\right] + \frac{\partial}{\partial q}\left[g(\Theta)\frac{\partial\Theta}{\partial q}\right] + \frac{\partial}{\partial r}\left[h(\Theta)\frac{\partial\Theta}{\partial r}\right].$$

12°. For results of the group analysis of the original equation, see Ibragimov (1994).

⊙ *References for equation* 8.6.2.6: A. D. Polyanin and V. F. Zaitsev (2004, pp. 342–343), A. D. Polyanin (2006, http://eqworld.ipmnet.ru/eqarchive/view.php?id=45).

7. $\dfrac{\partial^2 w}{\partial t^2} = \dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[f(w)\dfrac{\partial w}{\partial y}\right] + \dfrac{\partial}{\partial z}\left[f(w)\dfrac{\partial w}{\partial z}\right] + g(w).$

1°. Suppose the function $f = f(w)$ is arbitrary and the function $g = g(w)$ is defined as

$$g(w) = -a^2\frac{f'(w)}{f^3(w)} + b,$$

where a and b are some numbers. Then there is a functional separable solution, which can be written in the implicit form

$$\int f(w)\,dw = at + U(x,y,z),$$

where the function $U = U(x,y,z)$ is determined by the Poisson equation

$$\frac{\partial^2 U}{\partial x^2} + \frac{\partial^2 U}{\partial y^2} + \frac{\partial^2 U}{\partial z^2} + b = 0.$$

For solutions of this linear equation, see Tikhonov and Samarskii (1990) and Polyanin (2002).

Remark. The constant b in the expression of g can be replaced by an arbitrary function $b = b(x,y,z)$.

2°. Suppose that the determining functions are defined parametrically as

$$f = \frac{Ae^{-b\zeta}}{\varphi'_\zeta(\zeta)},$$
$$g = a^2\varphi''_{\zeta\zeta}(\zeta) - Ace^{-b\zeta},$$
$$w = \varphi(\zeta),$$

where $\varphi(\zeta)$ is an arbitrary function, ζ is the parameter, and A, a, b, and c are some numbers. Then the equation in question has a functional separable solution of the form

$$w = \varphi(\zeta), \quad \zeta = at + \theta(x, y, z),$$

where the function θ is described by the equation

$$\Delta\theta = b|\nabla\theta|^2 + c.$$

The substitution

$$\theta = -\frac{1}{b}\ln|u|$$

reduces this equation to the Helmholtz equation

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} + bcu = 0.$$

For solutions of this linear equation, see Tikhonov and Samarskii (1990) and Polyanin (2002).

8.6.3. Other Equations

1. $\dfrac{\partial^2 w}{\partial t^2} = ax^n\dfrac{\partial^2 w}{\partial x^2} + by^m\dfrac{\partial^2 w}{\partial y^2} + cz^k\dfrac{\partial^2 w}{\partial z^2} + f(w).$

1°. Solution for $n \neq 2$, $m \neq 2$, and $k \neq 2$:

$$w = w(r), \qquad r^2 = \frac{4}{B}\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} + \frac{z^{2-k}}{c(2-k)^2} - \frac{1}{4}(t+C)^2\right],$$

where C and B are arbitrary constants ($B \neq 0$) and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{A}{r}w'_r + Bf(w) = 0, \qquad A = 2\left(\frac{1-n}{2-n} + \frac{1-m}{2-m} + \frac{1-k}{2-k}\right).$$

2°. There are "two-dimensional" solutions of the following forms:

$$w = U(\xi, t), \quad \xi^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} + \frac{z^{2-k}}{c(2-k)^2}\right];$$

$$w = V(x, \eta), \quad \eta^2 = \pm 4\left[\frac{y^{2-m}}{b(2-m)^2} + \frac{z^{2-k}}{c(2-k)^2} - \frac{1}{4}(t+C)^2\right];$$

$$w = W(\zeta, \rho), \quad \zeta^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} - \frac{1}{4}(t+C)^2\right], \quad \rho^2 = 4\left[\frac{y^{2-m}}{b(2-m)^2} + \frac{z^{2-k}}{c(2-k)^2}\right].$$

The second and third solutions can be used to obtain other "two-dimensional" solutions by means of the following cyclic permutations of variables and determining parameters:

$$\begin{array}{ccc} & (x, a, n) & \\ \nearrow & & \searrow \\ (z, c, k) & \longleftarrow & (y, b, m) \end{array}$$

2. $\dfrac{\partial^2 w}{\partial t^2} = ae^{\lambda x}\dfrac{\partial^2 w}{\partial x^2} + be^{\mu y}\dfrac{\partial^2 w}{\partial y^2} + ce^{\nu z}\dfrac{\partial^2 w}{\partial z^2} + f(w).$

1°. Solution for $\lambda \neq 0$, $\mu \neq 0$, and $\nu \neq 0$:

$$w = w(r), \qquad r^2 = \frac{4}{B}\left[\frac{e^{-\lambda x}}{a\lambda^2} + \frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C)^2\right],$$

where B and C are arbitrary constants and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + 6r^{-1}w'_r + Bf(w) = 0.$$

2°. There are "two-dimensional" solutions of the following forms:

$$w = U(\xi, t), \quad \xi^2 = 4\left(\frac{e^{-\lambda x}}{a\lambda^2} + \frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2}\right);$$
$$w = V(x, \eta), \quad \eta^2 = \pm 4\left[\frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C)^2\right];$$
$$w = W(\zeta, \rho), \quad \zeta^2 = \pm 4\left[\frac{e^{-\lambda x}}{a\lambda^2} - \frac{1}{4}(t+C)^2\right], \quad \rho^2 = 4\left(\frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2}\right).$$

The second and third solutions can be used to obtain other "two-dimensional" solutions by means of the following cyclic permutations of variables and determining parameters:

$$\begin{array}{ccc} & (x, a, \lambda) & \\ \nearrow & & \searrow \\ (z, c, \nu) & \longleftarrow & (y, b, \mu) \end{array}$$

3. $\dfrac{\partial^2 w}{\partial t^2} = ax^n\dfrac{\partial^2 w}{\partial x^2} + by^m\dfrac{\partial^2 w}{\partial y^2} + ce^{\nu z}\dfrac{\partial^2 w}{\partial z^2} + f(w).$

1°. Solution for $n \neq 2$, $m \neq 2$, and $\nu \neq 0$:

$$w = w(r), \qquad r^2 = \frac{4}{B}\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C_1)^2\right],$$

where B and C are arbitrary constants and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{A}{r}w'_r + Bf(w) = 0, \qquad A = 2\left(\frac{1-n}{2-n} + \frac{1-m}{2-m} + 1\right).$$

2°. There are "two-dimensional" solutions of the following forms:

$$w = U(\xi, t), \qquad \xi^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} + \frac{e^{-\nu z}}{c\nu^2}\right];$$

$$w = V_1(x, \eta_1), \qquad \eta_1^2 = \pm 4\left[\frac{y^{2-m}}{b(2-m)^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C)^2\right];$$

$$w = V_2(y, \eta_2), \qquad \eta_2^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C)^2\right];$$

$$w = V_3(z, \eta_3), \qquad \eta_3^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} - \frac{1}{4}(t+C)^2\right];$$

$$w = W_1(\zeta_1, \rho_1), \quad \zeta_1^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} - \frac{1}{4}(t+C)^2\right], \quad \rho_1^2 = 4\left[\frac{y^{2-m}}{b(2-m)^2} + \frac{e^{-\nu z}}{c\nu^2}\right];$$

$$w = W_2(\zeta_2, \rho_2), \quad \zeta_2^2 = \pm 4\left[\frac{y^{2-m}}{b(2-m)^2} - \frac{1}{4}(t+C)^2\right], \quad \rho_2^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\nu z}}{c\nu^2}\right];$$

$$w = W_3(\zeta_3, \rho_3), \quad \zeta_3^2 = \pm 4\left[\frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C)^2\right], \quad \rho_3^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2}\right].$$

4. $\dfrac{\partial^2 w}{\partial t^2} = ax^n \dfrac{\partial^2 w}{\partial x^2} + be^{\mu y} \dfrac{\partial^2 w}{\partial y^2} + ce^{\nu z} \dfrac{\partial^2 w}{\partial z^2} + f(w).$

1°. Solution for $n \neq 2$, $\mu \neq 0$, and $\nu \neq 0$:

$$w = w(r), \qquad r^2 = \frac{4}{B}\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C)^2\right],$$

where B and C are arbitrary constants and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{2(5-3n)}{2-n}\frac{1}{r}w'_r + Bf(w) = 0.$$

2°. There are "two-dimensional" solutions of the following forms:

$$w = U(\xi, t), \qquad \xi^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2}\right];$$

$$w = V_1(x, \eta_1), \qquad \eta_1^2 = \pm 4\left[\frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C)^2\right];$$

$$w = V_2(y, \eta_2), \qquad \eta_2^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C)^2\right];$$

$$w = V_3(z, \eta_3), \qquad \eta_3^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\mu y}}{b\mu^2} - \frac{1}{4}(t+C)^2\right];$$

$$w = W_1(\zeta_1, \rho_1), \quad \zeta_1^2 = \pm 4\left[\frac{x^{2-n}}{a(2-n)^2} - \frac{1}{4}(t+C)^2\right], \quad \rho_1^2 = 4\left[\frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2}\right];$$

$$w = W_2(\zeta_2, \rho_2), \quad \zeta_2^2 = \pm 4\left[\frac{e^{-\mu y}}{b\mu^2} - \frac{1}{4}(t+C)^2\right], \quad \rho_2^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\nu z}}{c\nu^2}\right];$$

$$w = W_3(\zeta_3, \rho_3), \quad \zeta_3^2 = \pm 4\left[\frac{e^{-\nu z}}{c\nu^2} - \frac{1}{4}(t+C)^2\right], \quad \rho_3^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\mu y}}{b\mu^2}\right].$$

5. $\dfrac{\partial^2 w}{\partial t^2} = \sum\limits_{k=1}^{n} \dfrac{\partial}{\partial x_k}\left[f_k(w)\dfrac{\partial w}{\partial x_k}\right].$

Exact solutions in implicit form:

$$\sum_{k=1}^{n} x_k \varphi_k(w) = \psi_1(w) + t,$$
$$\sum_{k=1}^{n} x_k \varphi_k(w) = \psi_2(w) - t,$$

where $\varphi_1(w)$, $\ldots$, $\varphi_{n-1}(w)$, $\psi_1(w)$, and $\psi_2(w)$ are arbitrary functions, and the function $\varphi_n(w)$ is determined by the normalization condition

$$\sum_{k=1}^{n} f_k(w)\varphi_k^2(w) = 1.$$

Chapter 9
Second-Order Elliptic Equations with Two Space Variables

9.1. Equations with Power-Law Nonlinearities

9.1.1. Equations of the Form $\frac{\partial^2 w}{\partial x^2} + \frac{\partial^2 w}{\partial y^2} = aw + bw^n + cw^{2n-1}$

▷ *The general properties of this type of equation are listed in 9.4.1.1; traveling-wave solutions and solutions with central symmetry are also treated there.*

1. $\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} = kw^n.$

This is a steady heat and mass transfer equation with an nth-order volume reaction in two dimensions. This equation arises also in combustion theory and is a special case of equation 9.4.1.1 with $f(w) = kw^n$.

1°. Suppose $w(x, y)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^2 w(\pm C_1^{n-1}x + C_2, \pm C_1^{n-1}y + C_3),$$
$$w_2 = w(x\cos\beta - y\sin\beta,\ x\sin\beta + y\cos\beta),$$

where C_1, C_2, C_3, and β are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Solutions:

$$w(x, y) = (Ax + By + C)^{\frac{2}{1-n}}, \quad B = \pm\sqrt{\frac{k(n-1)^2}{2(n+1)} - A^2};$$
$$w(x, y) = s\left[(x + C_1)^2 + (y + C_2)^2\right]^{\frac{1}{1-n}}, \quad s = \left[\tfrac{1}{4}k(1-n)^2\right]^{\frac{1}{1-n}},$$

where A, C, C_1, and C_2 are arbitrary constants.

3°. Traveling-wave solution in implicit form (generalizes the first solution of Item 2°):

$$\int \left[D + \frac{2kw^{n+1}}{(n+1)(A^2 + B^2)}\right]^{-1/2} dw = Ax + By + C,$$

where A, B, C, and D are arbitrary constants ($n \neq -1$).

4°. Solution (generalizes the second solution of Item 2°):

$$w = w(r), \qquad r = \sqrt{(x + C_1)^2 + (y + C_2)^2},$$

where C_1 and C_2 are arbitrary constants, and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{1}{r}w'_r = kw^n.$$

5°. Self-similar solution:

$$w(x, y) = (x + C_1)^{\frac{2}{1-n}} u(\xi), \qquad \xi = \frac{y + C_2}{x + C_1},$$

where the function $u(\xi)$ is determined by the ordinary differential equation

$$(1 + \xi^2)u''_{\xi\xi} - \frac{2(1 + n)}{1 - n}\xi u'_\xi + \frac{2(1 + n)}{(1 - n)^2}u - ku^n = 0.$$

6°. Multiplicative separable solution in polar coordinates (another representation of the solution of Item 5°):

$$w(x, y) = r^{\frac{2}{1-n}} U(\theta), \qquad r = \sqrt{(x + C_1)^2 + (y + C_2)^2}, \quad \tan\theta = \frac{y + C_2}{x + C_1},$$

where the function $U = U(\theta)$ is determined by the autonomous ordinary differential equation

$$U''_{\theta\theta} + \frac{4}{(1 - n)^2}U = kU^n.$$

Integrating yields the general solution in implicit form:

$$\int \left[\frac{2k}{n + 1}U^{n+1} - \frac{4}{(n - 1)^2}U^2 + C_3\right]^{-1/2} dU = C_4 \pm \theta,$$

where C_3 and C_4 are arbitrary constants.

⊙ *Reference for equation* 9.1.1.1: A. D. Polyanin and V. F. Zaitsev (2002, p. 190).

2. $\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} = aw + bw^n.$

This is a special case of equation 9.4.1.1 with $f(w) = aw + bw^n$.

1°. Traveling-wave solutions for $a > 0$:

$$w(x, y) = \left[\frac{2b\sinh^2 z}{a(n+1)}\right]^{\frac{1}{1-n}}, \qquad z = \tfrac{1}{2}\sqrt{a}\,(1-n)(x\sin C_1 + y\cos C_1) + C_2 \quad \text{if } b(n+1) > 0,$$

$$w(x, y) = \left[-\frac{2b\cosh^2 z}{a(n+1)}\right]^{\frac{1}{1-n}}, \qquad z = \tfrac{1}{2}\sqrt{a}\,(1-n)(x\sin C_1 + y\cos C_1) + C_2 \quad \text{if } b(n+1) < 0,$$

where C_1 and C_2 are arbitrary constants.

2°. Traveling-wave solutions for $a < 0$ and $b(n + 1) > 0$:

$$w(x, y) = \left[-\frac{2b\cos^2 z}{a(n + 1)}\right]^{\frac{1}{1-n}}, \qquad z = \tfrac{1}{2}\sqrt{|a|}\,(1 - n)(x\sin C_1 + y\cos C_1) + C_2.$$

3. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=aw^n+bw^{2n-1}.$

This is a special case of equation 9.4.1.1 with $f(w)=aw^n+bw^{2n-1}$.

Solutions:

$$w(x,y)=\left[\frac{a(1-n)^2}{2(n+1)}(x\sin C_1+y\cos C_1+C_2)^2-\frac{b(n+1)}{2an}\right]^{\frac{1}{1-n}},$$

$$w(x,y)=\left\{\frac{1}{4}a(1-n)^2\left[(x+C_1)^2+(y+C_2)^2\right]-\frac{b}{an}\right\}^{\frac{1}{1-n}},$$

where C_1 and C_2 are arbitrary constants.

4. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=aw-a(n+1)w^n+bw^{2n-1}.$

1°. Traveling-wave solutions:

$$w(x,y)=\big(\lambda+C_1\exp z\big)^{\frac{1}{1-n}},\qquad z=\sqrt{a}\,(1-n)(x\sin C_2+y\cos C_2),$$

where $\lambda=\lambda_{1,2}$ are roots of the quadratic equation $a\lambda^2-a(n+1)\lambda+b=0$, and C_1 and C_2 are arbitrary constants.

2°. See also equation 9.1.1.5, where the following renaming should be made: $b\to -a(n+1)$ and $c\to b$.

5. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=aw+bw^n+cw^{2n-1}.$

This is a special case of equation 9.4.1.1 with $f(w)=aw+bw^n+cw^{2n-1}$.

1°. Traveling-wave solutions for $a>0$:

$$w(x,y)=(A+B\cosh z)^{\frac{1}{1-n}},\quad z=\sqrt{a}\,(1-n)(x\sin C_1+y\cos C_1)+C_2,$$
$$A=-\frac{b}{a(n+1)},\quad B=\pm\left[\frac{b^2}{a^2(n+1)^2}-\frac{c}{an}\right]^{1/2};$$

$$w(x,y)=(A+B\sinh z)^{\frac{1}{1-n}},\quad z=\sqrt{a}\,(1-n)(x\sin C_1+y\cos C_1)+C_2,$$
$$A=-\frac{b}{a(n+1)},\quad B=\pm\left[\frac{c}{an}-\frac{b^2}{a^2(n+1)^2}\right]^{1/2},$$

where C_1 and C_2 are arbitrary constants (the expressions in square brackets must be nonnegative).

2°. Traveling-wave solutions for $a<0$:

$$w(x,y)=(A+B\cos z)^{\frac{1}{1-n}},\quad z=\sqrt{|a|}\,(1-n)(x\sin C_1+y\cos C_1)+C_2,$$
$$A=-\frac{b}{a(n+1)},\quad B=\pm\left[\frac{b^2}{a^2(n+1)^2}-\frac{c}{an}\right]^{1/2},$$

where C_1 and C_2 are arbitrary constants.

3°. The substitution $u = w^{1-n}$ leads to an equation of the form 9.1.6.7:

$$u\left(\frac{\partial^2 u}{\partial x^2}+\frac{\partial^2 u}{\partial y^2}\right)+\frac{n}{1-n}\left[\left(\frac{\partial u}{\partial x}\right)^2+\left(\frac{\partial u}{\partial y}\right)^2\right]=a(1-n)u^2+b(1-n)u+c(1-n).$$

9.1.2. Equations of the Form $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=f(x,y,w)$

1. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=a(x^2+y^2)w^n.$

This is a special case of equation 9.4.1.3 with $f(w)=aw^n$.

1°. Suppose $w(x,y)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^4 w(\pm C_1^{n-1}x,\ \pm C_1^{n-1}y),$$
$$w_2 = w(x\cos\beta - y\sin\beta,\ x\sin\beta + y\cos\beta),$$

where C_1 and β are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. The transformation

$$w = U(z,\zeta),\quad z=\tfrac{1}{2}(x^2-y^2),\quad \zeta = xy$$

leads to a simpler equation of the form 9.1.1.1:

$$\frac{\partial^2 U}{\partial z^2}+\frac{\partial^2 U}{\partial \zeta^2}=aU^n.$$

2. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=c(ax+by)^k w^n.$

This is a special case of equation 9.4.1.11 with $f(z,w)=cz^k w^n$.

3. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=a(x^2+y^2)^k w^n.$

This is a special case of equation 9.4.1.4 with $f(w)=aw^n$.

4. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=a(x^2+y^2)(xy)^k w^n.$

This is a special case of equation 9.4.1.13 with $f(z,w)=az^k w^n$.

5. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=ae^{\beta x}w^n.$

This is a special case of equation 9.4.1.5 with $f(w)=aw^n$.

6. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=ke^{ax-by}w^n.$

This is a special case of equation 9.4.1.6 with $f(w)=kw^n$.

7. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=k\big(w+A_{11}x^2+A_{12}xy+A_{22}y^2+B_1x+B_2y\big)^n.$

This is a special case of equation 9.4.1.15 with $f(u)=ku^n$.

9.1.3. Equations of the Form $\dfrac{\partial^2 w}{\partial x^2}+a\dfrac{\partial^2 w}{\partial y^2}=F\Big(x,y,w,\dfrac{\partial w}{\partial x},\dfrac{\partial w}{\partial y}\Big)$

1. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=(a_1x+b_1y+c_1)\dfrac{\partial w}{\partial x}+(a_2x+b_2y+c_2)\dfrac{\partial w}{\partial y}+kw^n.$

This is a special case of equation 9.4.2.3 with $f(w)=-kw^n$.

2. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}+\dfrac{a}{x}\dfrac{\partial w}{\partial x}+\dfrac{b}{y}\dfrac{\partial w}{\partial y}=kw^n.$

This is a special case of equation 9.4.2.6 with $f(\xi,w)=kw^n$.

3. $\dfrac{\partial^2 w}{\partial x^2}+a\dfrac{\partial^2 w}{\partial y^2}=b\left(\dfrac{\partial w}{\partial y}\right)^2+cw+sx^n.$

This is a special case of equation 9.4.2.9 with $f(x)=b$, $g(x)=c$, and $h(x)=sx^n$.

4. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=\alpha\left(\dfrac{\partial w}{\partial y}\right)^2+\beta x^n y^2+\gamma x^m y+\mu x^k.$

This is a special case of equation 9.4.2.11 with $a=b=1$, $f(x)=\alpha$, $g(x)=h_1(x)=h_0(x)=p(x)=0$, $q_2(x)=\beta x^n$, $q_1(x)=\gamma x^m$, and $q_0(x)=\mu x^k$.

5. $\dfrac{\partial^2 w}{\partial x^2}+a\dfrac{\partial^2 w}{\partial y^2}=c\left(\dfrac{\partial w}{\partial y}\right)^2+bcw^2+kw+s.$

Let A be a root of the quadratic equation $bcA^2+kA+s=0$.

1°. Suppose the inequality $2Abc+k+ab=\sigma^2>0$ holds. Then the equation has the generalized separable solutions

$$w(x,y)=A+\big[C_1\exp(\sigma x)+C_2\exp(-\sigma x)\big]\exp\big(\pm y\sqrt{-b}\,\big),$$

where C_1 and C_2 are arbitrary constants.

2°. If $2Abc+k+ab=-\sigma^2<0$, then the equation has the generalized separable solutions

$$w(x,y)=A+\big[C_1\cos(\sigma x)+C_2\sin(\sigma x)\big]\exp\big(\pm y\sqrt{-b}\,\big).$$

3°. For more complicated solutions, see equation 9.4.2.10 with $f(x)=c$, $g(x)=k$, and $h(x)=s$.

6. $\dfrac{\partial^2 w}{\partial x^2}+a\dfrac{\partial^2 w}{\partial y^2}=cx^n\left(\dfrac{\partial w}{\partial y}\right)^2+bcx^n w^2+kx^m w+sx^l.$

This is a special case of equation 9.4.2.10 with $f(x)=cx^n$, $g(x)=kx^m$, and $h(x)=sx^l$.

7. $\dfrac{\partial^2 w}{\partial x^2}+a\dfrac{\partial^2 w}{\partial y^2}=ce^{\beta x}\left(\dfrac{\partial w}{\partial y}\right)^2+bce^{\beta x}w^2+ke^{\mu x}w+se^{\nu x}.$

This is a special case of equation 9.4.2.10 with $f(x)=ce^{\beta x}$, $g(x)=ke^{\mu x}$, and $h(x)=se^{\nu x}$.

8. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=aw^n\left[\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2\right].$

This is a special case of equation 9.4.2.3 with $f(w)=aw^n$. The substitution

$$U=\int \exp\left(-\frac{a}{n+1}w^{n+1}\right)dw$$

leads to the two-dimensional Laplace equation for $U=U(x,y)$:

$$\frac{\partial^2 U}{\partial x^2}+\frac{\partial^2 U}{\partial y^2}=0.$$

For solutions of this linear equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

9. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=\alpha\left(\dfrac{\partial w}{\partial x}\right)^n+\beta\left(\dfrac{\partial w}{\partial y}\right)^m+kw.$

This is a special case of equation 9.4.2.13 with $a=b=1$, $f(x)=\alpha$, and $g(y)=\beta$.

10. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=(a_1x+b_1y+c_1)\left(\dfrac{\partial w}{\partial x}\right)^k+(a_2x+b_2y+c_2)\left(\dfrac{\partial w}{\partial y}\right)^k.$

This is a special case of equation 9.4.2.15 with $f(w,u,v)=0$.

9.1.4. Equations of the Form $\dfrac{\partial}{\partial x}\left[f_1(x,y)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[f_2(x,y)\dfrac{\partial w}{\partial y}\right]=g(w)$

▷ *Equations of this form are encountered in stationary problems of heat and mass transfer and combustion theory. Here, f_1 and f_2 are the principal thermal diffusivities (diffusion coefficients) dependent on the space coordinates x and y, and $g=g(w)$ is a source function that defines the law of heat (substance) release or absorption.*

1. $\dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right)=cw^k.$

This is a special case of equation 9.4.3.1 with $f(w)=cw^k$.

1°. Suppose $w(x,y)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w\Big(C_1^{\frac{k-1}{2-n}} x,\ C_1^{\frac{k-1}{2-m}} y\Big),$$

where C_1 is an arbitrary constant, is also a solution of the equation.

2°. Functional separable solution for $n \neq 2$ and $m \neq 2$:

$$w = w(\xi), \qquad \xi = \big[b(2-m)^2 x^{2-n} + a(2-n)^2 y^{2-m}\big]^{1/2}.$$

Here, the function $w(\xi)$ is determined by the ordinary differential equation

$$w''_{\xi\xi} + \frac{A}{\xi} w'_\xi = B w^k, \tag{1}$$

where

$$A = \frac{4-nm}{(2-n)(2-m)}, \quad B = \frac{4c}{ab(2-n)^2(2-m)^2}.$$

3°. Below are some exact solutions of equation (1).

3.1. Equation (1) admits an exact solution of the form

$$w = \left[\frac{2(1+k+A-Ak)}{B(1-k)^2}\right]^{\frac{1}{k-1}} \xi^{\frac{2}{1-k}}$$

with $k \neq 1$.

3.2. For $m = 4/n$, the exact solution can be represented in implicit form as

$$\int \left[C_1 + \frac{2cn^2 w^{k+1}}{ab(k+1)(2-n)^4}\right]^{-1/2} dw = C_2 \pm \xi,$$

where C_1 and C_2 are arbitrary constants.

3.3. The substitution $\zeta = \xi^{1-A}$ brings (1) to the Emden–Fowler equation

$$w''_{\zeta\zeta} = \frac{B}{(1-A)^2} \zeta^{\frac{2A}{1-A}} w^k. \tag{2}$$

Over 20 exact solutions to equation (2) for various values of k can be found in Polyanin and Zaitsev (2003).

2. $\dfrac{\partial}{\partial x}\left(ax^n \dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\mu y} \dfrac{\partial w}{\partial y}\right) = cw^m.$

This is a special case of equation 9.4.3.8 with $f(w) = cw^m$.

1°. Suppose $w(x,y)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w\Big(C_1^{\frac{m-1}{2-n}} x,\ y + \frac{1-m}{\mu} \ln C_1\Big),$$

where C_1 is an arbitrary constant, is also a solution of the equation.

2°. Functional separable solution for $n \neq 2$ and $\mu \neq 0$:

$$w = w(\xi), \qquad \xi = \big[b\mu^2 x^{2-n} + a(2-n)^2 e^{-\mu y}\big]^{1/2},$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$w''_{\xi\xi} + \frac{n}{2-n} \frac{1}{\xi} w'_\xi = \frac{4c}{ab\mu^2(2-n)^2} w^m.$$

3. $\dfrac{\partial}{\partial x}\left(ae^{\beta x} \dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\mu y} \dfrac{\partial w}{\partial y}\right) = cw^m.$

This is a special case of equation 9.4.3.6 with $f(w) = cw^m$.

1°. Suppose $w(x, y)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w\Big(x + \frac{1-m}{\beta}\ln C_1,\ y + \frac{1-m}{\mu}\ln C_1\Big),$$

where C_1 is an arbitrary constant, is also a solution of the equation.

2°. Functional separable solution for $\beta\mu \neq 0$:

$$w = w(\xi), \qquad \xi = \big(b\mu^2 e^{-\beta x} + a\beta^2 e^{-\mu y}\big)^{1/2},$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$w''_{\xi\xi} - \frac{1}{\xi}w'_\xi = Aw^m, \qquad A = \frac{4c}{ab\beta^2\mu^2}. \tag{1}$$

3°. Below are some exact solutions of equation (1).

3.1. Equation (1) admits a solution of the form

$$w = \left[\frac{abm\beta^2\mu^2}{c(1-m)^2}\right]^{\frac{1}{m-1}} \xi^{\frac{2}{1-m}}.$$

3.2. The substitution $\zeta = \xi^2$ brings (1) to the Emden–Fowler equation

$$w''_{\zeta\zeta} = \tfrac{1}{4}A\zeta^{-1}w^m,$$

whose solutions with $m = -1$ and $m = -2$ can be found in Polyanin and Zaitsev (2003).

4. $\dfrac{\partial}{\partial x}\left[(ay+c)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[(bx+s)\dfrac{\partial w}{\partial y}\right] = kw^n.$

This is a special case of equation 9.4.4.1 with $f(w) = kw^n$.

The equation can be rewritten in the simpler form

$$(ay+c)\frac{\partial^2 w}{\partial x^2} + (bx+s)\frac{\partial^2 w}{\partial y^2} = kw^n.$$

5. $\dfrac{\partial}{\partial x}\left[(a_1x+b_1y+c_1)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[(a_2x+b_2y+c_2)\dfrac{\partial w}{\partial y}\right] = kw^n.$

This is a special case of equation 9.4.4.2 with $f(w) = kw^n$.

9.1.5. Equations of the Form $\dfrac{\partial}{\partial x}\left[f_1(w)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[f_2(w)\dfrac{\partial w}{\partial y}\right] = g(w)$

▷ *Equations of this form are encountered in stationary problems of heat and mass transfer and combustion theory. Here, $f_1 = f_1(w)$ and $f_2 = f_2(w)$ are the temperature (concentration) dependent principal thermal diffusivities (diffusion coefficients), and $g = g(w)$ is a source function that defines the law of heat (substance) release or absorption. Simple solutions dependent on a single space variable, $w = w(x)$ and $w = w(y)$, are not considered in this subsection.*

1. $\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial}{\partial y}\left[(\alpha w + \beta)\dfrac{\partial w}{\partial y}\right] = 0.$

Stationary Khokhlov–Zabolotskaya equation (for $\alpha = 1$ and $\beta = 0$). It arises in acoustics, nonlinear mechanics, and heat and mass transfer theory. This is a special case of equation 9.4.4.8 with $f(w) = 1$ and $g(w) = \alpha w + \beta$.

1°. Suppose $w(x, y)$ is a solution of the equation in question. Then the function

$$w_1 = \frac{C_1^2}{C_2^2} w(C_1 x + C_3, C_2 y + C_4) + \frac{\beta}{\alpha}\left(\frac{C_1^2}{C_2^2} - 1\right),$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. Solutions:

$$w(x, y) = Ay - \tfrac{1}{2}A^2\alpha x^2 + C_1 x + C_2,$$
$$w(x, y) = (Ax + B)y - \frac{\alpha}{12A^2}(Ax + B)^4 + C_1 x + C_2,$$
$$w(x, y) = -\frac{1}{\alpha}\left(\frac{y + A}{x + B}\right)^2 + \frac{C_1}{x + B} + C_2(x + B)^2 - \frac{\beta}{\alpha},$$
$$w(x, y) = -\frac{1}{\alpha}\left[\beta + \lambda^2 \pm \sqrt{A(y + \lambda x) + B}\,\right],$$
$$w(x, y) = (Ax + B)\sqrt{C_1 y + C_2} - \frac{\beta}{\alpha},$$

where A, B, C_1, C_2, and λ are arbitrary constants. The first two solutions are linear in y, the third is quadratic in y, and the fourth one is a traveling-wave solution.

3°. Generalized separable solution quadratic in y (generalizes the third solution of Item 2°):

$$w(x, y) = \varphi(x)y^2 + \psi(x)y + \chi(x),$$

where the functions $\varphi = \varphi(x)$, $\psi = \psi(x)$, and $\chi = \chi(x)$ are determined by the system of ordinary differential equations

$$\varphi''_{xx} + 6\alpha\varphi^2 = 0, \tag{1}$$
$$\psi''_{xx} + 6\alpha\varphi\psi = 0, \tag{2}$$
$$\chi''_{xx} + 2\alpha\varphi\chi = -2\beta\varphi - \alpha\psi^2. \tag{3}$$

The nonlinear autonomous equation (1) is independent of the others; its solution can be expressed in terms of elliptic integrals. Equations (2) and (3) are solved successively (these are linear in the unknowns ψ and χ, respectively).

System (1)–(3) admits the following five-parameter family of solutions:

$$\varphi(x) = -\frac{1}{\alpha(x + A)^2},$$
$$\psi(x) = \frac{B_1}{(x + A)^2} + B_2(x + A)^3,$$
$$\chi(x) = \frac{C_1}{x + A} + C_2(x + A)^2 - \frac{\beta}{\alpha} - \frac{\alpha B_1^2}{4(x + A)^2} - \frac{1}{2}\alpha B_1 B_2(x + A)^3 - \frac{1}{54}\alpha B_2^2(x + A)^8,$$

where A, B_1, B_2, C_1, and C_2 are arbitrary constants.

4°. Solution in parametric form:

$$x = C_1 wt + C_2 w + C_3 t + C_4,$$
$$y = \tfrac{1}{2}C_1 t^2 + C_2 t - \tfrac{1}{3}\alpha C_1 w^3 - \tfrac{1}{2}(\alpha C_3 + \beta C_1)w^2 - \beta C_3 w + C_5.$$

5°. Solution in parametric form:

$$x = C_1 t^2 + C_2 wt + C_3 t + C_4 w - C_1\left(\tfrac{1}{3}\alpha w^3 + \beta w^2\right) + C_5,$$
$$y = \tfrac{1}{2}C_2 t^2 + C_4 t - C_1 t\left(\alpha w^2 + 2\beta w\right) - \tfrac{1}{3}\alpha C_2 w^3 - \tfrac{1}{2}(\alpha C_3 + \beta C_2)w^2 - \beta C_3 w + C_6,$$

where $C_1, \ldots, C_6$ are arbitrary constants.

6°. Self-similar solution (A and B are arbitrary constants):

$$w = w(\zeta), \quad \zeta = \frac{x + A}{y + B}$$

where the function $w(\zeta)$ is determined by the ordinary differential equation

$$w''_{\zeta\zeta} + [\zeta^2(\alpha w + \beta)w'_\zeta]'_\zeta = 0.$$

On integrating the equation once and taking w to be the independent variable, one obtains a Riccati equation for $\zeta = \zeta(w)$:

$$C\zeta'_w = (\alpha w + \beta)\zeta^2 + 1,$$

where C is an arbitrary constant. The general solution to this equation can be expressed in terms of Bessel functions; see Polyanin and Zaitsev (2003).

7°. Solution (generalizes the last solution of Item 2°):

$$w(x, y) = \frac{1}{\alpha} f(x)g(y) - \frac{\beta}{\alpha}.$$

The functions $f(x)$ and $g(y)$ are determined by the autonomous ordinary differential equations (A is an arbitrary constant)

$$f''_{xx} = Af^2, \qquad (gg'_y)'_y = -Ag, \tag{4}$$

which are independent. Integrating the equations of (4) yields their general solutions in implicit form:

$$C_1 \pm x = \int \left(\tfrac{2}{3}Af^3 + B_1\right)^{-1/2} df,$$
$$C_2 \pm y = \int g\left(-\tfrac{2}{3}Ag^3 + B_2\right)^{-1/2} dg,$$

where B_1, B_2, C_1, and C_2 are arbitrary constants.

8°. Solution (A, B, and k are arbitrary constants):

$$w = \frac{1}{\alpha}(x + A)^{2k} F(z) - \frac{\beta}{\alpha}, \quad z = \frac{y + B}{(x + A)^{k+1}},$$

where the function $F = F(z)$ is determined by solving the generalized-homogeneous ordinary differential equation

$$2k(2k - 1)F - (k + 1)(3k - 2)zF'_z + (k + 1)^2 z^2 F''_{zz} + (FF'_z)'_z = 0.$$

Its order can be reduced.

9°. Solution (A and λ are arbitrary constants):

$$w = \frac{1}{\alpha}e^{-2\lambda x}\Phi(u) - \frac{\beta}{\alpha}, \quad u = (y + A)e^{\lambda x},$$

where the function $\Phi = \Phi(u)$ is determined by solving the generalized-homogeneous ordinary differential equation

$$4\lambda^2\Phi - 3\lambda^2 u\Phi'_u + \lambda^2 u^2\Phi''_{uu} + (\Phi\Phi'_u)'_u = 0.$$

Its order can be reduced.

10°. Solution (A, B, and C are arbitrary constants):

$$w = \frac{1}{\alpha}(\pm x + A)^{-2}\Psi(\xi) - \frac{\beta}{\alpha}, \quad \xi = y + B\ln(\pm x + A) + C,$$

where the function $\Psi = \Psi(\xi)$ is determined by the autonomous ordinary differential equation

$$6\Psi - 5B\Psi'_\xi + B^2\Psi''_{\xi\xi} + (\Psi\Psi'_\xi)'_\xi = 0.$$

Its order can be reduced.

11°. Solution:

$$w = U(\eta) - 4\alpha C_1^2 x^2 - 4\alpha C_1 C_2 x, \quad \eta = y + \alpha C_1 x^2 + \alpha C_2 x,$$

where C_1 and C_2 are arbitrary constants and the function $U(\eta)$ is determined by the first-order ordinary differential equation

$$(\alpha U + \beta + \alpha^2 C_2^2)U'_\eta + 2\alpha C_1 U = 8\alpha C_1^2\eta + C_3.$$

Through appropriate translations in both variables, one can make the equation homogeneous, which means that the equation is integrable by quadrature.

12°. The original equation can be rewritten as the system of equations

$$\frac{\partial w}{\partial x} = \frac{\partial v}{\partial y}, \quad -(\alpha w + \beta)\frac{\partial w}{\partial y} = \frac{\partial v}{\partial x}.$$

The hodograph transformation $x = x(w, v)$, $y = y(w, v)$ (w and v treated as the independent variables, and x and y, as the dependent ones) brings it to the linear system

$$\frac{\partial y}{\partial v} = \frac{\partial x}{\partial w}, \quad -(\alpha w + \beta)\frac{\partial x}{\partial v} = \frac{\partial y}{\partial w}.$$

On eliminating y, one obtains a linear equation for $x = x(w, v)$:

$$\frac{\partial^2 x}{\partial w^2} + (\alpha w + \beta)\frac{\partial^2 x}{\partial v^2} = 0.$$

13°. Let $w(x, y)$ be any solution of the Khokhlov–Zabolotskaya equation (with $\alpha = 1$ and $\beta = 0$). Then the ordinary differential equation

$$u''_{tt} = F(t, u), \qquad F(t, u) = \frac{1}{9\varphi}\left(\frac{\partial v}{\partial u} + 3\varphi''_{tt}u + 3\psi'_t\right),$$

where

$$v = -\varphi^{1/3}w(x, y) - \varphi^{-1}(\varphi'_t u + \psi)^2, \quad x = \frac{1}{3}\int \varphi^{-2/3}\,dt, \quad y = \varphi^{-1/3}u - \frac{1}{3}\int \varphi^{-4/3}\psi\,dt,$$

and $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are arbitrary functions, has a first integral cubic in u'_t.

⊙ *References for equation* 9.1.5.1: Y. Kodama and J. Gibbons (1989), V. V. Kozlov (1995, pp. 379–381), V. F. Zaitsev and A. D. Polyanin (2001), A. D. Polyanin and V. F. Zaitsev (2002, pp. 193–195).

2. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial}{\partial y}\left(\dfrac{1}{\alpha w+\beta}\dfrac{\partial w}{\partial y}\right)=0.$

1°. Solutions:

$$w(x,y)=\frac{-A^2x^2+Bx+C}{\alpha(Ay+D)^2}-\frac{\beta}{\alpha},$$

$$w(x,y)=\frac{p^2}{A\alpha}\frac{Ax^2+Bx+C}{\cosh^2(py+q)}-\frac{\beta}{\alpha},$$

$$w(x,y)=-\frac{p^2}{A\alpha}\frac{Ax^2+Bx+C}{\sinh^2(py+q)}-\frac{\beta}{\alpha},$$

$$w(x,y)=-\frac{p^2}{A\alpha}\frac{Ax^2+Bx+C}{\cos^2(py+q)}-\frac{\beta}{\alpha},$$

where A, B, C, D, p, and q are arbitrary constants.

2°. Solution in parametric form:

$$x=C_1wt+C_2w+C_3t+C_4,$$
$$y=\frac{1}{2}C_1t^2+C_2t-\frac{C_1}{\alpha}w-\frac{1}{\alpha^2}(\alpha C_3-\beta C_1)\ln|\alpha w+\beta|+C_5,$$

where $C_1,\ldots,C_5$ are arbitrary constants.

3°. For other exact solutions, see equation 9.4.4.8 with $f(w)=1$ and $g(w)=(\alpha w+\beta)^{-1}$.

4°. The substitution $\alpha w+\beta=e^U$ leads to an equation of the form 9.2.4.1 (with swapped variables, $x\rightleftarrows y$):

$$\frac{\partial}{\partial x}\left(e^U\frac{\partial U}{\partial x}\right)+\frac{\partial^2 U}{\partial y^2}=0.$$

3. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial}{\partial y}\left(\dfrac{\alpha}{\sqrt{w+\beta}}\dfrac{\partial w}{\partial y}\right)=0.$

The substitution $U=\dfrac{1}{\alpha}\sqrt{w+\beta}$ leads to the equation

$$\frac{\partial}{\partial x}\left(U\frac{\partial U}{\partial x}\right)+\frac{\partial^2 U}{\partial y^2}=0.$$

Up to the swap of the coordinates ($x\rightleftarrows y$) and renaming the unknown function, this equation coincides with a special case of 9.1.5.1.

4. $\dfrac{\partial}{\partial x}\left[(\alpha_1 w+\beta_1)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[(\alpha_2 w+\beta_2)\dfrac{\partial w}{\partial y}\right]=\gamma.$

1°. Traveling-wave solutions linear in the coordinates:

$$w(x,y)=Ax\pm\sqrt{\frac{\gamma-A^2\alpha_1}{\alpha_2}}\,y+B,$$

where A and B are arbitrary constants.

2°. Traveling-wave solution in implicit form:

$$(A^2\alpha_1 + B^2\alpha_2)w^2 + 2(A^2\beta_1 + B^2\beta_2)w = \gamma(Ax + By)^2 + C_1(Ax + By) + C_2,$$

where A, B, C_1, and C_2 are arbitrary constants.

3°. For other solutions with $\gamma = 0$, see 9.4.4.8 with $f(w) = \alpha_1 w + \beta_1$ and $g(w) = \alpha_2 w + \beta_2$.

5. $\dfrac{\partial}{\partial x}\left(w^m\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(w^m\dfrac{\partial w}{\partial y}\right) = \alpha w^n.$

1°. Suppose $w(x, y)$ is a solution of this equation. Then the functions

$$w_1 = C_1^2 w(\pm C_1^{n-m-1}x + C_2, \pm C_1^{n-m-1}y + C_3),$$
$$w_2 = w(x\cos\beta - y\sin\beta,\ x\sin\beta + y\cos\beta),$$

where C_1, C_2, C_3, and β are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. For $m \neq -1$, the substitution $U = w^{m+1}$ leads to an equation of the form 9.1.1.1:

$$\frac{\partial^2 U}{\partial x^2} + \frac{\partial^2 U}{\partial y^2} = \alpha(m+1)U^{\frac{n}{m+1}}.$$

3°. For $m = -1$, the substitution $w = e^V$ leads to an equation of the form 9.2.1.1:

$$\frac{\partial^2 V}{\partial x^2} + \frac{\partial^2 V}{\partial y^2} = \alpha e^{nV}.$$

6. $\dfrac{\partial}{\partial x}\left(aw^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(bw^m\dfrac{\partial w}{\partial y}\right) = 0.$

1°. Suppose $w(x, y)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-2} w(\pm C_1^n C_2 x + C_3, \pm C_1^m C_2 y + C_4),$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Multiplicative separable solution:

$$w(x, y) = f(x)g(y). \tag{1}$$

The functions $f(x)$ and $g(y)$ are determined by the autonomous ordinary differential equations (A is an arbitrary constant)

$$(f^n f'_x)'_x = Abf^{m+1}, \qquad (g^m g'_y)'_y = -Aag^{n+1}, \tag{2}$$

which are independent. Integrating the equations of (2) yields their general solutions in implicit form:

$$\int f^n\left(\frac{2Ab}{n+m+2}f^{n+m+2} + B_1\right)^{-1/2} df = C_1 \pm x,$$
$$\int g^m\left(-\frac{2Aa}{n+m+2}g^{n+m+2} + B_2\right)^{-1/2} dg = C_2 \pm y,$$

where B_1, B_2, C_1, and C_2 are arbitrary constants; $n + m + 2 \neq 0$.

3°. There are exact solutions of the following forms:

$$w(x,y) = x^{-2k}F(z), \qquad z = yx^{mk-nk-1},$$
$$w(x,y) = x^{\frac{2}{n-m}}G(\xi), \quad \xi = y + k\ln x,$$
$$w(x,y) = e^{2x}H(\eta), \qquad \eta = ye^{(n-m)x},$$

where k is an arbitrary constant.

4°. For other exact solutions of the original equation, see 9.4.4.8 with $f(w) = aw^n$ and $g(w) = bw^m$.

7. $\dfrac{\partial}{\partial x}\left(w^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(w^m\dfrac{\partial w}{\partial y}\right) = bw^k.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the functions

$$w_1 = C_1^2 w(\pm C_1^{k-n-1}x + C_2, \pm C_1^{k-m-1}y + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. There are exact solutions of the following forms:

$w(x,y) = F(\xi), \quad \xi = \alpha_1 x + \alpha_2 y$ traveling-wave solution;
$w(x,y) = x^{\frac{2}{n-k+1}}U(z), \quad z = yx^{\frac{k-m-1}{n-k+1}}$ self-similar solution.

9.1.6. Other Equations Involving Arbitrary Parameters

1. $\dfrac{\partial^2 w}{\partial x^2} + aw^4\dfrac{\partial^2 w}{\partial y^2} = by^n w^5.$

This is a special case of equation 9.4.5.1 with $f(y) = by^n$.

2. $\dfrac{\partial^2 w}{\partial x^2} + aw^4\dfrac{\partial^2 w}{\partial y^2} = be^{\beta y}w^5.$

This is a special case of equation 9.4.5.1 with $f(y) = be^{\beta y}$.

3. $ax^n\dfrac{\partial^2 w}{\partial x^2} + by^m\dfrac{\partial^2 w}{\partial y^2} = cw^k.$

This is a special case of equation 9.4.5.5 with $k = s = 0$ and $f(w) = cw^k$.

1°. Functional separable solution for $n \neq 2$ and $m \neq 2$:

$$w = w(\xi), \qquad \xi = \left[b(2-m)^2x^{2-n} + a(2-n)^2y^{2-m}\right]^{1/2}.$$

Here, the function $w(\xi)$ is determined by the ordinary differential equation

$$w''_{\xi\xi} + \frac{A}{\xi}w'_\xi = Bw^k, \tag{1}$$

where

$$A = \frac{3nm - 4n - 4m + 4}{(2-n)(2-m)}, \quad B = \frac{4c}{ab(2-n)^2(2-m)^2}.$$

2°. Below are some exact solutions of equation (1).

2.1. For $k \neq 1$, equation (1) admits an exact solution of the form

$$w = \left[\frac{2(1+k+A-Ak)}{B(1-k)^2}\right]^{\frac{1}{k-1}} \xi^{\frac{2}{1-k}}.$$

2.2. For $m = \dfrac{4n-4}{3n-4}$, the general solution of (1) is written out in implicit form as

$$\int \left[C_1 + \frac{2c(3n-4)^2 w^{k+1}}{ab(k+1)(2-n)^4}\right]^{-1/2} dw = C_2 \pm \xi,$$

where C_1 and C_2 are arbitrary constants.

2.3. The substitution $\zeta = \xi^{1-A}$ brings (1) to the Emden–Fowler equation

$$w''_{\zeta\zeta} = \frac{B}{(1-A)^2} \zeta^{\frac{2A}{1-A}} w^k. \tag{2}$$

Over 20 exact solutions to equation (2) for various values of k can be found in Polyanin and Zaitsev (2003).

4. $ax^n \dfrac{\partial^2 w}{\partial x^2} + be^{\beta y} \dfrac{\partial^2 w}{\partial y^2} = cw^m.$

This is a special case of equation 9.4.5.9 with $k = s = 0$ and $f(w) = cw^m$.

5. $ae^{\beta x} \dfrac{\partial^2 w}{\partial x^2} + be^{\mu y} \dfrac{\partial^2 w}{\partial y^2} = cw^m.$

This is a special case of equation 9.4.5.7 with $k = s = 0$ and $f(w) = cw^m$.

1°. Functional separable solution for $\beta\mu \neq 0$:

$$w = w(\xi), \qquad \xi = \left(b\mu^2 e^{-\beta x} + a\beta^2 e^{-\mu y}\right)^{1/2},$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$w''_{\xi\xi} + \frac{3}{\xi} w'_\xi = Aw^m, \qquad A = \frac{4c}{ab\beta^2\mu^2}. \tag{1}$$

2°. Below are some exact solutions of equation (1).

2.1. There is a solution of the form

$$w(\xi) = \left[\frac{ab(2-m)\beta^2\mu^2}{c(1-m)^2}\right]^{\frac{1}{m-1}} \xi^{\frac{2}{1-m}}.$$

2.2. The substitution $\zeta = \xi^{-2}$ brings (1) to the Emden–Fowler equation

$$w''_{\zeta\zeta} = \tfrac{1}{4} A \zeta^{-3} w^m,$$

whose solution for $m = 3$ can be found in Polyanin and Zaitsev (2003).

6. $w\left(\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}\right)-\left(\dfrac{\partial w}{\partial x}\right)^2-\left(\dfrac{\partial w}{\partial y}\right)^2=\alpha w^\beta.$

The substitution $w=e^U$ leads to an equation of the form 9.2.1.1:

$$\frac{\partial^2 U}{\partial x^2}+\frac{\partial^2 U}{\partial y^2}=\alpha e^{(\beta-2)U}.$$

7. $w\left(\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}\right)+\sigma\left[\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2\right]=\alpha w^2+\beta w+\gamma.$

1°. Traveling-wave solutions for $\alpha(1+\sigma)>0$:

$$w(x,y)=A_1+B_1\cosh z,\quad z=\sqrt{\frac{\alpha}{1+\sigma}}\,\frac{k_1x+k_2y}{\sqrt{k_1^2+k_2^2}}+C,$$

$$A_1=-\frac{\beta}{\alpha}\,\frac{1+\sigma}{1+2\sigma},\quad B_1=\pm\sqrt{\frac{\beta^2(1+\sigma)^2}{\alpha^2(1+2\sigma)^2}-\frac{\gamma(1+\sigma)}{\alpha\sigma}};$$

$$w(x,y)=A_2+B_2\sinh z,\quad z=\sqrt{\frac{\alpha}{1+\sigma}}\,\frac{k_1x+k_2y}{\sqrt{k_1^2+k_2^2}}+C,$$

$$A_2=-\frac{\beta}{\alpha}\,\frac{1+\sigma}{1+2\sigma},\quad B_2=\pm\sqrt{\frac{\gamma(1+\sigma)}{\alpha\sigma}-\frac{\beta^2(1+\sigma)^2}{\alpha^2(1+2\sigma)^2}},$$

where k_1, k_2, and C are arbitrary constants.

2°. Traveling-wave solutions for $\alpha(1+\sigma)<0$:

$$w(x,y)=A+B\cos z,\quad z=\sqrt{-\frac{\alpha}{1+\sigma}}\,\frac{k_1x+k_2y}{\sqrt{k_1^2+k_2^2}}+C,$$

$$A=-\frac{\beta}{\alpha}\,\frac{1+\sigma}{1+2\sigma},\quad B=\pm\sqrt{\frac{\beta^2(1+\sigma)^2}{\alpha^2(1+2\sigma)^2}-\frac{\gamma(1+\sigma)}{\alpha\sigma}},$$

where k_1, k_2, and C are arbitrary constants.

3°. Solution:

$$w=w(r),\qquad r=\sqrt{(x+C_1)^2+(y+C_2)^2},$$

where C_1 and C_2 are arbitrary constants and the function $w(r)$ is determined by the ordinary differential equation

$$ww_{rr}''+\frac{1}{r}ww_r'+\sigma\left(w_r'\right)^2=\alpha w^2+\beta w+\gamma.$$

4°. For $\gamma=0$, apart from the solutions presented in Items 1° to 3°, other solutions can be constructed. To this end, we apply the change of variable $w=u^2$ to the original equation to obtain

$$u\left(\frac{\partial^2 u}{\partial x^2}+\frac{\partial^2 u}{\partial y^2}\right)+(1+2\sigma)\left[\left(\frac{\partial u}{\partial x}\right)^2+\left(\frac{\partial u}{\partial y}\right)^2\right]=\tfrac{1}{2}\alpha u^2+\tfrac{1}{2}\beta.$$

This equation is a special case of the original one. It follows that its solution can be obtained with the formulas given in Items 1° and 2°, where variables and parameters should be renamed as follows: $\sigma\to 1+2\sigma$, $\alpha\to\frac{1}{2}\alpha$, $\beta\to 0$, and $\gamma\to\frac{1}{2}\beta$.

5°. Solutions for $\alpha = 0$:

$$w(x,y) = \frac{\beta}{2(1+2\sigma)}\left(\frac{k_1x+k_2y}{\sqrt{k_1^2+k_2^2}}+C\right)^2 - \frac{\gamma(1+2\sigma)}{2\beta\sigma},$$

$$w(x,y) = \frac{\beta}{4(1+\sigma)}\left[(x+C_1)^2+(y+C_2)^2\right] - \frac{\gamma(1+\sigma)}{\beta\sigma},$$

where k_1, k_2, C, C_1, and C_2 are arbitrary constants.

⊙ *Reference for equation* 9.1.6.7: A. D. Polyanin and V. F. Zaitsev (2002, pp. 199–200).

8. $$\frac{\partial}{\partial x}\left[(a_1x+b_1y+c_1w+k_1)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[(a_2x+b_2y+c_2w+k_2)\frac{\partial w}{\partial y}\right] = 0.$$

This is a special case of equation 9.4.4.11 with $f(w) = c_1w + k_1$ and $g(w) = c_2w + k_2$.

9. $$\frac{\partial}{\partial x}\left[(a_1x+b_1y+c_1w^n)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[(a_2x+b_2y+c_2w^k)\frac{\partial w}{\partial y}\right] = 0.$$

This is a special case of equation 9.4.4.11 with $f(w) = c_1w^n$ and $g(w) = c_2w^k$.

10. $$a\frac{\partial w}{\partial x}\frac{\partial^2 w}{\partial x^2} + \frac{\partial^2 w}{\partial y^2} = 0.$$

This is an *equation of steady transonic gas flow* (with $a < 0$).

1°. Suppose $w(x,y)$ is a solution of the equation in question. Then the function

$$w_1 = C_1^{-3}C_2^2 w(C_1x+C_3, C_2y+C_4) + C_5y + C_6,$$

where $C_1, \ldots, C_6$ are arbitrary constants, is also a solution of the equation.

⊙ *Reference*: N. H. Ibragimov (1985).

2°. Solutions:

$$w(x,y) = C_1xy + C_2x + C_3y + C_4,$$

$$w(x,y) = -\frac{(x+C_1)^3}{3a(y+C_2)^2} + C_3y + C_4,$$

$$w(x,y) = \frac{a^2C_1^3}{39}(y+A)^{13} + \frac{2}{3}aC_1^2(y+A)^8(x+B) + 3C_1(y+A)^3(x+B)^2 - \frac{(x+B)^3}{3a(y+A)^2},$$

$$w(x,y) = -aC_1y^2 + C_2y + C_3 \pm \frac{4}{3C_1}(C_1x+C_4)^{3/2},$$

$$w(x,y) = -aA^3y^2 - \frac{B^2}{aA^2}x + C_1y + C_2 \pm \frac{4}{3}(Ax+By+C_3)^{3/2},$$

$$w(x,y) = \frac{1}{3}(Ay+B)(2C_1x+C_2)^{3/2} - \frac{aC_1^3}{12A^2}(Ay+B)^4 + C_3y + C_4,$$

$$w(x,y) = -\frac{9aA^2}{y+C_1} + 4A\left(\frac{x+C_2}{y+C_1}\right)^{3/2} - \frac{(x+C_2)^3}{3a(y+C_1)^2} + C_3y + C_4,$$

$$w(x,y) = -\frac{3}{7}aA^2(y+C_1)^7 + 4A(x+C_2)^{3/2}(y+C_1)^{5/2} - \frac{(x+C_2)^3}{3a(y+C_1)^2} + C_3y + C_4,$$

where A, B, $C_1, \ldots, C_4$ are arbitrary constants (the first solution is degenerate).

3°. Self-similar solution:

$$w(x,y) = y^{-3k-2}U(z), \qquad z = xy^k,$$

where k is an arbitrary constant, and the function $U = U(z)$ is determined by the ordinary differential equation

$$aU_z'U_{zz}'' + k^2z^2U_{zz}'' - 5k(k+1)zU_z' + 3(k+1)(3k+2)U = 0.$$

4°. Generalized separable solution:

$$w(x,y) = \varphi_1(y) + \varphi_2(y)x^{3/2} + \varphi_3(y)x^3,$$

where the functions $\varphi_k = \varphi_k(y)$ are determined by the autonomous system of ordinary differential equations

$$\begin{aligned}
&\varphi_1'' + \tfrac{9}{8}a\varphi_2^2 = 0,\\
&\varphi_2'' + \tfrac{45}{4}a\varphi_2\varphi_3 = 0,\\
&\varphi_3'' + 18a\varphi_3^2 = 0,
\end{aligned}$$

where the prime stands for the differentiation with respect to y. The general solution of the third equation can be written out in implicit form (it is expressed in terms of the Weierstrass function).

5°. Generalized separable solution cubic in x:

$$w(x,y) = \psi_1(y) + \psi_2(y)x + \psi_3(y)x^2 + \psi_4(y)x^3,$$

where the functions $\psi_k = \psi_k(y)$ are determined by the autonomous system of ordinary differential equations

$$\begin{aligned}
&\psi_1'' + 2a\psi_2\psi_3 = 0,\\
&\psi_2'' + 2a(2\psi_3^2 + 3\psi_2\psi_4) = 0,\\
&\psi_3'' + 18a\psi_3\psi_4 = 0,\\
&\psi_4'' + 18a\psi_4^2 = 0.
\end{aligned}$$

A particular solution of the system is given by

$$\begin{aligned}
\psi_1(y) &= -2a\int_{y_0}^{y}(y-t)\psi_2(t)\psi_3(t)\,dt + B_1y + B_2,\\
\psi_2(y) &= C_3(y+A)^{-1} + C_4(y+A)^2 - aC_1^2(y+A)^{-2} - 2aC_1C_2(y+A)^3 - \frac{2}{27}aC_2^2(y+A)^8,\\
\psi_3(y) &= C_1(y+A)^{-2} + C_2(y+A)^3, \qquad \psi_4(y) = -\frac{1}{3a}(y+A)^{-2},
\end{aligned}$$

where A, B_1, B_2, C_1, …, C_4 are arbitrary constants and y_0 is any number.

6°. Generalized separable solution:

$$w(x,y) = \eta(y)\theta(x) - aC_1\int_0^y(y-t)\eta^2(t)\,dt + C_2y + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants, and the functions $\eta(y)$ and $\theta(x)$ satisfy the autonomous ordinary differential equations (C_4 is an arbitrary constant)

$$\eta''_{yy} + aC_4\eta^2 = 0, \tag{1}$$
$$\theta'_x\theta''_{xx} = C_4\theta + C_1. \tag{2}$$

The solutions to equations (1) and (2) can be written out in implicit form:

$$\int \left(C_5 - \tfrac{2}{3}aC_4\eta^3\right)^{-1/2} d\eta = C_6 \pm y,$$
$$\int \left(\tfrac{3}{2}C_4\theta^2 + 3C_1\theta + C_7\right)^{-1/3} d\theta = x + C_8,$$

where C_5, C_6, C_7, and C_8 are arbitrary constants.

7°. The Legendre transformation

$$u(\xi,\eta) = x\xi + y\eta - w(x,y), \quad \xi = \frac{\partial w}{\partial x}, \quad \eta = \frac{\partial w}{\partial y},$$

where u is the new dependent variable and ξ and η are the new independent variables, leads to *Tricomi's equation*

$$a\xi\frac{\partial^2 u}{\partial \eta^2} + \frac{\partial^2 u}{\partial \xi^2} = 0.$$

Exact solutions to this linear equation can be found in the book by Polyanin (2002).

⊙ *References for equation* 9.1.6.10: K. G. Guderley (1962), N. H. Ibragimov (1985), S. S. Titov (1988), S. R. Svirshchevskii (1995), A. D. Polyanin and V. F. Zaitsev (2004, pp. 361–362), V. A. Galaktionov and S. R. Svirshchevskii (2007, pp. 3–4).

11. $\dfrac{\partial^2 w}{\partial y^2} + \dfrac{a}{y}\dfrac{\partial w}{\partial y} + b\dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial x^2} = 0.$

For $b < 0$, this equation describes a transonic gas flow.

1°. Suppose $w(x,y)$ is a solution of the equation in question. Then the function

$$w_1 = C_1^{-3}C_2^2 w(C_1x + C_3, C_2y) + C_4y^{1-a} + C_5,$$

where $C_1, \ldots, C_5$ are arbitrary constants, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,y) = -\frac{bC_1}{4(a+1)}y^2 + C_2y^{1-a} + C_3 \pm \frac{2}{3C_1}(C_1x + C_4)^{3/2},$$

where $C_1, \ldots, C_4$ are arbitrary constants.

3°. Generalized separable solutions:

$$w(x,y) = -\frac{9A^2b}{16(n+1)(2n+1+a)}y^{2n+2} + Ay^n(x+C)^{3/2} + \frac{a-3}{9b}\frac{(x+C)^3}{y^2},$$

where A and C are arbitrary constants, and the $n = n_{1,2}$ are roots of the quadratic equation

$$n^2 + (a-1)n + \tfrac{5}{4}(a-3) = 0.$$

4°. Generalized separable solution:

$$w(x,y) = (Ay^{1-a} + B)(2C_1x + C_2)^{3/2} + 9bC_1^3\theta(y),$$

where A, B, C_1, and C_2 are arbitrary constants, and the function $\theta = \theta(y)$ is determined by the second-order linear ordinary differential equation

$$\theta''_{yy} + \frac{a}{y}\theta'_y + (Ay^{1-a} + B)^2 = 0.$$

Integrating yields

$$\theta(y) = -\frac{B^2}{2(a+1)}y^2 - \frac{AB}{3-a}y^{3-a} - \frac{A^2}{2(2-a)(3-a)}y^{4-2a} + C_3y^{1-a} + C_4.$$

5°. Self-similar solution:

$$w(x,y) = y^{-3k-2}U(z), \qquad z = xy^k,$$

where k is an arbitrary constant, and the function $U = U(z)$ is determined by the ordinary differential equation

$$bU'_zU''_{zz} + k^2z^2U''_{zz} + k(a-5k-5)zU'_z + (3k+2)(3k+3-a)U = 0.$$

6°. Generalized separable solution:

$$w(x,y) = \varphi_1(y) + \varphi_2(y)x^{3/2} + \varphi_3(y)x^3,$$

where the functions $\varphi_k = \varphi_k(y)$ are determined by the system of ordinary differential equations

$$\varphi''_1 + \frac{a}{y}\varphi'_1 + \frac{9}{8}b\varphi_2^2 = 0,$$
$$\varphi''_2 + \frac{a}{y}\varphi'_2 + \frac{45}{4}b\varphi_2\varphi_3 = 0,$$
$$\varphi''_3 + \frac{a}{y}\varphi'_3 + 18b\varphi_3^2 = 0,$$

where the prime stands for the differentiation with respect to y.

7°. Generalized separable solution cubic in x:

$$w(x,y) = \psi_1(y) + \psi_2(y)x + \psi_3(y)x^2 + \psi_4(y)x^3,$$

where the functions $\psi_k = \psi_k(y)$ are determined by the system of ordinary differential equations

$$\psi''_1 + \frac{a}{y}\psi'_1 + 2b\psi_2\psi_3 = 0,$$
$$\psi''_2 + \frac{a}{y}\psi'_2 + 2b(2\psi_3^2 + 3\psi_2\psi_4) = 0,$$
$$\psi''_3 + \frac{a}{y}\psi'_3 + 18b\psi_3\psi_4 = 0,$$
$$\psi''_4 + \frac{a}{y}\psi'_4 + 18b\psi_4^2 = 0.$$

8°. Generalized separable solution:

$$w(x,y) = \xi(y) + \eta(y)\theta(x).$$

Here, the functions $\xi(y)$ and $\eta(y)$ are determined by the system of ordinary differential equations

$$\eta''_{yy} + \frac{a}{y}\eta'_y + bC_1\eta^2 = 0,$$
$$\xi''_{yy} + \frac{a}{y}\xi'_y + bC_2\eta^2 = 0,$$

where C_1 and C_2 are arbitrary constants, and the function $\theta = \theta(x)$ is determined by the autonomous ordinary differential equation

$$\theta'_x\theta''_{xx} = C_1\theta + C_2.$$

Its solution can be written out in implicit form:

$$\int \left(\tfrac{3}{2}C_1\theta^2 + 3C_2\theta + C_3\right)^{-1/3} d\theta = x + C_4,$$

where C_3 and C_4 are arbitrary constants.

⊙ *References for equation* 9.1.6.11: K. G. Guderley (1962), S. S. Titov (1988), S. R. Svirshchevskii (1995), A. D. Polyanin and V. F. Zaitsev (2004, pp. 363–364), V. A. Galaktionov and S. R. Svirshchevskii (2007, pp. 3–4).

12. $\dfrac{\partial^2 w}{\partial x^2} = (ay^k + b)\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial y^2}.$

This is a special case of equation 9.1.6.15 with $f(y) = ay^k + b$.

13. $\dfrac{\partial^2 w}{\partial x^2} = (ay + b)^k\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial y^2}.$

This is a special case of equation 9.1.6.15 with $f(y) = (ay + b)^k$.

14. $\dfrac{\partial^2 w}{\partial x^2} = (ae^{\lambda y} + c)\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial y^2}.$

This is a special case of equation 9.1.6.15 with $f(y) = ae^{\lambda y} + c$.

15. $\dfrac{\partial^2 w}{\partial x^2} = f(y)\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial y^2}.$

1°. Generalized separable solution:

$$w = \frac{1}{12}A^2x^4 + \frac{1}{3}ABx^3 + \frac{1}{2}B^2x^2 + Cx + D + (Ax + B)\int\left[2\int\frac{dy}{f(y)}\right]^{1/2} dy,$$

where A, B, C, and D are arbitrary constants.

2°. Generalized separable solution:

$$w = Ax + B + C(x + D)^{-2}\varphi(y),$$

where A, B, C, and D are arbitrary constants, and the function $\varphi = \varphi(y)$ is determined by the ordinary differential equation

$$f(y)\varphi'_y\varphi''_{yy} = 6\varphi.$$

⊙ *Reference*: E. A. Vyazmina (2008, http://eqworld.ipmnet.ru/eqarchive/view.php?id=261).

9.2. Equations with Exponential Nonlinearities

9.2.1. Equations of the Form $\frac{\partial^2 w}{\partial x^2} + \frac{\partial^2 w}{\partial y^2} = a + be^{\beta w} + ce^{\gamma w}$

1. $\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} = ae^{\beta w}.$

This equation occurs in combustion theory and is a special case of equation 9.4.1.1 with $f(w) = ae^{\beta w}$.

1°. Suppose $w(x, y)$ is a solution of the equation in question. Then the functions

$$w_1 = w(\pm C_1^{\beta} x + C_2, \pm C_1^{\beta} y + C_3) + 2\ln|C_1|,$$
$$w_2 = w(x\cos\lambda - y\sin\lambda,\ x\sin\lambda + y\cos\lambda),$$

where C_1, C_2, C_3, and λ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Solutions:

$$w(x,y) = \frac{1}{\beta}\ln\left[\frac{2(A^2+B^2)}{a\beta(Ax+By+C)^2}\right] \quad \text{if } a\beta > 0,$$
$$w(x,y) = \frac{1}{\beta}\ln\left[\frac{2(A^2+B^2)}{a\beta\sinh^2(Ax+By+C)}\right] \quad \text{if } a\beta > 0,$$
$$w(x,y) = \frac{1}{\beta}\ln\left[\frac{-2(A^2+B^2)}{a\beta\cosh^2(Ax+By+C)}\right] \quad \text{if } a\beta < 0,$$
$$w(x,y) = \frac{1}{\beta}\ln\left[\frac{2(A^2+B^2)}{a\beta\cos^2(Ax+By+C)}\right] \quad \text{if } a\beta > 0,$$
$$w(x,y) = \frac{1}{\beta}\ln\left(\frac{8C}{a\beta}\right) - \frac{2}{\beta}\ln\left|(x+A)^2 + (y+B)^2 - C\right|,$$

where A, B, and C are arbitrary constants. The first four solutions are of traveling-wave type and the last one is a radial symmetric solution with center at the point $(-A, -B)$.

Special case. For $a = \beta = 1$, the boundary value problem for the circle $r = \sqrt{x^2+y^2} \le 1$ with the boundary condition $w\big|_{r=1} = 0$ has the following two solutions (see the last solution in Item 2° with $a = \beta = 1$, $A = B = 0$, and $C = k$):

$$w(r) = \ln\frac{8k}{(k-r^2)^2}, \qquad k = 5 \pm 2\sqrt{6}.$$

The first solution is bounded at every point inside the circle, $r \le 1$, and the second one has a singularity at the circumference $r = \sqrt{k}$.

3°. Functional separable solutions:

$$w(x,y) = -\frac{2}{\beta}\ln\left[C_1 e^{ky} \pm \frac{\sqrt{2a\beta}}{2k}\cos(kx + C_2)\right],$$
$$w(x,y) = \frac{1}{\beta}\ln\frac{2k^2(B^2 - A^2)}{a\beta[A\cosh(kx + C_1) + B\sin(ky + C_2)]^2},$$
$$w(x,y) = \frac{1}{\beta}\ln\frac{2k^2(A^2 + B^2)}{a\beta[A\sinh(kx + C_1) + B\cos(ky + C_2)]^2},$$

where A, B, C_1, C_2, and k are arbitrary constants (x and y can be swapped to give another three solutions).

4°. General solution:

$$w(x,y)=-\frac{2}{\beta}\ln\frac{\left|1-2a\beta\Phi(z)\overline{\Phi(z)}\,\right|}{4|\Phi'_z(z)|},$$

where $\Phi=\Phi(z)$ is an arbitrary analytic (holomorphic) function of the complex variable $z=x+iy$ with nonzero derivative, and the bar over a symbol denotes the complex conjugate.

5°. The original equation is related to the linear equation

$$\frac{\partial^2 U}{\partial x^2}+\frac{\partial^2 U}{\partial y^2}=0 \tag{1}$$

by the Bäcklund transformation

$$\frac{\partial U}{\partial x}+\tfrac{1}{2}\beta\frac{\partial w}{\partial y}=\left(\tfrac{1}{2}a\beta\right)^{1/2}\exp\left(\tfrac{1}{2}\beta w\right)\sin U, \tag{2}$$

$$\frac{\partial U}{\partial y}-\tfrac{1}{2}\beta\frac{\partial w}{\partial x}=\left(\tfrac{1}{2}a\beta\right)^{1/2}\exp\left(\tfrac{1}{2}\beta w\right)\cos U. \tag{3}$$

Suppose there is a (particular) solution $U=U(x,y)$ of the Laplace equation (1). Then (2) can be treated as a first-order ordinary differential equation for $w=w(y)$ with parameter x, which can be reduced to a linear equation with the help of the change of variable $z=\exp\left(-\frac{1}{2}\beta w\right)$. Finally, we have

$$w=-\frac{2}{\beta}F-\frac{2}{\beta}\ln\left[\Psi(x)-k\int e^{-F}\sin U\,dy\right],\qquad F=\int\left(\frac{\partial U}{\partial x}\right)dy,$$

where $k=\left(\frac{1}{2}a\beta\right)^{1/2}$; in the integration x is treated as a parameter. The function $\Psi(x)$ is determined after substituting this expression for w into equation (3).

⊙ *References for equation* 9.2.1.1: I. N. Vekua (1960), R. K. Bullough and P. J. Caudrey (1980), D. A. Frank-Kamenetskii (1987), V. F. Zaitsev and A. D. Polyanin (1996, p. 476), S. N. Aristov (1999), I. Kh. Sabitov (2001).

2. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=ae^{\beta w}+be^{2\beta w}$.

1°. Traveling-wave solution for $b\beta>0$:

$$w(x,y)=-\frac{1}{\beta}\ln\left\{-\frac{b}{a}+C_1\exp\left[a\sqrt{\frac{\beta}{b}}\,\left(x\sin C_2+y\cos C_2\right)\right]\right\},$$

where C_1 and C_2 are arbitrary constants.

2°. Traveling-wave solution (generalizes the solution of Item 1°):

$$w(x,y)=-\frac{1}{\beta}\ln\left[-\frac{a\beta}{C_1^2+C_2^2}+C_3\exp(C_1x+C_2y)+\frac{a^2\beta^2-b\beta(C_1^2+C_2^2)}{4C_3(C_1^2+C_2^2)^2}\exp(-C_1x-C_2y)\right],$$

where C_1, C_2, and C_3 are arbitrary constants.

3°. Traveling-wave solution:

$$w(x,y)=-\frac{1}{\beta}\ln\left[\frac{a\beta}{C_1^2+C_2^2}+\frac{\sqrt{a^2\beta^2+b\beta(C_1^2+C_2^2)}}{C_1^2+C_2^2}\,\sin(C_1x+C_2y+C_3)\right].$$

⊙ *References for equation* 9.2.1.2: A. D. Polyanin and V. F. Zaitsev (2004, p. 366).

3. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=ae^{\beta w}-be^{-\beta w}.$

The transformation

$$w(x,y)=u(x,y)+k,\quad k=\frac{1}{2\beta}\ln\frac{b}{a}$$

leads to an equation of the form 9.3.1.1:

$$\frac{\partial^2 u}{\partial x^2}+\frac{\partial^2 u}{\partial y^2}=2\sqrt{ab}\,\sinh(\beta u).$$

4. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=ae^{\beta w}+be^{-2\beta w}.$

Functional separable solution:

$$w(x,y)=\frac{1}{\beta}\ln[\varphi(x)+\psi(y)],$$

where the functions $\varphi(x)$ and $\psi(y)$ are determined by the first-order autonomous ordinary differential equations

$$(\varphi'_x)^2=2a\beta\varphi^3+C_1\varphi^2+C_2\varphi+C_3,$$
$$(\psi'_y)^2=2a\beta\psi^3-C_1\psi^2+C_2\psi-C_3-b\beta,$$

where C_1, C_2, and C_3 are arbitrary constants. Solving these equations for the derivatives, one obtains separable equations.

5. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=a+be^{\beta w}+ce^{2\beta w}.$

The substitution $u=e^{-\beta w}$ leads to a equation with a quadratic nonlinearity of the form 9.1.6.7:

$$u\left(\frac{\partial^2 u}{\partial x^2}+\frac{\partial^2 u}{\partial y^2}\right)-\left(\frac{\partial u}{\partial x}\right)^2-\left(\frac{\partial u}{\partial y}\right)^2+a\beta u^2+b\beta u+c\beta=0.$$

9.2.2. Equations of the Form $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=f(x,y,w)$

1. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=Ae^{\alpha x+\beta y}e^{\mu w}.$

The substitution $U=\alpha x+\beta y+\mu w$ leads to an equation of the form 9.2.1.1:

$$\frac{\partial^2 U}{\partial x^2}+\frac{\partial^2 U}{\partial y^2}=A\mu e^{U}.$$

2. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=Ae^{\alpha xy+\beta x+\gamma y}e^{\mu w}.$

The substitution $U=\alpha xy+\beta x+\gamma y+\mu w$ leads to an equation of the form 9.2.1.1:

$$\frac{\partial^2 U}{\partial x^2}+\frac{\partial^2 U}{\partial y^2}=A\mu e^{U}.$$

3. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=A(x^2+y^2)e^{\beta w}.$

The transformation

$$w=U(z,\zeta),\quad z=\tfrac{1}{2}(x^2-y^2),\quad \zeta=xy$$

leads to a simpler equation of the form 9.2.1.1:

$$\frac{\partial^2 U}{\partial z^2}+\frac{\partial^2 U}{\partial \zeta^2}=Ae^{\beta U}.$$

4. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=A(x^2+y^2)^k e^{\beta w}.$

This is a special case of equation 9.4.1.4 with $f(w)=Ae^{\beta w}$.

9.2.3. Equations of the Form $\dfrac{\partial}{\partial x}\left[f_1(x,y)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[f_2(x,y)\dfrac{\partial w}{\partial y}\right]=g(w)$

▷ *Equations of this form are encountered in stationary problems of heat and mass transfer and combustion theory. Here, f_1 and f_2 are the principal thermal diffusivities (diffusion coefficients) dependent on the space coordinates x and y, and $g=g(w)$ is a source function that defines the law of heat (substance) release or absorption.*

1. $\dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right)=ce^{\beta w}.$

This is a special case of equation 9.4.3.1 with $f(w)=ce^{\beta w}$.

1°. Suppose $w(x,y)$ is a solution of the equation in question. Then the function

$$w_1=w\Big(C^{\frac{2}{2-n}}x,\ C^{\frac{2}{2-m}}y\Big)+\frac{2}{\beta}\ln C,$$

where C is an arbitrary constant, is also a solution of the equation.

2°. Functional separable solution for $n\neq 2$ and $m\neq 2$:

$$w=w(\xi),\qquad \xi=\big[b(2-m)^2x^{2-n}+a(2-n)^2y^{2-m}\big]^{1/2}.$$

Here, the function $w=w(\xi)$ is determined by the ordinary differential equation

$$w''_{\xi\xi}+\frac{A}{\xi}w'_\xi=Be^{\beta w},\tag{1}$$

where

$$A=\frac{4-nm}{(2-n)(2-m)},\quad B=\frac{4c}{ab(2-n)^2(2-m)^2}.$$

3°. Below are some exact solutions of equation (1).

3.1. For $A\neq 1$, there is a solution of the form

$$w(\xi)=-\frac{1}{\beta}\ln\left[\frac{B\beta}{2(1-A)}\xi^2\right].$$

3.2. For $A=0$, which corresponds to $m=\dfrac{4}{n}$ and $B=\dfrac{cn^2}{ab(2-n)^4}$, we obtain from (1) several more families of exact solutions to the original equation:

$$w(\xi)=\frac{1}{\beta}\ln\left[\frac{2}{\beta B(\xi+C)^2}\right] \qquad \text{if } \beta B>0,$$

$$w(\xi)=\frac{1}{\beta}\ln\left[\frac{2\lambda^2}{\beta B\cos^2(\lambda\xi+C)}\right] \qquad \text{if } \beta B>0,$$

$$w(\xi)=\frac{1}{\beta}\ln\left[\frac{2\lambda^2}{\beta B\sinh^2(\lambda\xi+C)}\right] \qquad \text{if } \beta B>0,$$

$$w(\xi)=\frac{1}{\beta}\ln\left[\frac{-2\lambda^2}{\beta B\cosh^2(\lambda\xi+C)}\right] \qquad \text{if } \beta B<0,$$

$$w(\xi)=\frac{1}{\beta}\ln\left[\frac{-8\lambda^2C_1C_2}{\beta B\left(C_1e^{\lambda\xi}+C_2e^{-\lambda\xi}\right)^2}\right],$$

where λ, C, C_1, and C_2 are arbitrary constants.

3.3. For $A=1$, which corresponds to $m=\dfrac{n}{n-1}$, another family of exact solutions follows from (1):

$$w(\xi)=\frac{1}{\beta}\ln\left(-\frac{8C}{\beta B}\right)-\frac{2}{\beta}\ln(\xi^2+C),\qquad B=\frac{4c(n-1)^2}{ab(2-n)^4},$$

where C is an arbitrary constant.

4°. There is an exact solution of the form

$$w(x,y)=U(z)+\frac{n-2}{\beta}\ln x,\quad z=yx^{\frac{n-2}{2-m}}.$$

2. $\dfrac{\partial}{\partial x}\left(ae^{\beta x}\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(be^{\mu y}\dfrac{\partial w}{\partial y}\right)=ce^{\lambda w}$.

This is a special case of equation 9.4.3.6 with $f(w)=ce^{\lambda w}$.

1°. Suppose $w(x,y)$ is a solution of the equation in question. Then the function

$$w_1=w\Big(x-\frac{2}{\beta}\ln C,\ y-\frac{2}{\mu}\ln C\Big)+\frac{2}{\lambda}\ln C,$$

where C is an arbitrary constant, is also a solution of the equation.

2°. Functional separable solution:

$$w = -\frac{1}{\lambda}\ln\left[c\lambda\left(\frac{e^{-\beta x}}{a\beta^2} + \frac{e^{-\mu y}}{b\mu^2}\right)\right].$$

3°. Functional separable solution for $\beta\mu \neq 0$ (generalizes the solution of Item 2°):

$$w = w(\xi), \qquad \xi = \left(b\mu^2 e^{-\beta x} + a\beta^2 e^{-\mu y}\right)^{1/2}.$$

Here, the function $w(\xi)$ is determined by the ordinary differential equation

$$w''_{\xi\xi} - \frac{1}{\xi}w'_\xi = Ae^{\lambda w}, \qquad A = \frac{4c}{ab\beta^2\mu^2}.$$

4°. There is an exact solution of the form

$$w(x, y) = U(z) + \frac{\beta}{\lambda}x, \qquad z = y - \frac{\beta}{\mu}x.$$

3. $\dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(be^{\beta y}\dfrac{\partial w}{\partial y}\right) = ce^{\lambda w}.$

This is a special case of equation 9.4.3.8 with $f(w) = ce^{\lambda w}$.

1°. Suppose $w(x, y)$ is a solution of the equation in question. Then the function

$$w_1 = w\left(C^{\frac{2}{2-n}}x,\ y - \frac{2}{\beta}\ln C\right) + \frac{2}{\lambda}\ln C,$$

where C is an arbitrary constant, is also a solution of the equation.

2°. Functional separable solution:

$$w = -\frac{1}{\lambda}\ln\left\{\frac{c\lambda(2-n)}{(1-n)}\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\beta y}}{b\beta^2}\right]\right\}.$$

3°. Functional separable solution for $n \neq 2$ and $\beta \neq 0$ (generalizes the solution of Item 2°):

$$w = w(\xi), \qquad \xi^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\beta y}}{b\beta^2}\right],$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$w''_{\xi\xi} + \frac{A}{\xi}w'_\xi = ce^{\lambda w}, \qquad A = \frac{n}{2-n}.$$

4°. There is an exact solution of the form

$$w(x, y) = U(z) + \frac{n-2}{\lambda}\ln x, \qquad z = y + \frac{2-n}{\beta}\ln x.$$

4. $\dfrac{\partial}{\partial x}\left[(ay + c)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[(bx + s)\dfrac{\partial w}{\partial y}\right] = ke^{\lambda w}.$

This is a special case of equation 9.4.4.1 with $f(w) = ke^{\lambda w}$.

The equation can be rewritten in the form

$$(ay + c)\frac{\partial^2 w}{\partial x^2} + (bx + s)\frac{\partial^2 w}{\partial y^2} = ke^{\lambda w}.$$

5. $\dfrac{\partial}{\partial x}\left[(a_1x + b_1y + c_1)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[(a_2x + b_2y + c_2)\dfrac{\partial w}{\partial y}\right] = ke^{\lambda w}.$

This is a special case of equation 9.4.4.2 with $f(w) = ke^{\lambda w}$.

9.2.4. Equations of the Form $\frac{\partial}{\partial x}\left[f_1(w)\frac{\partial w}{\partial x}\right]+\frac{\partial}{\partial y}\left[f_2(w)\frac{\partial w}{\partial y}\right]=g(w)$

▷ *Equations of this form are encountered in stationary problems of heat and mass transfer and combustion theory. Here, $f_1 = f_1(w)$ and $f_2 = f_2(w)$ are the principal thermal diffusivities (diffusion coefficients) dependent on the temperature (concentration) w, and $g = g(w)$ is a source function that defines the law of heat (substance) release or absorption. Simple solutions dependent on a single coordinate, $w = w(x)$ and $w = w(y)$, are not treated in this subsection.*

1. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial}{\partial y}\left(ae^{\beta w}\dfrac{\partial w}{\partial y}\right)=0.$

1°. Suppose $w(x, y)$ is a solution of this equation. Then the functions

$$w_1 = w(C_1x + C_3, \pm C_1C_2^{\beta}y + C_4) - 2\ln|C_2|,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation.

2°. Additive separable solutions:

$$w(x,y) = \frac{1}{\beta}\ln(Ay + B) + Cx + D,$$

$$w(x,y) = \frac{1}{\beta}\ln(-aA^2y^2 + By + C) - \frac{2}{\beta}\ln(-aAx + D),$$

$$w(x,y) = \frac{1}{\beta}\ln(Ay^2 + By + C) + \frac{1}{\beta}\ln\left[\frac{p^2}{aA\cosh^2(px+q)}\right],$$

$$w(x,y) = \frac{1}{\beta}\ln(Ay^2 + By + C) + \frac{1}{\beta}\ln\left[\frac{p^2}{-aA\cos^2(px+q)}\right],$$

$$w(x,y) = \frac{1}{\beta}\ln(Ay^2 + By + C) + \frac{1}{\beta}\ln\left[\frac{p^2}{-aA\sinh^2(px+q)}\right],$$

where A, B, C, D, p, and q are arbitrary constants.

3°. Traveling-wave solution in implicit form:

$$k_1^2w + \frac{ak_2^2}{\beta}e^{\beta w} = C_1(k_1x + k_2y) + C_2,$$

where C_1, C_2, k_1, and k_2 are arbitrary constants.

4°. Self-similar solution (A and B are arbitrary constants):

$$w = u(z), \quad z = \frac{x + A}{y + B},$$

where the function $u(z)$ is determined by the ordinary differential equation

$$(z^2u'_z)'_z + (ae^{\beta u}u'_z)'_z = 0.$$

This equation admits the first integral

$$\left(z^2 + ae^{\beta u}\right)u'_z = C.$$

Treating u as the independent variable, we get a Riccati equation for $z = z(u)$,

$$Cz'_u = z^2 + ae^{\beta u},$$

whose solution is expressed in terms of Bessel functions (see Polyanin and Zaitsev, 2003).

5°. Solution (generalizes the solution of Item 4° with $A = B = 0$):

$$w = U(\xi) - \frac{2(k+1)}{\beta}\ln|x|, \qquad \xi = y|x|^k,$$

where k is an arbitrary constant and the function $U(\xi)$ is determined by the ordinary differential equation

$$\frac{2(k+1)}{\beta} + k(k-1)\xi U'_\xi + k^2\xi^2 U''_{\xi\xi} + (ae^{\beta U}U'_\xi)'_\xi = 0.$$

6°. There are exact solutions of the following forms:

$$w(x,y) = F(\eta) - \frac{2}{\beta}\ln|x|, \qquad \eta = y + k\ln|x|;$$
$$w(x,y) = H(\zeta) - \frac{2}{\beta}x, \qquad \zeta = ye^x,$$

where k is an arbitrary constant.

7°. For other solutions, see equation 9.4.4.8 with $f(w) = 1$ and $g(w) = ae^{\beta w}$.

⊙ *Reference for equation* 9.2.4.1: A. D. Polyanin and V. F. Zaitsev (2004, pp. 370–371).

2. $\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial}{\partial y}\left(ae^{\beta w}\dfrac{\partial w}{\partial y}\right) = be^{\lambda w}$.

1°. Suppose $w(x,y)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1^\lambda x + C_2, \pm C_1^{\lambda-\beta}y + C_3) + 2\ln|C_1|,$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solution:

$$w = u(z), \qquad z = k_1x + k_2y,$$

where k_1 and k_2 are arbitrary constants, and the function $u(z)$ is determined by the autonomous ordinary differential equation

$$k_1^2u''_{zz} + ak_2^2(e^{\beta u}u'_z)'_z = be^{\lambda u}.$$

The substitution $\Theta(u) = (u'_z)^2$ leads to the first-order linear equation

$$(k_1^2 + ak_2^2e^{\beta u})\Theta'_u + 2ak_2^2\beta e^{\beta u}\Theta = 2be^{\lambda u}.$$

3°. Solution:

$$w = U(\xi) - \frac{2}{\lambda}\ln|x|, \qquad \xi = yx^{\frac{\beta-\lambda}{\lambda}},$$

where the function $U(\xi)$ is determined by the ordinary differential equation

$$\frac{2}{\lambda} + \frac{(\beta-\lambda)(\beta-2\lambda)}{\lambda^2}\xi U'_\xi + \frac{(\beta-\lambda)^2}{\lambda^2}\xi^2U''_{\xi\xi} + (ae^{\beta U}U'_\xi)'_\xi = be^{\lambda U}.$$

3. $\dfrac{\partial}{\partial x}\left(ae^{\beta w}\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(be^{\gamma w}\dfrac{\partial w}{\partial y}\right)=0.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1 C_2^{\beta} x + C_3, \pm C_1 C_2^{\gamma} y + C_4) - 2\ln|C_2|,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solution in implicit form:

$$ak_1^2\beta^{-1}e^{\beta w} + bk_2^2\gamma^{-1}e^{\gamma w} = C_1(k_1x + k_2y) + C_2,$$

where C_1, C_2, k_1, and k_2 are arbitrary constants.

3°. Additive separable solution:

$$w(x,y) = \varphi(x) + \psi(y). \tag{1}$$

Here, the functions $\varphi(x)$ and $\psi(y)$ are determined by the autonomous ordinary differential equations (A is an arbitrary constant)

$$\begin{aligned} \varphi''_{xx} + \beta(\varphi'_x)^2 &= Abe^{(\gamma-\beta)\varphi}, \\ \psi''_{yy} + \gamma(\psi'_y)^2 &= -Aae^{(\beta-\gamma)\psi}, \end{aligned} \tag{2}$$

which are independent of each other.

Integrating yields the general solutions to the equations of (2) in implicit form:

$$\int e^{\beta\varphi}\left[\frac{2Ab}{\beta+\gamma}e^{(\beta+\gamma)\varphi} + B_1\right]^{-1/2} d\varphi = C_1 \pm x,$$
$$\int e^{\gamma\psi}\left[-\frac{2Aa}{\beta+\gamma}e^{(\beta+\gamma)\psi} + B_2\right]^{-1/2} d\psi = C_2 \pm y,$$

where B_1, B_2, C_1, and C_2 are arbitrary constants; $\beta+\gamma \neq 0$.

Remark. Particular solutions to equations (2) are given by

$$\varphi(x) = \frac{1}{\beta-\gamma}\ln\left[\frac{Ab(\beta-\gamma)^2}{2(\beta+\gamma)}(x+C_3)^2\right],$$
$$\psi(y) = \frac{1}{\gamma-\beta}\ln\left[-\frac{Aa(\beta-\gamma)^2}{2(\beta+\gamma)}(y+C_4)^2\right],$$

where C_3 and C_4 are arbitrary constants.

4°. There are exact solutions of the following forms:

$$w(x,y) = F(z) + \frac{2k}{\beta-\gamma}\ln|x|, \qquad z = y|x|^{k-1};$$
$$w(x,y) = G(\xi) + \frac{2}{\beta-\gamma}\ln|x|, \qquad \xi = y + k\ln|x|;$$
$$w(x,y) = H(\eta) + 2x, \qquad \eta = ye^{(\beta-\gamma)x},$$

where k is an arbitrary constant.

5°. For other exact solutions of the original equation, see 9.4.4.8 with $f(w) = ae^{\beta w}$ and $g(w) = be^{\gamma w}$.

4. $a\dfrac{\partial}{\partial x}\left(e^{\beta w}\dfrac{\partial w}{\partial x}\right)+b\dfrac{\partial}{\partial y}\left(e^{\gamma w}\dfrac{\partial w}{\partial y}\right)=ce^{\lambda w}.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1^{\lambda-\beta}x + C_2, \pm C_1^{\lambda-\gamma}y + C_3) + 2\ln|C_1|,$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. There are exact solutions of the following forms:

$$w(x,y) = F(z), \qquad z = k_1x + k_2y;$$
$$w(x,y) = G(\xi) + \frac{2}{\beta-\lambda}\ln|x|, \qquad \xi = y|x|^{\frac{\lambda-\gamma}{\beta-\lambda}}.$$

9.2.5. Other Equations Involving Arbitrary Parameters

1. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}+\dfrac{a}{x}\dfrac{\partial w}{\partial x}+\dfrac{b}{y}\dfrac{\partial w}{\partial y}=ce^{\beta w}.$

This is a special case of equation 9.4.2.6 with $f(\xi, w) = ce^{\beta w}$.

2. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=ae^{\beta w}\left[\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2\right].$

This is a special case of equation 9.4.2.12 with $f(w) = ae^{\beta w}$.

The substitution $U = \int \exp\left(-\dfrac{a}{\beta}e^{\beta w}\right) dw$ leads to the two-dimensional Laplace equation for $U = U(x,y)$:

$$\frac{\partial^2 U}{\partial x^2}+\frac{\partial^2 U}{\partial y^2}=0.$$

For solutions of this linear equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

3. $\dfrac{\partial^2 w}{\partial x^2}+ae^{\beta w}\dfrac{\partial^2 w}{\partial y^2}=0, \qquad a>0.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_\pm = w(C_1x + C_3, \pm C_1C_2^{\beta}y + C_4,) - 2\ln|C_2|,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation.

2°. Solutions:

$$w(x,y) = Axy + By + Cx + D,$$

$$w(x,y) = \frac{1}{\beta}\ln\left[\frac{B^2}{a}\frac{(y+A)^2}{\sinh^2(Bx+C)}\right], \qquad w(x,y) = \frac{1}{\beta}\ln\left[\frac{1}{aA^2}\frac{\sinh^2(Ay+B)}{(x+C)^2}\right],$$

$$w(x,y) = \frac{1}{\beta}\ln\left[\frac{B^2}{a}\frac{(y+A)^2}{\cos^2(Bx+C)}\right], \qquad w(x,y) = \frac{1}{\beta}\ln\left[\frac{1}{aA^2}\frac{\cos^2(Ay+B)}{(x+C)^2}\right],$$

$$w(x,y) = \frac{1}{\beta}\ln\left[\frac{C^2}{aA^2}\frac{\cos^2(Ay+B)}{\sinh^2(Cx+D)}\right], \qquad w(x,y) = \frac{1}{\beta}\ln\left[\frac{C^2}{aA^2}\frac{\sinh^2(Ay+B)}{\cos^2(Cx+D)}\right],$$

$$w(x,y) = \frac{1}{\beta}\ln\left[\frac{C^2}{aA^2}\frac{\sinh^2(Ay+B)}{\sinh^2(Cx+D)}\right], \qquad w(x,y) = \frac{1}{\beta}\ln\left[\frac{C^2}{aA^2}\frac{\cos^2(Ay+B)}{\cos^2(Cx+D)}\right],$$

where A, B, C, and D are arbitrary constants. The first solution is degenerate and the others are representable as the sum of functions with different arguments.

3°. Self-similar solution:

$$w = w(z), \qquad z = y/x,$$

where the function $w(z)$ is determined by the ordinary differential equation

$$(z^2 + ae^{\beta w})w''_{zz} + 2zw'_z = 0.$$

4°. Solution (generalizes the solution of Item 3°):

$$w = U(\zeta) - \frac{2(k+1)}{\beta}\ln|x + C_1|, \qquad \zeta = (y + C_2)(x + C_1)^k,$$

where C_1, C_2, and k are arbitrary constants, and the function $U = U(\zeta)$ is determined by the ordinary differential equation

$$(k^2\zeta^2 + ae^{\beta U})U''_{\zeta\zeta} + k(k-1)\zeta U'_\zeta + \frac{2(k+1)}{\beta} = 0.$$

4. $\dfrac{\partial^2 w}{\partial x^2} + ae^{\beta w}\dfrac{\partial^2 w}{\partial y^2} = be^{\lambda w}$.

1°. Suppose $w(x,y)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1^{\lambda-\beta}y + C_2, \pm C_1^{\lambda}x + C_3) + 2\ln|C_1|,$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solution:

$$w = u(z), \qquad z = k_1x + k_2y,$$

where k_1 and k_2 are arbitrary constants, and the function $u(z)$ is determined by the autonomous ordinary differential equation

$$(k_1^2 + ak_2^2e^{\beta u})u''_{zz} = be^{\lambda u}.$$

Its solution can be written out in implicit form as

$$\int \frac{du}{\sqrt{F(u)}} = C_1 \pm z, \qquad F(u) = 2b\int \frac{e^{\lambda u}\,du}{k_1^2 + ak_2^2e^{\beta u}} + C_2,$$

where C_1 and C_2 are arbitrary constants.

3°. Solution:

$$w = U(\xi) - \frac{2}{\lambda}\ln|x|, \qquad \xi = y|x|^{\frac{\beta-\lambda}{\lambda}},$$

where the function $U(\xi)$ is determined by the ordinary differential equation

$$\frac{2}{\lambda} + \frac{(\beta-\lambda)(\beta-2\lambda)}{\lambda^2}\xi U'_\xi + \frac{(\beta-\lambda)^2}{\lambda^2}\xi^2 U''_{\xi\xi} + ae^{\beta U}U''_{\xi\xi} = be^{\lambda U}.$$

5. $ax^n\dfrac{\partial^2 w}{\partial x^2} + by^m\dfrac{\partial^2 w}{\partial y^2} = ce^{\beta w}$.

This is a special case of equation 9.4.5.5 with $k = s = 0$ and $f(w) = ce^{\beta w}$.

1°. Suppose $w(x, y)$ is a solution of the equation in question. Then the function

$$w_1 = w\Big(C^{\frac{2}{2-n}}x,\, C^{\frac{2}{2-m}}y\Big) + \frac{2}{\beta}\ln C,$$

where C is an arbitrary constant, is also a solution of the equation.

2°. Functional separable solution for $n \neq 2$ and $m \neq 2$:

$$w = w(\xi), \qquad \xi = \big[b(2-m)^2x^{2-n} + a(2-n)^2y^{2-m}\big]^{1/2}.$$

Here, the function $w(\xi)$ is determined by the ordinary differential equation

$$w''_{\xi\xi} + \frac{A}{\xi}w'_\xi = Be^{\beta w}, \tag{1}$$

where

$$A = \frac{3nm - 4n - 4m + 4}{(2-n)(2-m)}, \quad B = \frac{4c}{ab(2-n)^2(2-m)^2}.$$

3°. Below are some exact solutions of equation (1).

3.1. For $A \neq 1$, equation (1) admits an exact solution of the form

$$w(\xi) = -\frac{1}{\beta}\ln\left[\frac{B\beta}{2(1-A)}\xi^2\right].$$

3.2. For $A = 0$, which corresponds to $m = \dfrac{4n-4}{3n-4}$ and $B = \dfrac{c(3n-4)^2}{ab(2-n)^4}$, we obtain from (1) several more families of exact solutions to the original equation:

$$w(\xi) = \frac{1}{\beta}\ln\left[\frac{2\lambda^2}{\beta B\cos^2(\lambda\xi + C)}\right] \quad \text{if } \beta B > 0,$$

$$w(\xi) = \frac{1}{\beta}\ln\left[\frac{2\lambda^2}{\beta B\sinh^2(\lambda\xi + C)}\right] \quad \text{if } \beta B > 0,$$

$$w(\xi) = \frac{1}{\beta}\ln\left[\frac{-2\lambda^2}{\beta B\cosh^2(\lambda\xi + C)}\right] \quad \text{if } \beta B < 0,$$

where λ and C are arbitrary constants.

3.3. For $A = 1$, which corresponds to $m = \dfrac{n}{n-1}$, another family of exact solutions follows from (1):

$$w(\xi) = \frac{1}{\beta}\ln\left(-\frac{8C}{\beta B}\right) - \frac{2}{\beta}\ln(\xi^2 + C), \qquad B = \frac{4c(n-1)^2}{ab(2-n)^4},$$

where C is an arbitrary constant.

6. $ae^{\beta x}\dfrac{\partial^2 w}{\partial x^2} + be^{\mu y}\dfrac{\partial^2 w}{\partial y^2} = ce^{\lambda w}.$

This is a special case of equation 9.4.5.7 with $k = s = 0$ and $f(w) = ce^{\beta w}$.

1°. Suppose $w(x, y)$ is a solution of the equation in question. Then the function

$$w_1 = w\Big(x - \frac{2}{\beta}\ln C,\ y - \frac{2}{\mu}\ln C\Big) + \frac{2}{\lambda}\ln C,$$

where C is an arbitrary constant, is also a solution of the equation.

2°. Functional separable solution for $\beta\mu \neq 0$:

$$w = w(\xi), \qquad \xi = \big(b\mu^2 e^{-\beta x} + a\beta^2 e^{-\mu y}\big)^{1/2}.$$

Here, the function $w(\xi)$ is determined by the ordinary differential equation

$$w''_{\xi\xi} + \frac{3}{\xi}w'_\xi = Ae^{\lambda w}, \qquad A = \frac{4c}{ab\beta^2\mu^2},$$

which admits the exact solution

$$w = -\frac{1}{\lambda}\ln\left(-\frac{1}{4}A\lambda\xi^2\right).$$

7. $ax^n\dfrac{\partial^2 w}{\partial x^2} + be^{\beta y}\dfrac{\partial^2 w}{\partial y^2} = ce^{\lambda w}.$

This is a special case of equation 9.4.5.9 with $k = s = 0$ and $f(w) = ce^{\lambda w}$.

8. $\dfrac{1}{\sin\theta}\dfrac{\partial}{\partial\theta}\left(\sin\theta\dfrac{\partial w}{\partial\theta}\right) + \dfrac{1}{\sin^2\theta}\dfrac{\partial^2 w}{\partial\varphi^2} = -2 + Ae^{-w}.$

The left-hand side of the equation includes the two-dimensional Laplace operator written for the surface of a unit radius sphere; θ and φ are the spherical coordinates.

The transformation

$$x = \varphi, \quad y = \ln\Big|\tan\frac{\theta}{2}\Big|, \quad w = 2\ln|\sin\theta| + U(x, y),$$

leads to the equation of the form 9.2.1.1:

$$\frac{\partial^2 U}{\partial x^2} + \frac{\partial^2 U}{\partial y^2} = Ae^{-U}.$$

⊙ *Reference*: S. N. Aristov (1998).

9.3. Equations Involving Other Nonlinearities

9.3.1. Equations with Hyperbolic Nonlinearities

1. $\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} = a\sinh(\beta w).$

This is a special case of equation 9.4.1.1 with $f(w) = a\sinh(\beta w)$.

1°. Traveling-wave solution in implicit form:

$$\int \left[D + \frac{2a\cosh(\beta w)}{\beta(A^2 + B^2)}\right]^{-1/2} dw = Ax + By + C,$$

where A, B, C, and D are arbitrary constants.

2°. Solution with central symmetry about the point $(-C_1, -C_2)$:

$$w = w(\xi), \qquad \xi = \sqrt{(x + C_1)^2 + (y + C_2)^2},$$

where C_1 and C_2 are arbitrary constants, and the function $w(\xi)$ is determined by the ordinary differential equation

$$w''_{\xi\xi} + \frac{1}{\xi} w'_\xi = a\sinh(\beta w).$$

3°. Functional separable solution:

$$w(x, y) = \frac{4}{\beta}\operatorname{arctanh}\big[f(x)g(y)\big], \qquad \operatorname{arctanh} z = \frac{1}{2}\ln\frac{1+z}{1-z},$$

where the functions $f = f(x)$ and $g = g(y)$ are determined by the first-order autonomous ordinary differential equations

$$\big(f'_x\big)^2 = Af^4 + Bf^2 + C,$$
$$\big(g'_y\big)^2 = -Cg^4 + (a\beta - B)g^2 - A,$$

and A, B, and C are arbitrary constants.

4°. The original equation is related to an equation of the form 9.3.3.1,

$$\frac{\partial^2 U}{\partial x^2} + \frac{\partial^2 U}{\partial y^2} = a\sin(\beta U),$$

by the Bäcklund transformation

$$\frac{\partial U}{\partial x} + \frac{\partial w}{\partial y} = 2\sqrt{\frac{a}{\beta}}\sin\big(\tfrac{1}{2}\beta U\big)\cosh\big(\tfrac{1}{2}\beta w\big),$$
$$\frac{\partial U}{\partial y} - \frac{\partial w}{\partial x} = 2\sqrt{\frac{a}{\beta}}\cos\big(\tfrac{1}{2}\beta U\big)\sinh\big(\tfrac{1}{2}\beta w\big).$$

⊙ *References for equation* 9.3.1.1: R. K. Bullough and P. J. Caudrey (1980), A. C. Wing, H. H. Cheb, and Y. C. Lee (1987), J. Miller (Jr.) and L. A. Rubel (1993), V. K. Andreev, O. V. Kaptsov, V. V. Pukhnachov, and A. A. Rodionov (1999).

2. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=a\sinh(\beta w)+b\sinh(2\beta w).$

Denote $k=\dfrac{a}{2b}$.

Traveling-wave solutions:

$$w=\pm\frac{1}{\beta}\operatorname{arccosh}\frac{1-k\sin z}{\sin z-k},\qquad z=\sqrt{2b\beta(1-k^2)}\,(x\sin C_1+y\cos C_1+C_2)$$

if $|k|<1$;

$$w=\pm\frac{2}{\beta}\operatorname{arctanh}\left(\sqrt{\frac{k+1}{k-1}}\tanh\frac{\xi}{2}\right),\qquad \xi=\sqrt{2b\beta(k^2-1)}\,(x\sin C_1+y\cos C_1+C_2)$$

if $|k|>1$,

where C_1 and C_2 are arbitrary constants.

3. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=a(x^2+y^2)\sinh(\beta w).$

This is a special case of equation 9.4.1.3 with $f(w)=a\sinh(\beta w)$.

4. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=a(x^2+y^2)\cosh(\beta w).$

This is a special case of equation 9.4.1.3 with $f(w)=a\cosh(\beta w)$.

5. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=ae^{\beta x}\sinh(\lambda w).$

This is a special case of equation 9.4.1.5 with $f(w)=a\sinh(\lambda w)$.

6. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=a\cosh^n(\beta w)\left[\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2\right].$

This is a special case of equation 9.4.2.12 with $f(w)=a\cosh^n(\beta w)$.

7. $\dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right)=k\sinh(\beta w).$

This is a special case of equation 9.4.3.1 with $f(w)=k\sinh(\beta w)$.

8. $\dfrac{\partial}{\partial x}\left(ae^{\beta x}\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(be^{\mu y}\dfrac{\partial w}{\partial y}\right)=k\sinh(\lambda w).$

This is a special case of equation 9.4.3.6 with $f(w)=k\sinh(\lambda w)$.

9. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial}{\partial y}\left[a\cosh(\beta w)\dfrac{\partial w}{\partial y}\right]=0.$

This is a special case of equation 9.4.4.8 with $f(w)=1$ and $g(w)=a\cosh(\beta w)$.

9.3.2. Equations with Logarithmic Nonlinearities

1. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=\alpha w\ln(\beta w).$

This is a special case of equation 9.4.1.1 with $f(w)=\alpha w\ln(\beta w)$.

On making the change of variable $U=\ln(\beta w)$, one obtains an equation with a quadratic nonlinearity:

$$\frac{\partial^2 U}{\partial x^2}+\frac{\partial^2 U}{\partial y^2}+\left(\frac{\partial U}{\partial x}\right)^2+\left(\frac{\partial U}{\partial y}\right)^2=\alpha U. \tag{1}$$

1°. Equation (1) has exact solutions quadratic in the independent variables:

$$U(x,y)=\tfrac{1}{4}\alpha(x+A)^2+\tfrac{1}{4}\alpha(y+B)^2+1,$$
$$U(x,y)=A(x+B)^2\pm\sqrt{A\alpha-4A^2}\,(x+B)(y+C)+(\tfrac{1}{4}\alpha-A)(y+C)^2+\tfrac{1}{2},$$

where A, B, and C are arbitrary constants.

2°. Equation (1) has a traveling-wave solution:

$$U(x,y)=F(\xi),\qquad \xi=Ax+By+C.$$

Here, the function $F=F(\xi)$ is defined implicitly by

$$\xi=\int\left[De^{-2F}+\frac{\alpha}{A^2+B^2}(F-\tfrac{1}{2})\right]^{-1/2}dF,$$

where A, B, C, and D are arbitrary constants.

3°. Equation (1) has a solution in the form of the sum of functions with different arguments:

$$U(x,y)=f(x)+g(y).$$

Here, the functions $f=f(x)$ and $g=g(y)$ are defined implicitly by

$$A_1\pm x=\int\left(B_1e^{-2f}+\alpha f-\tfrac{1}{2}\alpha\right)^{-1/2}df,$$
$$A_2\pm y=\int\left(B_2e^{-2g}+\alpha g-\tfrac{1}{2}\alpha\right)^{-1/2}dg,$$

where A_1, B_1, A_2, and B_2 are arbitrary constants.

4°. The original equation admits exact solutions of the form

$$w=w(\zeta),\qquad \zeta=\sqrt{(x+C_1)^2+(y+C_2)^2},$$

where C_1 and C_2 are arbitrary constants, and the function $w(\zeta)$ is determined by the ordinary differential equation

$$w''_{\zeta\zeta}+\frac{1}{\zeta}w'_\zeta=\alpha w\ln(\beta w).$$

⊙ *References for equation* 9.3.2.1: J. A. Shercliff (1977), A. D. Polyanin, A. V. Vyazmin, A. I. Zhurov, and D. A. Kazenin (1998).

2. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=aw\ln w+(bx^n+cy^k)w.$

This is a special case of equation 9.4.1.9 with $f(x)=bx^n$ and $g(y)=cy^k$.

3. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=\alpha(x^2+y^2)\ln(\beta w).$

This is a special case of equation 9.4.1.3 with $f(w)=\alpha\ln(\beta w)$.

4. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=ae^{\beta x}\ln(\lambda w).$

This is a special case of equation 9.4.1.5 with $f(w)=a\ln(\lambda w)$.

5. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=axw+bw\ln|w|.$

This equation is used for describing some flows of ideal stratified fluids. It is a special case of equation 9.3.2.6 with $k=a_2=a_0=0$.

1°. Multiplicative separable solution:

$$w(x,y)=\exp\left[-\frac{a}{b}x+\frac{b}{4}(y+C)^2+\frac{a^2}{b^3}+\frac{1}{2}\right],$$

where C is an arbitrary constant.

2°. Multiplicative separable solution (generalizes the solution of Item 1°):

$$w(x,y)=\varphi(x)\psi(y),$$

where the functions $\varphi=\varphi(x)$ and $\psi=\psi(y)$ are determined by the system of ordinary differential equations

$$\varphi''_{xx}=b\varphi\ln|\varphi|+(ax+C)\varphi,$$
$$\psi''_{yy}=b\psi\ln|\psi|-C\psi,$$

C is an arbitrary constant.

⊙ *Reference for equation* 9.3.2.5: V. K. Andreev, O. V. Kaptsov, V. V. Pukhnachov, and A. A. Rodionov (1999).

6. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}+\dfrac{k}{x}\dfrac{\partial w}{\partial x}=(a_2x^2+a_1x+a_0)w+bw\ln|w|.$

Grad–Shafranov equation (with $k=-1$ and $a_1=a_0=0$). This equation is used to describe some steady-state axisymmetric (swirling) flows of ideal fluids. It also occurs in plasma physics.

1°. Multiplicative separable solution:

$$w(x,y)=\varphi(x)\psi(y),$$

where the functions $\varphi=\varphi(x)$ and $\psi=\psi(y)$ are determined by the system of ordinary differential equations

$$\varphi''_{xx}+\frac{k}{x}\varphi'_x=b\varphi\ln|\varphi|+(a_2x^2+a_1x+a_0+C)\varphi,$$
$$\psi''_{yy}=b\psi\ln|\psi|-C\psi,$$

with C being an arbitrary constant.

2°. Solutions for $a_1 = 0$:

$$w(x,y) = \exp\left[Ax^2 + \frac{b}{4}(y+B)^2 + \frac{2}{b}A(k+1) - \frac{a_0}{b} + \frac{1}{2}\right], \quad A = \frac{1}{8}\left(b \pm \sqrt{b^2 + 16a_2}\right),$$

where B is an arbitrary constant.

3°. Solution for $a_1 = a_2 = 0$:

$$w = w(r), \quad r = \sqrt{x^2 + y^2},$$

where the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{k+1}{r}w'_r = a_0 w + bw\ln|w|.$$

⊙ *Reference for equation* 9.3.2.6: G. Rosen (1969), V. K. Andreev, O. V. Kaptsov, V. V. Pukhnachov, and A. A. Rodionov (1999).

7. $\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} + \dfrac{a}{x}\dfrac{\partial w}{\partial x} + \dfrac{b}{y}\dfrac{\partial w}{\partial y} = cw^n \ln(\beta w).$

This is a special case of equation 9.4.2.6 with $f(\xi, w) = cw^n \ln(\beta w)$.

8. $\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} = a\ln^n(\beta w)\left[\left(\dfrac{\partial w}{\partial x}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2\right].$

This is a special case of equation 9.4.2.12 with $f(w) = a\ln^n(\beta w)$.

9. $\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial}{\partial y}\left[a\ln^n(\beta w)\dfrac{\partial w}{\partial y}\right] = 0.$

This is a special case of equation 9.4.4.8 with $f(w) = 1$ and $g(w) = a\ln^n(\beta w)$.

10. $\dfrac{\partial}{\partial x}\left[(a_1 x + b_1)\dfrac{\partial w}{\partial x}\right] + \dfrac{\partial}{\partial y}\left[(a_2 y + b_2)\dfrac{\partial w}{\partial y}\right] = kw\ln(\beta w).$

1°. Traveling-wave solution:

$$w = w(\xi), \qquad \xi = \frac{x}{a_1} + \frac{y}{a_2} + \frac{b_1}{a_1^2} + \frac{b_2}{a_2^2},$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$(\xi w'_\xi)'_\xi = kw\ln(\beta w).$$

Remark. The above solution is a nonclassical (noninvariant) traveling-wave solution, since the equation in question is not invariant under translation transformations in the independent variables.

2°. Multiplicative separable solution:

$$w(x,y) = \varphi(x)\psi(y),$$

where the functions $\varphi(x)$ and $\psi(y)$ are determined by the ordinary differential equations

$$[(a_1 x + b_1)\varphi'_x]'_x - k\varphi\ln(\beta\varphi) + C\varphi = 0,$$
$$[(a_2 y + b_2)\psi'_y]'_y - k\psi\ln\psi - C\psi = 0,$$

with C being an arbitrary constant.

11. $\dfrac{\partial}{\partial x}\left[(a_1x+b_1y+c_1)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[(a_2x+b_2y+c_2)\dfrac{\partial w}{\partial y}\right]=kw\ln w.$

This is a special case of equation 9.4.4.2 with $f(w)=kw\ln w$.

12. $\dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right)=k\ln(\beta w).$

This is a special case of equation 9.4.3.1 with $f(w)=k\ln(\beta w)$.

13. $\dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right)=kw\ln w.$

This is a special case of equation 9.4.3.1 with $f(w)=kw\ln w$ and a special case of equation 9.4.3.9 with $f(x)=ax^n$ and $g(y)=by^m$.

14. $\dfrac{\partial}{\partial x}\left(ae^{\beta x}\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(be^{\mu y}\dfrac{\partial w}{\partial y}\right)=k\ln(\lambda w).$

This is a special case of equation 9.4.3.6 with $f(w)=k\ln(\lambda w)$.

15. $\dfrac{\partial}{\partial x}\left(ae^{\beta x}\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(be^{\mu y}\dfrac{\partial w}{\partial y}\right)=kw\ln w.$

This is a special case of equation 9.4.3.6 with $f(w)=kw\ln w$ and a special case of equation 9.4.3.9 with $f(x)=ae^{\beta x}$ and $g(y)=be^{\mu y}$.

9.3.3. Equations with Trigonometric Nonlinearities

1. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=\alpha\sin(\beta w).$

This is a special case of equation 9.4.1.1 with $f(w)=\alpha\sin(\beta w)$.

1°. Traveling-wave solution:

$$w=w(z),\qquad z=Ax+By+C,$$

where $w(z)$ is defined implicitly by

$$\int\left[D-\frac{2\alpha\cos(\beta w)}{\beta(A^2+B^2)}\right]^{-1/2}dw=z,$$

and A, B, C, and D are arbitrary constants.

2°. Solution with central symmetry about the point $(-C_1,-C_2)$:

$$w=w(\xi),\qquad \xi=\sqrt{(x+C_1)^2+(y+C_2)^2},$$

where C_1 and C_2 are arbitrary constants and the function $w=w(\xi)$ is determined by the ordinary differential equation

$$w''_{\xi\xi}+\frac{1}{\xi}w'_\xi=\alpha\sin(\beta w).$$

3°. Functional separable solution for $\alpha = \beta = 1$:

$$w(x,y) = 4\arctan\left(\cot A\frac{\cosh F}{\cosh G}\right),$$
$$F = \frac{\cos A}{\sqrt{1+B^2}}(x - By), \quad G = \frac{\sin A}{\sqrt{1+B^2}}(y + Bx),$$

where A and B are arbitrary constants.

4°. Functional separable solution:

$$w(x,y) = \frac{4}{\beta}\arctan\big[f(x)g(y)\big],$$

where the functions $f = f(x)$ and $g = g(y)$ are determined by the first-order autonomous ordinary differential equations

$$\big(f'_x\big)^2 = Af^4 + Bf^2 + C,$$
$$\big(g'_y\big)^2 = Cg^4 + (\alpha\beta - B)g^2 + A,$$

and A, B, and C are arbitrary constants.

5°. Auto-Bäcklund transformation ($\alpha = \beta = 1$):

$$\frac{\partial\widetilde{w}}{\partial x} = -i\frac{\partial w}{\partial y} + k\sin\frac{\widetilde{w}+w}{2} + \frac{1}{k}\sin\frac{\widetilde{w}-w}{2},$$
$$-i\frac{\partial\widetilde{w}}{\partial y} = \frac{\partial w}{\partial x} + k\sin\frac{\widetilde{w}+w}{2} - \frac{1}{k}\sin\frac{\widetilde{w}-w}{2},$$

where $i^2 = -1$. With this transformation, the original equation is reduced to exactly the same equation.

⊙ *References for equation* 9.3.3.1: R. K. Bullough and P. J. Caudrey (1980), W. Miller (Jr.) and L. A. Rubel (1993), V. K. Andreev, O. V. Kaptsov, V. V. Pukhnachov, and A. A. Rodionov (1999).

2. $\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} = a\sin(\beta w) + b\sin(2\beta w).$

Denote $k = \dfrac{a}{2b}$.

Traveling-wave solutions:

$$w = \pm\frac{2}{\beta}\arctan\left(\frac{k+1}{\sqrt{1-k^2}}\coth\frac{z}{2}\right), \quad z = \sqrt{2b\beta(1-k^2)}\,(x\sin C_1 + y\cos C_1 + C_2)$$
if $|k| < 1$;
$$w = \pm\frac{2}{\beta}\arctan\left(\frac{k+1}{\sqrt{k^2-1}}\tan\frac{\xi}{2}\right), \quad \xi = \sqrt{2b\beta(k^2-1)}\,(x\sin C_1 + y\cos C_1 + C_2)$$
if $|k| > 1$,

where C_1 and C_2 are arbitrary constants.

3. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=\alpha\cos(\beta w).$

The substitution $\beta w=\beta u+\frac{1}{2}\pi$ leads to an equation of the form 9.3.3.1:

$$\frac{\partial^2 u}{\partial x^2}+\frac{\partial^2 u}{\partial y^2}=-\alpha\sin(\beta u).$$

4. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=\alpha(x^2+y^2)\sin(\beta w).$

This is a special case of equation 9.4.1.3 with $f(w)=\alpha\sin(\beta w)$.

5. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=\alpha(x^2+y^2)\cos(\beta w).$

This is a special case of equation 9.4.1.3 with $f(w)=\alpha\cos(\beta w)$.

6. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=ae^{\beta x}\sin(\lambda w).$

This is a special case of equation 9.4.1.5 with $f(w)=a\sin(\lambda w)$.

7. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=a\cos(\beta w)\left[\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2\right].$

This is a special case of equation 9.4.2.12 with $f(w)=a\cos(\beta w)$.

8. $\dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right)=k\sin(\beta w).$

This is a special case of equation 9.4.3.1 with $f(w)=k\sin(\beta w)$.

9. $\dfrac{\partial}{\partial x}\left(ae^{\beta x}\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(be^{\mu y}\dfrac{\partial w}{\partial y}\right)=k\sin(\lambda w).$

This is a special case of equation 9.4.3.6 with $f(w)=k\sin(\lambda w)$.

10. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial}{\partial y}\left[a\cos^n(\beta w)\dfrac{\partial w}{\partial y}\right]=0.$

This is a special case of equation 9.4.4.8 with $f(w)=1$ and $g(w)=a\cos^n(\beta w)$.

9.4. Equations Involving Arbitrary Functions

9.4.1. Equations of the Form $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=F(x,y,w)$

1. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=f(w).$

This is a *stationary heat equation with a nonlinear source*.

1°. Suppose $w = w(x, y)$ is a solution of the equation in question. Then the functions

$$w_1 = w(\pm x + C_1, \pm y + C_2),$$
$$w_2 = w(x\cos\beta - y\sin\beta,\ x\sin\beta + y\cos\beta),$$

where C_1, C_2, and β are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. Traveling-wave solution in implicit form:

$$\int \left[C + \frac{2}{A^2 + B^2}F(w)\right]^{-1/2} dw = Ax + By + D, \qquad F(w) = \int f(w)\,dw,$$

where A, B, C, and D are arbitrary constants.

3°. Solution with central symmetry about the point $(-C_1, -C_2)$:

$$w = w(\zeta), \qquad \zeta = \sqrt{(x + C_1)^2 + (y + C_2)^2},$$

where C_1 and C_2 are arbitrary constants and the function $w = w(\zeta)$ is determined by the ordinary differential equation

$$w''_{\zeta\zeta} + \frac{1}{\zeta}w'_\zeta = f(w).$$

4°. For exact solutions of the original equation for some $f(w)$, see Subsections 9.1.1 and 9.2.1 and equations 9.3.1.1, 9.3.2.1, and 9.3.3.1 (see also Example 30.11 in Subsection 30.3.2).

2. $\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} = yf(w) + g(w).$

This equation describes a steady planar flow of an inviscid stratified fluid.

For $f(w) \equiv 0$, see equation 9.4.1.1.

1°. The translation transformation $y = \bar{y} + C$ leads to an equation of the same form, in which the function $g(w)$ must be replaced by $g(w) + Cf(w)$.

2°. Let $f(w) = aw^{3k-1}$ and $g(w) = bw^{2k+1} + cw^{3k-1}$, where a, b, c, and k are arbitrary constants ($ak \neq 0$).

Solution:

$$w = x^{-\frac{1}{k}}u(\eta), \qquad \eta = \frac{y}{x} + \frac{c}{ax},$$

where the function $u = u(\eta)$ is determined by the ordinary differential equation

$$(\eta^2 + 1)u''_{\eta\eta} + \frac{2(k+1)}{k}\eta u'_\eta + \frac{k+1}{k^2}u = a\eta u^{3k-1} + bu^{2k+1}.$$

To $c = 0$ there corresponds a self-similar solution.

3°. Let $f(w) = ae^{3\lambda w}$ and $g(w) = be^{2\lambda w} + ce^{3\lambda w}$.

Solution:

$$w = U(\eta) - \frac{1}{\lambda}\ln x, \qquad \eta = \frac{y}{x} + \frac{c}{ax},$$

where the function $U = U(\eta)$ is determined by the ordinary differential equation

$$(\eta^2 + 1)U''_{\eta\eta} + 2\eta U'_\eta + \frac{1}{\lambda} = a\eta e^{3\lambda U} + be^{2\lambda U}.$$

4°. Let $f(w) = aw$ and $g(w) = bw\ln w + cw$.

Multiplicative separable solution:

$$w = \varphi(x)\psi(y),$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(y)$ are determined by the second-order ordinary differential equations

$$\varphi''_{xx} - (b\ln\varphi + K)\varphi = 0,$$
$$\psi''_{yy} - (b\ln\psi + ay + c - K)\psi = 0,$$

and K is an arbitrary constant.

Remark. For linear functions $f(w) = a$ and $g(w) = bw + c$, the substitution $w = \varphi(y) + u(x, y)$, where

$$\varphi(y) = \begin{cases} \frac{1}{6}ay^3 + \frac{1}{2}cy^2 & \text{if } b = 0, \\ -\dfrac{ay + c}{b} & \text{if } b \neq 0, \end{cases}$$

leads to the Helmholtz equation $\Delta u = bu$.

5°. Let

$$f(w) = -\frac{2\varphi''}{(\varphi')^3}, \qquad g(w) = \frac{2\varphi\varphi''}{(\varphi')^3} - \frac{1}{\varphi'},$$

where $\varphi = \varphi(w)$ is an arbitrary function.

Solution in implicit form:

$$\varphi(w) = y - \frac{(x + C)^2 + 1}{2},$$

where C is an arbitrary constant.

6°. Let

$$f(w) = k\big[\cos w + \cos\big(\tfrac{1}{2}w\big)\big], \qquad g(w) = \sin w.$$

Functional separable solution:

$$w = 4\arctan\left(\frac{y}{R(x)}\right),$$

where $R = R(x)$ satisfies the equation for elliptic functions

$$(R'_x)^2 = 1 + R^2 + kR^3.$$

7°. Let

$$f(w) = k\big[\cosh w \pm \cosh\big(\tfrac{1}{2}w\big)\big], \qquad g(w) = \sinh w.$$

Functional separable solutions:

$$w = 4\operatorname{arctanh}\left(\frac{y}{R(x)}\right)$$

for the plus signin the expression of $f(w)$ and

$$w = 4\operatorname{arctanh}\left(\frac{R(x)}{y}\right)$$

for the minus sign; the function $R = R(x)$ satisfies the equation

$$(R'_x)^2 = -1 + R^2 + kR^3.$$

⊙ *References for equation* 9.4.1.2: C.-S. Yih (1980, p. 144), O. V. Kaptsov (1990), Yu. V. Shan'ko (2001).

3. $\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} = (x^2 + y^2) f(w).$

1°. Suppose $w = w(x, y)$ is a solution of this equation. Then the function

$$w_1 = w(x\cos\beta - y\sin\beta,\ x\sin\beta + y\cos\beta),$$

where β is an arbitrary constant, is also a solution of the equation.

2°. Solution with central symmetry:

$$w = w(r), \qquad r = \sqrt{x^2 + y^2},$$

where the function $w = w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{1}{r}w'_r = r^2 f(w).$$

3°. Self-similar solution:

$$w = w(\zeta), \qquad \zeta = xy.$$

Here, the function $w = w(\zeta)$ is determined by the autonomous ordinary differential equation

$$w''_{\zeta\zeta} = f(w),$$

whose general solution can be written out in implicit form as

$$\int \left[C_1 + 2F(w)\right]^{-1/2} dw = C_2 \pm \zeta, \qquad F(w) = \int f(w)\, dw,$$

where C_1 and C_2 are arbitrary constants.

Remark. The above solution is a nonclassical (noninvariant) self-similar solution, since the equation in question is not invariant under scaling transformations.

4°. Functional separable solution:

$$w = w(z), \qquad z = \tfrac{1}{2}(x^2 - y^2).$$

Here, the function $w = w(z)$ is determined by the autonomous ordinary differential equation

$$w''_{zz} = f(w),$$

whose general solution can be written out in implicit form as

$$\int \big[C_1 + 2F(w)\big]^{-1/2} dw = C_2 \pm z, \qquad F(w) = \int f(w)\, dw,$$

where C_1 and C_2 are arbitrary constants.

5°. The transformation

$$w = U(z, \zeta), \quad z = \tfrac{1}{2}(x^2 - y^2), \quad \zeta = xy$$

leads to a simpler equation of the form 9.4.1.1:

$$\frac{\partial^2 U}{\partial z^2} + \frac{\partial^2 U}{\partial \zeta^2} = f(U).$$

⊙ *References for equation* 9.4.1.3: A. D. Polyanin and V. F. Zaitsev (2002, p. 212), A. D. Polyanin (2004 *a*).

4. $\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} = (x^2 + y^2)^k f(w).$

1°. Suppose $w = w(x, y)$ is a solution of this equation. Then the function

$$w_1 = w(x\cos\beta - y\sin\beta,\ x\sin\beta + y\cos\beta),$$

where β is an arbitrary constant, is also a solution of the equation.

2°. Solution with central symmetry:

$$w = w(r), \qquad r = \sqrt{x^2 + y^2},$$

where the function $w = w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{1}{r} w'_r = r^{2k} f(w).$$

3°. Suppose $k = \pm 1, \pm 2, \ldots$. The transformation

$$\begin{aligned}
&z = \tfrac{1}{2}(x^2 - y^2), && \zeta = xy && \text{for } k = 1,\\
&z = \tfrac{1}{3}(x^3 - 3xy^2), && \zeta = \tfrac{1}{3}(3x^2 y - y^3) && \text{for } k = 2,\\
&z = \tfrac{1}{2}\ln(x^2 + y^2), && \zeta = \arctan\frac{y}{x} && \text{for } k = -1,\\
&z = -\frac{x}{x^2 + y^2}, && \zeta = \frac{y}{x^2 + y^2} && \text{for } k = -2
\end{aligned}$$

leads to a simpler equation of the form 9.4.1.1:

$$\frac{\partial^2 w}{\partial z^2}+\frac{\partial^2 w}{\partial \zeta^2}=f(w). \tag{1}$$

For arbitrary $f=f(w)$, this equation admits a traveling-wave solution $w=w(Az+B\zeta)$, where A and B are arbitrary constants, and a solution of the form $w=w(z^2+\zeta^2)$.

In the general case, for any integer $k\neq -1$, the transformation

$$z=\frac{(x+iy)^{k+1}+(x-iy)^{k+1}}{2(k+1)},\quad \zeta=\frac{(x+iy)^{k+1}-(x-iy)^{k+1}}{2(k+1)i},\quad i^2=-1 \tag{2}$$

leads to equation (1). It follows from (2) that

$$z^2+\zeta^2=\frac{1}{(k+1)^2}(x^2+y^2)^{k+1}.$$

4°. Suppose k is an arbitrary constant ($k\neq -1$). The transformation

$$z=\frac{1}{k+1}r^{k+1}\cos\big[(k+1)\varphi\big],\quad \zeta=\frac{1}{k+1}r^{k+1}\sin\big[(k+1)\varphi\big], \tag{3}$$

where $x=r\cos\varphi$ and $y=r\sin\varphi$, leads to the simpler equation (1). For $k=\pm1,\pm2,\ldots$, transformation (3) coincides with transformation (2).

⊙ *Reference for equation* 9.4.1.4: A. D. Polyanin and V. F. Zaitsev (2002, pp. 212–213).

5. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=e^{\beta x}f(w).$

The transformation

$$w=W(u,v),\quad u=\exp\big(\tfrac{1}{2}\beta x\big)\cos\big(\tfrac{1}{2}\beta y\big),\quad v=\exp\big(\tfrac{1}{2}\beta x\big)\sin\big(\tfrac{1}{2}\beta y\big)$$

leads to a simpler equation of the form 9.4.1.1:

$$\frac{\partial^2 W}{\partial u^2}+\frac{\partial^2 W}{\partial v^2}=4\beta^{-2}f(W).$$

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2002, p. 213).

6. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=e^{ax-by}f(w).$

Let us represent the exponent of e in the form

$$ax-by=\beta(x\cos\sigma-y\sin\sigma);\quad \beta=\sqrt{a^2+b^2},\quad \cos\sigma=a/\beta,\quad \sin\sigma=b/\beta.$$

The transformation

$$\xi=x\cos\sigma-y\sin\sigma,\quad \eta=x\sin\sigma+y\cos\sigma,$$

leads to an equation of the form 9.4.1.5:

$$\frac{\partial^2 w}{\partial \xi^2}+\frac{\partial^2 w}{\partial \eta^2}=e^{\beta\xi}f(w).$$

7. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=f(x,y)e^{\beta w}.$

Suppose $f(x,y)=a|F(z)|^2$, where $F=F(z)$ is a prescribed analytic function of the complex variable $z=x+iy$.

General solution:

$$w(x,y)=-\frac{2}{\beta}\ln\frac{|F(z)||1-2a\beta\Phi(z)\overline{\Phi(z)}|}{4|\Phi'_z(z)|},$$

where $\Phi=\Phi(z)$ is an arbitrary analytic (holomorphic) function of the complex variable $z=x+iy$ with nonzero derivative; the bar over a symbol denotes the complex conjugate.

⊙ *Reference*: I. Kh. Sabitov (2001).

8. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=aw\ln w+f(x)w.$

Multiplicative separable solution:

$$w(x,y)=\varphi(x)\psi(y),$$

where the functions $\varphi(x)$ and $\psi(y)$ are determined by the ordinary differential equations

$$\varphi''_{xx}-\big[a\ln\varphi+f(x)+C\big]\varphi=0,$$
$$\psi''_{yy}-\big(a\ln\psi-C\big)\psi=0,$$

and C is an arbitrary constant.

9. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=aw\ln w+\big[f(x)+g(y)\big]w.$

Multiplicative separable solution:

$$w(x,y)=\varphi(x)\psi(y),$$

where the functions $\varphi(x)$ and $\psi(y)$ are determined by the ordinary differential equations

$$\varphi''_{xx}-\big[a\ln\varphi+f(x)+C\big]\varphi=0,$$
$$\psi''_{yy}-\big[a\ln\psi+g(y)-C\big]\psi=0,$$

and C is an arbitrary constant.

10. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=f(x)w\ln w+\big[af(x)y+g(x)\big]w.$

Multiplicative separable solution:

$$w(x,y)=e^{-ay}\varphi(x),$$

where the function $\varphi(x)$ is determined by the ordinary differential equation

$$\varphi''_{xx}=f(x)\varphi\ln\varphi+\big[g(x)-a^2\big]\varphi.$$

11. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=f(ax+by,w).$

Solution:

$$w=w(\xi),\qquad \xi=ax+by,$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$(a^2+b^2)w''_{\xi\xi}=f(\xi,w).$$

12. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=f(x^2+y^2,w).$

1°. Suppose $w=w(x,y)$ is a solution of this equation. Then the function

$$w_1=w(x\cos\beta-y\sin\beta,\ x\sin\beta+y\cos\beta),$$

where β is an arbitrary constant, is also a solution of the equation.

2°. Solution with central symmetry:

$$w=w(\xi),\qquad \xi=\left(x^2+y^2\right)^{1/2},$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$w''_{\xi\xi}+\frac{1}{\xi}w'_\xi=f(\xi^2,w).$$

13. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=(x^2+y^2)f(xy,\ w).$

1°. Self-similar solution:

$$w=w(\zeta),\qquad \zeta=xy,$$

where the function $w(\zeta)$ is determined by the ordinary differential equation

$$w''_{\zeta\zeta}=f(\zeta,w).$$

Remark. The above solution is a nonclassical (noninvariant) self-similar solution, since the equation in question is not invariant under scaling transformations.

2°. The transformation

$$w=U(z,\zeta),\quad z=\tfrac{1}{2}(x^2-y^2),\quad \zeta=xy$$

leads to the simpler equation

$$\frac{\partial^2 U}{\partial z^2}+\frac{\partial^2 U}{\partial \zeta^2}=f(\zeta,U).$$

⊙ *Reference for equation* 9.4.1.13: A. D. Polyanin and V. F. Zaitsev (2002, p. 215).

14. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=(x^2+y^2)f(x^2-y^2,\ w).$

1°. Functional separable solution:

$$w=w(z),\qquad z=\tfrac{1}{2}(x^2-y^2),$$

where the function $w(z)$ is determined by the ordinary differential equation

$$w''_{zz}=f(2z,w).$$

2°. The transformation

$$w=U(z,\zeta),\quad z=\tfrac{1}{2}(x^2-y^2),\quad \zeta=xy$$

leads to the simpler equation

$$\frac{\partial^2 U}{\partial z^2}+\frac{\partial^2 U}{\partial \zeta^2}=f(2z,U).$$

15. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=f\big(w+A_{11}x^2+A_{12}xy+A_{22}y^2+B_1x+B_2y\big).$

The substitution $U=w+A_{11}x^2+A_{12}xy+A_{22}y^2+B_1x+B_2y$ leads to an equation of the form 9.4.1.1:

$$\frac{\partial^2 U}{\partial x^2}+\frac{\partial^2 U}{\partial y^2}=f(U)+2A_{11}+2A_{22}.$$

9.4.2. Equations of the Form $a\dfrac{\partial^2 w}{\partial x^2}+b\dfrac{\partial^2 w}{\partial y^2}=F\Big(x,y,w,\dfrac{\partial w}{\partial x},\dfrac{\partial w}{\partial y}\Big)$

1. $a\dfrac{\partial^2 w}{\partial x^2}+b\dfrac{\partial^2 w}{\partial y^2}=f(w).$

This equation describes steady-state processes of heat/mass transfer or combustion in anisotropic media. Here, a and b are the principal thermal diffusivities (diffusion coefficients) and $f=f(w)$ is a kinetic function that defines the law of heat (substance) release.

The transformation $\xi=x/\sqrt{a}$, $\eta=y/\sqrt{b}$ leads to an equation of the form 9.4.1.1:

$$\frac{\partial^2 w}{\partial \xi^2}+\frac{\partial^2 w}{\partial \eta^2}=f(w).$$

2. $ax\dfrac{\partial w}{\partial x}+ay\dfrac{\partial w}{\partial y}=\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}-f(w).$

Traveling-wave solution:

$$w=w(z),\qquad z=k_1x+k_2y,$$

where k_1 and k_2 are arbitrary constants and the function $w(z)$ is determined by the ordinary differential equation

$$azw'_z=(k_1^2+k_2^2)w''_{zz}-f(w).$$

Remark. The above solution is a nonclassical (noninvariant) traveling-wave solution, since the equation in question is not invariant under translation transformations.

⊙ *Reference*: A. D. Polyanin (2004 *a*).

3. $(a_1x + b_1y + c_1)\dfrac{\partial w}{\partial x} + (a_2x + b_2y + c_2)\dfrac{\partial w}{\partial y} = \dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} - f(w).$

This equation describes steady-state mass transfer with a volume chemical reaction in a translational-shear fluid flow.

Traveling-wave solution:

$$w = w(z), \qquad z = a_2x + (k - a_1)y,$$

where k is a root of the quadratic equation

$$k^2 - (a_1 + b_2)k + a_1b_2 - a_2b_1 = 0,$$

and the function $w(z)$ is determined by the ordinary differential equation

$$\big[kz + a_2c_1 + (k - a_1)c_2\big]w'_z = \big[a_2^2 + (k - a_1)^2\big]w''_{zz} - f(w).$$

Remark. In the case of an incompressible fluid, the equation coefficients must satisfy the condition $a_1 + b_2 = 0$.

⊙ *Reference for equation* 9.4.2.3: A. D. Polyanin and V. F. Zaitsev (2004, p. 387).

4. $a\dfrac{\partial^2 w}{\partial x^2} + b\dfrac{\partial^2 w}{\partial y^2} + cx\dfrac{\partial w}{\partial x} - cy\dfrac{\partial w}{\partial y} = (bx^2 + ay^2)f(w).$

Solution:

$$w = w(z), \qquad z = xy,$$

where the function $w = w(z)$ is determined by the autonomous ordinary differential equation

$$w''_{zz} = f(w).$$

5. $\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} - \dfrac{1}{y}\dfrac{\partial w}{\partial y} = y^2 f(w) + g(w).$

Grad–Shafranov equation. This equation describes some classes of steady-state rotationally symmetric (swirling) flows of an ideal incompressible fluid, where y plays the role of the radial coordinate. Also it is the equilibrium equation in ideal magnetohydrodynamics for a two-dimensional plasma, for example the axisymmetric toroidal plasma in a tokamak.

1°. Let $f(w) = 0$ and $g(w)$ is an arbitrary function.

Functional separable solution:

$$w = w(\xi), \qquad \xi = \sqrt{(x + C)^2 + y^2},$$

where the function $w = w(\xi)$ is determined by the autonomous ordinary differential equation

$$w''_{\xi\xi} = g(w).$$

2°. Let $f(w) = ag(w)$, where $a > 0$ and $g(w)$ is an arbitrary function.

New functional separable solutions:

$$w = w(z), \qquad z = x \pm \tfrac{1}{2}\sqrt{a}\,y^2,$$

where the function $w = w(z)$ is determined by the autonomous ordinary differential equation

$$w''_{zz} = g(w).$$

3°. Let $f(w) = aw^{2k-1}$ and $g(w) = bw^k$, where a, b, and k are arbitrary constants.
Self-similar solution:

$$w = x^{\frac{2}{1-k}}\, u(\eta), \qquad \eta = \frac{y}{x},$$

where the function $u = u(\eta)$ is determined by the ordinary differential equation

$$(\eta^2 + 1)u''_{\eta\eta} - \left[\frac{2(1+k)}{1-k}\eta + \frac{1}{\eta}\right]u'_\eta + \frac{2(1+k)}{(1-k)^2}u = a\eta^2 u^{2k-1} + bu^k.$$

4°. Let $f(w) = ae^{2\lambda w}$ and $g(w) = be^{\lambda w}$.
Solution:

$$w = U(\eta) - \frac{2}{\lambda}\ln|x|, \qquad \eta = \frac{y}{x},$$

where the function $U = U(\eta)$ is determined by the ordinary differential equation

$$(\eta^2 + 1)U''_{\eta\eta} + \left(2\eta - \frac{1}{\eta}\right)U'_\eta + \frac{2}{\lambda} = a\eta^2 e^{2\lambda U} + be^{\lambda U}.$$

5°. Let $f(w) = aw$ and $g(w) = bw\ln w + cw$.
Multiplicative separable solution:

$$w = \varphi(x)\psi(y),$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(y)$ are determined by the second-order ordinary differential equations

$$\varphi''_{xx} - (b\ln\varphi + K)\varphi = 0,$$
$$\psi''_{yy} - \frac{1}{y}\psi'_y - (b\ln\psi + ay^2 + c - K)\psi = 0,$$

and K is an arbitrary constant.

⊙ *References for equation* 9.4.2.5: H. Grad and H. Rubin (1958), V. D. Shafranov (1966), G. K. Batchelor (1970), O. V. Kaptsov (1990, 1992, 1998), V. F. Zaitsev and A. D. Polyanin (1996, pp. 486–487), E. Yu. Meshcheryakova (2003), Yu. E. Litvinenko (2010).

6. $\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial^2 w}{\partial y^2} + \dfrac{a}{x}\dfrac{\partial w}{\partial x} + \dfrac{b}{y}\dfrac{\partial w}{\partial y} = f(x^2 + y^2, w).$

1°. Solution with central symmetry:

$$w = w(\xi), \qquad \xi = \left(x^2 + y^2\right)^{1/2},$$

where the function $w = w(\xi)$ is determined by the ordinary differential equation

$$w''_{\xi\xi} + \frac{a+b+1}{\xi}w'_\xi = f(\xi^2, w).$$

2°. See also equation 9.4.5.5 with $n = m = 0$ and $f(u, w) = f(w)$.

⊙ *Reference for equation* 9.4.2.6: V. F. Zaitsev and A. D. Polyanin (1996, pp. 486–487), A. D. Polyanin and V. F. Zaitsev (2004, p. 388).

7. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}+\dfrac{f(w)}{x}\dfrac{\partial w}{\partial x}+\dfrac{g(w)}{y}\dfrac{\partial w}{\partial y}=h(w).$

Solution with central symmetry:

$$w=w(\xi),\qquad \xi=\left(x^2+y^2\right)^{1/2},$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$w''_{\xi\xi}+\frac{f(w)+g(w)+1}{\xi}w'_\xi=h(w).$$

Remark. The functions $f(w)$, $g(w)$, and $h(w)$ in the equation and solution can be replaced by functions of two arguments $f(w,\xi)$, $g(w,\xi)$, and $h(w,\xi)$, where $\xi=\left(x^2+y^2\right)^{1/2}$.

8. $a\dfrac{\partial^2 w}{\partial x^2}+b\dfrac{\partial^2 w}{\partial y^2}=f_1(x)\dfrac{\partial w}{\partial x}+f_2(y)\dfrac{\partial w}{\partial y}+kw\ln w+\left[g_1(x)+g_2(y)\right]w.$

Multiplicative separable solution:

$$w(x,y)=\varphi(x)\psi(y).$$

Here, the functions $\varphi(x)$ and $\psi(x)$ are determined by the ordinary differential equations

$$a\varphi''_{xx}=f_1(x)\varphi'_x+k\varphi\ln\varphi+\left[g_1(x)+C\right]\varphi,$$
$$b\psi''_{yy}=f_2(y)\psi'_y+k\psi\ln\psi+\left[g_2(y)-C\right]\psi,$$

where C is an arbitrary constant.

9. $\dfrac{\partial^2 w}{\partial x^2}+a\dfrac{\partial^2 w}{\partial y^2}=f(x)\left(\dfrac{\partial w}{\partial y}\right)^2+g(x)w+h(x).$

Generalized separable solution quadratic in y:

$$w(x,y)=\varphi(x)y^2+\psi(x)y+\chi(x), \tag{1}$$

where the functions $\varphi(x)$, $\psi(x)$, and $\chi(x)$ are determined by the following system of ordinary differential equations (the arguments of f, g, and h are omitted):

$$\varphi''_{xx}=4f\varphi^2+g\varphi, \tag{2}$$
$$\psi''_{xx}=(4f\varphi+g)\psi, \tag{3}$$
$$\chi''_{xx}=g\chi+f\psi^2+h-2a\varphi. \tag{4}$$

Whenever a solution $\varphi=\varphi(x)$ of the nonlinear equation (2) is found, the functions $\psi=\psi(x)$ and $\chi=\chi(x)$ can be determined successively from equations (3) and (4), which are linear in ψ and χ, respectively.

It is apparent from the comparison of equations (2) and (3) that (3) has the particular solution $\psi=\varphi(x)$. Hence, the general solution to (3) is given by (see Polyanin and Zaitsev, 2003)

$$\psi(x)=C_1\varphi(x)+C_2\varphi(x)\int\frac{dx}{\varphi^2(x)},\qquad \varphi\not\equiv 0.$$

Note that equation (2) has the trivial particular solution $\varphi(x)\equiv 0$, to which there corresponds solution (1) linear in y. If the functions f and g are proportional, then a particular solution to equation (2) is given by $\varphi=-\frac{1}{4}g/f=\text{const}$.

10. $\dfrac{\partial^2 w}{\partial x^2} + a\dfrac{\partial^2 w}{\partial y^2} = f(x)\left(\dfrac{\partial w}{\partial y}\right)^2 + bf(x)w^2 + g(x)w + h(x).$

1°. Generalized separable solutions:

$$w(x,y) = \varphi(x) + \psi(x)\exp\bigl(\pm y\sqrt{-b}\,\bigr), \qquad b < 0, \tag{1}$$

where the functions $\varphi(x)$ and $\psi(x)$ are determined by the following system of ordinary differential equations (the arguments of f, g, and h are omitted):

$$\varphi''_{xx} = bf\varphi^2 + g\varphi + h, \tag{2}$$
$$\psi''_{xx} = (2bf\varphi + g + ab)\psi. \tag{3}$$

Whenever a solution $\varphi = \varphi(x)$ of equation (2) is found, the functions $\psi = \psi(x)$ can be determined by solving equation (3), which is linear in ψ.

If the functions f, g, and h are proportional, i.e.,

$$g = \alpha f, \quad h = \beta f \qquad (\alpha,\ \beta = \text{const}),$$

then particular solutions of equation (2) are given by

$$\varphi = k_1, \quad \varphi = k_2, \tag{4}$$

where k_1 and k_2 are roots of the quadratic equation $bk^2 + \alpha k + \beta = 0$. In this case, equation (3) can be rewritten as

$$\psi''_{xx} = \bigl[(2bk_n + \alpha)f + ab\bigr]\psi, \qquad n = 1,\ 2. \tag{5}$$

The books by Kamke (1977) and Polyanin and Zaitsev (2003) present a large number of exact solutions to the linear equation (5) for various $f = f(x)$. In the special case $f = \text{const}$, the general solution of equation (5) is the sum of exponentials (or sine and cosine).

2°. Generalized separable solution (generalizes the solutions of Item 1°):

$$w(x,y) = \varphi(x) + \psi(x)\bigl[A\exp\bigl(y\sqrt{-b}\,\bigr) + B\exp\bigl(-y\sqrt{-b}\,\bigr)\bigr], \qquad b < 0, \tag{6}$$

where the functions $\varphi(x)$ and $\psi(x)$ are determined by the system of ordinary differential equations

$$\varphi''_{xx} = bf\bigl(\varphi^2 + 4AB\psi^2\bigr) + g\varphi + h,$$
$$\psi''_{xx} = 2bf\varphi\psi + g\psi + ab\psi.$$

Note two special cases of solution (6) that involve hyperbolic functions. These are:

$$w(x,y) = \varphi(x) + \psi(x)\cosh\bigl(y\sqrt{-b}\,\bigr), \quad A = \tfrac{1}{2},\ B = \tfrac{1}{2},$$
$$w(x,y) = \varphi(x) + \psi(x)\sinh\bigl(y\sqrt{-b}\,\bigr), \quad A = \tfrac{1}{2},\ B = -\tfrac{1}{2}.$$

3°. Generalized separable solution (c is an arbitrary constant):

$$w(x,y) = \varphi(x) + \psi(x)\cos\bigl(y\sqrt{b} + c\bigr), \qquad b > 0,$$

where the functions $\varphi(x)$ and $\psi(x)$ are determined by the system of ordinary differential equations

$$\varphi''_{xx} = bf\bigl(\varphi^2 + \psi^2\bigr) + g\varphi + h,$$
$$\psi''_{xx} = 2bf\varphi\psi + g\psi + ab\psi.$$

⊙ *References for equation* 9.4.2.10: V. A. Galaktionov (1995), V. F. Zaitsev and A. D. Polyanin (1996, p. 488).

11. $$a\frac{\partial^2 w}{\partial x^2}+b\frac{\partial^2 w}{\partial y^2}=f(x)\left(\frac{\partial w}{\partial y}\right)^2+g(x)\frac{\partial w}{\partial x}+\big[h_1(x)y+h_0(x)\big]\frac{\partial w}{\partial y}+p(x)w+q_2(x)y^2+q_1(x)y+q_0(x).$$

There is a generalized separable solution quadratic in y:

$$w(x,y)=\varphi(x)y^2+\psi(x)y+\chi(x).$$

12. $$\frac{\partial^2 w}{\partial x^2}+\frac{\partial^2 w}{\partial y^2}=f(w)\left[\left(\frac{\partial w}{\partial x}\right)^2+\left(\frac{\partial w}{\partial y}\right)^2\right].$$

The substitution

$$U=\int\frac{dw}{F(w)},\qquad\text{where}\quad F(w)=\exp\left[\int f(w)\,dw\right],$$

leads to the two-dimensional Laplace equation for $U=U(x,y)$:

$$\frac{\partial^2 U}{\partial x^2}+\frac{\partial^2 U}{\partial y^2}=0.$$

For solutions of this linear equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

13. $$a\frac{\partial^2 w}{\partial x^2}+b\frac{\partial^2 w}{\partial y^2}=f(x)\left(\frac{\partial w}{\partial x}\right)^n+g(y)\left(\frac{\partial w}{\partial y}\right)^m+kw.$$

Additive separable solution:

$$w(x,y)=\varphi(x)+\psi(y).$$

Here, the functions $\varphi(x)$ and $\psi(x)$ are determined by the ordinary differential equations

$$a\varphi''_{xx}-f(x)\big(\varphi'_x\big)^n-k\varphi=C,$$
$$b\psi''_{yy}-g(y)\big(\psi'_y\big)^m-k\psi=-C,$$

where C is an arbitrary constant.

14. $$a\frac{\partial^2 w}{\partial x^2}+b\frac{\partial^2 w}{\partial y^2}=f_1(x)\left(\frac{\partial w}{\partial x}\right)^n+f_2(y)\left(\frac{\partial w}{\partial y}\right)^m+g_1(x)\frac{\partial w}{\partial x}+g_2(y)\frac{\partial w}{\partial y}+h_1(x)+h_2(y)+kw.$$

Additive separable solution:

$$w(x,y)=\varphi(x)+\psi(y).$$

Here, the functions $\varphi(x)$ and $\psi(x)$ are determined by the ordinary differential equations

$$a\varphi''_{xx}-f_1(x)\big(\varphi'_x\big)^n-g_1(x)\varphi'_x-k\varphi-h_1(x)=C,$$
$$b\psi''_{yy}-f_2(y)\big(\psi'_y\big)^m-g_2(y)\psi'_y-k\psi-h_2(y)=-C,$$

where C is an arbitrary constant.

15. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}=(a_1x+b_1y+c_1)\left(\dfrac{\partial w}{\partial x}\right)^k+(a_2x+b_2y+c_2)\left(\dfrac{\partial w}{\partial y}\right)^k+f\left(w,\ \dfrac{\partial w}{\partial x},\ \dfrac{\partial w}{\partial y}\right).$

Solutions are sought in the traveling-wave form

$$w=w(z),\qquad z=Ax+By+C,$$

where the constants A, B, and C are determined by solving the algebraic system of equations

$$a_1A^k+a_2B^k=A, \tag{1}$$
$$b_1A^k+b_2B^k=B, \tag{2}$$
$$c_1A^k+c_2B^k=C. \tag{3}$$

Equations (1) and (2) are first solved for A and B and then equation (3) is used to evaluate C. The unknown function $w(z)$ is determined by the ordinary differential equation

$$(A^2+B^2)w''_{zz}=z(w'_z)^k+f\big(w,\ Aw'_z,\ Bw'_z\big).$$

16. $a\dfrac{\partial^2 w}{\partial x^2}+b\dfrac{\partial^2 w}{\partial y^2}=f_1\left(x,\dfrac{\partial w}{\partial x}\right)+f_2\left(y,\dfrac{\partial w}{\partial y}\right)+kw.$

Additive separable solution:

$$w(x,y)=\varphi(x)+\psi(y).$$

Here, the functions $\varphi(x)$ and $\psi(x)$ are determined by the ordinary differential equations

$$a\varphi''_{xx}-f_1\big(x,\varphi'_x\big)-k\varphi=C,$$
$$b\psi''_{yy}-f_2\big(y,\psi'_y\big)-k\psi=-C,$$

where C is an arbitrary constant.

17. $a\dfrac{\partial^2 w}{\partial x^2}+b\dfrac{\partial^2 w}{\partial y^2}=f_1\left(x,\dfrac{1}{w}\dfrac{\partial w}{\partial x}\right)w+f_2\left(y,\dfrac{1}{w}\dfrac{\partial w}{\partial y}\right)w.$

Multiplicative separable solution:

$$w(x,y)=\varphi(x)\psi(y).$$

Here, the functions $\varphi(x)$ and $\psi(y)$ are determined by the ordinary differential equations

$$a\frac{\varphi''_{xx}}{\varphi}-f_1\left(x,\frac{\varphi'_x}{\varphi}\right)=C,$$
$$b\frac{\psi''_{yy}}{\psi}-f_2\left(y,\frac{\psi'_y}{\psi}\right)=-C,$$

where C is an arbitrary constant.

9.4.3. Heat and Mass Transfer Equations of the Form $\frac{\partial}{\partial x}\left[f(x)\frac{\partial w}{\partial x}\right]+\frac{\partial}{\partial y}\left[g(y)\frac{\partial w}{\partial y}\right]=h(w)$

▷ *Equations of this form describe steady-state heat/mass transfer or combustion processes in inhomogeneous anisotropic media. Here, $f=f(x)$ and $g=g(y)$ are the principal thermal diffusivities (diffusion coefficients) dependent on coordinates; $h=h(w)$ is the kinetic function (source function), which defines the law of heat (substance) release of absorption. The simple solutions dependent on a single coordinate, $w=w(x)$ or $w=w(y)$, are not considered in this subsection.*

1. $\dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right)=f(w).$

1°. Functional separable solution for $n\neq 2$ and $m\neq 2$:

$$w=w(\xi),\qquad \xi=\left[b(2-m)^2x^{2-n}+a(2-n)^2y^{2-m}\right]^{1/2}.$$

Here, the function $w(\xi)$ is determined by the ordinary differential equation

$$w''_{\xi\xi}+\frac{A}{\xi}w'_\xi=Bf(w), \tag{1}$$

where

$$A=\frac{4-nm}{(2-n)(2-m)},\quad B=\frac{4}{ab(2-n)^2(2-m)^2}.$$

For $m=4/n$, a family of exact solutions to the original equation with arbitrary $f=f(w)$ follows from (1). It is given by

$$\int\left[C_1+\frac{2n^2}{ab(2-n)^4}F(w)\right]^{-1/2}dw=C_2\pm\xi,\qquad F(w)=\int f(w)\,dw,$$

where C_1 and C_2 are arbitrary constants.

2°. The substitution $\zeta=\xi^{1-A}$ brings (1) to the generalized Emden–Fowler equation

$$w''_{\zeta\zeta}=\frac{B}{(1-A)^2}\zeta^{\frac{2A}{1-A}}f(w). \tag{2}$$

A large number of exact solutions to equation (2) for various $f=f(w)$ can be found in Polyanin and Zaitsev (2003).

⊙ *Reference for equation* 9.4.3.1: V. F. Zaitsev and A. D. Polyanin (1996, p. 485).

2. $\dfrac{\partial}{\partial x}\left[a(x+c)^n\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[b(y+s)^m\dfrac{\partial w}{\partial y}\right]=f(w).$

The transformation $\zeta=x+c$, $\eta=y+s$ leads to an equation of the form 9.4.3.1:

$$\frac{\partial}{\partial\zeta}\left(a\zeta^n\frac{\partial w}{\partial\zeta}\right)+\frac{\partial}{\partial\eta}\left(b\eta^m\frac{\partial w}{\partial\eta}\right)=f(w).$$

3. $\dfrac{\partial}{\partial x}\left[a\big(|x|+c\big)^n\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[b\big(|y|+s\big)^m\dfrac{\partial w}{\partial y}\right]=f(w).$

The transformation $\zeta = |x| + c$, $\eta = |y| + s$ leads to an equation of the form 9.4.3.1:

$$\frac{\partial}{\partial\zeta}\left(a\zeta^n\frac{\partial w}{\partial\zeta}\right)+\frac{\partial}{\partial\eta}\left(b\eta^m\frac{\partial w}{\partial\eta}\right)=f(w).$$

4. $a\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial}{\partial y}\left(be^{\mu y}\dfrac{\partial w}{\partial y}\right)=f(w).$

Functional separable solution for $\mu \neq 0$:

$$w = w(\xi), \qquad \xi = \left[b\mu^2(x+C_1)^2+4ae^{-\mu y}\right]^{1/2},$$

where C_1 is an arbitrary constant and the function $w(\xi)$ is determined by the autonomous ordinary differential equation

$$w''_{\xi\xi}=\frac{1}{ab\mu^2}f(w).$$

The general solution of this equation with arbitrary kinetic function $f = f(w)$ is defined implicitly by

$$\int\left[C_2+\frac{2}{ab\mu^2}F(w)\right]^{-1/2}dw=C_3\pm\xi, \qquad F(w)=\int f(w)\,dw,$$

where C_2 and C_3 are arbitrary constants.

5. $a\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial}{\partial y}\left(be^{\mu|y|}\dfrac{\partial w}{\partial y}\right)=f(w).$

The substitution $\zeta = |y|$ leads to an equation of the form 9.4.3.4.

6. $\dfrac{\partial}{\partial x}\left(ae^{\beta x}\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(be^{\mu y}\dfrac{\partial w}{\partial y}\right)=f(w).$

Functional separable solution for $\beta\mu \neq 0$:

$$w = w(\xi), \qquad \xi = \left(b\mu^2e^{-\beta x}+a\beta^2e^{-\mu y}\right)^{1/2},$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$w''_{\xi\xi}-\frac{1}{\xi}w'_\xi=Af(w), \qquad A=\frac{4}{ab\beta^2\mu^2}. \tag{1}$$

The substitution $\zeta = \xi^2$ brings (1) to the generalized Emden–Fowler equation

$$w''_{\zeta\zeta}=\tfrac{1}{4}A\zeta^{-1}f(w),$$

whose solutions with $f(w) = (kw + s)^{-1}$ and $f(w) = (kw + s)^{-2}$ (k, s = const) can be found in Polyanin and Zaitsev (2003).

⊙ *Reference for equation* 9.4.3.6: V. F. Zaitsev and A. D. Polyanin (1996, p. 487).

7. $\dfrac{\partial}{\partial x}\left(ae^{\beta|x|}\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(be^{\mu|y|}\dfrac{\partial w}{\partial y}\right)=f(w).$

The transformation $\zeta=|x|$, $\eta=|y|$ leads to an equation of the form 9.4.3.6.

8. $\dfrac{\partial}{\partial x}\left(ax^{n}\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(be^{\mu y}\dfrac{\partial w}{\partial y}\right)=f(w).$

Functional separable solution for $n\neq 2$ and $\mu\neq 0$:

$$w=w(\xi),\qquad \xi=\left[b\mu^2x^{2-n}+a(2-n)^2e^{-\mu y}\right]^{1/2},$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$w''_{\xi\xi}+\frac{n}{2-n}\frac{1}{\xi}w'_{\xi}=\frac{4}{ab\mu^2(2-n)^2}f(w).$$

9. $\dfrac{\partial}{\partial x}\left[f(x)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[g(y)\dfrac{\partial w}{\partial y}\right]=kw\ln w.$

Multiplicative separable solution:

$$w(x,y)=\varphi(x)\psi(y),$$

where the functions $\varphi(x)$ and $\psi(y)$ are determined by the ordinary differential equations

$$[f(x)\varphi'_x]'_x=k\varphi\ln\varphi+C\varphi,$$
$$[g(y)\psi'_y]'_y=k\psi\ln\psi-C\psi,$$

and C is an arbitrary constant.

⊙ *Reference for equation* 9.4.3.9: A. D. Polyanin and V. F. Zaitsev (2002, p. 221).

10. $\dfrac{\partial}{\partial x}\left[f(x)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[g(y)\dfrac{\partial w}{\partial y}\right]=aw\ln w+bw.$

This is a special case of equation 9.4.4.6 with $k=a$, $h_1(x)=b$, and $h_2(y)=0$.

9.4.4. Equations of the Form $\dfrac{\partial}{\partial x}\left[f(x,y,w)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[g(x,y,w)\dfrac{\partial w}{\partial y}\right]=h(x,y,w)$

1. $(ay+c)\dfrac{\partial^2 w}{\partial x^2}+(bx+s)\dfrac{\partial^2 w}{\partial y^2}=f(w).$

This equation can be rewritten in the divergence form

$$\frac{\partial}{\partial x}\left[(ay+c)\frac{\partial w}{\partial x}\right]+\frac{\partial}{\partial y}\left[(bx+s)\frac{\partial w}{\partial y}\right]=f(w).$$

For $ab\neq 0$, there is an exact solution of the form

$$w=w(\xi),\qquad \xi=(a^2b)^{-1/3}x+(ab^2)^{-1/3}y+(a^2b)^{-2/3}c+(ab^2)^{-2/3}s,$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$\xi w''_{\xi\xi}=f(w).$$

2. $\dfrac{\partial}{\partial x}\left[(a_1x+b_1y+c_1)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[(a_2x+b_2y+c_2)\dfrac{\partial w}{\partial y}\right]=f(w).$

Solutions are sought in the traveling wave form

$$w=w(z),\qquad z=Ax+By+C,$$

where the constants A, B, and C are determined by solving the algebraic system of equations

$$a_1A^2+a_2B^2=A, \tag{1}$$
$$b_1A^2+b_2B^2=B, \tag{2}$$
$$c_1A^2+c_2B^2=C. \tag{3}$$

Equations (1) and (2) are first solved for A and B and then equation (3) is used to evaluate C. The unknown function $w(z)$ is determined by the ordinary differential equation

$$zw''_{zz}+(Aa_1+Bb_2)w'_z=f(w).$$

3. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial}{\partial y}\left\{\left[f(x)w+g(x)\right]\dfrac{\partial w}{\partial y}\right\}=0.$

1°. Generalized separable solution linear in y:

$$w(x,y)=(Ax+B)y-\int_{x_0}^{x}(x-t)(At+B)^2f(t)\,dt+C_1x+C_2,$$

where A, B, C_1, C_2, and x_0 are arbitrary constants. This solution is degenerate.

2°. Generalized separable solution quadratic in y:

$$w(x,y)=\varphi(x)y^2+\psi(x)y+\chi(x),$$

where the functions $\varphi=\varphi(x)$, $\psi=\psi(x)$, and $\chi=\chi(x)$ are determined by the system of ordinary differential equations

$$\varphi''_{xx}+6f\varphi^2=0, \tag{1}$$
$$\psi''_{xx}+6f\varphi\psi=0, \tag{2}$$
$$\chi''_{xx}+2f\varphi\chi+2\varphi g+f\psi^2=0. \tag{3}$$

The nonlinear equation (1) is treated independently from the others. For $f\equiv\text{const}$, its solution can be expressed in terms of elliptic integrals. For $f=ae^{\lambda x}$, a particular solution to (1) is given by $\varphi=-\frac{\lambda^2}{6a}e^{-\lambda x}$. Equations (2) and (3) are solved successively (these are linear in their respective unknowns). Since $\psi=\varphi(x)$ is a particular solution to equation (2), the general solution is expressed as (see Polyanin and Zaitsev, 2003)

$$\psi(x)=C_1\varphi(x)+C_2\varphi(x)\int\frac{dx}{\varphi^2(x)},$$

where C_1 and C_2 are arbitrary constants.

4. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial}{\partial y}\left[\dfrac{f(y)}{\sqrt{w+a}}\dfrac{\partial w}{\partial y}\right]=0.$

The substitution $U=\sqrt{w+a}$ leads to the equation

$$\frac{\partial}{\partial x}\left(U\frac{\partial U}{\partial x}\right)+\frac{\partial}{\partial y}\left[f(y)\frac{\partial U}{\partial y}\right]=0,$$

which has a generalized separable solution of the form

$$U(x,y)=\varphi(y)x+\psi(y),$$
$$U(x,y)=\varphi(y)x^2+\psi(y)x+\chi(y).$$

5. $\dfrac{\partial^2 w}{\partial x^2}+f(w)\dfrac{\partial^2 w}{\partial y^2}=0.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the functions

$$w_1=w(C_1x+C_2,\pm C_1y+C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Degenerate solution: $w=C_1xy+C_2x+C_3y+C_4$.

3°. Self-similar solution:

$$w=w(z),\qquad z=y/x,$$

where the function $w(z)$ is determined by the ordinary differential equation

$$[z^2+f(w)]w''_{zz}+2zw'_z=0.$$

6. $\dfrac{\partial}{\partial x}\left[f(x)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[g(y)\dfrac{\partial w}{\partial y}\right]=kw\ln w+\big[h_1(x)+h_2(y)\big]w.$

Multiplicative separable solution:

$$w(x,y)=\exp\big[\varphi(x)+\psi(y)\big].$$

Here, the functions $\varphi(x)$ and $\psi(y)$ are determined by the ordinary differential equations

$$e^{-\varphi}[fe^{\varphi}\varphi'_x]'_x-k\varphi-h_1(x)=C,$$
$$e^{-\psi}[ge^{\psi}\psi'_y]'_y-k\psi-h_2(y)=-C,$$

where C is an arbitrary constant.

7. $\dfrac{\partial}{\partial x}\left[f(x)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left\{\big[g(x)w+h(x)\big]\dfrac{\partial w}{\partial y}\right\}=0.$

There are generalized separable solutions linear and quadratic in y:

$$w(x,y)=\varphi(x)y+\psi(x),$$
$$w(x,y)=\varphi(x)y^2+\psi(x)y+\chi(x).$$

8. $\dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[g(w)\dfrac{\partial w}{\partial y}\right]=0.$

This is a *stationary anisotropic heat (diffusion) equation*; $f(w)$ and $g(w)$ are the principal thermal diffusivities (diffusion coefficients).

1°. Suppose $w(x,y)$ is a solution of the equation in question. Then the function

$$w_1 = w(C_1x + C_2, \pm C_1y + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solution in implicit form:

$$\int \left[A^2 f(w) + B^2 g(w)\right] dw = C_1(Ax + By) + C_2,$$

where A, B, C_1, and C_2 are arbitrary constants.

3°. Self-similar solution (α and β are arbitrary constants):

$$w = w(\zeta), \quad \zeta = \frac{x+\alpha}{y+\beta},$$

where the function $w(\zeta)$ is determined by the ordinary differential equation

$$[f(w)w'_\zeta]'_\zeta + [\zeta^2 g(w)w'_\zeta]'_\zeta = 0. \tag{1}$$

Integrating (1) and taking w to be the independent variable, one obtains a Riccati equation for $\zeta = \zeta(w)$:

$$C\zeta'_w = g(w)\zeta^2 + f(w), \tag{2}$$

where C is an arbitrary constant. A large number of exact solutions to equation (2) for various $f = f(w)$ and $g = g(w)$ can be found in Polyanin and Zaitsev (2003).

4°. Solution in parametric form:

$$x = C_1v^2 + C_2v - \int f(w)[2C_1G(w) + C_3]\,dw + C_4,$$
$$y = -[2C_1G(w) + C_3]v - C_2G(w) + C_5, \quad G(w) = \int g(w)\,dw,$$

where $C_1, \ldots, C_5$ are arbitrary constants.

5°. Solution in parametric form:

$$x = [C_1F(w) + C_2]v + C_3F(w) + C_4, \quad F(w) = \int f(w)\,dw,$$
$$y = \frac{1}{2}C_1v^2 + C_3v - \int g(w)[C_1F(w) + C_2]\,dw + C_5.$$

6°. Solution in parametric form:

$$x = [C_1F(w) + C_2]v^2 + C_3F(w) + C_4 - 2\int\left\{f(w)\int g(w)[C_1F(w) + C_2]\,dw\right\}dw,$$
$$y = \frac{1}{3}C_1v^3 + C_3v - 2v\int g(w)[C_1F(w) + C_2]\,dw + C_5.$$

7°. Solution in parametric form:

$$x = (C_1 e^{\lambda v} + C_2 e^{-\lambda v})H(w) + C_3,$$
$$y = \frac{1}{\lambda}(C_1 e^{\lambda v} - C_2 e^{-\lambda v})\frac{1}{f(w)}H'_w(w) + C_4,$$

where $C_1, \ldots, C_4$ and λ are arbitrary constants, the function $H = H(w)$ is determined by the ordinary differential equation $\mathbf{L}_f[H] + \lambda^2 g(w)H = 0$, and the differential operator $\mathbf{L}_f$ is defined as

$$\mathbf{L}_f[\varphi] \equiv \frac{d}{dw}\left[\frac{1}{f(w)}\frac{d\varphi}{dw}\right]. \tag{3}$$

8°. Solution in parametric form:

$$x = [C_1 \sin(\lambda v) + C_2 \cos(\lambda v)]Z(w) + C_3,$$
$$y = \frac{1}{\lambda}[C_2 \sin(\lambda v) - C_1 \cos(\lambda v)]\frac{1}{f(w)}Z'_w(w) + C_4,$$

where $C_1, \ldots, C_4$ and λ are arbitrary constants, and the function $Z = Z(w)$ is determined by the ordinary differential equation $\mathbf{L}_f[Z] - \lambda^2 g(w)Z = 0$.

9°. Solution in parametric form:

$$x = [2C_1 F(w) + C_3]v + C_2 F(w) + C_5, \quad F(w) = \int f(w)\,dw,$$
$$y = C_1 v^2 + C_2 v - \int g(w)[2C_1 F(w) + C_3]\,dw + C_4.$$

10°. Solution in parametric form:

$$x = \frac{1}{2}C_1 v^2 + C_3 v - \int f(w)[C_1 G(w) + C_2]\,dw + C_5,$$
$$y = -[C_1 G(w) + C_2]v - C_3 G(w) + C_4, \quad G(w) = \int g(w)\,dw.$$

11°. Solution in parametric form:

$$x = \frac{1}{3}C_1 v^3 + C_3 v - 2v\int f(w)[C_1 G(w) + C_2]\,dw + C_5,$$
$$y = -[C_1 G(w) + C_2]v^2 - C_3 G(w) + C_4 + 2\int\left\{g(w)\int f(w)[C_1 G(w) + C_2]\,dw\right\}dw.$$

12°. Solution in parametric form:

$$x = -\frac{1}{\lambda}(C_1 e^{\lambda v} - C_2 e^{-\lambda v})\frac{1}{g(w)}H'_w(w) + C_3,$$
$$y = (C_1 e^{\lambda v} + C_2 e^{-\lambda v})H(w) + C_4,$$

where C_1, C_2, C_3, and λ are arbitrary constants, the function $H = H(w)$ is determined by the ordinary differential equation $\mathbf{L}_g[H] + \lambda^2 f(w)H = 0$, and the differential operator $\mathbf{L}_g$ is defined by (3) with $f(w) = g(w)$.

13°. Solution in parametric form:

$$x = -\frac{1}{\lambda}[C_2\sin(\lambda v) - C_1\cos(\lambda v)]\frac{1}{g(w)}Z'_w(w) + C_3,$$
$$y = [C_1\sin(\lambda v) + C_2\cos(\lambda v)]Z(w) + C_4,$$

where C_1, C_2, C_3, and λ are arbitrary constants, the function $Z = Z(w)$ is determined by the ordinary differential equation $\mathbf{L}_g[Z] - \lambda^2 f(w)Z = 0$, and the differential operator $\mathbf{L}_g$ is defined by (3) with $f(w) = g(w)$.

14°. The original equation can be represented as the system of the equations

$$f(w)\frac{\partial w}{\partial x} = \frac{\partial v}{\partial y}, \quad -g(w)\frac{\partial w}{\partial y} = \frac{\partial v}{\partial x}. \tag{4}$$

The hodograph transformation

$$x = x(w, v), \quad y = y(w, v), \tag{5}$$

where w, v are treated as the independent variables and x, y as the dependent ones, brings (4) to the linear system

$$f(w)\frac{\partial y}{\partial v} = \frac{\partial x}{\partial w}, \quad -g(w)\frac{\partial x}{\partial v} = \frac{\partial y}{\partial w}. \tag{6}$$

Eliminating y yields the following linear equation for $x = x(w, v)$:

$$\frac{\partial}{\partial w}\left[\frac{1}{f(w)}\frac{\partial x}{\partial w}\right] + g(w)\frac{\partial^2 x}{\partial v^2} = 0. \tag{7}$$

Likewise, we can obtain another linear equation for $y = y(w, v)$ from system (6). We have

$$\frac{\partial}{\partial w}\left[\frac{1}{g(w)}\frac{\partial y}{\partial w}\right] + f(w)\frac{\partial^2 y}{\partial v^2} = 0. \tag{8}$$

The procedure for constructing exact solutions to the original equation consists of the following two stages. First, one finds an exact solution to the linear equation (7) for $x = x(w, v)$. Then, this solution is substituted into the linear system (6), from which the function $y = y(w, v)$ is found in the form

$$y = \int_{v_0}^{v} \frac{1}{f(w)}\frac{\partial x}{\partial w}(w, \xi)\,d\xi - \int_{w_0}^{w} g(\eta)\frac{\partial x}{\partial v}(\eta, v_0)\,d\eta, \tag{9}$$

where w_0 and v_0 are any numbers. The thus obtained expressions of (5) define a solution to the original equation in parametric form.

Likewise, one can first construct an exact solution to the linear equation (8) for $y = y(w, v)$ and then find $x = x(w, v)$ from (6) in the form

$$x = -\int_{v_0}^{v} \frac{1}{g(w)}\frac{\partial y}{\partial w}(w, \xi)\,d\xi + \int_{w_0}^{w} f(\eta)\frac{\partial y}{\partial v}(\eta, v_0)\,d\eta,$$

where w_0 and v_0 are any numbers.

Remark 1. Let $x = \Phi(w, v; f, g)$ be a solution to equation (7). Then $y = \Phi(w, v; g, f)$ solves equation (8).

Remark 2. Let $x = \Phi(w, v; f, g)$, $y = \Psi(w, v; f, g)$ be a solution to system of equations (6). Then the functions $x = \Psi(w, v; -g, -f)$ and $y = \Phi(w, v; -g, -f)$ also solve this system.

15°. Solutions to equation (7) with even powers of v:

$$x = \sum_{k=0}^{n} \varphi_k(w) v^{2k}, \tag{10}$$

where the functions $\varphi_k = \varphi_k(w)$ are determined by the recurrence relations

$$\varphi_n(w) = A_n F(w) + B_n, \qquad F(w) = \int f(w)\, dw,$$
$$\varphi_{k-1}(w) = A_k F(w) + B_k - 2k(2k-1) \int f(w) \left\{ \int g(w)\varphi_k(w)\, dw \right\} dw,$$

where the A_k and B_k are arbitrary constants ($k = n, \ldots, 1$).

The function $y = y(w, v)$ is defined by (9) and, in conjunction with relation (10), gives a solution to the original nonlinear equation in parametric form.

16°. Solutions to equation (7) with odd powers of v:

$$x = \sum_{k=0}^{n} \psi_k(w) v^{2k+1}, \tag{11}$$

where the functions $\psi_k = \psi_k(w)$ are determined by the recurrence relations

$$\psi_n(w) = A_n F(w) + B_n, \qquad F(w) = \int f(w)\, dw,$$
$$\psi_{k-1}(w) = A_k F(w) + B_k - 2k(2k+1) \int f(w) \left\{ \int g(w)\psi_k(w)\, dw \right\} dw,$$

where the A_k and B_k are arbitrary constants ($k = n, \ldots, 1$).

The function $y = y(w, v)$ is defined by (9) and, in conjunction with relation (11), gives a solution to the original nonlinear equation in parametric form.

17°. In the special case $g(w) = k^2 f(w)$, the transformation

$$\bar{x} = kx, \quad u = \int f(w)\, dw$$

leads to the Laplace equation

$$\frac{\partial^2 u}{\partial \bar{x}^2} + \frac{\partial^2 u}{\partial y^2} = 0.$$

For solutions of this linear equation, see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

⊙ *References for equation* 9.4.4.8: V. F. Zaitsev and A. D. Polyanin (2001), A. D. Polyanin and V. F. Zaitsev (2002, pp. 223–226).

9. $\dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[g(w)\dfrac{\partial w}{\partial y}\right]=ax\dfrac{\partial w}{\partial x}+ay\dfrac{\partial w}{\partial y}-h(w).$

Traveling-wave solution:

$$w=w(z),\qquad z=k_1x+k_2y,$$

where k_1 and k_2 are arbitrary constants, and the function $w(z)$ is determined by the ordinary differential equation

$$[\varphi(w)w_z']_z'=azw_z'-h(w),\qquad \varphi(w)=k_1^2f(w)+k_2^2g(w).$$

Remark. The above solution is a nonclassical (noninvariant) traveling-wave solution, since the equation in question is not invariant under translation transformations in the independent variables.

⊙ *Reference*: A. D. Polyanin (2004 *a*).

10. $\dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[g(w)\dfrac{\partial w}{\partial y}\right]=(a_1x+b_1y+c_1)\dfrac{\partial w}{\partial x}+(a_2x+b_2y+c_2)\dfrac{\partial w}{\partial y}.$

This equation describes steady-state anisotropic heat/mass transfer in a translational-shear fluid flow.

Traveling-wave solution:

$$w=w(z),\qquad z=a_2x+(k-a_1)y,$$

where k is a root of the quadratic equation

$$k^2-(a_1+b_2)k+a_1b_2-a_2b_1=0,$$

and the function $w(z)$ is determined by the ordinary differential equation

$$[\varphi(w)w_z']_z'=[kz+a_2c_1+(k-a_1)c_2]w_z',\qquad \varphi(w)=a_2^2f(w)+(k-a_1)^2g(w).$$

Remark 1. The above remains the same if an arbitrary function, $h(w)$, is added to the right-hand side of the original equation.

Remark 2. In the case of an incompressible fluid, equation coefficients must satisfy the condition $a_1+b_2=0$.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2004, p. 399).

11. $\dfrac{\partial}{\partial x}\left\{\left[a_1x+b_1y+f(w)\right]\dfrac{\partial w}{\partial x}\right\}+\dfrac{\partial}{\partial y}\left\{\left[a_2x+b_2y+g(w)\right]\dfrac{\partial w}{\partial y}\right\}=0.$

Solutions are sought in the traveling-wave form

$$w=w(\xi),\qquad \xi=Ax+By,$$

where the constants A and B are determined by solving the algebraic system of equations

$$a_1A^2+a_2B^2=A,\qquad b_1A^2+b_2B^2=B.$$

The desired function $w(\xi)$ is determined by the first-order ordinary differential equation (C is an arbitrary constant):

$$\left[\xi+A^2f(w)+B^2g(w)\right]w_\xi'=C.$$

Taking w to be the independent variable, we obtain a first-order linear equation for $\xi=\xi(w)$:

$$C\xi_w'=\xi+A^2f(w)+B^2g(w).$$

9.4.5. Other Equations

1. $\dfrac{\partial^2 w}{\partial x^2} + a w^4 \dfrac{\partial^2 w}{\partial y^2} = f(y) w^5.$

1°. Suppose $w(x, y)$ is a solution of this equation. Then the functions

$$w_1 = C_1 w\big(\pm C_1^2 x + C_2,\ y\big),$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

2°. Let $u = u(y)$ be any nontrivial particular solution of the second-order linear ordinary differential equation

$$a u''_{yy} - f(y) u = 0. \tag{1}$$

The transformation

$$\zeta = \int \frac{dy}{u^2}, \quad \xi = \frac{w}{u}$$

simplifies the original equation considerably, bringing it to the form

$$\frac{\partial^2 \xi}{\partial x^2} + a\xi^4 \frac{\partial^2 \xi}{\partial \zeta^2} = 0. \tag{2}$$

This equation is independent of f explicitly and has a degenerate solution

$$\xi(x, \zeta) = Ax\zeta + B\zeta + Cx + D,$$

where A, B, C, and D are arbitrary constants. Furthermore, equation (2) has exact solutions with the following structures, for example:

$$\begin{aligned}
&\xi(x, \zeta) = \xi(kx + \lambda\zeta) && \text{(traveling-wave solution)},\\
&\xi(x, \zeta) = g(x)h(\zeta) && \text{(multiplicative separable solution)},\\
&\xi(x, \zeta) = x^{\beta}\varphi(\eta), \quad \eta = \zeta x^{-2\beta-1} && \text{(self-similar solution)},
\end{aligned}$$

where k, λ, and β are arbitrary constants.

⊙ *Reference for equation* 9.4.5.1: V. F. Zaitsev and A. D. Polyanin (1996, pp. 489–490).

2. $\dfrac{\partial^2 w}{\partial x^2} + a \dfrac{\partial}{\partial y}\left(w^n \dfrac{\partial w}{\partial y} \right) = f(y) w^{n+1} + g(x) w.$

Multiplicative separable solution:

$$w = \varphi(x)\psi(y),$$

where the functions $\psi = \psi(y)$ and $\varphi = \varphi(x)$ are determined by the ordinary differential equations (C is an arbitrary constant)

$$\begin{aligned}
\varphi''_{xx} - g(x)\varphi + C\varphi^{n+1} &= 0,\\
a(\psi^n \psi'_y)'_y - f(y)\psi^{n+1} - C\psi &= 0.
\end{aligned}$$

3. $\dfrac{\partial^2 w}{\partial x^2} + a\dfrac{\partial}{\partial y}\left(e^{\lambda w}\dfrac{\partial w}{\partial y}\right) = f(y)e^{\lambda w} + g(x).$

Additive separable solution:

$$w = \varphi(x) + \psi(y),$$

where the functions $\psi = \psi(y)$ and $\varphi = \varphi(x)$ are determined by the ordinary differential equations

$$\varphi''_{xx} - g(x) + Ce^{\lambda\varphi} = 0,$$
$$a(e^{\lambda\psi}\psi'_y)'_y - f(y)e^{\lambda\psi} - C = 0,$$

and C is an arbitrary constant. The second equation can be reduced, with the change of variable $U = e^{\lambda\psi}$, to the linear equation $aU''_{yy} - \lambda f(y)U - \lambda C = 0$.

4. $\dfrac{\partial^2 w}{\partial x^2} + \big[f_3(x)w + f_2(x)y^2 + f_1(x)y + f_0(x)\big]\dfrac{\partial^2 w}{\partial y^2} = g_2(x)\left(\dfrac{\partial w}{\partial y}\right)^2$
$+ g_1(x)\dfrac{\partial w}{\partial x} + \big[h_1(x)y + h_0(x)\big]\dfrac{\partial w}{\partial y} + s_3(x)w + s_2(x)y^2 + s_1(x)y + s_0(x).$

There is a generalized separable solution quadratic in y:

$$w(x, y) = \varphi(x)y^2 + \psi(x)y + \chi(x).$$

5. $ax^n\dfrac{\partial^2 w}{\partial x^2} + by^m\dfrac{\partial^2 w}{\partial y^2} + kx^{n-1}\dfrac{\partial w}{\partial x} + sy^{m-1}\dfrac{\partial w}{\partial y} = f(w).$

Functional separable solution for $n \neq 2$ and $m \neq 2$:

$$w = w(\xi), \qquad \xi = \big[b(2-m)^2x^{2-n} + a(2-n)^2y^{2-m}\big]^{1/2}.$$

Here, the function $w(\xi)$ is determined by the ordinary differential equation

$$Aw''_{\xi\xi} + \frac{B}{\xi}w'_\xi = f(w), \tag{1}$$

where

$$A = \tfrac{1}{4}ab(2-n)^2(2-m)^2,$$
$$B = \tfrac{1}{4}(2-n)(2-m)\big[ab(3nm - 4n - 4m + 4) + 2bk(2-m) + 2as(2-n)\big].$$

Solution of equation (1) with $B = 0$ and arbitrary $f = f(w)$ in implicit form:

$$\int\left[C_1 + \frac{2}{A}F(w)\right]^{-1/2} dw = C_2 \pm \xi, \qquad F(w) = \int f(w)\,dw,$$

where C_1 and C_2 are arbitrary constants.

⊙ *Reference for equation* 9.4.5.5: V. F. Zaitsev and A. D. Polyanin (1996, p. 486–487).

6. $ax^n\dfrac{\partial^2 w}{\partial x^2}+by^m\dfrac{\partial^2 w}{\partial y^2}+kx^{n-1}f(w)\dfrac{\partial w}{\partial x}+sy^{m-1}f(w)\dfrac{\partial w}{\partial y}=g(w).$

For $n\neq 2$ and $m\neq 2$, there is a functional separable solution of the form

$$w=w(\xi),\qquad \xi=\left[b(2-m)^2x^{2-n}+a(2-n)^2y^{2-m}\right]^{1/2}.$$

7. $ae^{\beta x}\dfrac{\partial^2 w}{\partial x^2}+be^{\mu y}\dfrac{\partial^2 w}{\partial y^2}+ke^{\beta x}\dfrac{\partial w}{\partial x}+se^{\mu y}\dfrac{\partial w}{\partial y}=f(w).$

Functional separable solution for $\beta\mu\neq 0$:

$$w=w(\xi),\qquad \xi=\left(b\mu^2e^{-\beta x}+a\beta^2e^{-\mu y}\right)^{1/2}.$$

Here, the function $w=w(\xi)$ is determined by the ordinary differential equation

$$Aw''_{\xi\xi}+\frac{B}{\xi}w'_\xi=f(w), \tag{1}$$

where

$$A=\tfrac{1}{4}ab\beta^2\mu^2,\quad B=\tfrac{1}{4}\beta\mu(3ab\beta\mu-2bk\mu-2as\beta).$$

Solution of equation (1) with $B=0$ and arbitrary $f=f(w)$ in implicit form:

$$\int\left[C_1+\frac{2}{A}F(w)\right]^{-1/2}dw=C_2\pm\xi,\qquad F(w)=\int f(w)\,dw,$$

where C_1 and C_2 are arbitrary constants.

8. $ae^{\beta x}\dfrac{\partial^2 w}{\partial x^2}+be^{\mu y}\dfrac{\partial^2 w}{\partial y^2}+ke^{\beta x}f(w)\dfrac{\partial w}{\partial x}+se^{\mu y}f(w)\dfrac{\partial w}{\partial y}=g(w).$

For $\beta\mu\neq 0$, there is a functional separable solution of the form

$$w=w(\xi),\qquad \xi=\left(b\mu^2e^{-\beta x}+a\beta^2e^{-\mu y}\right)^{1/2}.$$

9. $ax^n\dfrac{\partial^2 w}{\partial x^2}+be^{\beta y}\dfrac{\partial^2 w}{\partial y^2}+kx^{n-1}\dfrac{\partial w}{\partial x}+se^{\beta y}\dfrac{\partial w}{\partial y}=f(w).$

Functional separable solution $\beta\neq 0$ and $n\neq 2$:

$$w=w(\xi),\qquad \xi=\left[b\beta^2x^{2-n}+a(2-n)^2e^{-\beta y}\right]^{1/2}.$$

Here, the function $w(\xi)$ is determined by the ordinary differential equation

$$Aw''_{\xi\xi}+\frac{B}{\xi}w'_\xi=f(w), \tag{1}$$

where

$$A=\tfrac{1}{4}ab\beta^2(2-n)^2,\quad B=\tfrac{1}{4}\beta(2-n)\left[ab\beta(4-3n)+2bk\beta-2as(2-n)\right].$$

Solution of equation (1) with $B=0$ and arbitrary $f=f(w)$ in implicit form:

$$\int\left[C_1+\frac{2}{A}F(w)\right]^{-1/2}dw=C_2\pm\xi,\qquad F(w)=\int f(w)\,dw,$$

where C_1 and C_2 are arbitrary constants.

⊙ *Reference for equation* 9.4.5.9: V. F. Zaitsev and A. D. Polyanin (1996, p. 488).

10. $ax^n\dfrac{\partial^2 w}{\partial x^2}+be^{\beta y}\dfrac{\partial^2 w}{\partial y^2}+kx^{n-1}f(w)\dfrac{\partial w}{\partial x}+se^{\beta y}f(w)\dfrac{\partial w}{\partial y}=g(w).$

For $\beta \neq 0$ and $n \neq 2$, there is a functional separable solution of the form

$$w = w(\xi), \qquad \xi = \left[b\beta^2 x^{2-n} + a(2-n)^2 e^{-\beta y}\right]^{1/2}.$$

11. $(ay+c)\dfrac{\partial^2 w}{\partial x^2}+(bx+s)\dfrac{\partial^2 w}{\partial y^2}=f\left(w,\ \dfrac{\partial w}{\partial x},\ \dfrac{\partial w}{\partial y}\right).$

Functional separable solution for $ab \neq 0$:

$$w = w(\xi), \qquad \xi = (a^2b)^{-1/3}x + (ab^2)^{-1/3}y + (a^2b)^{-2/3}c + (ab^2)^{-2/3}s.$$

Here, the function $w(\xi)$ is determined by the ordinary differential equation

$$\xi w''_{\xi\xi} = f\left(w,\ \beta w'_\xi,\ \mu w'_\xi\right),$$

where $\beta = (a^2b)^{-1/3}$, $\mu = (ab^2)^{-1/3}$.

12. $(a_1x+b_1y+c_1)\dfrac{\partial^2 w}{\partial x^2}+(a_2x+b_2y+c_2)\dfrac{\partial^2 w}{\partial y^2}=f\left(w,\ \dfrac{\partial w}{\partial x},\ \dfrac{\partial w}{\partial y}\right).$

Solutions are sought in the traveling-wave form

$$w = w(\xi), \qquad \xi = Ax + By + C,$$

where the constants A, B, and C are determined by solving the algebraic system of equations

$$a_1A^2 + a_2B^2 = A, \tag{1}$$
$$b_1A^2 + b_2B^2 = B, \tag{2}$$
$$c_1A^2 + c_2B^2 = C. \tag{3}$$

Equations (1) and (2) are first solved for A and B and then equation (3) is used to evaluate C.

The desired function $w(\xi)$ is determined by the ordinary differential equation

$$\xi w''_{\xi\xi} = f\left(w,\ Aw'_\xi,\ Bw'_\xi\right).$$

13. $f_1(x)\dfrac{\partial^2 w}{\partial x^2}+f_2(y)\dfrac{\partial^2 w}{\partial y^2}=g_1(x)\dfrac{\partial w}{\partial x}+g_2(y)\dfrac{\partial w}{\partial y}+kw\ln w+\left[h_1(x)+h_2(y)\right]w.$

Multiplicative separable solution:

$$w(x, y) = \varphi(x)\psi(y).$$

Here, the functions $\varphi(x)$ and $\psi(y)$ are determined by the ordinary differential equations

$$f_1(x)\varphi''_{xx} = g_1(x)\varphi'_x + k\varphi\ln\varphi + \left[h_1(x) + C\right]\varphi,$$
$$f_2(y)\psi''_{yy} = g_2(y)\psi'_y + k\psi\ln\psi + \left[h_2(y) - C\right]\psi,$$

where C is an arbitrary constant.

14. $\big[a_1x + b_1y + f(w)\big]\dfrac{\partial^2 w}{\partial x^2} + \big[a_2x + b_2y + g(w)\big]\dfrac{\partial^2 w}{\partial y^2} = h\left(w,\ \dfrac{\partial w}{\partial x},\ \dfrac{\partial w}{\partial y}\right).$

Traveling-wave solution:

$$w = w(\xi), \qquad \xi = Ax + By,$$

where the constants A, B, and C are determined by solving the algebraic system of equations

$$a_1A^2 + a_2B^2 = A, \quad b_1A^2 + b_2B^2 = B,$$

and the function $w(\xi)$ is determined by the ordinary differential equation

$$\big[\xi + A^2 f(w) + B^2 g(w)\big]w''_{\xi\xi} = h\big(w,\ Aw'_\xi,\ Bw'_\xi\big).$$

15. $\dfrac{\partial}{\partial x}\left\{\big[a_1x+b_1y+f(w)\big]\dfrac{\partial w}{\partial x}\right\}+\dfrac{\partial}{\partial y}\left\{\big[a_2x+b_2y+g(w)\big]\dfrac{\partial w}{\partial y}\right\}=h\left(w,\dfrac{\partial w}{\partial x},\dfrac{\partial w}{\partial y}\right).$

Traveling-wave solution:

$$w = w(\xi), \qquad \xi = Ax + By,$$

where the constants A, B, and C are determined by solving the algebraic system of equations

$$A^2a_1 + B^2a_2 = A, \quad A^2b_1 + B^2b_2 = B,$$

and the function $w(\xi)$ is determined by the ordinary differential equation

$$\big[\varphi(\xi, w)w'_\xi\big]'_\xi = h\big(w,\ Aw'_\xi,\ Bw'_\xi\big),$$
$$\varphi(\xi, w) = \xi + A^2 f(w) + B^2 g(w).$$

16. $\dfrac{\partial^2 w}{\partial x^2} + f(x)\dfrac{\partial w}{\partial x} + g(x)\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial y^2} + h(x)w = 0.$

1°. Suppose $w(x, y)$ is a solution of this equation. Then the function

$$w_1 = C_1^{-3}w\big(x,\ C_1y + C_2\big) + \phi(x),$$

where C_1 and C_2 are arbitrary constants, and $\phi(x)$ is determined by the second-order linear ordinary differential equation $\phi''_{xx} + f(x)\phi'_x + h(x)\phi = 0$, is also a solution of the equation.

2°. Generalized separable solution:

$$w(x, y) = \varphi_1(x) + \varphi_2(x)y^{3/2} + \varphi_3(x)y^3,$$

where the functions $\varphi_k = \varphi_k(x)$ are determined by the system of ordinary differential equations

$$\varphi''_1 + f(x)\varphi'_1 + \tfrac{9}{8}g(x)\varphi_2^2 + h(x)\varphi_1 = 0,$$
$$\varphi''_2 + f(x)\varphi'_2 + \tfrac{45}{4}g(x)\varphi_2\varphi_3 + h(x)\varphi_2 = 0,$$
$$\varphi''_3 + f(x)\varphi'_3 + 18g(x)\varphi_3^2 + h(x)\varphi_3 = 0,$$

where the prime stands for the differentiation with respect to x.

3°. Generalized separable solution cubic in y:

$$w(x,y)=\psi_1(x)+\psi_2(x)y+\psi_3(x)y^2+\psi_4(x)y^3,$$

where the functions $\psi_k=\psi_k(x)$ are determined by the system of ordinary differential equations

$$\begin{aligned}
&\psi_1''+f(x)\psi_1'+2g(x)\psi_2\psi_3+h(x)\varphi_1=0,\\
&\psi_2''+f(x)\psi_2'+2g(x)(2\psi_3^2+3\psi_2\psi_4)+h(x)\varphi_2=0,\\
&\psi_3''+f(x)\psi_3'+18g(x)\psi_3\psi_4+h(x)\varphi_3=0,\\
&\psi_4''+f(x)\psi_4'+18g(x)\psi_4^2+h(x)\varphi_4=0.
\end{aligned}$$

4°. Generalized separable solution:

$$w(x,y)=\xi(x)+\eta(x)\theta(y).$$

Here, the functions $\xi=\xi(x)$ and $\eta=\eta(x)$ are determined by the system of ordinary differential equations

$$\begin{aligned}
&\eta_{xx}''+f(x)\eta_x'+ag(x)\eta^2+h(x)\eta=0,\\
&\xi_{xx}''+f(x)\xi_x'+bg(x)\eta^2+h(x)\xi=0,
\end{aligned}$$

where a and b are arbitrary constants, and the function $\theta=\theta(y)$ is determined by the autonomous ordinary differential equation

$$\theta_y'\theta_{yy}''=a\theta+b,$$

whose solution can be written out in implicit form.

17. $\dfrac{\partial^2 w}{\partial x^2}+f\left(\dfrac{\partial w}{\partial x},\dfrac{\partial w}{\partial y}\right)\dfrac{\partial^2 w}{\partial y^2}=0.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the function

$$w_1=C_1^{-1}w\big(C_1x+C_2,\ C_1y+C_3\big)+C_4,$$

where C_1, C_2, C_4, and C_4 are arbitrary constants, is also a solution of the equation.

2°. Degenerate solution:

$$w(x,t)=Axy+Bx+Cy+D,$$

where A, B, C, and D are arbitrary constants.

3°. Self-similar solution:

$$w(x,y)=xu(z),\qquad z=y/x,$$

where the function $u(z)$ is determined by the ordinary differential equation

$$z(zu_z'-u)_z'+f(u-zu_z',\ u_z')u_{zz}''=0.$$

4°. The Legendre transformation

$$u(\xi,\eta)=x\xi+y\eta-w(x,y),\quad \xi=\frac{\partial w}{\partial x},\quad \eta=\frac{\partial w}{\partial y},$$

where u is the new dependent variable, and ξ and η are the new independent variables, leads to the linear equation

$$\frac{\partial^2 u}{\partial\eta^2}+f(\xi,\eta)\frac{\partial^2 u}{\partial\xi^2}=0.$$

Exact solutions of this equation for some $f(\xi,\eta)$ can be found in Polyanin (2002).

Chapter 10
Second-Order Elliptic Equations with Three or More Space Variables

10.1. Equations with Three Space Variables Involving Power-Law Nonlinearities

10.1.1. Equations of the Form $\frac{\partial}{\partial x}\Big[f(x)\frac{\partial w}{\partial x}\Big]+\frac{\partial}{\partial y}\Big[g(y)\frac{\partial w}{\partial y}\Big]+\frac{\partial}{\partial z}\Big[h(z)\frac{\partial w}{\partial z}\Big]=aw^p$

1. $\dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right)+\dfrac{\partial}{\partial z}\left(cz^k\dfrac{\partial w}{\partial z}\right)=sw^p.$

This is a special case of equation 10.3.1.3 with $f(w)=sw^p$.

1°. Suppose $w(x,y,z)$ is a solution of the equation in question. Then the function

$$w_1=C_1 w\Big(C_1^{\frac{p-1}{2-n}}x,\ C_1^{\frac{p-1}{2-m}}y,\ C_1^{\frac{p-1}{2-k}}z\Big),$$

where C_1 is an arbitrary constant, is also a solution of the equation.

2°. Solution for $n\neq 2$, $m\neq 2$, $k\neq 2$, and $p\neq 1$:

$$w=\left[\frac{1}{s(1-p)}\left(\frac{p}{1-p}+\frac{1}{2-n}+\frac{1}{2-m}+\frac{1}{2-k}\right)\right]^{\frac{1}{p-1}}\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{y^{2-m}}{b(2-m)^2}+\frac{z^{2-k}}{c(2-k)^2}\right]^{\frac{1}{1-p}}.$$

3°. Functional separable solution for $n\neq 2$, $m\neq 2$, and $k\neq 2$ (generalizes the solution of Item 2°):

$$w=w(r),\qquad r^2=4\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{y^{2-m}}{b(2-m)^2}+\frac{z^{2-k}}{c(2-k)^2}\right],$$

where the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr}+\frac{A}{r}w'_r=sw^p,\qquad A=\frac{2}{2-n}+\frac{2}{2-m}+\frac{2}{2-k}-1.$$

4°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,z)=U(\xi,z),\quad \xi^2=\frac{x^{2-n}}{a(2-n)^2}+\frac{y^{2-m}}{b(2-m)^2},$$

$$w(x,y,z)=V(x,\eta),\quad \eta^2=\frac{y^{2-m}}{b(2-m)^2}+\frac{z^{2-k}}{c(2-k)^2},$$

$$w(x,y,z)=W(y,\zeta),\quad \zeta^2=\frac{x^{2-n}}{a(2-n)^2}+\frac{z^{2-k}}{c(2-k)^2},$$

$$w(x,y,z)=x^{\frac{n-2}{p-1}}F(\rho_1,\rho_2),\quad \rho_1=yx^{\frac{n-2}{2-m}},\quad \rho_2=zx^{\frac{n-2}{2-k}}.$$

2. $\dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right)+\dfrac{\partial}{\partial z}\left(ce^{\lambda z}\dfrac{\partial w}{\partial z}\right)=sw^p.$

This is a special case of equation 10.3.1.5 with $f(w)=sw^p$.

1°. Suppose $w(x,y,z)$ is a solution of the equation in question. Then the function

$$w_1=C_1 w\Big(C_1^{\frac{p-1}{2-n}}x,\ C_1^{\frac{p-1}{2-m}}y,\ z+\frac{1-p}{\lambda}\ln C_1\Big),$$

where C_1 is an arbitrary constant, is also a solution of the equation.

2°. Solution for $n\neq 2$, $m\neq 2$, $\lambda\neq 0$, and $p\neq 1$:

$$w=\left[\frac{1}{s(p-1)}\left(\frac{p}{1-p}+\frac{1}{2-n}+\frac{1}{2-m}\right)\right]^{\frac{1}{p-1}}\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{y^{2-m}}{b(2-m)^2}+\frac{e^{-\lambda z}}{c\lambda^2}\right]^{\frac{1}{1-p}}.$$

3°. Functional separable solution for $n\neq 2$, $m\neq 2$, and $\lambda\neq 0$ (generalizes the solution of Item 2°):

$$w=w(r),\qquad r^2=4\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{y^{2-m}}{b(2-m)^2}+\frac{e^{-\lambda z}}{c\lambda^2}\right],$$

where the function $w(r)$ is determined by the ordinary differential equation

$$w_{rr}''+\frac{A}{r}w_r'=sw^p,\qquad A=\frac{2}{2-n}+\frac{2}{2-m}-1.$$

4°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,z)=U(\xi,z),\quad \xi^2=\frac{x^{2-n}}{a(2-n)^2}+\frac{y^{2-m}}{b(2-m)^2},$$
$$w(x,y,z)=V(x,\eta),\quad \eta^2=\frac{y^{2-m}}{b(2-m)^2}+\frac{e^{-\lambda z}}{c\lambda^2},$$
$$w(x,y,z)=W(y,\zeta),\quad \zeta^2=\frac{x^{2-n}}{a(2-n)^2}+\frac{e^{-\lambda z}}{c\lambda^2},$$
$$w(x,y,z)=x^{\frac{n-2}{p-1}}F(\rho_1,\rho_2),\quad \rho_1=yx^{\frac{n-2}{2-m}},\quad \rho_2=z+\frac{2-n}{\lambda}\ln x.$$

3. $\dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(be^{\beta y}\dfrac{\partial w}{\partial y}\right)+\dfrac{\partial}{\partial z}\left(ce^{\lambda z}\dfrac{\partial w}{\partial z}\right)=sw^p.$

This is a special case of equation 10.3.1.6 with $f(w)=sw^p$.

1°. Suppose $w(x,y,z)$ is a solution of the equation in question. Then the function

$$w_1=C_1 w\Big(C_1^{\frac{p-1}{2-n}}x,\ y+\frac{1-p}{\beta}\ln C_1,\ z+\frac{1-p}{\lambda}\ln C_1\Big),$$

where C_1 is an arbitrary constant, is also a solution of the equation.

2°. Solution for $n \neq 2$, $\beta \neq 0$, $\lambda \neq 0$, and $p \neq 1$:

$$w = \left[\frac{1}{s(p-1)}\left(\frac{p}{1-p}+\frac{1}{2-n}\right)\right]^{\frac{1}{p-1}}\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{e^{-\beta y}}{b\beta^2}+\frac{e^{-\lambda z}}{c\lambda^2}\right]^{\frac{1}{1-p}}.$$

3°. Functional separable solution for $n \neq 2$, $\beta \neq 0$, and $\lambda \neq 0$ (generalizes the solution of Item 2°):

$$w = w(r), \qquad r^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{e^{-\beta y}}{b\beta^2}+\frac{e^{-\lambda z}}{c\lambda^2}\right],$$

where the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{A}{r}w'_r = sw^p, \qquad A = \frac{n}{2-n}.$$

4°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,z) = U(\xi,z), \quad \xi^2 = \frac{x^{2-n}}{a(2-n)^2}+\frac{e^{-\beta y}}{b\beta^2},$$

$$w(x,y,z) = V(x,\eta), \quad \eta^2 = \frac{e^{-\beta y}}{b\beta^2}+\frac{e^{-\lambda z}}{c\lambda^2},$$

$$w(x,y,z) = W(y,\zeta), \quad \zeta^2 = \frac{x^{2-n}}{a(2-n)^2}+\frac{e^{-\lambda z}}{c\lambda^2},$$

$$w(x,y,z) = x^{\frac{n-2}{p-1}}F(\rho_1,\rho_2), \quad \rho_1 = y+\frac{2-n}{\beta}\ln x, \quad \rho_2 = z+\frac{2-n}{\lambda}\ln x.$$

4. $\dfrac{\partial}{\partial x}\left(ae^{\beta x}\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(be^{\gamma y}\dfrac{\partial w}{\partial y}\right)+\dfrac{\partial}{\partial z}\left(ce^{\lambda z}\dfrac{\partial w}{\partial z}\right) = sw^p.$

This is a special case of equation 10.3.1.4 with $f(w) = sw^p$.

1°. Suppose $w(x,y,z)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w\Big(x+\frac{1-p}{\beta}\ln C_1,\ y+\frac{1-p}{\gamma}\ln C_1,\ z+\frac{1-p}{\lambda}\ln C_1\Big),$$

where C_1 is an arbitrary constant, is also a solution of the equation.

2°. Solution for $p \neq 1$, $\beta \neq 0$, $\gamma \neq 0$, and $\lambda \neq 0$:

$$w = \left[\frac{p}{b(1-p)^2}\right]^{\frac{1}{p-1}}\left(\frac{e^{-\beta x}}{a\beta^2}+\frac{e^{-\gamma y}}{b\gamma^2}+\frac{e^{-\lambda z}}{c\lambda^2}\right)^{\frac{1}{1-p}}.$$

3°. Functional separable solution for $\beta \neq 0$, $\gamma \neq 0$, and $\lambda \neq 0$ (generalizes the solution of Item 2°):

$$w = w(r), \qquad r^2 = 4\left(\frac{e^{-\beta x}}{a\beta^2}+\frac{e^{-\gamma y}}{b\gamma^2}+\frac{e^{-\lambda z}}{c\lambda^2}\right),$$

where the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} - \frac{1}{r}w'_r = sw^p.$$

4°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,z) = U(\xi,z), \quad \xi^2 = \frac{e^{-\beta x}}{a\beta^2} + \frac{e^{-\gamma y}}{b\gamma^2},$$

$$w(x,y,z) = V(x,\eta), \quad \eta^2 = \frac{e^{-\gamma y}}{b\gamma^2} + \frac{e^{-\lambda z}}{c\lambda^2},$$

$$w(x,y,z) = W(y,\zeta), \quad \zeta^2 = \frac{e^{-\beta x}}{a\beta^2} + \frac{e^{-\lambda z}}{c\lambda^2},$$

$$w(x,y,z) = \exp\Big(\frac{\beta x}{p-1}\Big)F(\rho_1,\rho_2), \quad \rho_1 = y - \frac{\beta}{\gamma}x, \quad \rho_2 = z - \frac{\beta}{\lambda}x.$$

10.1.2. Equations of the Form $\dfrac{\partial}{\partial x}\Big[f(w)\dfrac{\partial w}{\partial x}\Big] + \dfrac{\partial}{\partial y}\Big[g(w)\dfrac{\partial w}{\partial y}\Big] + \dfrac{\partial}{\partial z}\Big[g(w)\dfrac{\partial w}{\partial z}\Big] = 0$

1. $\dfrac{\partial^2 w}{\partial x^2} + a\dfrac{\partial^2 w}{\partial y^2} + \dfrac{\partial}{\partial z}\Big[(bw+c)\dfrac{\partial w}{\partial z}\Big] = 0.$

1°. Suppose $w(x,y,z)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-2}w(\pm C_2 x + C_3, \pm C_2 y + C_4, \pm C_1 C_2 z + C_5) + \frac{c(1-C_1^2)}{bC_1^2},$$

$$w_2 = w(x\cos\beta + ya^{-1/2}\sin\beta, -xa^{1/2}\sin\beta + y\cos\beta,\ z),$$

where $C_1, \ldots, C_5$ and β are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. Solutions:

$$w(x,y,z) = A\sqrt{C_1x + C_2y + C_3z + C_4} - \frac{C_1^2 + aC_2^2}{bC_3^2} - \frac{c}{b},$$

$$w(x,y,z) = (C_1x + C_2)z + C_3x + C_4y + C_5 - \tfrac{1}{12}bC_1^{-2}(C_1x + C_2)^4,$$

$$w(x,y,z) = (C_1x + C_2)z + C_3(ax^2 - y^2) - \tfrac{1}{12}bC_1^{-2}(C_1x + C_2)^4,$$

$$w(x,y,z) = |z|^{1/2}\big[C_1(ax^2 - y^2) + C_2x + C_3 + C_4)\big] - \frac{c}{b},$$

$$w(x,y,z) = C_1|z|^{1/2}\exp\big(\sqrt{a}C_2x\big)\sin(C_2y + C_3) - \frac{c}{b},$$

$$w(x,y,z) = C_1|z|^{1/2}\sin(\sqrt{a}C_2x + C_3)\exp(C_2y) - \frac{c}{b},$$

where $A, C_1, \ldots, C_5$ are arbitrary constants (the first solution is of the traveling-wave type).

3°. Solution:

$$w = u(\xi) - 4bC_1^2x^2, \quad \xi = z + bC_1x^2 + C_2y,$$

where C_1 and C_2 are arbitrary constants and the function $u(\xi)$ is determined by the first-order ordinary differential equation

$$(bu + c + aC_2^2)u'_\xi + 2bC_1u = 8bC_1^2\xi + C_3.$$

With appropriate translations in both variables, one can make the equation homogeneous, which means it is integrable by quadrature.

4°. Solution:

$$w = v(r) - 4bC_2^2x^2 - 4abC_1^2y^2, \qquad r = z + bC_1x^2 + bC_2y^2,$$

where C_1 and C_2 are arbitrary constants and the function $v(r)$ is determined by the first-order ordinary differential equation

$$(bv + c)v_r' + 2b(aC_2 + C_1)v = 8b(a^2C_1^2 + C_2^2)r + C_3.$$

With appropriate translations in both variables, one can make the equation homogeneous.

5°. Solution (generalizes the solution of Items 3° and 4°):

$$w = U(\zeta) + A_1x^2 + A_2y^2 + A_3xy + A_4x + A_5y, \qquad \zeta = z + b(B_1x^2 + B_2y^2 + B_3xy + B_4x + B_5y),$$

where B_1, B_2, B_3, B_4, and B_5 are arbitrary constants, the coefficients A_n are expressed in terms of B_n by

$$\begin{aligned} A_1 &= -b(4B_1^2 + aB_3^2), \\ A_2 &= -b(B_3^2 + 4aB_2^2), \\ A_3 &= -4bB_3(B_1 + aB_2), \\ A_4 &= -2b(2B_1B_4 + aB_3B_5), \\ A_5 &= -2b(B_3B_4 + 2aB_2B_5), \end{aligned}$$

and the function $U(\zeta)$ is determined by the first-order ordinary differential equation

$$(bU + c + ab^2B_5^2 + b^2B_4^2)U_\zeta' + 2b(aB_2 + B_1)U + 2(aA_2 + A_1)\zeta = C_1.$$

With appropriate translations in both variables, one can make the equation homogeneous, which means it is integrable by quadrature.

6°. "Two-dimensional" generalized separable solution linear in z (generalizes the second and third solutions of Item 2°):

$$w = f(x, \eta)z + g(x, \eta), \qquad \eta = a^{-1/2}y,$$

where the functions f and g are determined by the system of differential equations

$$\frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial \eta^2} = 0, \tag{1}$$

$$\frac{\partial^2 g}{\partial x^2} + \frac{\partial^2 g}{\partial \eta^2} = -bf^2. \tag{2}$$

Equation (1) is the Laplace equation. Given $f = f(x, \eta)$, (2) represents a Helmholtz equation. For solutions of these linear equations, see Tikhonov and Samarskii (1990) and Polyanin (2002).

7°. "Two-dimensional" generalized separable solution quadratic in z:

$$w = f(x, y)z^2 + g(x, y)z + h(x, y),$$

where the functions $f = f(x, y)$, $g = g(x, y)$, and $h = h(x, y)$ are determined by the system of differential equations

$$\begin{aligned} &f_{xx} + af_{yy} + 6bf^2 = 0, \\ &g_{xx} + ag_{yy} + 6bfg = 0, \\ &h_{xx} + ah_{yy} + bg^2 + 2bfh + 2cf = 0. \end{aligned}$$

Here, the subscripts denote the corresponding partial derivatives.

8°. "Two-dimensional" solution (generalizes the last three solutions of Item 2°):

$$w(x,y,z) = |z|^{1/2}U(x,\eta) - \frac{c}{b}, \qquad \eta = a^{-1/2}y,$$

where the function $U = U(x,\eta)$ is determined by the Laplace equation

$$\frac{\partial^2 U}{\partial x^2} + \frac{\partial^2 U}{\partial \eta^2} = 0.$$

9°. There are solutions of the following forms:

$$w(x,y,z) = F(z,r), \quad r = ax^2 + y^2 \qquad \text{"two-dimensional" solution;}$$
$$w(x,y,z) = x^{2\lambda}G(\xi,\eta) - \frac{c}{b}, \quad \xi = \frac{y}{x}, \quad \eta = \frac{z}{x^{\lambda+1}} \qquad \text{"two-dimensional" solution;}$$
$$w(x,y,z) = H(\zeta), \quad \zeta = (ax^2 + y^2)z^{-2} \qquad \text{"one-dimensional" solution,}$$

where λ is an arbitrary constant.

10°. The substitution $u = w + (c/b)$ leads to a special case of equation 10.1.2.3 with $n = 1$.

Remark. In the special case $a = 1$, $b < 0$, and $c > 0$, the equation in question describes transonic flows of ideal polytropic gases (Pokhozhaev, 1989).

⊙ *Reference for equation* 10.1.2.1: A. D. Polyanin and V. F. Zaitsev (2004, pp. 408–409).

2. $\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial}{\partial y}\left[(a_1 w + b_1)\dfrac{\partial w}{\partial y}\right] + \dfrac{\partial}{\partial z}\left[(a_2 w + b_2)\dfrac{\partial w}{\partial z}\right] = 0.$

1°. Suppose $w(x,y,z)$ is a solution of this equation. Then the functions

$$w_1 = (\pm C_1 x + C_2, \pm C_1 y + C_3, \pm C_1 z + C_4),$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solution:

$$w(x,y,z) = A\sqrt{k_1 x + k_2 y + k_3 z + B} - \frac{k_1^2 + b_1 k_2^2 + b_2 k_3^2}{a_1 k_2^2 + a_2 k_3^2},$$

where A, B, k_1, k_2, and k_3 are arbitrary constants.

3°. Solution linear in y and z:

$$w(x,y,z) = (A_1 x + B_1)y + (A_2 x + B_2)z - \tfrac{1}{12}(a_1 A_1^2 + a_2 A_2^2)x^4 - \tfrac{1}{3}(a_1 A_1 B_1 + a_2 A_2 B_2)x^3 - \tfrac{1}{2}(a_1 B_1^2 + a_2 B_2^2)x^2 + Cx + D,$$

where A_1, A_2, B_1, B_2, C, and D are arbitrary constants.

4°. There is a generalized separable solution of the form

$$w(x,y,z) = f(x)y^2 + g(x)yz + h(x)z^2 + \varphi(x)y + \psi(x)z + \chi(x).$$

5°. For other solutions, see equation 10.3.2.3 with $f(w) = 1$, $g(w) = a_1 w + b_1$, and $h(w) = a_2 w + b_2$.

3. $\dfrac{\partial^2 w}{\partial x^2}+a\dfrac{\partial^2 w}{\partial y^2}+b\dfrac{\partial}{\partial z}\left(w^n\dfrac{\partial w}{\partial z}\right)=0.$

1°. Suppose $w(x,y,z)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-2}w(\pm C_2x+C_3,\pm C_2y+C_4,\pm C_1^nC_2z+C_5),$$
$$w_2 = w(x\cos\beta+ya^{-1/2}\sin\beta,-xa^{1/2}\sin\beta+y\cos\beta,\ z),$$

where $C_1,\ldots,C_5$ and β are arbitrary constants, are also solutions of the equation (the plus or minus signs in w_1 are chosen arbitrarily).

2°. Solutions:

$$w(x,y,z)=z^{\frac{1}{n+1}}[C_1(ax^2-y^2)+C_2x+C_3y+C_4],$$
$$w(x,y,z)=z^{\frac{1}{n+1}}[C_1\ln(ax^2+y^2)+C_2],$$
$$w(x,y,z)=C_1z^{\frac{1}{n+1}}\exp(\sqrt{a}C_2x)\cos(C_2y+C_3),$$

where $C_1,\ldots,C_4$ are arbitrary constants.

3°. "Two-dimensional" solution (generalizes the solutions of Item 2°):

$$w(x,y,z)=z^{\frac{1}{n+1}}U(x,\eta),\qquad \eta=a^{-1/2}y,$$

where the function $U=U(x,\eta)$ is determined by the Laplace equation

$$\frac{\partial^2U}{\partial x^2}+\frac{\partial^2U}{\partial\eta^2}=0.$$

For this linear equation, see Tikhonov and Samarskii (1990) and Polyanin (2002).

4°. "Two-dimensional" solution:

$$w(x,y,z)=u(x,\eta)z^{2/n},\qquad \eta=a^{-1/2}y,$$

where the function $u=u(x,\eta)$ is determined by a differential equation of the form 9.1.1.1:

$$\frac{\partial^2u}{\partial x^2}+\frac{\partial^2u}{\partial\eta^2}+\frac{2b(n+2)}{n^2}u^{n+1}=0.$$

For $n=-1$ and $n=-2$, this equation is linear.

Remark. The solutions of Items 2° to 4° are special cases of a multiplicative separable solution $w=u(x,y)\theta(z)$, where $\theta=\theta(z)$ is determined by the autonomous ordinary differential equation $(\theta^n\theta'_z)'_z=C\theta$.

5°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,z)=F(z,r),\quad r=ax^2+y^2;$$
$$w(x,y,z)=x^{2\lambda}G(\xi,\eta),\quad \xi=\frac{y}{x},\quad \eta=\frac{z}{x^{n\lambda+1}};$$
$$w(x,y,z)=|x|^{-2/n}H(z,\zeta),\quad \zeta=y/x;$$
$$w(x,y,z)=|z|^{2/n}U(t_1,t_2),\quad t_1=x+k_1\ln|z|,\quad t_2=y+k_2\ln|z|;$$
$$w(x,y,z)=\exp\left(-\frac{2z}{n+1}\right)V(\rho_1,\rho_2),\quad \rho_1=x\exp\left(-\frac{nz}{n+1}\right),\quad \rho_2=y\exp\left(-\frac{nz}{n+1}\right),$$

where k_1, k_2, and λ are arbitrary constants.

6°. There are solutions of the following forms:

$$w(x,y,z) = W(\zeta), \quad \zeta = (ax^2 + y^2)z^{-2};$$
$$w(x,y,z) = S(r)z^{2/n}, \quad r = ax^2 + y^2.$$

7°. For other solutions, see equation 10.1.2.5, where n should be set equal to zero and then k should be renamed n.

⊙ *References for equation* 10.1.2.3: N. Ibragimov (1994, p. 224), A. D. Polyanin and V. F. Zaitsev (2004, pp. 408–409).

4. $\dfrac{\partial^2 w}{\partial x^2} + a\dfrac{\partial}{\partial y}\left(w^n\dfrac{\partial w}{\partial y}\right) + b\dfrac{\partial}{\partial z}\left(w^n\dfrac{\partial w}{\partial z}\right) = 0.$

1°. Suppose $w(x,y,z)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-2}w(\pm C_2 x + C_3, \pm C_1^n C_2 y + C_4, \pm C_1^n C_2 z + C_5),$$
$$w_2 = w\big(x,\ y\cos\beta + z\sqrt{a/b}\,\sin\beta, -y\sqrt{b/a}\,\sin\beta + z\cos\beta\big),$$

where $C_1, \ldots, C_5$ and β are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Degenerate solutions:

$$w(x,y,z) = x\big[C_1(by^2 - ax^2) + C_2 x + C_3 y + C_4\big]^{\frac{1}{n+1}},$$
$$w(x,y,z) = x\big[C_1\ln\big(by^2 + az^2\big) + C_2\big]^{\frac{1}{n+1}},$$
$$w(x,y,z) = x\big[C_1\exp\big(\lambda\sqrt{b}\,y\big)\sin\big(\lambda\sqrt{a}\,z + C_2\big) + C_3\big]^{\frac{1}{n+1}},$$

where $C_1, \ldots, C_4$ and λ are arbitrary constants.

3°. "Two-dimensional" solution (generalizes the solutions of Item 2°):

$$w(x,y,z) = (C_1 x + C_2)\big[U(\xi,\eta)\big]^{\frac{1}{n+1}}, \quad \xi = \sqrt{b}\,y, \quad \eta = \sqrt{a}\,z,$$

where the function $U = U(\xi,\eta)$ is determined by the Laplace equation

$$\frac{\partial^2 U}{\partial\xi^2} + \frac{\partial^2 U}{\partial\eta^2} = 0.$$

For solutions of this linear equation, see Tikhonov and Samarskii (1990) and Polyanin (2002).

4°. "Two-dimensional" solution:

$$w(x,y,z) = x^{-2/n}\Theta(y,z),$$

where the function $\Theta = \Theta(y,z)$ is determined by the differential equation

$$a\frac{\partial}{\partial y}\left(\Theta^n\frac{\partial\Theta}{\partial y}\right) + b\frac{\partial}{\partial z}\left(\Theta^n\frac{\partial\Theta}{\partial z}\right) + \frac{2(n+2)}{n^2}\Theta = 0.$$

For $n = -2$, the equation obtained can be reduced, with the transformation $u = 1/\Theta$, $\xi = \sqrt{b}\,y$, $\eta = \sqrt{a}\,z$, to the Laplace equation.

Remark. The solutions of Items 2° to 4° are special cases of a multiplicative separable solution $w = \varphi(x)u(y,z)$, where $\varphi = \varphi(x)$ is determined by the autonomous ordinary differential equation $\varphi''_{zz} = C\varphi^{n+1}$.

5°. There are "two-dimensional" and "one-dimensional" solutions of the following forms:

$$w(x,y,z) = F(x,r), \quad r = by^2 + az^2;$$
$$w(x,y,z) = x^{2\lambda}G(\xi,\eta), \quad \xi = \frac{y}{x^{n\lambda+1}}, \quad \eta = \frac{z}{x^{n\lambda+1}};$$
$$w(x,y,z) = z^{2/n}H(x,\zeta), \quad \zeta = z/y;$$
$$w(x,y,z) = |x|^{-2/n}U(z_1,z_2), \quad z_1 = y + k_1\ln|x|, \quad z_2 = z + k_2\ln|x|;$$
$$w(x,y,z) = e^{-2x}V(\rho_1,\rho_2), \quad \rho_1 = ye^{nx}, \quad \rho_2 = ze^{nx};$$
$$w(x,y,z) = W(\theta), \quad \theta = (by^2 + az^2)x^{-2},$$

where k_1, k_2, and λ are arbitrary constants.

6°. For other solutions, see equation 10.1.2.5 with $k = n$.

⊙ *References for equation* 10.1.2.4: N. Ibragimov (1994, p. 223), A. D. Polyanin and V. F. Zaitsev (2004, pp. 411–412).

5. $\dfrac{\partial^2 w}{\partial x^2} + a\dfrac{\partial}{\partial y}\left(w^n\dfrac{\partial w}{\partial y}\right) + b\dfrac{\partial}{\partial z}\left(w^k\dfrac{\partial w}{\partial z}\right) = 0.$

This is a special case of equation 10.3.2.3 with $f(w) = 1$, $g(w) = aw^n$, and $h(w) = bw^k$.

1°. Suppose $w(x,y,z)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^{-2}w(\pm C_2x + C_3, \pm C_1^nC_2y + C_4, \pm C_1^kC_2z + C_5),$$

where $C_1, \ldots, C_5$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solution in implicit form:

$$\beta_1^2 w + \frac{a\beta_2^2}{n+1}w^{n+1} + \frac{b\beta_3^2}{k+1}w^{k+1} = C_1(\beta_1x + \beta_2y + \beta_3z) + C_2,$$

where C_1, C_2, β_1, β_2, and β_3 are arbitrary constants.

3°. "Two-dimensional" solution (c_1 and c_2 are arbitrary constants):

$$w(x,y,z) = u(x,\xi), \quad \xi = c_1y + c_2z,$$

where the function $u = u(x,\xi)$ is determined by a differential equation of the form 9.4.4.8:

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial}{\partial\xi}\left[\varphi(u)\frac{\partial u}{\partial\xi}\right] = 0, \quad \varphi(u) = ac_1^2u^n + bc_2^2u^k,$$

which can be reduced to a linear equation.

4°. "Two-dimensional" solution (s_1 and s_2 are arbitrary constants):

$$w(x,y,z) = v(y,\eta), \quad \eta = s_1x + s_2z,$$

where the function $v = v(y,\eta)$ is determined by a differential equation of the form 9.4.4.8:

$$a\frac{\partial}{\partial y}\left(v^n\frac{\partial v}{\partial y}\right) + \frac{\partial}{\partial\eta}\left[\psi(v)\frac{\partial v}{\partial\eta}\right] = 0, \quad \psi(v) = s_1^2 + bs_2^2v^k,$$

which can be reduced to a linear equation.

5°. There is a "two-dimensional" solution of the form (generalize the solutions of Items 3° and 4°):

$$w(x,y,z)=U(z_1,z_2),\quad z_1=a_1y+b_1z+c_1x,\quad z_2=a_2y+b_2z+c_2x.$$

6°. There are exact solutions of the following forms:

$w(x,y,z)=x^{2\lambda}F(\xi,\eta),\quad \xi=\dfrac{y}{x^{n\lambda+1}},\quad \eta=\dfrac{z}{x^{k\lambda+1}}$ "two-dimensional" solution;

$w(x,y,z)=y^{2/n}G(\zeta,x),\quad \zeta=y^{-k/n}z$ "two-dimensional" solution;

$w(x,y,z)=e^{-2x}H(z_1,z_2),\quad z_1=ye^{nx},\quad z_2=ze^{kx}$ "two-dimensional" solution;

$w(x,y,z)=(y/x)^{2/n}U(\theta),\quad \theta=x^{k/n-1}y^{-k/n}z$ "one-dimensional" solution,

where λ is an arbitrary constant.

⊙ *References for equation* 10.1.2.5: N. Ibragimov (1994, p. 224), V. F. Zaitsev and A. D. Polyanin (2001), A. D. Polyanin and V. F. Zaitsev (2004, pp. 412–413).

6. $\dfrac{\partial}{\partial y}\left(w^{n_1}\dfrac{\partial w}{\partial y}\right)+\dfrac{\partial}{\partial y}\left(w^{n_2}\dfrac{\partial w}{\partial y}\right)+\dfrac{\partial}{\partial z}\left(w^{n_3}\dfrac{\partial w}{\partial z}\right)=0.$

This is a special case of equation 10.3.2.3 with $f(w)=a_1w^{n_1}$, $g(w)=a_2w^{n_2}$, and $h(w)=a_3w^{n_3}$.

10.2. Equations with Three Space Variables Involving Exponential Nonlinearities

10.2.1. Equations of the Form $\dfrac{\partial}{\partial x}\left[f(x)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[g(y)\dfrac{\partial w}{\partial y}\right]+\dfrac{\partial}{\partial z}\left[h(z)\dfrac{\partial w}{\partial z}\right]=ae^{\lambda w}$

1. $\dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right)+\dfrac{\partial}{\partial z}\left(cz^k\dfrac{\partial w}{\partial z}\right)=se^{\lambda w}.$

This is a special case of equation 10.3.1.3 with $f(w)=se^{\lambda w}$.

1°. Suppose $w(x,y,z)$ is a solution of the equation in question. Then the function

$$w_1=w\Big(C_1^{\frac{2}{2-n}}x,\,C_1^{\frac{2}{2-m}}y,\,C_1^{\frac{2}{2-k}}y\Big)+\frac{2}{\lambda}\ln C_1,$$

where C_1 is an arbitrary constant, is also a solution of the equation.

2°. Solution for $n\neq 2$, $m\neq 2$, and $k\neq 2$:

$$w=-\frac{1}{\lambda}\ln\left\{\frac{s\lambda}{A}\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{y^{2-m}}{b(2-m)^2}+\frac{z^{2-k}}{c(2-k)^2}\right]\right\},\qquad A=1-\frac{1}{2-n}-\frac{1}{2-m}-\frac{1}{2-k}.$$

3°. Functional separable solution for $n\neq 2$, $m\neq 2$, and $k\neq 2$ (generalizes the solution of Item 2°):

$$w=w(r),\qquad r^2=4\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{y^{2-m}}{b(2-m)^2}+\frac{z^{2-k}}{c(2-k)^2}\right],$$

where the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{B}{r}w'_r = se^{\lambda w}, \qquad B = \frac{2}{2-n} + \frac{2}{2-m} + \frac{2}{2-k} - 1.$$

4°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,z) = U(\xi,z), \quad \xi^2 = \frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2},$$
$$w(x,y,z) = V(x,\eta), \quad \eta^2 = \frac{y^{2-m}}{b(2-m)^2} + \frac{z^{2-k}}{c(2-k)^2},$$
$$w(x,y,z) = W(y,\zeta), \quad \zeta^2 = \frac{x^{2-n}}{a(2-n)^2} + \frac{z^{2-k}}{c(2-k)^2},$$
$$w(x,y,z) = F(\rho_1,\rho_2) + \frac{n-2}{\lambda}\ln x, \quad \rho_1 = yx^{\frac{n-2}{2-m}}, \quad \rho_2 = zx^{\frac{n-2}{2-k}}.$$

2. $\dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right) + \dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right) + \dfrac{\partial}{\partial z}\left(ce^{\lambda z}\dfrac{\partial w}{\partial z}\right) = se^{\sigma w}.$

This is a special case of equation 10.3.1.5 with $f(w) = se^{\sigma w}$.

1°. Suppose $w(x,y,z)$ is a solution of the equation in question. Then the function

$$w_1 = w\Big(C_1^{\frac{2}{2-n}}x,\ C_1^{\frac{2}{2-m}}y,\ z - \frac{2}{\lambda}\ln C_1\Big) + \frac{2}{\sigma}\ln C_1,$$

where C_1 is an arbitrary constant, is also a solution of the equation.

2°. Solution for $n \neq 2$, $m \neq 2$, and $\lambda \neq 0$:

$$w = -\frac{1}{\sigma}\ln\left\{\frac{s\sigma}{A}\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} + \frac{e^{-\lambda z}}{c\lambda^2}\right]\right\}, \qquad A = 1 - \frac{1}{2-n} - \frac{1}{2-m}.$$

3°. Functional separable solution for $n \neq 2$, $m \neq 2$, and $\lambda \neq 0$ (generalizes the solution of Item 2°):

$$w = w(r), \qquad r^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} + \frac{e^{-\lambda z}}{c\lambda^2}\right],$$

where the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{B}{r}w'_r = se^{\sigma w}, \qquad B = \frac{2}{2-n} + \frac{2}{2-m} - 1.$$

4°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,z) = U(\xi,z), \quad \xi^2 = \frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2},$$
$$w(x,y,z) = V(x,\eta), \quad \eta^2 = \frac{y^{2-m}}{b(2-m)^2} + \frac{e^{-\lambda z}}{c\lambda^2},$$
$$w(x,y,z) = W(y,\zeta), \quad \zeta^2 = \frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\lambda z}}{c\lambda^2},$$
$$w(x,y,z) = F(\rho_1,\rho_2) + \frac{n-2}{\sigma}\ln x, \quad \rho_1 = yx^{\frac{n-2}{2-m}}, \quad \rho_2 = z + \frac{2-n}{\lambda}\ln x.$$

3. $\dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(be^{\beta y}\dfrac{\partial w}{\partial y}\right)+\dfrac{\partial}{\partial z}\left(ce^{\lambda z}\dfrac{\partial w}{\partial z}\right)=se^{\sigma w}.$

This is a special case of equation 10.3.1.6 with $f(w)=se^{\sigma w}$.

1°. Suppose $w(x,y,z)$ is a solution of the equation in question. Then the function

$$w_1=w\Big(C_1^{\frac{2}{2-n}}x,\ y-\frac{2}{\beta}\ln C_1,\ z-\frac{2}{\lambda}\ln C_1\Big)+\frac{2}{\sigma}\ln C_1,$$

where C_1 is an arbitrary constant, is also a solution of the equation.

2°. Solution for $n\neq 2$, $\beta\neq 0$, and $\lambda\neq 0$:

$$w=-\frac{1}{\sigma}\ln\left\{\frac{s\sigma(2-n)}{1-n}\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{e^{-\beta y}}{b\beta^2}+\frac{e^{-\lambda z}}{c\lambda^2}\right]\right\}.$$

3°. Functional separable solution for $n\neq 2$, $\beta\neq 0$, and $\lambda\neq 0$ (generalizes the solution of Item 2°):

$$w=w(r),\qquad r^2=4\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{e^{-\beta y}}{b\beta^2}+\frac{e^{-\lambda z}}{c\lambda^2}\right],$$

where the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr}+\frac{A}{r}w'_r=se^{\sigma w},\qquad A=\frac{n}{2-n}.$$

4°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,z)=U(\xi,z),\quad \xi^2=\frac{x^{2-n}}{a(2-n)^2}+\frac{e^{-\beta y}}{b\beta^2},$$
$$w(x,y,z)=V(x,\eta),\quad \eta^2=\frac{e^{-\beta y}}{b\beta^2}+\frac{e^{-\lambda z}}{c\lambda^2},$$
$$w(x,y,z)=W(y,\zeta),\quad \zeta^2=\frac{x^{2-n}}{a(2-n)^2}+\frac{e^{-\lambda z}}{c\lambda^2},$$
$$w(x,y,z)=F(\rho_1,\rho_2)+\frac{n-2}{\sigma}\ln x,\quad \rho_1=y+\frac{2-n}{\beta}\ln x,\quad \rho_2=z+\frac{2-n}{\lambda}\ln x.$$

4. $\dfrac{\partial}{\partial x}\left(ae^{\beta x}\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(be^{\gamma y}\dfrac{\partial w}{\partial y}\right)+\dfrac{\partial}{\partial z}\left(ce^{\lambda z}\dfrac{\partial w}{\partial z}\right)=se^{\sigma w}.$

This is a special case of equation 10.3.1.4 with $f(w)=se^{\sigma w}$.

1°. Suppose $w(x,y,z)$ is a solution of the equation in question. Then the function

$$w_1=w\Big(x-\frac{2}{\beta}\ln C_1,\ y-\frac{2}{\gamma}\ln C_1,\ z-\frac{2}{\lambda}\ln C_1\Big)+\frac{2}{\sigma}\ln C_1,$$

where C_1 is an arbitrary constant, is also a solution of the equation.

2°. Solution for $\beta \neq 0$, $\gamma \neq 0$, and $\lambda \neq 0$:

$$w = -\frac{1}{\sigma}\ln\left[s\sigma\left(\frac{e^{-\beta x}}{a\beta^2} + \frac{e^{-\gamma y}}{b\gamma^2} + \frac{e^{-\lambda z}}{c\lambda^2}\right)\right].$$

3°. Functional separable solution for $\beta \neq 0$, $\gamma \neq 0$, and $\lambda \neq 0$ (generalizes the solution of Item 2°):

$$w = w(r), \qquad r^2 = 4\left(\frac{e^{-\beta x}}{a\beta^2} + \frac{e^{-\gamma y}}{b\gamma^2} + \frac{e^{-\lambda z}}{c\lambda^2}\right),$$

where the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} - \frac{1}{r}w'_r = se^{\sigma w}.$$

4°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,z) = U(\xi,z), \quad \xi^2 = \frac{e^{-\beta x}}{a\beta^2} + \frac{e^{-\gamma y}}{b\gamma^2},$$

$$w(x,y,z) = V(x,\eta), \quad \eta^2 = \frac{e^{-\gamma y}}{b\gamma^2} + \frac{e^{-\lambda z}}{c\lambda^2},$$

$$w(x,y,z) = W(y,\zeta), \quad \zeta^2 = \frac{e^{-\beta x}}{a\beta^2} + \frac{e^{-\lambda z}}{c\lambda^2},$$

$$w(x,y,z) = F(\rho_1,\rho_2) + \frac{\beta}{\sigma}x, \quad \rho_1 = y - \frac{\beta}{\gamma}x, \quad \rho_2 = z - \frac{\beta}{\lambda}x.$$

10.2.2. Equations of the Form $a_1\frac{\partial}{\partial x}\left(e^{\lambda_1 w}\frac{\partial w}{\partial x}\right) + a_2\frac{\partial}{\partial y}\left(e^{\lambda_2 w}\frac{\partial w}{\partial y}\right) + a_3\frac{\partial}{\partial y}\left(e^{\lambda_2 w}\frac{\partial w}{\partial y}\right) = be^{\beta w}$

1. $\dfrac{\partial^2 w}{\partial x^2} + a\dfrac{\partial^2 w}{\partial y^2} + b\dfrac{\partial}{\partial z}\left(e^{w}\dfrac{\partial w}{\partial z}\right) = 0.$

1°. Suppose $w(x,y,z)$ is a solution of this equation. Then the functions

$$w_1 = w(C_1x + C_3, \pm C_1y + C_4, C_2z + C_5) + \ln\frac{C_1^2}{C_2^2},$$

$$w_2 = w(x\cos\beta + ya^{-1/2}\sin\beta,\ -xa^{1/2}\sin\beta + y\cos\beta,\ z),$$

where $C_1, \ldots, C_5$ and β are arbitrary constants, are also solutions of the equation.

2°. Solutions:

$$w(x,y,z) = C_1(ax^2 - y^2) + C_2xy + C_3x + C_4y + C_5 + \ln(C_6z + C_7),$$

$$w(x,y,z) = C_1\exp(\sqrt{a}\,C_2x)\sin(C_2y + C_3) + \ln(C_4z + C_5),$$

$$w(x,y,z) = C_1\exp(C_2y)\sin(\sqrt{a}\,C_2x + C_3) + \ln(C_4z + C_5),$$

$$w(x,y,z) = \ln\left[\frac{(C_1^2 + aC_2^2)(z + C_4)^2}{b\cosh^2(C_1x + C_2y + C_3)}\right],$$

$$w(x,y,z) = \ln\left(\frac{4aC_3}{b}\right) - 2\ln\left|(y + C_1)^2 + a(x + C_2)^2 + C_3\right| + 2\ln|z + C_4|,$$

where $C_1, \ldots, C_7$ are arbitrary constants.

3°. "Two-dimensional" solution (generalizes the first three solutions of Item 2°):

$$w(x,y,z) = U(x,\eta) + \ln(C_1 z + C_2), \qquad \eta = a^{-1/2}y,$$

where C_1 and C_2 are arbitrary constants and the function $U(x,\eta)$ is determined by the Laplace equation

$$\frac{\partial^2 U}{\partial x^2} + \frac{\partial^2 U}{\partial \eta^2} = 0.$$

For this linear equation, see Tikhonov and Samarskii (1990) and Polyanin (2002).

4°. "Two-dimensional" solution:

$$w(x,y,z) = V(x,\eta) + 2\ln|z + C|, \qquad \eta = a^{-1/2}y,$$

where the function $V = V(x,\eta)$ is determined by a solvable differential equation of the form 9.2.1.1:

$$\frac{\partial^2 V}{\partial x^2} + \frac{\partial^2 V}{\partial \eta^2} = -2be^V.$$

5°. There are "two-dimensional" and "one-dimensional" solutions of the following forms:

$$w(x,y,z) = F(r,z), \quad r = ax^2 + y^2;$$
$$w(x,y,z) = G(\xi_1,\xi_2) - 2k\ln|x|, \quad \xi_1 = yx^{-1}, \quad \xi_2 = z|x|^{k-1};$$
$$w(x,y,z) = H(\eta_1,\eta_2) + 2k\ln|z|, \quad \eta_1 = x|z|^{k-1}, \quad \eta_2 = y|z|^{k-1};$$
$$w(x,y,z) = U(\zeta_1,\zeta_2) + 2\ln|z|, \quad \zeta_1 = x + k_1\ln|z|, \quad \zeta_2 = y + k_2\ln|z|;$$
$$w(x,y,z) = V(\rho_1,\rho_2) + 2z, \quad \rho_1 = xe^z, \quad \rho_2 = ye^z;$$
$$w(x,y,z) = W(\chi), \quad \chi = (ax^2 + y^2)z^{-2},$$

where k, k_1, and k_2 are arbitrary constants.

6°. For other exact solutions, see equation 10.3.2.3 with $f(w) = 1$, $g(w) = a$, and $h(w) = be^w$.

2. $\dfrac{\partial^2 w}{\partial x^2} + a\dfrac{\partial}{\partial y}\left(e^{\lambda w}\dfrac{\partial w}{\partial y}\right) + b\dfrac{\partial}{\partial z}\left(e^{\lambda w}\dfrac{\partial w}{\partial z}\right) = 0.$

1°. Suppose $w(x,y,z)$ is a solution of this equation. Then the functions

$$w_1 = w(C_1 x + C_3, C_2 y + C_4, C_2 z + C_5) + \frac{1}{\lambda}\ln\frac{C_1^2}{C_2^2},$$
$$w_2 = w\big(x,\ y\cos\beta + z\sqrt{a/b}\,\sin\beta,\ -y\sqrt{b/a}\,\sin\beta + z\cos\beta\big),$$

where $C_1, \ldots, C_5$ and β are arbitrary constants.

2°. Solutions:

$$w(x,y,z) = C_1 x + C_2 + \frac{1}{\lambda}\ln(C_3 y + C_4 z + C_5);$$
$$w(x,y,z) = C_1 x + C_2 + \frac{1}{\lambda}\ln\big[C_3(by^2 - az^2) + C_4 yz + C_5\big];$$

$$w(x,y,z) = C_1x + C_2 + \frac{1}{\lambda}\ln\bigl[C_3\ln(by^2 + az^2) + C_4\bigr];$$

$$w(x,y,z) = C_1x + C_2 + \sqrt{b}\,C_3y + \frac{1}{\lambda}\ln\cos\bigl(\sqrt{a}\,C_3\lambda z + C_4\bigr);$$

$$w(x,y,z) = C_1x + C_2 + \frac{1}{\lambda}\ln\bigl[C_3\exp\bigl(\sqrt{b}\,C_4y\bigr)\cos\bigl(\sqrt{a}\,C_4z + C_5\bigr) + C_6\bigr];$$

$$w(x,y,z) = \frac{1}{\lambda}\ln\left[\frac{-aC_1^2y^2 + C_2\exp\bigl(\sqrt{b}\,C_3y\bigr)\cos\bigl(\sqrt{a}\,C_3z + C_4\bigr)}{\cos^2(aC_1x + C_5)}\right];$$

$$w(x,y,z) = \frac{1}{\lambda}\ln\left[\frac{-bC_1^2z^2 + C_2\exp\bigl(\sqrt{b}\,C_3y\bigr)\cos\bigl(\sqrt{a}\,C_3z + C_4\bigr)}{\cos^2(bC_1x + C_5)}\right];$$

$$w(x,y,z) = \frac{1}{\lambda}\ln\left[\frac{-aC_1^2y^2 + C_2\exp\bigl(\sqrt{b}\,C_3y\bigr)\cos\bigl(\sqrt{a}\,C_3z + C_4\bigr)}{\sinh^2(aC_1x + C_5)}\right];$$

$$w(x,y,z) = \frac{1}{\lambda}\ln\left[\frac{-bC_1^2z^2 + C_2\exp\bigl(\sqrt{b}\,C_3y\bigr)\cos\bigl(\sqrt{a}\,C_3z + C_4\bigr)}{\sinh^2(bC_1x + C_5)}\right];$$

$$w(x,y,z) = \frac{1}{\lambda}\ln\left[\frac{aC_1^2y^2 + C_2\exp\bigl(\sqrt{b}\,C_3y\bigr)\cos\bigl(\sqrt{a}\,C_3z + C_4\bigr)}{\cosh^2(aC_1x + C_5)}\right];$$

$$w(x,y,z) = \frac{1}{\lambda}\ln\left[\frac{bC_1^2z^2 + C_2\exp\bigl(\sqrt{b}\,C_3y\bigr)\cos\bigl(\sqrt{a}\,C_3z + C_4\bigr)}{\cosh^2(bC_1x + C_5)}\right],$$

where $C_1, \ldots, C_6$ are arbitrary constants.

3°. "Two-dimensional" solution (generalizes the first five solutions of Item 2°):

$$w(x,y,z) = C_1x + C_2 + \frac{1}{\lambda}\ln U(\xi,\eta), \qquad \xi = \frac{y}{\sqrt{a}}, \qquad \eta = \frac{z}{\sqrt{b}},$$

where C_1 and C_2 are arbitrary constants and the function $U = U(\xi,\eta)$ is determined by the Laplace equation

$$\frac{\partial^2U}{\partial\xi^2} + \frac{\partial^2U}{\partial\eta^2} = 0.$$

For solutions of this linear equation, see Tikhonov and Samarskii (1990) and Polyanin (2002).

4°. "Two-dimensional" solution:

$$w(x,y,z) = f(x) + \frac{1}{\lambda}\ln V(\xi,\eta), \qquad \xi = \frac{y}{\sqrt{a}}, \qquad \eta = \frac{z}{\sqrt{b}},$$

where the function $f = f(x)$ is determined by the autonomous ordinary differential equation (k is an arbitrary constant)

$$f''_{xx} + ke^{\lambda f} = 0, \tag{1}$$

and the function $V = V(\xi,\eta)$ is a solution of the Poisson equation

$$\Delta V - k\lambda = 0, \qquad \Delta = \frac{\partial^2}{\partial\xi^2} + \frac{\partial^2}{\partial\eta^2}. \tag{2}$$

For solutions of this linear equation, see Tikhonov and Samarskii (1990) and Polyanin (2002).

The general solution of equation (1) is expressed as

$$f(x)=\begin{cases}-\dfrac{1}{\lambda}\ln\left[-\frac{1}{2}k\lambda(x+C_1)^2\right] & \text{if } k\lambda<0,\\ -\dfrac{1}{\lambda}\ln\left[-\dfrac{k\lambda}{2C_1^2}\cos^2(C_1x+C_2)\right] & \text{if } k\lambda<0,\\ -\dfrac{1}{\lambda}\ln\left[-\dfrac{k\lambda}{2C_1^2}\sinh^2(C_1x+C_2)\right] & \text{if } k\lambda<0,\\ -\dfrac{1}{\lambda}\ln\left[\dfrac{k\lambda}{2C_1^2}\cosh^2(C_1x+C_2)\right] & \text{if } k\lambda>0.\end{cases}$$

5°. There are "two-dimensional" and "one-dimensional" solutions of the following forms:

$$w(x,y,z)=F(x,\tau)+\frac{2}{\lambda}\ln|y|,\quad \tau=\frac{z}{y};$$
$$w(x,y,z)=G(x,r),\quad r=by^2+az^2;$$
$$w(x,y,z)=H(z_1,z_2)-\frac{2k}{\lambda}\ln|x|,\quad z_1=y|x|^{k-1},\quad z_2=z|x|^{k-1};$$
$$w(x,y,z)=U(\xi,\eta)-\frac{2}{\lambda}\ln|x|,\quad \xi=y+k_1\ln|x|,\quad \eta=z+k_2\ln|x|;$$
$$w(x,y,z)=V(\rho_1,\rho_2)-\frac{2}{\lambda}x,\quad \rho_1=ye^x,\quad \rho_2=ze^x;$$
$$w(x,y,z)=W(\zeta),\quad \zeta=\frac{by^2+az^2}{x^2}.$$

6°. For other exact solutions, see equation 10.3.2.3 with $f(w)=1$, $g(w)=ae^{\lambda w}$, and $h(w)=be^{\lambda w}$.

3. $\dfrac{\partial^2 w}{\partial x^2}+a\dfrac{\partial}{\partial y}\left(e^w\dfrac{\partial w}{\partial y}\right)+b\dfrac{\partial}{\partial z}\left(e^{\lambda w}\dfrac{\partial w}{\partial z}\right)=0.$

1°. Suppose $w(x,y,z)$ is a solution of this equation. Then the functions

$$w_1=w(\pm C_1x+C_3,\pm C_1C_2y+C_4,\pm C_1C_2^{\lambda}z+C_5)-2\ln|C_2|,$$

where $C_1,\ldots,C_5$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. Traveling-wave solution in implicit form:

$$k_1^2w+ak_2^2e^w+bk_3^2\lambda^{-1}e^{\lambda w}=C_1(k_1x+k_2y+k_3z)+C_2,$$

where C_1, C_2, k_1, k_2, and k_3 are arbitrary constants.

3°. "Two-dimensional" solution (c_1 and c_2 are arbitrary constants):

$$w(x,y,z)=u(x,\xi),\quad \xi=c_1y+c_2z,$$

where the function $u=u(x,\xi)$ is determined by a differential equation of the form 9.4.4.8:

$$\frac{\partial^2u}{\partial x^2}+\frac{\partial}{\partial\xi}\left[\varphi(u)\frac{\partial u}{\partial\xi}\right]=0,\quad \varphi(u)=ac_1^2e^u+bc_2^2e^{\lambda u},$$

which can be reduced to a linear equation.

4°. "Two-dimensional" solution (s_1 and s_2 are arbitrary constants):

$$w(x,y,z) = v(y,\eta), \quad \eta = s_1x + s_2z,$$

where the function $v = v(y,\eta)$ is determined by a differential equation of the form 9.4.4.8:

$$a\frac{\partial}{\partial y}\left(e^v\frac{\partial v}{\partial y}\right) + \frac{\partial}{\partial \eta}\left[\psi(v)\frac{\partial v}{\partial \eta}\right] = 0, \quad \psi(v) = bs_2^2e^{\lambda v} + s_1^2,$$

which can be reduced to a linear equation.

5°. There is a "two-dimensional" solution of the form (generalizes the solutions of Items 3° and 4°):

$$w(x,y,z) = U(z_1,z_2), \quad z_1 = a_1x + b_1y + c_1z, \quad z_2 = a_2x + b_2y + c_2z.$$

6°. There are exact solutions of the following forms:

$$w(x,y,z) = F(\xi_1,\xi_2) - 2k\ln|x|, \quad \xi_1 = y|x|^{k-1}, \quad \xi_2 = z|x|^{k\lambda-1} \quad \text{"two-dimensional"};$$
$$w(x,y,z) = G(x,\eta) + 2\ln|y|, \quad \eta = |y|^{-\lambda}z \quad \text{"two-dimensional"};$$
$$w(x,y,z) = H(\zeta_1,\zeta_2) - 2kx, \quad \zeta_1 = ye^{kx}, \quad \zeta_2 = ze^{k\lambda x} \quad \text{"two-dimensional"};$$
$$w(x,y,z) = V(\rho) + 2\ln|y/x|, \quad \rho = |x|^{\lambda-1}|y|^{-\lambda}z \quad \text{"one-dimensional"},$$

where k is an arbitrary constant.

7°. For other exact solutions, see equation 10.3.2.3 with $f(w) = 1$, $g(w) = ae^w$, and $h(w) = be^{\lambda w}$.

⊙ *References for equation* 10.2.2.3: N. Ibragimov (1994, pp. 222–223), A. D. Polyanin and V. F. Zaitsev (2004, p. 419).

4. $a_1\dfrac{\partial}{\partial x}\left(e^{\lambda_1 w}\dfrac{\partial w}{\partial x}\right) + a_2\dfrac{\partial}{\partial y}\left(e^{\lambda_2 w}\dfrac{\partial w}{\partial y}\right) + a_3\dfrac{\partial}{\partial z}\left(e^{\lambda_3 w}\dfrac{\partial w}{\partial z}\right) = 0.$

1°. Suppose $w(x,y,z)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1C_2^{\lambda_1}x + C_3, \pm C_1C_2^{\lambda_2}y + C_4, \pm C_1C_2^{\lambda_3}z + C_5) - 2\ln|C_2|,$$

where $C_1, \ldots, C_5$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. There is an exact solution of the form

$$w(x,y,z) = U(\xi) - \frac{2}{\lambda_1-\lambda_2}\ln\left|\frac{y}{x}\right|, \quad \xi = |x|^{\frac{\lambda_2-\lambda_3}{\lambda_1-\lambda_2}}|y|^{\frac{\lambda_3-\lambda_1}{\lambda_1-\lambda_2}}z.$$

3°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,z) = U(\eta_1,\eta_2) - 2k\ln|x|, \quad \eta_1 = y|x|^{k(\lambda_2-\lambda_1)-1}, \quad \eta_2 = z|x|^{k(\lambda_3-\lambda_1)-1},$$
$$w(x,y,z) = V(\zeta_1,\zeta_2) - 2kx, \quad \zeta_1 = y\exp\big[k(\lambda_2-\lambda_1)x\big], \quad \zeta_2 = z\exp\big[k(\lambda_3-\lambda_1)x\big],$$

where k is an arbitrary constant.

4°. For other exact solutions, see equation 10.3.2.3 with $f(w) = a_1e^{\lambda_1 w}$, $g(w) = a_2e^{\lambda_2 w}$, and $h(w) = a_3e^{\lambda_3 w}$.

5. $a_1\dfrac{\partial}{\partial x}\left(e^{\lambda_1 w}\dfrac{\partial w}{\partial x}\right)+a_2\dfrac{\partial}{\partial y}\left(e^{\lambda_2 w}\dfrac{\partial w}{\partial y}\right)+a_3\dfrac{\partial}{\partial z}\left(e^{\lambda_3 w}\dfrac{\partial w}{\partial z}\right)=be^{\beta w}.$

1°. Suppose $w(x,y,z)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm C_1^{\beta-\lambda_1}x + C_2, \pm C_1^{\beta-\lambda_2}y + C_3, \pm C_1^{\beta-\lambda_3}z + C_4) + 2\ln|C_1|,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs are chosen arbitrarily).

2°. There is a "two-dimensional" solution of the form

$$w(x,y,z) = U(\xi,\eta) + \frac{2}{\lambda_1-\beta}\ln|x|, \quad \xi = y|x|^{\frac{\beta-\lambda_2}{\lambda_1-\beta}}, \quad \eta = z|x|^{\frac{\beta-\lambda_3}{\lambda_1-\beta}}.$$

10.3. Three-Dimensional Equations Involving Arbitrary Functions

10.3.1. Heat and Mass Transfer Equations of the Form

$$\frac{\partial}{\partial x}\left[f_1(x)\frac{\partial w}{\partial x}\right]+\frac{\partial}{\partial y}\left[f_2(y)\frac{\partial w}{\partial y}\right]+\frac{\partial}{\partial z}\left[f_3(z)\frac{\partial w}{\partial z}\right]=g(w)$$

▷ *Equations of this type describe steady-state heat/mass transfer or combustion processes in inhomogeneous anisotropic media. Here, $f_1(x)$, $f_2(y)$, and $f_3(z)$ are the principal thermal diffusivities (diffusion coefficients) dependent on coordinates, and $g = g(w)$ is the kinetic function, which defines the law of heat (substance) release or absorption.*

1. $a\dfrac{\partial^2 w}{\partial x^2}+b\dfrac{\partial^2 w}{\partial y^2}+c\dfrac{\partial^2 w}{\partial z^2}=f(w).$

1°. Traveling-wave solution:

$$w = w(\theta), \qquad \theta = Ax + By + Cz.$$

The function $w(\theta)$ is defined implicitly by

$$\int\left[C_1+\frac{2}{aA^2+bB^2+cC^2}F(w)\right]^{-1/2}dw = C_2 \pm \theta, \qquad F(w)=\int f(w)\,dw,$$

where A, B, C, C_1, and C_2 are arbitrary constants.

2°. Solution:

$$w = w(r), \qquad r^2 = \frac{(x+C_1)^2}{a}+\frac{(y+C_2)^2}{b}+\frac{(z+C_3)^2}{c},$$

where C_1, C_2, and C_3 are arbitrary constants, and the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr}+\frac{2}{r}w'_r = f(w).$$

3°. "Two-dimensional" solution:

$$w = U(\xi,\eta), \quad \xi = \frac{y}{\sqrt{b}}+\frac{x}{\sqrt{a}C}, \quad \eta = (C^2-1)\frac{x^2}{a}-2C\frac{xy}{\sqrt{ab}}+C^2\frac{z^2}{c},$$

where C is an arbitrary constant ($C \neq 0$), and the function $U = U(\xi, \eta)$ is determined by the equation

$$\left(1 + \frac{1}{C^2}\right)\frac{\partial^2 U}{\partial \xi^2} - 4\xi\frac{\partial^2 U}{\partial \xi \partial \eta} + 4C^2(\xi^2 + \eta)\frac{\partial^2 U}{\partial \eta^2} + 2(2C^2 - 1)\frac{\partial U}{\partial \eta} = f(U).$$

Remark. The solution specified in Item 3° can be used to obtain other "two-dimensional" solutions by means of the following cyclic permutations of variables and determining parameters:

$$\begin{array}{ccc} & (x, a) & \\ \nearrow & & \searrow \\ (z, c) & \longleftarrow & (y, b) \end{array}$$

4°. "Two-dimensional" solution:

$$w = V(\zeta, \rho), \quad \zeta = \frac{Ax}{\sqrt{a}} + \frac{By}{\sqrt{b}} + \frac{Cz}{\sqrt{c}}, \quad \rho^2 = \left(\frac{Bx}{\sqrt{a}} - \frac{Ay}{\sqrt{b}}\right)^2 + \left(\frac{Cy}{\sqrt{b}} - \frac{Bz}{\sqrt{c}}\right)^2 + \left(\frac{Az}{\sqrt{c}} - \frac{Cx}{\sqrt{a}}\right)^2,$$

where A, B, and C are arbitrary constants and the function $V = V(\zeta, \rho)$ is determined by the equation

$$\frac{\partial^2 V}{\partial \zeta^2} + \frac{\partial^2 V}{\partial \rho^2} + \frac{1}{\rho}\frac{\partial V}{\partial \rho} = \frac{1}{A^2 + B^2 + C^2} f(V).$$

5°. The transformation $x = \sqrt{a}\,\bar{x}$, $y = \sqrt{b}\,\bar{y}$, $z = \sqrt{c}\,\bar{z}$ brings the original equation to the form $\Delta w = f(w)$.

2. $a\dfrac{\partial^2 w}{\partial x^2} + \dfrac{\partial}{\partial y}\left(by^n\dfrac{\partial w}{\partial y}\right) + \dfrac{\partial}{\partial z}\left(cz^m\dfrac{\partial w}{\partial z}\right) = f(w).$

1°. For $n = m = 0$, see equation 10.3.1.1.

2°. Functional separable solution for $n \neq 2$ and $m \neq 2$:

$$w = w(r), \qquad r^2 = 4\left[\frac{x^2}{4a} + \frac{y^{2-n}}{b(2-n)^2} + \frac{z^{2-m}}{c(2-m)^2}\right],$$

where the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{A}{r}w'_r = f(w), \qquad A = \frac{2(4-n-m)}{(2-n)(2-m)}.$$

3°. "Two-dimensional" solution for $n \neq 2$ and $m \neq 2$:

$$w = U(x, \xi), \qquad \xi^2 = 4\left[\frac{y^{2-n}}{b(2-n)^2} + \frac{z^{2-m}}{c(2-m)^2}\right],$$

where the function $U(x, \xi)$ is determined by the differential equation

$$a\frac{\partial^2 U}{\partial x^2} + \frac{\partial^2 U}{\partial \xi^2} + \frac{B}{\xi}\frac{\partial U}{\partial \xi} = f(U), \qquad B = \frac{4 - nm}{(2-n)(2-m)}.$$

4°. There are "two-dimensional" solutions of the following forms:

$$w = V(y, \eta), \quad \eta^2 = 4\left[\frac{x^2}{4a} + \frac{z^{2-m}}{c(2-m)^2}\right],$$

$$w = W(z, \zeta), \quad \zeta^2 = 4\left[\frac{x^2}{4a} + \frac{y^{2-n}}{b(2-n)^2}\right].$$

⊙ *Reference for equation* 10.3.1.2: A. D. Polyanin and A. I. Zhurov (1998).

3. $\dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right)+\dfrac{\partial}{\partial z}\left(cz^k\dfrac{\partial w}{\partial z}\right)=f(w).$

1°. Functional separable solution for $n\neq 2$, $m\neq 2$, and $k\neq 2$:

$$w=w(r),\qquad r^2=4\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{y^{2-m}}{b(2-m)^2}+\frac{z^{2-k}}{c(2-k)^2}\right],$$

where the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr}+\frac{A}{r}w'_r=f(w),\qquad A=2\left(\frac{1}{2-n}+\frac{1}{2-m}+\frac{1}{2-k}\right)-1.$$

2°. There are "two-dimensional" solutions of the following forms:

$$w=U(x,\xi),\quad \xi^2=4\left[\frac{y^{2-m}}{b(2-m)^2}+\frac{z^{2-k}}{c(2-k)^2}\right],$$
$$w=V(y,\eta),\quad \eta^2=4\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{z^{2-k}}{c(2-k)^2}\right],$$
$$w=W(z,\zeta),\quad \zeta^2=4\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{y^{2-m}}{b(2-m)^2}\right].$$

⊙ *Reference for equation* 10.3.1.3: A. D. Polyanin and A. I. Zhurov (1998).

4. $\dfrac{\partial}{\partial x}\left(ae^{\beta x}\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(be^{\gamma y}\dfrac{\partial w}{\partial y}\right)+\dfrac{\partial}{\partial z}\left(ce^{\lambda z}\dfrac{\partial w}{\partial z}\right)=f(w).$

1°. Functional separable solution for $\beta\neq 0$, $\gamma\neq 0$, and $\lambda\neq 0$:

$$w=w(r),\qquad r^2=4\left(\frac{e^{-\beta x}}{a\beta^2}+\frac{e^{-\gamma y}}{b\gamma^2}+\frac{e^{-\lambda z}}{c\lambda^2}\right),$$

where the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr}-\frac{1}{r}w'_r=f(w).$$

2°. There are "two-dimensional" solutions of the following forms:

$$w=U(x,\xi),\quad \xi^2=4\left(\frac{e^{-\gamma y}}{b\gamma^2}+\frac{e^{-\lambda z}}{c\lambda^2}\right),$$
$$w=V(y,\eta),\quad \eta^2=4\left(\frac{e^{-\beta x}}{a\beta^2}+\frac{e^{-\lambda z}}{c\lambda^2}\right),$$
$$w=W(z,\zeta),\quad \zeta^2=4\left(\frac{e^{-\beta x}}{a\beta^2}+\frac{e^{-\gamma y}}{b\gamma^2}\right).$$

⊙ *Reference for equation* 10.3.1.4: A. D. Polyanin and A. I. Zhurov (1998).

5. $\dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(by^m\dfrac{\partial w}{\partial y}\right)+\dfrac{\partial}{\partial z}\left(ce^{\lambda z}\dfrac{\partial w}{\partial z}\right)=f(w).$

1°. Functional separable solution for $n\neq 2$, $m\neq 2$, and $\lambda\neq 0$:

$$w=w(r),\qquad r^2=4\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{y^{2-m}}{b(2-m)^2}+\frac{e^{-\lambda z}}{c\lambda^2}\right],$$

where the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr}+\frac{A}{r}w'_r=f(w),\qquad A=2\left(\frac{1}{2-n}+\frac{1}{2-m}\right)-1.$$

2°. There are "two-dimensional" solutions of the following forms:

$$w=U(x,\xi),\quad \xi^2=4\left[\frac{y^{2-m}}{b(2-m)^2}+\frac{e^{-\lambda z}}{c\lambda^2}\right],$$
$$w=V(y,\eta),\quad \eta^2=4\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{e^{-\lambda z}}{c\lambda^2}\right],$$
$$w=W(z,\zeta),\quad \zeta^2=4\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{y^{2-m}}{b(2-m)^2}\right].$$

6. $\dfrac{\partial}{\partial x}\left(ax^n\dfrac{\partial w}{\partial x}\right)+\dfrac{\partial}{\partial y}\left(be^{\beta y}\dfrac{\partial w}{\partial y}\right)+\dfrac{\partial}{\partial z}\left(ce^{\lambda z}\dfrac{\partial w}{\partial z}\right)=f(w).$

1°. Functional separable solution for $n\neq 2$, $\beta\neq 0$, and $\lambda\neq 0$:

$$w=w(r),\qquad r^2=4\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{e^{-\beta y}}{b\beta^2}+\frac{e^{-\lambda z}}{c\lambda^2}\right],$$

where the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr}+\frac{n}{2-n}\frac{1}{r}w'_r=f(w). \tag{1}$$

Special case 1. For $n=0$ and any $f=f(w)$, equation (1) can be solved by quadrature to obtain

$$\int\left[C_1+2\int f(w)\,dw\right]^{-1/2}dw=C_2\pm r,$$

where C_1 and C_2 are arbitrary constants.

Special case 2. For $n=1$ and $f(w)=Ae^{\beta w}$, equation (1) has the one-parameter solution

$$w(r)=\frac{1}{\beta}\ln\left(-\frac{8C}{\beta A}\right)-\frac{2}{\beta}\ln(r^2+C),$$

where C is an arbitrary constant.

2°. There are "two-dimensional" solutions of the following forms:

$$w=U(x,\xi),\quad \xi^2=4\left[\frac{e^{-\beta y}}{b\beta^2}+\frac{e^{-\lambda z}}{c\lambda^2}\right],$$
$$w=V(y,\eta),\quad \eta^2=4\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{e^{-\lambda z}}{c\lambda^2}\right],$$
$$w=W(z,\zeta),\quad \zeta^2=4\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{e^{-\beta y}}{b\beta^2}\right].$$

⊙ *Reference for equation* 10.3.1.6: A. D. Polyanin and A. I. Zhurov (1998).

7. $\dfrac{\partial}{\partial x}\left[f_1(x)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[f_2(y)\dfrac{\partial w}{\partial y}\right]+\dfrac{\partial}{\partial z}\left[f_3(z)\dfrac{\partial w}{\partial z}\right]=aw\ln w+bw.$

This is a special case of equation 10.3.3.6 with $g_1(x)=b$ and $g_2(y)=g_3(z)=0$.

10.3.2. Heat and Mass Transfer Equations with Complicating Factors

1. $(a_1x+b_1y+c_1z+d_1)\dfrac{\partial w}{\partial x}+(a_2x+b_2y+c_2z+d_2)\dfrac{\partial w}{\partial y}$

$$+(a_3x+b_3y+c_3z+d_3)\frac{\partial w}{\partial z}=\frac{\partial^2 w}{\partial x^2}+\frac{\partial^2 w}{\partial y^2}+\frac{\partial^2 w}{\partial z^2}-f(w).$$

This equation describes steady-state mass transfer with a volume chemical reaction in a three-dimensional translational-shear fluid flow.

Let k be a root of the cubic equation

$$\begin{vmatrix} a_1-k & a_2 & a_3 \\ b_1 & b_2-k & b_3 \\ c_1 & c_2 & c_3-k \end{vmatrix}=0,$$

and the constants A, B, and C solve the degenerate system of linear algebraic equations

$$\begin{aligned}(a_1-k)A+a_2B+a_3C&=0,\\ b_1A+(b_2-k)B+b_3C&=0,\\ c_1A+c_2B+(c_3-k)C&=0.\end{aligned}$$

One of the equations follows from the other two and, hence, can be omitted.

Solution:

$$w=w(\zeta),\qquad \zeta=Ax+By+Cz,$$

where the function $w(\zeta)$ is determined by the ordinary differential equation

$$(k\zeta+Ad_1+Bd_2+Cd_3)w'_\zeta=(A^2+B^2+C^2)w''_{\zeta\zeta}-f(w).$$

Remark. In the case of an incompressible fluid, some of the equation coefficients must satisfy the condition $a_1+b_2+c_3=0$.

2. $\dfrac{\partial}{\partial x}\left[(a_1x+b_1y+c_1z+d_1)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[(a_2x+b_2y+c_2z+d_2)\dfrac{\partial w}{\partial y}\right]$

$$+\frac{\partial}{\partial z}\left[(a_3x+b_3y+c_3z+d_3)\frac{\partial w}{\partial z}\right]=f(w).$$

Solutions are sought in the form

$$w=w(\zeta),\qquad \zeta=Ax+By+Cz+D,$$

where the constants A, B, C, and D are determined by solving the algebraic system of equations

$$\begin{aligned}a_1A^2+a_2B^2+a_3C^2&=A,\\ b_1A^2+b_2B^2+b_3C^2&=B,\\ c_1A^2+c_2B^2+c_3C^2&=C,\\ d_1A^2+d_2B^2+d_3C^2&=D.\end{aligned}$$

The first three equations are first solved for A, B, and C. The resulting expressions are then substituted into the last equation to evaluate D. The desired function $w(\zeta)$ is determined by the ordinary differential equation

$$\zeta w''_{\zeta\zeta}+(a_1A+b_2B+c_3C)w'_\zeta=f(w).$$

3. $\dfrac{\partial}{\partial x}\left[f(w)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[g(w)\dfrac{\partial w}{\partial y}\right]+\dfrac{\partial}{\partial z}\left[h(w)\dfrac{\partial w}{\partial z}\right]=0.$

This equation describes steady-state heat/mass transfer or combustion processes in inhomogeneous anisotropic media. Here, $f(w)$, $g(w)$, and $h(w)$ are the principal thermal diffusivities (diffusion coefficients) dependent on the temperature w.

1°. Suppose $w(x,y,z)$ is a solution of the equation in question. Then the functions

$$w_1 = w(\pm C_1 x + C_2, \pm C_1 y + C_3, \pm C_1 z + C_4),$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation (the plus or minus signs in front of C_1 are chosen arbitrarily).

2°. Traveling-wave solution in implicit form:

$$\int \left[k_1^2 f(w) + k_2^2 g(w) + k_3^2 h(w)\right] dw = C_1(k_1 x + k_2 y + k_3 z) + C_2,$$

where C_1, C_2, k_1, k_2, k_3, and λ are arbitrary constants.

3°. Solution:

$$w = w(\theta), \quad \theta = \frac{C_1 y + C_2 z + C_3}{x + C_4}, \tag{1}$$

where $C_1, \ldots, C_4$ are arbitrary constants, and the function $w(\theta)$ is determined by the ordinary differential equation

$$[\theta^2 f(w) w'_\theta]'_\theta + C_1^2 [g(w) w'_\theta]'_\theta + C_2^2 [h(w) w'_\theta]'_\theta = 0,$$

which admits the first integral

$$[\theta^2 f(w) + C_1^2 g(w) + C_2^2 h(w)] w'_\theta = C_5.$$

For $C_5 \neq 0$, treating w as the independent variable, one obtains a Riccati equation for $\theta = \theta(w)$:

$$C_5 \theta'_w = \theta^2 f(w) + C_1^2 g(w) + C_2^2 h(w). \tag{2}$$

For exact solutions of this equation, which can be reduced to a second-order linear equation; see Polyanin and Zaitsev (2003).

Relations (1) and equation (2) can be used to obtain two other "one-dimensional" solutions by means of the following cyclic permutations of variables and determining functions:

$$\begin{array}{ccc} & (x, f) & \\ \nearrow & & \searrow \\ (z, h) & \longleftarrow & (y, g) \end{array} \tag{3}$$

4°. "Two-dimensional" solution (a and b are arbitrary constants):

$$w(x,y,z) = U(x,\zeta), \quad \zeta = ay + bz, \tag{4}$$

where the function $U = U(x,\zeta)$ is determined by a differential equation of the form 9.4.4.8:

$$\frac{\partial}{\partial x}\left[f(U)\frac{\partial U}{\partial x}\right]+\frac{\partial}{\partial \zeta}\left[\psi(U)\frac{\partial U}{\partial \zeta}\right]=0, \quad \psi(U) = a^2 g(U) + b^2 h(U), \tag{5}$$

which can be reduced to a linear equation.

Relations (4) and equation (5) can be used to obtain two other "two-dimensional" solutions by means of the cyclic permutations of variables and determining functions; see (3).

5°. There are "two-dimensional" solutions of the following forms:

$$w(x,y,z) = V(z_1, z_2), \quad z_1 = a_1x + a_2y + a_3z, \quad z_2 = b_1x + b_2y + b_3z;$$
$$w(x,y,z) = W(\xi, \eta), \quad \xi = y/x, \quad \eta = z/x,$$

where the a_n and b_n are arbitrary constants (the first solution generalizes the Items 3° and 4°).

6°. Let $g(w) = af(w)$. Then, there is a "two-dimensional" solution of the form

$$w(x,y,z) = u(r,z), \quad r = ax^2 + y^2.$$

7°. Let $g(w) = af(w)$ and $h(w) = bf(w)$. Then, the transformation

$$v = \int f(w)\,dw, \quad y = \sqrt{a}\,\overline{y}, \quad z = \sqrt{b}\,\overline{z}$$

leads to the Laplace equation

$$\frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial \overline{y}^2} + \frac{\partial^2 v}{\partial \overline{z}^2} = 0.$$

For solutions of this linear equation, see Tikhonov and Samarskii (1990) and Polyanin (2002).

4. $$\frac{\partial}{\partial x}\left[f_1(w)\frac{\partial w}{\partial x}\right] + \frac{\partial}{\partial y}\left[f_2(w)\frac{\partial w}{\partial y}\right] + \frac{\partial}{\partial z}\left[f_3(w)\frac{\partial w}{\partial z}\right]$$
$$= (a_1x+b_1y+c_1z+d_1)\frac{\partial w}{\partial x} + (a_2x+b_2y+c_2z+d_2)\frac{\partial w}{\partial y} + (a_3x+b_3y+c_3z+d_3)\frac{\partial w}{\partial z}.$$

This equation describes steady-state anisotropic heat/mass transfer with a volume chemical reaction in a three-dimensional translational-shear fluid flow.

Let k be a root of the cubic equation

$$\begin{vmatrix} a_1 - k & a_2 & a_3 \\ b_1 & b_2 - k & b_3 \\ c_1 & c_2 & c_3 - k \end{vmatrix} = 0,$$

and the constants A, B, and C solve the degenerate system of linear algebraic equations

$$(a_1 - k)A + a_2B + a_3C = 0,$$
$$b_1A + (b_2 - k)B + b_3C = 0,$$
$$c_1A + c_2B + (c_3 - k)C = 0.$$

One of the equations follows from the other two and, hence, can be omitted.

Solution:

$$w = w(\zeta), \quad \zeta = Ax + By + Cz, \tag{1}$$

where the function $w(\zeta)$ is determined by the ordinary differential equation

$$[\varphi(w)w'_\zeta]'_\zeta = (k\zeta + Ad_1 + Bd_2 + Cd_3)w'_\zeta,$$
$$\varphi(w) = A^2f_1(w) + B^2f_2(w) + C^2f_3(w).$$

Remark 1. A more general equation, with an additional term $g(w)$ on the right-hand side, where g is an arbitrary function, also has a solution of the form (1).

Remark 2. In the case of an incompressible fluid, some of the equation coefficients must satisfy the condition $a_1 + b_2 + c_3 = 0$.

10.3.3. Other Equations

1. $\dfrac{\partial^2 w}{\partial x^2}+\dfrac{\partial^2 w}{\partial y^2}+\dfrac{\partial^2 w}{\partial z^2}=f(w)\left[\left(\dfrac{\partial w}{\partial x}\right)^2+\left(\dfrac{\partial w}{\partial y}\right)^2+\left(\dfrac{\partial w}{\partial z}\right)^2\right].$

The substitution

$$U=\int\frac{dw}{F(w)},\qquad \text{where}\quad F(w)=\exp\left[\int f(w)\,dw\right],$$

leads to the three-dimensional Laplace equation for $U=U(x,y,z)$:

$$\frac{\partial^2 U}{\partial x^2}+\frac{\partial^2 U}{\partial y^2}+\frac{\partial^2 U}{\partial z^2}=0.$$

For solutions of this linear equation, see Tikhonov and Samarskii (1990) and Polyanin (2002).

Remark. For a more complicated equation of the form $(\mathbf{v}\cdot\nabla)w=\Delta w-f(w)|\nabla w|^2$, with an additional convective term, see 10.4.1.1.

2. $ax^n\dfrac{\partial^2 w}{\partial x^2}+by^m\dfrac{\partial^2 w}{\partial y^2}+cz^k\dfrac{\partial^2 w}{\partial z^2}=f(w).$

1°. Functional separable solution for $n\neq 2$, $m\neq 2$, and $k\neq 2$:

$$w=w(r),\qquad r^2=4\left[\frac{x^{2-n}}{a(2-n)^2}+\frac{y^{2-m}}{b(2-m)^2}+\frac{z^{2-k}}{c(2-k)^2}\right],$$

where the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr}+\frac{A}{r}w'_r=f(w),\qquad A=5-2\left(\frac{1}{2-n}+\frac{1}{2-m}+\frac{1}{2-k}\right).$$

2°. There is a "two-dimensional" solution of the form

$$w(x,y,z)=U(x,\rho),\qquad \rho^2=4\left[\frac{y^{2-m}}{b(2-m)^2}+\frac{z^{2-k}}{c(2-k)^2}\right].$$

This solution can be used to obtain other "two-dimensional" solutions by means of the following cyclic permutations of variables and determining parameters:

$$\begin{array}{ccc} & (x,a,n) & \\ \nearrow & & \searrow \\ (z,c,k) & \longleftarrow & (y,b,m) \end{array}$$

3. $ae^{\lambda x}\dfrac{\partial^2 w}{\partial x^2}+be^{\mu y}\dfrac{\partial^2 w}{\partial y^2}+ce^{\nu z}\dfrac{\partial^2 w}{\partial z^2}=f(w).$

1°. Functional separable solution for $\lambda\neq 0$, $\mu\neq 0$, and $\nu\neq 0$:

$$w=w(r),\qquad r^2=4\left(\frac{e^{-\lambda x}}{a\lambda^2}+\frac{e^{-\mu y}}{b\mu^2}+\frac{e^{-\nu z}}{c\nu^2}\right),$$

where the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{5}{r}w'_r = f(w).$$

2°. There is a "two-dimensional" solution of the form

$$w(x,y,z) = U(x,\xi), \qquad \xi^2 = 4\left(\frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2}\right).$$

This solution can be used to obtain other "two-dimensional" solutions by means of the following cyclic permutations of the variables and determining parameters:

$$\begin{array}{ccc} & (x,a,\lambda) & \\ \nearrow & & \searrow \\ (z,c,\nu) & \longleftarrow & (y,b,\mu) \end{array}$$

4. $$ax^n\frac{\partial^2 w}{\partial x^2} + by^m\frac{\partial^2 w}{\partial y^2} + ce^{\nu z}\frac{\partial^2 w}{\partial z^2} = f(w).$$

1°. Functional separable solution for $n \neq 2$, $m \neq 2$, and $\nu \neq 0$:

$$w = w(r), \qquad r^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2} + \frac{e^{-\nu z}}{c\nu^2}\right],$$

where the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{A}{r}w'_r = f(w), \qquad A = 2\left(\frac{1-n}{2-n} + \frac{1-m}{2-m}\right) + 1.$$

2°. There are "two-dimensional" solutions of the following forms:

$$w = U(x,\xi), \quad \xi^2 = 4\left[\frac{y^{2-m}}{b(2-m)^2} + \frac{e^{-\nu z}}{c\nu^2}\right],$$

$$w = V(y,\eta), \quad \eta^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\nu z}}{c\nu^2}\right],$$

$$w = W(z,\zeta), \quad \zeta^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{y^{2-m}}{b(2-m)^2}\right].$$

5. $$ax^n\frac{\partial^2 w}{\partial x^2} + be^{\mu y}\frac{\partial^2 w}{\partial y^2} + ce^{\nu z}\frac{\partial^2 w}{\partial z^2} = f(w).$$

1°. Functional separable solution for $n \neq 2$, $\mu \neq 0$, and $\nu \neq 0$:

$$w = w(r), \qquad r^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2}\right],$$

where the function $w(r)$ is determined by the ordinary differential equation

$$w''_{rr} + \frac{8-5n}{2-n}\frac{1}{r}w'_r = f(w).$$

2°. There are "two-dimensional" solutions of the following forms:

$$w = U(x,\xi), \quad \xi^2 = 4\left[\frac{e^{-\mu y}}{b\mu^2} + \frac{e^{-\nu z}}{c\nu^2}\right],$$

$$w = V(y,\eta), \quad \eta^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\nu z}}{c\nu^2}\right],$$

$$w = W(z,\zeta), \quad \zeta^2 = 4\left[\frac{x^{2-n}}{a(2-n)^2} + \frac{e^{-\mu y}}{b\mu^2}\right].$$

6. $\dfrac{\partial}{\partial x}\left[f_1(x)\dfrac{\partial w}{\partial x}\right]+\dfrac{\partial}{\partial y}\left[f_2(y)\dfrac{\partial w}{\partial y}\right]+\dfrac{\partial}{\partial z}\left[f_3(z)\dfrac{\partial w}{\partial z}\right]$
$= aw\ln w+\big[g_1(x)+g_2(y)+g_3(z)\big]w.$

Multiplicative separable solution:

$$w(x,y,z)=\varphi(x)\psi(y)\chi(z),$$

where the functions $\varphi=\varphi(x)$, $\psi=\psi(y)$, and $\chi=\chi(z)$ are determined by the ordinary differential equations (C_1 and C_2 are arbitrary constants)

$$[f_1(x)\varphi'_x]'_x-a\varphi\ln\varphi-[g_1(x)+C_1]\varphi=0,$$
$$[f_2(y)\psi'_y]'_y-a\psi\ln\psi-[g_2(y)+C_2]\psi=0,$$
$$[f_3(z)\chi'_z]'_z-a\chi\ln\chi-[g_3(z)-C_1-C_2]\chi=0.$$

10.4. Equations with n Independent Variables

10.4.1. Equations of the Form $\dfrac{\partial}{\partial x_1}\left[f_1(x_1)\dfrac{\partial w}{\partial x_1}\right]+\cdots+\dfrac{\partial}{\partial x_n}\left[f_n(x_n)\dfrac{\partial w}{\partial x_n}\right]=g(x_1,\ldots,x_n,w)$

1. $\displaystyle\sum_{k=1}^{n}\frac{\partial^2 w}{\partial x_k^2}=f(w)\sum_{k=1}^{n}\left(\frac{\partial w}{\partial x_k}\right)^2+\sum_{k=1}^{n}g_k(x_1,\ldots,x_n)\frac{\partial w}{\partial x_k}.$

The substitution

$$U=\int\frac{dw}{F(w)},\qquad\text{where}\quad F(w)=\exp\left[\int f(w)\,dw\right],$$

leads to the linear equation

$$\sum_{k=1}^{n}\frac{\partial^2 U}{\partial x_k^2}=\sum_{k=1}^{n}g_k(x_1,\ldots,x_n)\frac{\partial U}{\partial x_k}.$$

2. $\displaystyle\sum_{k=1}^{n}\frac{\partial}{\partial x_k}\left(a_k x_k^{m_k}\frac{\partial w}{\partial x_k}\right)=f(w).$

Functional separable solution:

$$w=w(r),\qquad r^2=A\sum_{k=1}^{n}\frac{x_k^{2-m_k}}{a_k(2-m_k)^2},$$

where the function $w(r)$ is determined by the ordinary differential equation

$$\frac{d^2w}{dr^2}+\frac{B}{r}\frac{dw}{dr}=\frac{4}{A}f(w),\qquad B=\sum_{k=1}^{n}\frac{2}{2-m_k}-1.$$

Special case 1. For $f(w) = bw^p$, there is an exact solution of the form

$$w = \left[\frac{1}{b(1-p)}\left(\frac{p}{1-p} + \sum_{k=1}^{n}\frac{1}{2-m_k}\right)\right]^{\frac{1}{p-1}}\left[\sum_{k=1}^{n}\frac{x_k^{2-m_k}}{a_k(2-m_k)^2}\right]^{\frac{1}{1-p}}.$$

Special case 2. For $f(w) = be^{\lambda w}$, there is an exact solution of the form

$$w = -\frac{1}{\lambda}\ln\left[\sum_{k=1}^{n}\frac{x_k^{2-m_k}}{a_k(2-m_k)^2}\right] + \frac{1}{\lambda}\ln\frac{1-B}{2b\lambda}, \qquad B = \sum_{k=1}^{n}\frac{2}{2-m_k} - 1.$$

⊙ *Reference*: A. D. Polyanin and A. I. Zhurov (1998).

3. $\displaystyle\sum_{k=1}^{n}\frac{\partial}{\partial x_k}\left(a_k e^{\lambda_k x_k}\frac{\partial w}{\partial x_k}\right) = f(w).$

Functional separable solution:

$$w = w(r), \qquad r^2 = A\sum_{k=1}^{n}\frac{e^{-\lambda_k x_k}}{a_k\lambda_k^2},$$

where the function $w(r)$ is determined by the ordinary differential equation

$$\frac{d^2w}{dr^2} - \frac{1}{r}\frac{dw}{dr} = \frac{4}{A}f(w).$$

Special case 1. For $f(w) = bw^p$, there is an exact solution of the form

$$w = \left[\frac{p}{b(1-p)^2}\right]^{\frac{1}{p-1}}\left(\sum_{k=1}^{n}\frac{e^{-\lambda_k x_k}}{a_k\lambda_k^2}\right)^{\frac{1}{1-p}}.$$

Special case 2. For $f(w) = be^{\beta w}$, there is an exact solution of the form

$$w = -\frac{1}{\beta}\ln\left(b\beta\sum_{k=1}^{n}\frac{e^{-\lambda_k x_k}}{a_k\lambda_k^2}\right).$$

⊙ *Reference*: A. D. Polyanin and A. I. Zhurov (1998).

4. $\displaystyle\sum_{k=1}^{s}\frac{\partial}{\partial x_k}\left(a_k x_k^{m_k}\frac{\partial w}{\partial x_k}\right) + \sum_{k=s+1}^{n}\frac{\partial}{\partial x_k}\left(b_k e^{\lambda_k x_k}\frac{\partial w}{\partial x_k}\right) = f(w).$

1°. Functional separable solution:

$$w = w(r), \qquad r^2 = A\sum_{k=1}^{s}\frac{x_k^{2-m_k}}{a_k(2-m_k)^2} + A\sum_{k=s+1}^{n}\frac{e^{-\lambda_k x_k}}{b_k\lambda_k^2},$$

where the function $w(r)$ is determined by the ordinary differential equation

$$\frac{d^2w}{dr^2} + \frac{B}{r}\frac{dw}{dr} = \frac{4}{A}f(w), \qquad B = \sum_{k=1}^{s}\frac{2}{2-m_k} - 1.$$

Special case 1. For $f(w) = cw^p$, there is an exact solution of the form

$$w = \left[\frac{1}{c(1-p)}\left(\frac{p}{1-p} + \sum_{k=1}^{s}\frac{1}{2-m_k}\right)\right]^{\frac{1}{p-1}}\left[\sum_{k=1}^{s}\frac{x_k^{2-m_k}}{a_k(2-m_k)^2} + \sum_{k=s+1}^{n}\frac{e^{-\lambda_k x_k}}{b_k\lambda_k^2}\right]^{\frac{1}{1-p}}.$$

Special case 2. For $f(w) = ce^{\beta w}$, there is an exact solution of the form

$$w = -\frac{1}{\beta}\ln\left[\sum_{k=1}^{s}\frac{x_k^{2-m_k}}{a_k(2-m_k)^2} + \sum_{k=s+1}^{n}\frac{e^{-\lambda_k x_k}}{b_k\lambda_k^2}\right] + \frac{1}{\beta}\ln\frac{1-B}{2c\beta}, \qquad B = \sum_{k=1}^{s}\frac{2}{2-m_k} - 1.$$

2°. We divide the equation variables into two groups (responsible for both power-law and exponential terms) and look for exact solutions in the form

$$w = w(y, z),$$

where

$$y^2 = A_1\sum_{k=1}^{q}\frac{x_k^{2-m_k}}{a_k(2-m_k)^2} + A_1\sum_{k=s+1}^{p}\frac{e^{-\lambda_k x_k}}{b_k\lambda_k^2}, \qquad 0 \le q \le s \le p \le n;$$
$$z^2 = A_2\sum_{k=q+1}^{s}\frac{x_k^{2-m_k}}{a_k(2-m_k)^2} + A_2\sum_{k=p+1}^{n}\frac{e^{-\lambda_k x_k}}{b_k\lambda_k^2}.$$

Then we obtain the following equation for w:

$$A_1\left(\frac{\partial^2 w}{\partial y^2} + \frac{B_1}{y}\frac{\partial w}{\partial y}\right) + A_2\left(\frac{\partial^2 w}{\partial z^2} + \frac{B_2}{z}\frac{\partial w}{\partial z}\right) = 4f(w),$$
$$B_1 = \sum_{k=1}^{q}\frac{2}{2-m_k} - 1, \quad B_2 = \sum_{k=q+1}^{s}\frac{2}{2-m_k} - 1.$$

For $B_1 = B_2 = 0$ and $A_1 = A_2 = 1$, this equation arises in plane problems of heat and mass transfer (see equations 9.1.1.1, 9.2.1.1, 9.3.1.1, 9.3.2.1, 9.3.3.1, and 9.4.1.1).

⊙ *Reference for equation* 10.4.1.4: A. D. Polyanin and A. I. Zhurov (1998).

5. $\displaystyle\sum_{k=1}^{n}\frac{\partial}{\partial x_k}\left[f_k(x_k)\frac{\partial w}{\partial x_k}\right] = aw\ln w + w\sum_{k=1}^{n}g_k(x_k).$

Multiplicative separable solution:

$$w(x_1, x_2, \ldots, x_n) = \varphi_1(x_1)\varphi_2(x_2)\ldots\varphi_n(x_n),$$

where the functions $\varphi_1 = \varphi_1(x_1)$, $\varphi_2 = \varphi_2(x_2)$, $\ldots$, $\varphi_n = \varphi_n(x_n)$ are determined by the ordinary differential equations

$$\frac{d}{dx_k}\left[f_k(x_k)\frac{d\varphi_k}{dx_k}\right] - a\varphi_k\ln\varphi_k - \left[g_k(x_k) + C_k\right]\varphi_k = 0; \qquad k = 1, 2, \ldots, n.$$

The arbitrary constants $C_1, \ldots, C_n$ are related by a single constraint, $C_1 + \cdots + C_n = 0$.

10.4.2. Other Equations

1. $\displaystyle\sum_{k=1}^{n} f_k(x_k)\frac{\partial^2 w}{\partial x_k^2} + \sum_{k=1}^{n} g_k(x_k)\frac{\partial w}{\partial x_k} = aw\ln w + w\sum_{k=1}^{n} h_k(x_k).$

Multiplicative separable solution:

$$w(x_1, x_2, \ldots, x_n) = \varphi_1(x_1)\varphi_2(x_2)\ldots\varphi_n(x_n),$$

where the functions $\varphi_1 = \varphi_1(x_1)$, $\varphi_2 = \varphi_2(x_2)$, $\ldots$, $\varphi_n = \varphi_n(x_n)$ are determined by the ordinary differential equations

$$f_k(x_k)\frac{d^2\varphi_k}{dx_k^2} + g_k(x_k)\frac{d\varphi_k}{dx_k} - a\varphi_k\ln\varphi_k - \big[h_k(x_k) + C_k\big]\varphi_k = 0; \qquad k = 1, 2, \ldots, n.$$

The arbitrary constants $C_1, \ldots, C_n$ are related by a single constraint, $C_1 + \cdots + C_n = 0$.

2. $\displaystyle\sum_{k=1}^{n} a_k x_k^{m_k}\frac{\partial^2 w}{\partial x_k^2} + \sum_{k=1}^{n} b_k x_k^{m_k-1}\frac{\partial w}{\partial x_k} = f(w).$

Functional separable solution:

$$w = w(r), \qquad r^2 = A\sum_{k=1}^{n}\frac{x_k^{2-m_k}}{a_k(2-m_k)^2}$$

where the function $w(r)$ is determined by the ordinary differential equation

$$\frac{d^2w}{dr^2} + \frac{B}{r}\frac{dw}{dr} = \frac{4}{A}f(w), \qquad B = 2\sum_{k=1}^{n}\frac{a_k(1-m_k)+b_k}{a_k(2-m_k)} - 1.$$

Special case 1. For $f(w) = cw^p$, there is an exact solution of the form

$$w = \left[\frac{1}{2c(1-p)}\left(\frac{1+p}{1-p} + B\right)\right]^{\frac{1}{p-1}}\left[\sum_{k=1}^{n}\frac{x_k^{2-m_k}}{a_k(2-m_k)^2}\right]^{\frac{1}{1-p}}.$$

Special case 2. For $f(w) = ce^{\beta w}$, there is an exact solution of the form

$$w = -\frac{1}{\beta}\ln\left[\sum_{k=1}^{n}\frac{x_k^{2-m_k}}{a_k(2-m_k)^2}\right] + \frac{1}{\beta}\ln\frac{1-B}{2c\beta}.$$

3. $\displaystyle\sum_{k=1}^{n} a_k e^{\lambda_k x_k}\frac{\partial^2 w}{\partial x_k^2} + \sum_{k=1}^{n} b_k e^{\lambda_k x_k}\frac{\partial w}{\partial x_k} = f(w).$

Functional separable solution:

$$w = w(r), \qquad r^2 = A\sum_{k=1}^{n}\frac{e^{-\lambda_k x_k}}{a_k\lambda_k^2},$$

where the function $w(r)$ is determined by the ordinary differential equation

$$\frac{d^2w}{dr^2} + \frac{B}{r}\frac{dw}{dr} = \frac{4}{A}f(w), \qquad B = 2n - 1 - 2\sum_{k=1}^{n}\frac{b_k}{a_k\lambda_k}.$$

Special case 1. For $f(w) = cw^p$, there is an exact solution of the form

$$w = \left[\frac{1}{2c(1-p)}\left(\frac{1+p}{1-p} + B\right)\right]^{\frac{1}{p-1}} \left(\sum_{k=1}^{n} \frac{e^{-\lambda_k x_k}}{a_k \lambda_k^2}\right)^{\frac{1}{1-p}}.$$

Special case 2. For $f(w) = ce^{\beta w}$, there is an exact solution of the form

$$w = -\frac{1}{\beta} \ln\left(\sum_{k=1}^{n} \frac{e^{-\lambda_k x_k}}{a_k \lambda_k^2}\right) + \frac{1}{\beta} \ln \frac{1-B}{2c\beta}.$$

4. $$\sum_{k=1}^{m_1}\left(a_k x_k^{n_k} \frac{\partial^2 w}{\partial x_k^2} + a_k p_k x_k^{n_k-1} \frac{\partial w}{\partial x_k}\right) + \sum_{k=1}^{m_2}\left(b_k e^{\lambda_k x_k} \frac{\partial^2 w}{\partial x_k^2} + b_k q_k e^{\lambda_k x_k} \frac{\partial w}{\partial x_k}\right) = f(w).$$

Functional separable solution:

$$w = w(r), \qquad r^2 = A\sum_{k=1}^{m_1} \frac{x_k^{2-n_k}}{a_k(2-n_k)^2} + A\sum_{k=1}^{m_2} \frac{e^{-\lambda_k x_k}}{b_k \lambda_k^2},$$

where the function $w(r)$ is determined by the ordinary differential equation

$$\frac{d^2 w}{dr^2} + \frac{B}{r}\frac{dw}{dr} = \frac{4}{A} f(w), \qquad B = 2\sum_{k=1}^{m_1} \frac{1-n_k+p_k}{2-n_k} - 2\sum_{k=1}^{m_2} \frac{q_k}{\lambda_k} + 2m_2 - 1.$$

Chapter 11
Second-Order Equations Involving Mixed Derivatives and Some Other Equations

Preliminary remarks. Semilinear equations with mixed derivatives, which can be reduced to the canonical form by standard transformations (see Section 25.1), are not considered in this chapter. For hyperbolic equations of the form $\frac{\partial^2 w}{\partial x \partial y} = F\big(x, y, w, \frac{\partial w}{\partial x}, \frac{\partial w}{\partial y}\big)$ that contain mixed derivatives, see Section 7.5.

11.1. Equations Linear in the Mixed Derivative

11.1.1. Calogero Equation and Related Equations

1. $\dfrac{\partial^2 w}{\partial x \partial t} = w\dfrac{\partial^2 w}{\partial x^2}.$

This is a special case of equation 11.1.1.5 with $f(u) = 0$.

General solution:

$$w(x,t) = \int_a^{\Phi} F(\xi)e^{-t/\xi}d\xi + \frac{dG(t)}{dt},$$

where $\Phi = \Phi(x,t)$ is defined implicitly by

$$x - \int_a^{\Phi} \xi F(\xi)e^{-t/\xi}d\xi + G(t) = 0,$$

and $F(\xi)$ and $G(t)$ are arbitrary functions, and a is an arbitrary constant.

⊙ Yu. N. Kosovtsov (2007, from *EqWorld*: http://eqworld.ipmnet.ru/eqarchive/view.php?id=86).

2. $\dfrac{\partial^2 w}{\partial x \partial t} = w\dfrac{\partial^2 w}{\partial x^2} + a.$

This is a special case of equation 11.1.1.5 with $f(u) = a$.

3. $\dfrac{\partial^2 w}{\partial x \partial t} + w\dfrac{\partial^2 w}{\partial x^2} + \dfrac{1}{2}\left(\dfrac{\partial w}{\partial x}\right)^2 = 0.$

Hunter–Saxton equation. It is an integrable equation that arises in the theoretical study of nematic liquid crystals. If the molecules in the liquid crystal are initially all aligned, and some of them are then wiggled slightly, this disturbance in orientation will propagate through the crystal, and this equation describes certain aspects of such orientation waves.

The Hunter–Saxton equation is often written in the form $(w_t + ww_x)_x = \frac{1}{2}w_x^2$.
The substitution $w = -u$ leads to an equation of the form 11.1.1.5 with $a = \frac{1}{2}$:

$$\frac{\partial^2 u}{\partial x \partial t} = u\frac{\partial^2 u}{\partial x^2} + \frac{1}{2}\left(\frac{\partial u}{\partial x}\right)^2.$$

⊙ *References*: J. K. Hunter and R. Saxton (1991), J. K. Hunter and Y. Zheng (1994, 1995 *a, b*), P. G. Gennes and J. Prost (1994), R. Beals, D. H. Sattinger and J. Szmigielski (2001), A. Bressan and A. Constantin (2005), J. Lenells (2007).

4. $$\frac{\partial^2 w}{\partial x \partial t} = w\frac{\partial^2 w}{\partial x^2} + a\left(\frac{\partial w}{\partial x}\right)^2.$$

This is a special case of equation 11.1.1.5 with $f(u) = au^2$.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w(C_2 x + C_2\varphi(t), C_1 C_2 t + C_3) + \varphi_t'(t),$$

where C_1, C_2, and C_3 are arbitrary constants, and $\varphi(t)$ is an arbitrary function, is also a solution of the equation.

2°. General solution in parametric form:

$$w = f_t'(t) + \int \big[g(z) - at\big]^{\frac{1-a}{a}}\, dz,$$
$$x = -f(t) + \int \big[g(z) - at\big]^{\frac{1}{a}}\, dz,$$

where $f(t)$ and $g(z)$ are arbitrary functions and z is the parameter.

3°. Conservation laws:

$$D_t\big[(w_x)^{1/a}\big] + D_x\big[-w(w_x)^{1/a}\big] = 0,$$
$$D_t\big[(w_{xx})^{\frac{1}{2a+1}}\big] + D_x\big[-w(w_{xx})^{\frac{1}{2a+1}}\big] = 0.$$

⊙ *References for equation* 11.1.1.4: F. Calogero (1984), J. K. Hunter and R. Saxton (1991), M. V. Pavlov (2001).

5. $$\frac{\partial^2 w}{\partial x \partial t} = w\frac{\partial^2 w}{\partial x^2} + f\left(\frac{\partial w}{\partial x}\right).$$

Calogero equation. This is special case of equations 11.1.1.6 and 11.1.1.8.

1°. Suppose $w(x, t)$ is a solution of this equation. Then the function

$$w_1 = C_1^{-1} w(C_1 x + C_1\varphi(t), t + C_2) + \varphi_t'(t),$$

where C_1 and C_2 are arbitrary constants and $\varphi(t)$ is an arbitrary function, is also a solution of the equation.

2°. Degenerate solution linear in x:

$$w(x,t) = \varphi(t)x + \psi(t),$$

where $\psi(t)$ is an arbitrary function and the function $\varphi(t)$ is defined implicitly by (C is an arbitrary constant)

$$\int \frac{d\varphi}{f(\varphi)} = t + C.$$

3°. Introduce the notation

$$u = \frac{\partial w}{\partial x}, \quad v = \Phi(u) = \exp\left[\int \frac{u\,du}{f(u)}\right]. \tag{1}$$

The transformation

$$dz = v\,dx + vw\,dt, \quad dy = dt \qquad \left(dz = \frac{\partial z}{\partial x}\,dx + \frac{\partial z}{\partial t}\,dt\right) \tag{2}$$

defines the passage from x, t to the new independent variables z, y in accordance with the rule

$$\frac{\partial}{\partial x} = v\frac{\partial}{\partial z}, \quad \frac{\partial}{\partial t} = \frac{\partial}{\partial y} + vw\frac{\partial}{\partial z}. \tag{3}$$

This results in the first-order equation

$$\frac{\partial u}{\partial y} = f(u),$$

which is independent of z and can be treated as an ordinary differential equation. Integrating yields its solution in implicit form:

$$\int \frac{du}{f(u)} = y + \varphi(z), \tag{4}$$

where $\varphi(z)$ is an arbitrary function. With the first relations of (1) and (3), we obtain the equation

$$\frac{\partial w}{\partial z} = \frac{u}{v} \quad \Longrightarrow \quad \frac{\partial w}{\partial z} = \frac{u}{\Phi(u)},$$

whose general solution is given by

$$w = \int \frac{u\,dz}{\Phi(u)} + \psi(y), \tag{5}$$

where $\psi(y)$ is an arbitrary function, and $u = u(z,y)$ is defined implicitly by (4). The inverse of transformation (2) has the form

$$dx = \frac{1}{\Phi(u)}\,dz - w\,dy, \quad dt = dy. \tag{6}$$

Integrating the first relation in (6) yields

$$x = \int_{z_0}^{z} \frac{d\xi}{\Phi(u(\xi,y))} - \int_{y_0}^{y} w(z_0,\tau)\,d\tau, \tag{7}$$

where $w = w(z,y)$ is defined by (5), and x_0 and y_0 are any numbers.

Formulas (4), (5), and (7) with $y = t$ define the general solution of the equation in question in parametric form (z is the parameter).

4°. Conservation law:

$$D_t[\Phi(w_x)] + D_x[-w\Phi(w_x)] = 0,$$

where $D_t = \frac{\partial}{\partial t}$, $D_x = \frac{\partial}{\partial x}$, and the function $\Phi(u)$ is defined in (1).

⊙ *References for equation* 11.1.1.5: F. Calogero (1984), M. V. Pavlov (2001), H. C. Lei (2002), X. Yonga, Z. Zhang, and Y. Chen (2008).

6. $\dfrac{\partial^2 w}{\partial x \partial t} + [a(t)w + b(t)x]\dfrac{\partial^2 w}{\partial x^2} = F\left(t, \dfrac{\partial w}{\partial x}\right).$

By changing from the original variables to the Crocco variables

$$t,\ x,\ w = w(t,x) \quad \Longrightarrow \quad t,\ \eta,\ \Phi = \Phi(t,\eta), \quad \text{where} \quad \eta = \frac{\partial w}{\partial x}, \quad \Phi = \frac{\partial^2 w}{\partial x^2},$$

one arrives at the first-order equation

$$\frac{a(t)\eta + b(t)}{\Phi} - \frac{\partial}{\partial t}\frac{1}{\Phi} = \frac{\partial}{\partial \eta}\left[\frac{1}{\Phi}F(t,\eta)\right],$$

which becomes linear after substituting $\Phi = 1/\Psi$.

For details, see Example 26.40 in Subsection 26.6.1.

⊙ *References*: A. D. Polyanin and S. N. Aristov (2009), S. N. Aristov and A. D. Polyanin (2010).

7. $\dfrac{\partial^2 w}{\partial t \partial x} = \left[F\left(t, \dfrac{\partial w}{\partial x}\right) - a(t)w - b(t)x\right]\dfrac{\partial^2 w}{\partial x^2} + G\left(t, \dfrac{\partial w}{\partial x}\right).$

Generalized Calogero equation.

By changing from the original variables to the Crocco variables

$$t,\ x,\ w = w(t,x) \quad \Longrightarrow \quad t,\ \eta,\ \Phi = \Phi(t,\eta), \quad \text{where} \quad \eta = \frac{\partial w}{\partial x}, \quad \Phi = \frac{\partial^2 w}{\partial x^2},$$

one arrives at the first-order equation

$$\frac{a(t)\eta + b(t)}{\Phi} - \frac{\partial}{\partial t}\frac{1}{\Phi} = \frac{\partial}{\partial \eta}\left[F(t,\eta) + \frac{G(t,\eta)}{\Phi}\right],$$

which becomes linear after substituting $\Phi = 1/\Psi$.

For details, see Example 26.40 in Subsection 26.6.1.

⊙ *References for equation* 11.1.1.7: A. D. Polyanin and S. N. Aristov (2009), A. D. Polyanin and A. I. Zhurov (2009 *b*).

8. $\dfrac{\partial^2 w}{\partial x \partial t} = wF\left(t, \dfrac{\partial w}{\partial x}\right)\dfrac{\partial^2 w}{\partial x^2} + G\left(t, \dfrac{\partial w}{\partial x}\right).$

By setting $v = w_x$, let us rewrite the nonlinear equation as a system of equations:

$$v = \frac{\partial w}{\partial x}, \qquad \frac{\partial v}{\partial t} = wF(t,v)\frac{\partial v}{\partial x} + G(t,v).$$

Using the hodograph transformation

$$x = x(v,t), \qquad w = w(v,t),$$

with v and t treated as independent variables and x and w treated as the dependent variables, and expressing the "old" derivatives through the "new" ones,

$$v_x = \frac{1}{x_v}, \quad v_t = -\frac{x_t}{x_v}, \quad w_x = \frac{w_v}{x_v}, \quad w_t = w_t - \frac{x_t}{x_v}w_v,$$

we obtain the linear system of equations

$$v\frac{\partial x}{\partial v} = \frac{\partial w}{\partial v}, \qquad \frac{\partial x}{\partial t} + G(t,v)\frac{\partial x}{\partial v} + F(t,v)w = 0.$$

9. $\dfrac{\partial^2 w}{\partial x \partial t} + [a(t)w + b(t)x]\dfrac{\partial^2 w}{\partial x^2} = F\left(t, \dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right).$

By changing from the old variables t, x, and $w = w(x,t)$ to the new variable t, η, and $\Phi = \Phi(t,\eta)$ with η and Φ defined as $\eta = \frac{\partial w}{\partial x}$ and $\Phi = \frac{\partial^2 w}{\partial x^2}$, one arrives at the first-order equation

$$\frac{a(t)\eta + b(t)}{\Phi} - \frac{\partial}{\partial t}\frac{1}{\Phi} = \frac{\partial}{\partial \eta}\left[\frac{1}{\Phi}F(t,\eta,\Phi)\right].$$

⊙ *References*: A. D. Polyanin and S. N. Aristov (2009), S. N. Aristov and A. D. Polyanin (2010).

11.1.2. Khokhlov–Zabolotskaya and Related Equations

1. $\dfrac{\partial^2 w}{\partial x \partial t} - w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2 - \dfrac{\partial^2 w}{\partial y^2} = 0.$

Two-dimensional Khokhlov–Zabolotskaya equation. It describes the propagation of a sound beam in a nonlinear medium; t and y play the role of the space coordinates and x is a linear combination of time and a coordinate.

The equation of unsteady transonic gas flows (see 11.1.3.1 with $a = b = 1/2$)

$$2u_{x\tau} + u_x u_{xx} - u_{yy} = 0$$

can be reduced to the Khokhlov–Zabolotskaya equation; see Lin, Reissner, and Tsien (1948). To this end, one should pass to the new variable $\tau = 2t$, differentiate the equation with respect to x, and then substitute $w = -\partial u/\partial x$.

1°. Suppose $w(x,y,t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^{-2}C_2^2 w(C_1 x + C_3, C_2 y + C_4, C_1^{-1}C_2^2 t + C_5),$$
$$w_2 = w(x + \lambda y + \varphi(t), y + 2\lambda t, t) + \varphi_t'(t) - \lambda^2,$$

where $C_1, \ldots, C_5$ and λ are arbitrary constants and $\varphi = \varphi(t)$ is an arbitrary function, are also solutions of the equation.

2°. Solutions:

$$w(x,y,t) = -\frac{x}{t + C_1} + \varphi y + \psi,$$
$$w(x,y,t) = 2\varphi x + (\varphi_t' - 2\varphi^2)y^2 + \psi y + \chi,$$
$$w(x,y,t) = (\varphi y + \psi)x - \frac{1}{12\varphi^2}(\varphi y + \psi)^4 + \frac{1}{6}\varphi_t' y^3 + \frac{1}{2}\psi_t' y^2 + \chi y + \theta,$$
$$w(x,y,t) = C_1\sqrt{x + C_2 y + \varphi} + \varphi_t' - C_2^2,$$
$$w(x,y,t) = \frac{C_1}{t}\sqrt{4t(x + \varphi) - (y + C_2)^2} + \varphi_t',$$

where $\varphi = \varphi(t)$, $\psi = \psi(t)$, $\chi = \chi(t)$, and $\theta = \theta(t)$ are arbitrary functions, the prime stands for the differentiation, and C_1 and C_2 are arbitrary constants.

3°. Solution in implicit form:

$$tz + x + \lambda y + \lambda^2 t + \varphi(t) = F(z), \qquad z = w - \varphi_t'(t),$$

where $\varphi(t)$ and $F(z)$ are arbitrary functions. With $\lambda = 0$, this relation determines the general y-independent solution of the original equation.

4°. "Two-dimensional" generalized separable solution quadratic in x:

$$w = f(y,t)x^2 + g(y,t)x + h(y,t),$$

where the functions $f = f(y,t)$, $g = g(y,t)$, and $h = h(y,t)$ are determined by the system of differential equations

$$\begin{aligned} f_{yy} &= -6f^2, \\ g_{yy} &= -6fg + 2f_t, \\ h_{yy} &= -2fh + g_t - g^2. \end{aligned}$$

The subscripts y and t denote the corresponding partial derivatives. A particular solution of this system is given by

$$f = -\frac{1}{R^2}, \quad g = \frac{C_1(t)}{R^2} + C_2(t)R^3 - \frac{\varphi_t'(t)}{2R},$$
$$h = \frac{C_3(t)}{R} + C_4(t)R^2 + \frac{R^2}{3}\int \frac{1}{R}(g_t - g^2)\,dy - \frac{1}{3R}\int R^2(g_t - g^2)\,dy, \quad R = y + \varphi(t),$$

where $\varphi(t)$, $C_1(t)$, …, $C_4(t)$ are arbitrary functions.

5°. "Two-dimensional" solution:

$$w = xu(\xi,t), \quad \xi = yx^{-1/2},$$

where the function $u = u(\xi,t)$ is determined by the differential equation

$$2\xi\frac{\partial^2 u}{\partial\xi\partial t} + (\xi^2 u + 4)\frac{\partial^2 u}{\partial\xi^2} + \xi^2\left(\frac{\partial u}{\partial\xi}\right)^2 - 5\xi u\frac{\partial u}{\partial\xi} - 4\frac{\partial u}{\partial t} + 4u^2 = 0.$$

6°. "Two-dimensional" solution:

$$w = v(\zeta,t) + \frac{\alpha_t' + 4}{\alpha}x, \quad \zeta = y^2 + \alpha x,$$

where $\alpha = \alpha(t)$ is an arbitrary function and the function $v = v(\zeta,t)$ is determined by the differential equation

$$\alpha\frac{\partial^2 v}{\partial\zeta\partial t} - (\alpha^2 v + 4\zeta)\frac{\partial^2 v}{\partial\zeta^2} - \alpha^2\left(\frac{\partial v}{\partial\zeta}\right)^2 - (\alpha_t' + 10)\frac{\partial v}{\partial\zeta} + \beta_t' - \beta^2 = 0, \quad \beta = \frac{\alpha_t' + 4}{\alpha}.$$

The last equation has a particular solution of the form $v = \zeta\varphi(t)$, where the function $\varphi = \varphi(t)$ is determined by the Riccati equation $\alpha\varphi_t' - \alpha^2\varphi^2 - (\alpha_t' + 10)\varphi + \beta_t' - \beta^2 = 0$.

7°. "Two-dimensional" solution:

$$w = U(r,z), \quad z = x + \beta y + \lambda t, \quad r = y + \mu t,$$

where β, λ, and μ are arbitrary constants, and the function $U = U(r,z)$ is determined by the differential equation

$$(\lambda - \beta^2)\frac{\partial^2 U}{\partial z^2} + (\mu - 2\beta)\frac{\partial^2 U}{\partial r\partial z} - \frac{\partial^2 U}{\partial r^2} - U\frac{\partial^2 U}{\partial z^2} - \left(\frac{\partial U}{\partial z}\right)^2 = 0.$$

With $\lambda = \beta^2$ and $\mu = 2\beta$, we obtain an equation of the form 9.1.5.1.

8°. "Two-dimensional" solution:

$$w = x^{-2}V(p,q), \quad p = tx^{-3}, \quad q = yx^{-2},$$

where the function $V = V(p,q)$ is determined by the differential equation

$$3p(3Vp+1)\frac{\partial^2 V}{\partial p^2} + (4q^2V+1)\frac{\partial^2 V}{\partial q^2} + 2q(6pV+1)\frac{\partial^2 V}{\partial p\partial q} + \left(3p\frac{\partial V}{\partial p} + 2q\frac{\partial V}{\partial q}\right)^2 + (36pV+5)\frac{\partial V}{\partial p} + 22qV\frac{\partial V}{\partial q} + 10V^2 = 0.$$

9°. Solution:

$$w = u(r)x^2y^{-2}, \quad r = (At+B)^{-1}x^{-1}y^2,$$

where A and B are arbitrary constants, and the function $u = u(r)$ is determined by the ordinary differential equation

$$r^2(u - Ar + 4)u''_{rr} + r^2(u'_r)^2 - r(6u - Ar + 6)u'_r + 6(u+1)u = 0.$$

⊙ *References for equation* 11.1.2.1: Y. Kodama (1988), Y. Kodama and J. Gibbons (1989), N. H. Ibragimov (1994, pp. 299–300; 1995, pp. 447–450), A. M. Vinogradov and I. S. Krasil'shchik (1997), A. D. Polyanin and V. F. Zaitsev (2002, pp. 238–239).

2. $\dfrac{\partial^2 w}{\partial x\partial t} + a\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) + b\dfrac{\partial^2 w}{\partial y^2} = 0.$

The transformation

$$w(x,y,t) = \frac{b}{a}u(x,y,\tau), \quad \tau = -bt$$

leads to an equation of the form 11.1.2.1:

$$\frac{\partial^2 u}{\partial x\partial\tau} - \frac{\partial}{\partial x}\left(u\frac{\partial u}{\partial x}\right) - \frac{\partial^2 u}{\partial y^2} = 0.$$

3. $\dfrac{\partial^2 w}{\partial x\partial t} - f(t)\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right) - g(t)\dfrac{\partial^2 w}{\partial y^2} = 0.$

Generalized Khokhlov–Zabolotskaya equation.

1°. Suppose $w(x,y,t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^{-2}w(C_1^2x + C_2, C_1y + C_3, t),$$
$$w_2 = w(\xi,\eta,t) + \varphi(t), \quad \xi = x + \lambda y + \int [f(t)\varphi(t) + \lambda^2 g(t)]\,dt, \quad \eta = y + 2\lambda\int g(t)\,dt,$$

where C_1, C_2, C_3, and λ are arbitrary constants and $\varphi = \varphi(t)$ is an arbitrary function, are also solutions of the equation.

2°. Solutions:

$$w(x,y,t) = -x\left(\int f\,dt + C\right)^{-1} + \varphi y + \psi,$$

$$w(x,y,t) = 2\varphi x + \frac{\varphi_t' - 2f\varphi^2}{g}y^2 + \psi y + \chi,$$

$$w(x,y,t) = (\varphi y + \psi)x - \frac{f}{12g\varphi^2}(\varphi y + \psi)^4 + \frac{\varphi_t'}{6g}y^3 + \frac{\psi_t'}{2g}y^2 + \chi y + \theta,$$

where $\varphi = \varphi(t)$, $\psi = \psi(t)$, $\chi = \chi(t)$, and $\theta = \theta(t)$ are arbitrary functions; C is an arbitrary constant; $f = f(t)$ and $g = g(t)$; the prime denotes a derivative with respect to t.

3°. "Two-dimensional" solution:

$$w(x,y,t) = U(z,t) + \varphi(t), \quad z = x + \lambda y,$$

where the function $\varphi(t)$ is an arbitrary function, λ is an arbitrary constant, and the function $U = U(z,t)$ is determined by the first-order partial differential equation [$\psi(t)$ is an arbitrary function]

$$\frac{\partial U}{\partial t} - f(t)U\frac{\partial U}{\partial z} - [f(t)\varphi(t) + \lambda^2 g(t)]\frac{\partial U}{\partial z} = \psi(t).$$

A complete integral of this equation is sought in the form $U = A(t)z + B(t)$, which allows obtaining the general solution (see Polyanin, Zaitsev, and Moussiaux, 2002).

4°. "Two-dimensional" generalized separable solution quadratic in x:

$$w = \varphi(y,t)x^2 + \psi(y,t)x + \chi(y,t),$$

where the function $\varphi = \varphi(y,t)$, $\psi = \psi(y,t)$, and $\chi = \chi(y,t)$ are determined by the system of differential equations

$$g\varphi_{yy} = -6f\varphi^2,$$
$$g\psi_{yy} = -6f\varphi\psi + 2\varphi_t,$$
$$g\chi_{yy} = -f(2\varphi\chi + \psi^2) + \psi_t.$$

The subscripts y and t denote the corresponding partial derivatives, $f = f(t)$ and $g = g(t)$.

⊙ *Reference for equation* 11.1.2.3: A. D. Polyanin and V. F. Zaitsev (2002, p. 240).

4. $\dfrac{\partial^2 w}{\partial x\partial t} - \left(\dfrac{\partial w}{\partial x}\right)^2 - w\dfrac{\partial^2 w}{\partial x^2} - \dfrac{\partial^2 w}{\partial y^2} - \dfrac{\partial^2 w}{\partial z^2} = 0.$

Three-dimensional Khokhlov–Zabolotskaya equation.

1°. Suppose $w(x,y,z,t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^{-2}C_2^2 w(C_1x + C_3, C_2y + C_4, C_2z + C_5, C_1^{-1}C_2^2 t + C_6),$$
$$w_2 = w(x + \lambda y + \mu z + \varphi(t), y + 2\lambda t, z + 2\mu t, t) + \varphi_t'(t) - \lambda^2 - \mu^2,$$
$$w_3 = w(x, y\cos\beta + z\sin\beta, -y\sin\beta + z\cos\beta, t),$$

where $C_1, \ldots, C_6$, λ, μ, and β are arbitrary constants, and $\varphi = \varphi(t)$ is an arbitrary function, are also solutions of the equation.

2°. Solutions:

$$w(x,y,z,t) = 2\alpha_1 x + (\alpha_1' - 2\alpha_1^2 - \alpha_2)y^2 + \alpha_3 y + \alpha_2 z^2 + \beta z + \gamma,$$
$$w(x,y,z,t) = \frac{C\sqrt{4tx - y^2 - z^2}}{t^{3/2}},$$

where α_1, α_2, α_3, β, and γ are arbitrary functions of t, and C is an arbitrary constant.

3°. "Three-dimensional" solution:

$$w = u(x,\xi,t), \quad \xi = y\sin\beta + z\cos\beta,$$

where β is an arbitrary constant and the function $u = u(x,\xi,t)$ is determined by the Khokhlov–Zabolotskaya equation of the form 11.1.2.1:

$$\frac{\partial^2 u}{\partial x \partial t} - \left(\frac{\partial u}{\partial x}\right)^2 - u\frac{\partial^2 u}{\partial x^2} - \frac{\partial^2 u}{\partial \xi^2} = 0.$$

4°. "Three-dimensional" generalized separable solution linear in x:

$$w = f(y,z,t)x + g(y,z,t),$$

where the functions $f = f(y,z,t)$ and $g = g(y,z,t)$ are determined by the differential equations

$$f_{yy} + f_{zz} = 0,$$
$$g_{yy} + g_{zz} = f_t - f^2.$$

The subscripts y, z, and t denote the corresponding partial derivatives. The first equation represents the Laplace equation and the second one is a Poisson equation (for g). For solutions of these linear equations, see, for example, Tikhonov and Samarskii (1990) and Polyanin (2002).

5°. "Three-dimensional" generalized separable solution quadratic in x:

$$w = f(y,z,t)x^2 + g(y,z,t)x + h(y,z,t),$$

where the functions $f = f(y,z,t)$, $g = g(y,z,t)$, and $h = h(y,z,t)$ are determined by the system of differential equations

$$f_{yy} + f_{zz} = -6f^2,$$
$$g_{yy} + g_{zz} = -6fg + 2f_t,$$
$$h_{yy} + h_{zz} = -2fh + g_t - g^2.$$

6°. Solution:

$$w(x,y,z,t) = u(\xi)t^{-\lambda}, \quad \xi = t^{\lambda-2}(4xt - y^2 - z^2),$$

where λ is an arbitrary constant, and the function $u = u(\xi)$ is determined by the ordinary differential equation

$$[4u + (1-\lambda)\xi]u''_{\xi\xi} + 4(u'_\xi)^2 = 0.$$

For $\lambda \neq 1$, the passage to the inverse $\xi = \xi(u)$, the change of variable $\xi(u) = p(u) - \frac{4}{1-\lambda}u$, and the reduction of order with $p'_u = \frac{4}{1-\lambda}\eta(p)$ result in the first-order equation $p\eta\eta'_p - \eta + 1 = 0$. Integrating yields $(\eta - 1)e^\eta = C_1 p$.

For $\lambda = 1$, we have $u(\xi) = \pm\sqrt{C_1\xi + C_2}$.

7°. Solution:

$$w(x,y,z,t)=\frac{y^2+z^2}{t^2}U(\zeta),\quad \zeta=\frac{y^2+z^2}{xt},$$

where the function $U=U(\zeta)$ is determined by the ordinary differential equation

$$\zeta^2(\zeta^2U-\zeta+4)U''_{\zeta\zeta}+\zeta^4(U'_\zeta)^2+\zeta(2\zeta^2U-3\zeta+12)U'_\zeta+4U=0.$$

8°. Solution:

$$w(x,y,z,t)=\frac{z^2}{t^2}V(q),\quad q=\frac{4tx-y^2}{z^2},$$

where the function $V=V(q)$ is determined by the ordinary differential equation

$$2(4V+q^2-q)V''_{qq}+8(V'_q)^2+(1-q)V'_q+V=0.$$

⊙ *References for equation* 11.1.2.4: A. M. Vinogradov, I. S. Krasil'shchik, and V. V. Lychagin (1986), N. H. Ibragimov (1994, pp. 300–301; 1995, pp. 448–450), A. D. Polyanin and V. F. Zaitsev (2002, pp. 240–241).

5. $\dfrac{\partial^2 w}{\partial t\partial x}+a\dfrac{\partial}{\partial x}\left(w\dfrac{\partial w}{\partial x}\right)+b\dfrac{\partial^2 w}{\partial y^2}+c\dfrac{\partial^2 w}{\partial z^2}=0.$

1°. For $a<0$, $b<0$, and $c<0$, the passage to the new independent variables according to

$$x=\bar{x}\sqrt{-a},\quad y=\bar{y}\sqrt{-b},\quad z=\bar{z}\sqrt{-a},\quad t=\bar{t}/\sqrt{-a}$$

leads to the three-dimensional Khokhlov–Zabolotskaya equation 11.1.2.4.

2°. Suppose $w(x,y,z,t)$ is a solution of the equation in question. Then the functions

$$w_1=C_1^{-2}C_2^2w(C_1x+C_3,C_2y+C_4,C_2z+C_5,C_1^{-1}C_2^2t+C_6),$$
$$w_2=w(x+\lambda y+\mu z+\varphi(t),y-2b\lambda t,z-2c\mu t,t)-\frac{1}{a}\varphi'_t(t)-\frac{b\lambda^2+c\mu^2}{a},$$

where $C_1,\ldots,C_6$, λ, μ, and β are arbitrary constants and $\varphi=\varphi(t)$ is an arbitrary function, are also solutions of the equation.

3°. Solutions:

$$w(x,y,z,t)=\alpha y+\beta z+\frac{1}{at+C}x+\gamma,$$
$$w(x,y,z,t)=\alpha\ln(cy^2+bz^2)-(\beta'_t+4abc\beta^2)(cy^2+bz^2)+4bc\beta x+\gamma,$$

where $\alpha=\alpha(t)$, $\beta=\beta(t)$, and $\gamma=\gamma(t)$ are arbitrary functions and C is an arbitrary constant.

4°. "Three-dimensional" generalized separable solution linear in x:

$$w=f(y,z,t)x+g(y,z,t),$$

where the functions $f=f(y,z,t)$ and $g=g(y,z,t)$ are determined by the differential equations

$$bf_{yy}+cf_{zz}=0, \tag{1}$$
$$bg_{yy}+cg_{zz}=-f_t-af^2. \tag{2}$$

The subscripts y, z, t denote the corresponding partial derivatives. If $bc>0$, then by the scaling $y=\bar{y}\sqrt{|b|}$, $z=\bar{z}\sqrt{|c|}$, equation (1) can be reduced to the Laplace equation, and if $bc<0$, to the wave equation. Likewise, equation (2) can be reduced to a Poisson equation and a nonhomogeneous wave equation, respectively. For solutions of these linear equations, see, for example, Tikhonov and Samarskii (1990) and Polyanin (2002).

Remark. The above remains true if the coefficients a, b, and c are functions of y, z, and t.

5°. "Three-dimensional" generalized separable solution quadratic in x:

$$w = f(y,z,t)x^2 + g(y,z,t)x + h(y,z,t),$$

where the functions $f = f(y,z,t)$, $g = g(y,z,t)$, and $h = h(y,z,t)$ are determined by the system of differential equations

$$\begin{aligned} bf_{yy} + cf_{zz} &= -6af^2, \\ bg_{yy} + cg_{zz} &= -6afg - 2f_t, \\ bh_{yy} + ch_{zz} &= -2afh - g_t - ag^2. \end{aligned}$$

Remark. This remains true if the coefficients a, b, and c are functions of y, z, and t.

6°. There are "three-dimensional" solutions of the following forms:

$$\begin{aligned} &w(x,y,z,t) = u(x,t,\xi), \quad \xi = cy^2 + bz^2; \\ &w(x,y,z,t) = v(p,q,r)x^{k+2}, \quad p = tx^{k+1}, \quad q = yx^{k/2}, \quad r = zx^{k/2}, \end{aligned}$$

where k is an arbitrary constant.

7°. "Two-dimensional" solution:

$$w(x,y,z,t) = xU(\eta,t), \quad \eta = (cy^2 + bz^2)x^{-1},$$

where the function $U = U(\eta,t)$ is determined by the differential equation

$$\eta(a\eta U + 4bc)\frac{\partial^2 U}{\partial \eta^2} - \eta\frac{\partial^2 U}{\partial t\partial \eta} + a\eta^2\left(\frac{\partial U}{\partial \eta}\right)^2 - 2(a\eta U - 2bc)\frac{\partial U}{\partial \eta} + \frac{\partial U}{\partial t} + aU^2 = 0.$$

8°. "Two-dimensional" solution:

$$w(x,y,z,t) = V(\zeta,t) - \frac{\varphi_t' - 4bc}{a\varphi}x, \quad \zeta = cy^2 + bz^2 + \varphi x,$$

where $\varphi = \varphi(t)$ is an arbitrary function, and $V = V(\zeta,t)$ is determined by the differential equation

$$a\varphi^2(a\varphi^2 V + 4bc\zeta)\frac{\partial^2 V}{\partial \zeta^2} + a\varphi^3\frac{\partial^2 V}{\partial t\partial \zeta} + a\varphi^2\left(a\varphi^2\frac{\partial V}{\partial \zeta} - \varphi_t' + 12bc\right)\frac{\partial V}{\partial \zeta} - \varphi_{tt}''\varphi + 2(\varphi_t')^2 - 12bc\varphi_t' + 16b^2c^2 = 0.$$

⊙ *References for equation* 11.1.2.5: P. Kucharczyk (1967), S. V. Sukhinin (1978), N. H. Ibragimov (1994, pp. 300–301).

11.1.3. Equation of Unsteady Transonic Gas Flows

1. $\dfrac{\partial^2 w}{\partial x \partial t} + a\dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial x^2} - b\dfrac{\partial^2 w}{\partial y^2} = 0.$

This is a special case of equation 11.1.3.2 with $f(t) = a$ and $g(t) = -b$. For $a = b = \frac{1}{2}$, this is the *Lin–Reissner–Tsien equation* for an unsteady transonic gas flow (a special case).

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the functions

$$w_1 = C_1^{-3}C_2^2 w(C_1 x + C_3, C_2 y + C_4, C_1^{-1}C_2^2 t + C_5) + C_6 yt + C_7 y + C_8 t + C_9,$$
$$w_2 = w(\xi, \eta, t) + \varphi_{tt}''(t)y^2 + 2b\varphi_t'(t)x + \psi(t)y + \chi(t),$$
$$\xi = x + \lambda y + b\lambda^2 t - 2ab\varphi(t), \quad \eta = y + 2b\lambda t,$$

where the C_n and λ are arbitrary constants and $\varphi = \varphi(t)$, $\psi = \psi(t)$, and $\chi = \chi(t)$ are arbitrary functions, are also solutions of the equation.

2°. Generalized separable solution in the form of a polynomial of degree 4 in y:

$$w(x, y, t) = \frac{1}{12b^2}(\gamma_{tt}'' + 6a\gamma\gamma_t' + 4a^2\gamma^3)y^4 + \frac{1}{6b}(\alpha_t' + 2a\alpha\gamma)y^3$$
$$+ \frac{1}{2b}[2(\gamma_t' + 2a\gamma^2)x + \beta_t' + 2a\beta\gamma]y^2 + (\alpha x + \delta)y + \gamma x^2 + \beta x + \mu,$$

where $\alpha = \alpha(t)$, $\beta = \beta(t)$, $\gamma = \gamma(t)$, $\mu = \mu(t)$, and $\delta = \delta(t)$ are arbitrary functions.

3°. "Two-dimensional" solution:

$$w(x, y, t) = U(z, t) + \varphi(t)y + \psi(t), \quad z = x + \lambda y,$$

where $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are arbitrary functions, λ is an arbitrary constant, and the function $U = U(z, t)$ is determined by the first-order partial differential equation

$$\frac{\partial U}{\partial t} + \frac{a}{2}\left(\frac{\partial U}{\partial z}\right)^2 - b\lambda^2\frac{\partial U}{\partial z} = 0. \tag{1}$$

A complete integral of this equation is given by

$$U = C_1 z + \left(b\lambda^2 C_1 - \tfrac{1}{2}aC_1^2\right)t + C_2,$$

where C_1 and C_2 are arbitrary constants. The general solution of equation (1) can be written out in parametric form (Polyanin, Zaitsev, and Moussiaux, 2002):

$$U = sz + \left(b\lambda^2 s - \tfrac{1}{2}as^2\right)t + f(s),$$
$$z + \left(b\lambda^2 - as\right)t + f_s'(s) = 0,$$

where $f = f(s)$ is an arbitrary function and s is the parameter.

4°. "Two-dimensional" solution of a more general form:

$$w(x, y, t) = U(z, t) + \varphi(t)y^2 + \psi(t)y + \chi(t)x + \theta(t), \quad z = x + \lambda y,$$

where $\varphi = \varphi(t)$, $\psi = \psi(t)$, $\chi = \chi(t)$, and $\theta = \theta(t)$ are arbitrary functions, λ is an arbitrary constant, and the function $U = U(z, t)$ is determined by the first-order partial differential equation [$\sigma(t)$ is an arbitrary function]:

$$\frac{\partial U}{\partial t} + \frac{a}{2}\left(\frac{\partial U}{\partial z}\right)^2 + \left[a\chi(t) - b\lambda^2\right]\frac{\partial U}{\partial z} = \left[2b\varphi(t) - \chi_t'(t)\right]z + \sigma(t).$$

This equation can be fully integrated — a complete integral is sought in the form $U = f(t)z + g(t)$.

5°. "Two-dimensional" generalized separable solution cubic in x:

$$w(x,y,t) = f(y,t)x^3 + g(y,t)x^2 + h(y,t)x + r(y,t),$$

where the functions $f = f(y,t)$, $g = g(y,t)$, $h = h(y,t)$, and $r = r(y,t)$ are determined by the differential equations

$$\begin{aligned} bf_{yy} &= 18af^2, \\ bg_{yy} &= 18afg + 3f_t, \\ bh_{yy} &= 6afh + 4ag^2 + 2g_t, \\ br_{yy} &= 2agh + h_t. \end{aligned}$$

The subscripts y and t denote the corresponding partial derivatives. Setting $f = 0$ and $g = \varphi(t)y + \psi(t)$, where $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are arbitrary functions, one can integrate the system with respect to y to obtain a solution dependent on six arbitrary functions.

6°. "Two-dimensional" solution:

$$w(x,y,t) = v(x,r)t^{-1}, \quad r = yt^{-1/2},$$

where the function $v = v(x,r)$ is determined by the differential equation

$$r\frac{\partial^2 v}{\partial x \partial r} - 2a\frac{\partial v}{\partial x}\frac{\partial^2 v}{\partial x^2} + 2b\frac{\partial^2 v}{\partial r^2} + 2\frac{\partial v}{\partial r} = 0.$$

7°. "Two-dimensional" solution:

$$w(x,y,t) = v(p,t) + \frac{\gamma\gamma''_{tt} - 2(\gamma'_t)^2 - 18b\gamma'_t - 40b^2}{12ab\gamma^3}y^4 + \left(\frac{4b+\gamma'_t}{a\gamma^3}p - \delta\right)y^2 + \mu y + \lambda, \quad p = y^2 + \gamma x,$$

where $\gamma = \gamma(t)$, $\mu = \mu(t)$, $\lambda = \lambda(t)$, and $\delta = \delta(t)$ are arbitrary functions, and the function $v = v(p,t)$ is determined by the differential equation

$$\left(\gamma'_t p + a\gamma^3\frac{\partial v}{\partial p}\right)\frac{\partial^2 v}{\partial p^2} + \gamma\frac{\partial^2 v}{\partial t \partial p} + (\gamma'_t - 2b)\frac{\partial v}{\partial p} - \frac{2b[p(\gamma'_t + 4b) - a\gamma^3\delta]}{a\gamma^3} = 0.$$

⊙ *References for equation* 11.1.3.1: C. C. Lin, E. Reissner, and H. S. Tsien (1948), O. S. Ryzhov and S. A. Khristianovich (1958), E. V. Mamontov (1969), J. D. Cole and L. P. Cook (1986), E. M. Vorob'ev, N. V. Ignatovich, and E. O. Semenova (1989), A. D. Polyanin and V. F. Zaitsev (2002, pp. 242–243).

2. $\dfrac{\partial^2 w}{\partial x \partial t} + a\dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial x^2} - c\dfrac{\partial^2 w}{\partial x^2} - b\dfrac{\partial^2 w}{\partial y^2} = 0.$

For $a = \frac{1}{2}(\gamma + 1)$, $b = \frac{1}{2}$, $c = \frac{1}{2}(1 - M_\infty^2)$, it is the *complete Lin–Reissner–Tsien equation*, where γ is the adiabatic exponent of the gas and M_∞ is the *Mach number*.

The transformation

$$w = u(z,y,t), \quad z = x + ct$$

leads to an equation of the form 11.1.3.1:

$$\frac{\partial^2 u}{\partial x \partial t} + a\frac{\partial u}{\partial x}\frac{\partial^2 u}{\partial x^2} - b\frac{\partial^2 u}{\partial y^2} = 0.$$

3. $\dfrac{\partial^2 w}{\partial x \partial t} + f(t)\dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial x^2} + g(t)\dfrac{\partial^2 w}{\partial y^2} = 0.$

1°. Suppose $w(x, y, t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-4} w(C_1^2 x + C_2, C_1 y + C_3, t) + C_4 yt + C_5 y + C_6 t + C_7,$$

$$w_2 = w(\xi, \eta, t) - \frac{\varphi_t'(t)}{2g(t)} y^2 + \psi(t) y + \varphi(t) x + \chi(t),$$

$$\xi = x + \lambda y - \int \left[\lambda^2 g(t) + f(t)\varphi(t)\right] dt, \quad \eta = y - 2\lambda \int g(t)\, dt,$$

where $C_1, \ldots, C_7$ and λ are arbitrary constants and $\varphi = \varphi(t)$, $\psi = \psi(t)$, and $\chi = \chi(t)$ are arbitrary functions, are also solutions of the equation.

2°. Generalized separable solution in the form of a polynomial of degree 4 in y:

$$w(x, y, t) = a(t)y^4 + b(t)y^3 + [c(t)x + d(t)]y^2 + [\alpha(t)x + \beta(t)]y + \gamma(t)x^2 + \mu(t)x + \delta(t),$$

where $\alpha = \alpha(t)$, $\beta = \beta(t)$, $\gamma = \gamma(t)$, $\mu = \mu(t)$, and $\delta = \delta(t)$ are arbitrary functions, and the functions $a = a(t)$, $b = b(t)$, $c = c(t)$, and $d = d(t)$ are given by

$$a = -\frac{c_t' + 2f\gamma c}{12g}, \quad b = -\frac{\alpha_t' + 2f\alpha\gamma}{6g}, \quad c = -\frac{\gamma_t' + 2f\gamma^2}{g}, \quad d = -\frac{\mu_t' + 2f\gamma\mu}{2g}.$$

3°. "Two-dimensional" solution:

$$w(x, y, t) = U(z, t) + \varphi(t)y^2 + \psi(t)y + \chi(t)x + \theta(t), \quad z = x + \lambda y,$$

where $\varphi = \varphi(t)$, $\psi = \psi(t)$, $\chi = \chi(t)$, and $\theta = \theta(t)$ are arbitrary functions, λ is an arbitrary constant, and the function $U = U(z, t)$ is determined by the first-order partial differential equation [$\sigma(t)$ is an arbitrary function]:

$$\frac{\partial U}{\partial t} + \frac{1}{2} f(t) \left(\frac{\partial U}{\partial z}\right)^2 + [f(t)\chi(t) + \lambda^2 g(t)] \frac{\partial U}{\partial z} = -[2g(t)\varphi(t) + \chi_t'(t)]z + \sigma(t).$$

This equation can be fully integrated; a complete integral is sought in the form $U = f(t)z + g(t)$.

4°. "Two-dimensional" generalized separable solution cubic in x:

$$w(x, y, t) = \varphi(y, t)x^3 + \psi(y, t)x^2 + \chi(y, t)x + \theta(y, t),$$

where the functions $\varphi = \varphi(y, t)$, $\psi = \psi(y, t)$, $\chi = \chi(y, t)$, and $\theta = \theta(y, t)$ are determined by the differential equations

$$\begin{aligned}
&g\varphi_{yy} + 18f\varphi^2 = 0,\\
&g\psi_{yy} + 18f\varphi\psi + 3\varphi_t = 0,\\
&g\chi_{yy} + 6f\varphi\chi + 4f\psi^2 + 2\psi_t = 0,\\
&g\theta_{yy} + 2f\psi\chi + \chi_t = 0.
\end{aligned}$$

The subscripts y and t denote the corresponding partial derivatives, $f = f(t)$ and $g = g(t)$. These equations can be treated as ordinary differential equations for y with parameter t; the constants of integration will be functions of t. The first equation has the following particular solutions: $\varphi = 0$ and $\varphi = -\dfrac{g}{3f(y + h)^2}$, where $h = h(t)$ is an arbitrary function.

5°. "Two-dimensional" solution:

$$w(x,y,t) = u(p,t) + a(t)y^4 + [b(t)p + c(t)]y^2 + \mu(t)y + \lambda(t), \quad p = y^2 + \gamma(t)x.$$

Here, $c = c(t)$, $\gamma = \gamma(t)$, $\mu = \mu(t)$, and $\lambda = \lambda(t)$ are arbitrary functions; and the function $u = u(p,t)$ is determined by the differential equation

$$\gamma\frac{\partial^2 u}{\partial p\partial t} + \left(\gamma_t' p + f\gamma^3\frac{\partial u}{\partial p}\right)\frac{\partial^2 u}{\partial p^2} + (\gamma_t' + 2g)\frac{\partial u}{\partial p} + 2g(bp + c) = 0,$$

where the functions $a = a(t)$ and $b = b(t)$ are given by

$$a = -\frac{(b\gamma)_t' + 10gb}{12g}, \quad b = \frac{\gamma_t' - 4g}{f\gamma^3}.$$

⊙ *Reference for equation* 11.1.3.3: A. D. Polyanin and V. F. Zaitsev (2002, pp. 243–244).

4. $$\frac{\partial^2 w}{\partial x\partial t} + \frac{1}{2}\frac{\partial w}{\partial x}\frac{\partial^2 w}{\partial x^2} - \frac{1}{2}\left(\frac{\partial^2 w}{\partial y^2} + \frac{\partial^2 w}{\partial z^2}\right) = 0.$$

Lin–Reissner–Tsien equation. For $w = w(t,x,y)$ see equation 11.1.3.1.

In cylindrical coordinates $y = r\cos\theta$ and $z = r\sin\theta$, the original equation becomes

$$\frac{\partial^2 w}{\partial x\partial t} + \frac{1}{2}\frac{\partial w}{\partial x}\frac{\partial^2 w}{\partial x^2} - \frac{1}{2}\left(\frac{\partial^2 w}{\partial r^2} + \frac{1}{r}\frac{\partial w}{\partial r} + \frac{1}{r^2}\frac{\partial^2 w}{\partial\theta^2}\right) = 0.$$

1°. *Ryzhov–Shefter solution*:

$$w = \lambda(t)x + \tfrac{1}{2}a(t)[x - b(t)]^2 + f(\theta,t)[x - b(t)]r^2 + g(\theta,t)r^4, \tag{1}$$

where the three functions $\lambda = \lambda(t)$, $a = a(t)$, and $b = b(t)$ are linked by a single relation (two of the functions can be chosen arbitrarily)

$$\lambda_t' + \tfrac{1}{2}a\lambda = ab_t',$$

and the functions $f = f(\theta,t)$ and $g = g(\theta,t)$ are described by the linear system of equations

$$f_{\theta\theta} + 4f = 2a_t' + a^2,$$
$$g_{\theta\theta} + 16g = 2f_t + af.$$

These equations are easy to integrate, since they are ordinary differential equations in θ with parameter t.

2°. Generalized separable solution (generalizes the solution from Item 1°):

$$w = F_1 + F_2x + F_3x^2 + F_4r^2 + F_5xr^2 + F_6r^4,$$

where the functions $F_k = F_k(\theta,t)$ are determined by the system of equations

$$\begin{aligned}
&(F_1)_{\theta\theta} = (F_2)_{\theta\theta} = (F_3)_{\theta\theta} = 0,\\
&(F_4)_{\theta\theta} + 4F_4 = 2(F_2)_t + 2F_2F_3,\\
&(F_5)_{\theta\theta} + 4F_5 = 4(F_3)_t + 4F_3^2,\\
&(F_6)_{\theta\theta} + 16F_6 = 2(F_5)_t + 2F_3F_5.
\end{aligned} \tag{2}$$

Solutions (1) then correspond to

$$F_1 = \tfrac{1}{2}ab^2, \quad F_2 = \lambda - ab, \quad F_3 = \tfrac{1}{2}a, \quad F_4 = -bf, \quad F_5 = f, \quad F_6 = g.$$

The general solution of system (2) is as follows:

$$\begin{aligned}
&F_1 = a_1(t)\theta + b_1(t), \quad F_2 = a_2(t)\theta + b_2(t), \quad F_3 = a_3(t)\theta + b_3(t),\\
&F_4 = c_1(t)\cos 2\theta + c_2(t)\sin 2\theta + \alpha_1(t)\theta^2 + \beta_1(t)\theta + \gamma_1(t),\\
&F_5 = c_3(t)\cos 2\theta + c_4(t)\sin 2\theta + \alpha_2(t)\theta^2 + \beta_2(t)\theta + \gamma_2(t),\\
&F_6 = c_5(t)\cos 4\theta + c_6(t)\sin 4\theta + [\mu_1(t) + \nu_1(t)\theta]\cos 2\theta + [\mu_2(t) + \nu_2(t)\theta]\sin 2\theta\\
&\qquad + \sigma(t)\theta^3 + \alpha_3(t)\theta^2 + \beta_3(t)\theta + \gamma_3(t),
\end{aligned}$$

where $a_k(t)$, $b_k(t)$, and $c_k(t)$ are arbitrary functions, and the functions $\alpha_n(t)$, $\beta_n(t)$, $\gamma_n(t)$, $\mu_n(t)$, $\nu_n(t)$, and $\sigma(t)$ are determined by substituting the above solutions into the last three equations in system (2).

⊙ *References for equation* 11.1.3.4: C. C. Lin, E. Reissner, and H. S. Tsien (1948), O. S. Ryzhov and G. M. Shefter (1959), V. A. Galaktionov and S. R. Svirshchevskii (2007, pp. 4–5).

11.1.4. Equations of the Form $\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial x\partial y} - \dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial y^2} = F\left(x, y, \dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}\right)$

1. $\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial x\partial y} - \dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial y^2} = 0.$

General solution:

$$w(x, y) = F\big(y + G(x)\big),$$

where $F(z)$ and $G(x)$ are arbitrary functions.

⊙ *Reference*: D. Zwillinger (1989, p. 397).

2. $\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial x\partial y} - \dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial y^2} = f(x).$

1°. Suppose $w(x, y)$ is a solution of this equation. Then the functions

$$w_1 = \pm C_1^{-1} w(x, C_1 y + \varphi(x)) + C_2,$$

where C_1 and C_2 are arbitrary constants and $\varphi(x)$ is an arbitrary function, are also solutions of the equation.

2°. Generalized separable solutions linear and quadratic in y:

$$\begin{aligned}
w(x, y) &= \pm y\left[2\int f(x)\,dx + C_1\right]^{1/2} + \varphi(x),\\
w(x, y) &= C_1 y^2 + \varphi(x)y + \frac{1}{4C_1}\left[\varphi^2(x) - 2\int f(x)\,dx\right] + C_2,
\end{aligned}$$

where $\varphi(x)$ is an arbitrary function and C_1 and C_2 are arbitrary constants.

3°. The von Mises transformation

$$\xi = x, \quad \eta = w, \quad U(\xi,\eta) = \frac{\partial w}{\partial y}, \qquad \text{where} \quad w = w(x,y), \tag{1}$$

brings the original equation to the first-order nonlinear equation

$$U\frac{\partial U}{\partial \xi} = f(\xi), \tag{2}$$

which is independent of η. On integrating (2) and taking into account the relations of (1), we obtain the first-order equation

$$\left(\frac{\partial w}{\partial y}\right)^2 = 2\int f(x)\,dx + \psi(w), \tag{3}$$

where $\psi(w)$ is an arbitrary function.

Integrating (3) yields the general solution in implicit form:

$$\int \frac{dw}{\sqrt{2F(x)+\psi(w)}} = \pm y + \varphi(x),$$

where $\varphi(x)$ and $\psi(w)$ are arbitrary functions, $F(x) = \int f(x)\,dx$.

3. $\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial x\partial y} - \dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial y^2} = f(x)\dfrac{\partial w}{\partial y}.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-1} w(x, C_1 y + C_2) + C_3,$$
$$w_2 = w\big(x, y + \varphi(x)\big),$$

where C_1, C_2, and C_3 are arbitrary constants and $\varphi(x)$ is an arbitrary function, are also solutions of the equation.

2°. Generalized separable solutions:

$$w(x,y) = y\left[\int f(x)\,dx + C\right] + \varphi(x),$$
$$w(x,y) = \varphi(x)e^{\lambda y} - \frac{1}{\lambda}\int f(x)\,dx + C,$$

where $\varphi(x)$ is an arbitrary function and C and λ are arbitrary constants.

3°. The equation can be rewritten as the relation that the Jacobian of the functions w and $v = w_y - \int f(x)\,dx$ is equal to zero. It follows that w and v are functionally dependent, which means that v is expressible in terms of w:

$$\frac{\partial w}{\partial y} - \int f(x)\,dx = \varphi(w), \tag{1}$$

where $\varphi(w)$ is an arbitrary function. Any solution of the first-order equation (1) for any $\varphi(w)$ is a solution of the original equation.

Equation (1) can be treated as an ordinary differential equation in the independent variable y with parameter x. Integrating yields its general solution in implicit form:

$$\int\left[\varphi(w) + \int f(x)\,dx\right]^{-1} dw = y + \psi(x),$$

where $\psi(x)$ and $\varphi(w)$ are arbitrary functions.

4. $\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial x\partial y} - \dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial y^2} = f(x)\dfrac{\partial w}{\partial y} + g(y)\dfrac{\partial w}{\partial x}.$

First integral:

$$\frac{\partial w}{\partial y} = \varphi(w) - \int g(y)\,dy + \int f(x)\,dx,$$

where $\varphi(w)$ is an arbitrary function. This equation can be treated as a first-order ordinary differential equation in the independent variable y with parameter x.

5. $\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial x\partial y} - \dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial y^2} = f(x)g\left(\dfrac{\partial w}{\partial y}\right).$

1°. Suppose $w(x, y)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-1} w(x, C_1 y + C_2) + C_3,$$
$$w_2 = w\big(x, y + \varphi(x)\big),$$

where C_1, C_2, and C_3 are arbitrary constants and $\varphi(x)$ is an arbitrary function, are also solutions of the equation.

2°. First integral:

$$\int \frac{U\,dU}{g(U)} = \varphi(w) + \int f(x)\,dx, \qquad U = \frac{\partial w}{\partial y},$$

where $\varphi(w)$ is an arbitrary function. This equation can be treated as a first-order ordinary differential equation in the independent variable y with parameter x.

11.1.5. Other Equations with Two Independent Variables

1. $A\dfrac{\partial^2 w}{\partial x^2} + B\dfrac{\partial^2 w}{\partial x\partial y} + f(w)\dfrac{\partial w}{\partial x}\left(A\dfrac{\partial w}{\partial x} + B\dfrac{\partial w}{\partial y}\right) + C\dfrac{\partial w}{\partial x} = 0.$

Here $A = A(x, y)$, $B = B(x, y)$, $C = C(x, y)$, and $f = f(w)$ are arbitrary functions.

This equation can be represented as the first-order factor system

$$A\frac{\partial u}{\partial x} + B\frac{\partial u}{\partial y} + Cu = 0, \tag{1}$$

$$u = \exp\left(\int f(w)\,dw\right)\frac{\partial w}{\partial x}. \tag{2}$$

First, one solves the linear first-order equation (1) by the method of characteristics and then equation (2) by straightforward integration with respect to x.

2. $w\dfrac{\partial^2 w}{\partial x^2} = a\left(w\dfrac{\partial^2 w}{\partial x\partial y} - \dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}\right) + f(x, y)\left(\dfrac{\partial w}{\partial x}\right)^2.$

This equation can be represented as the first-order factor system

$$a\frac{\partial u}{\partial x} - \frac{\partial u}{\partial x} + [f(x, y) - 1]u^2 = 0,$$
$$u = \frac{1}{w}\frac{\partial w}{\partial x},$$

which is integrated successively.

3. $\dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial x\partial y}=\dfrac{\partial w}{\partial y}\left[\dfrac{\partial^2 w}{\partial x^2}+a\left(\dfrac{\partial w}{\partial x}\right)^2\right].$

General solution in implicit form:

$$e^{aw}f(y)=x+g(w),$$

where $f(y)$ and $g(w)$ are arbitrary functions.

⊙ *Reference*: Yu. N. Kosovtsov (2008 *a*).

4. $\dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial x\partial y}=\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial x^2}+aw^m\left(\dfrac{\partial w}{\partial x}\right)^n.$

General solution in implicit form with $n\neq 2$:

$$\int_b^{w(x,y)}\frac{d\xi}{Z(y,\xi)}=x+f(y),$$

where $Z=Z(y,\xi)$ is any solution of the transcendental equation

$$Z^{2-n}+a(n-2)y\xi^m=g(\xi),$$

and $f(y)$ and $g(\xi)$ are arbitrary functions; b is an arbitrary constant.

⊙ *Reference*: Yu. N. Kosovtsov (2008 *a*).

5. $\dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial x\partial y}=\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial x^2}+aw^n\dfrac{\partial^2 w}{\partial x^2}+bw^m\left(\dfrac{\partial w}{\partial x}\right)^2.$

General solution in implicit form:

$$\int_c^{w(x,y)}\exp\left[\frac{b\xi^{m-n+1}}{a(m-n+1)}\right]G\left(\frac{\xi^{1-n}}{a(n-1)}-y\right)d\xi=F(y)-x,$$

where $F=F(y)$ and $G(z)$ are arbitrary functions, c is an arbitrary constant ($ab\neq 0$, $n\neq 1$, and $m\neq n-1$).

⊙ *Reference*: Yu. N. Kosovtsov (2008 *a*).

6. $\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial x\partial y}=\left[a\dfrac{\partial w}{\partial x}+f(x)\right]\dfrac{\partial^2 w}{\partial y^2}.$

First integral:

$$(1-a)y\frac{\partial w}{\partial y}+aw+\int f(x)\,dx=\Phi\left(\frac{\partial w}{\partial y}\right),$$

where $\Phi(z)$ is an arbitrary function.

7. $\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial x\partial y}=\left[\dfrac{\partial w}{\partial x}+f(x)w\right]\dfrac{\partial^2 w}{\partial y^2}.$

First integral:

$$\frac{\partial w}{\partial y}=\Phi\left(w\exp\left(\int f(x)\,dx\right)\right),$$

where $\Phi(z)$ is an arbitrary function.

⊙ *Reference*: V. F. Zaitsev (2008, http://eqworld.ipmnet.ru/eqarchive/view.php?id=173).

8. $\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial x\partial y} = \left[a\dfrac{\partial w}{\partial x} + f(x)\dfrac{\partial w}{\partial y}\right]\dfrac{\partial^2 w}{\partial y^2}.$

First integral:

$$(1-a)y\frac{\partial w}{\partial y} + aw + \frac{\partial w}{\partial y}\int f(x)\,dx = \Phi\left(\frac{\partial w}{\partial y}\right),$$

where $\Phi(z)$ is an arbitrary function.

9. $\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial x\partial y} - \dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial y^2} + \dfrac{\partial^2 w}{\partial x^2} + 1 = 0.$

Gibbons–Tsarev equation. This equation arises in the theory of Benney moment equations (a system of hydrodynamic type). This is a special case of equation 11.1.5.10 with $f(x) = -1$, $g(x) = 0$, and $h(x) = -1$.

⊙ *References*: J. Gibbons and S. P. Tsarev (1999), V. A. Galaktionov and S. R. Svirshchevskii (2007, pp. 22, 31), O. V. Kaptsov (2009).

10. $\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial x\partial y} - \dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial y^2} = f(x)\dfrac{\partial^2 w}{\partial x^2} + g(x)w + h(x).$

1°. Generalized separable solution:

$$w = \varphi_2(x)y^2 + \varphi_1(x)y + \varphi_0(x), \tag{1}$$

where the functions $\varphi_n = \varphi_n(x)$ are determined by the system of ordinary differential equations

$$\begin{aligned} f\varphi_2'' &= 2\varphi_2\varphi_2' - g\varphi_2,\\ f\varphi_1'' &= 2\varphi_1\varphi_2' - g\varphi_1,\\ f\varphi_0'' &= -2\varphi_2\varphi_0' - g\varphi_0 + \varphi_1\varphi_1' - h. \end{aligned} \tag{2}$$

Remark 1. In the original equation, f can also depend on the second derivative w_{yy}: $f = f(x, w_{yy})$. In this case, one should set $f = f(x, 2\varphi_2)$ in equations (2).

2°. Generalized separable solution:

$$w = \psi_1(x) + \psi_2(x)\cos(ky) + \psi_3(x)\sin(ky),$$

where k is an arbitrary constant and the functions $\psi_n = \psi_n(x)$ are determined by the system of ordinary differential equations

$$\begin{aligned} f\psi_3'' &= k^2\psi_3\psi_1' - g\psi_3,\\ f\psi_2'' &= k^2\psi_2\psi_1' - g\psi_2,\\ f\psi_1'' &= k^2\psi_2\psi_2' + k^2\psi_3\psi_3' - g\psi_1 - h. \end{aligned}$$

3°. Generalized separable solution:

$$w = \psi_1(x) + \psi_2(x)\cosh(ky) + \psi_3(x)\sinh(ky),$$

where k is an arbitrary constant and the functions $\psi_n = \psi_n(x)$ are determined by the system of ordinary differential equations

$$\begin{aligned} f\psi_3'' &= -k^2\psi_3\psi_1' - g\psi_3,\\ f\psi_2'' &= -k^2\psi_2\psi_1' - g\psi_2,\\ f\psi_1'' &= -k^2\psi_2\psi_2' + k^2\psi_3\psi_3' - g\psi_1 - h. \end{aligned}$$

4°. For $f(x) = a = \text{const}$ and $g(x) = h(x) = 0$, the original equation is linearized with the Legendre transformation (see Subsection 26.3.3).

Remark 2. The *Chaplygin gas equation* (Chaplygin, 1904)

$$\frac{\partial}{\partial t}\left(\frac{1}{\sqrt{w_t+\frac{1}{2}w_x^2}}\right)+\frac{\partial}{\partial x}\left(\frac{w_x}{\sqrt{w_t+\frac{1}{2}w_x^2}}\right)=0,$$

where $w=w(x,t)$ is the velocity potential, is reduced, by differentiating, to the equation

$$\frac{1}{2}\frac{\partial^2 w}{\partial t^2}+\frac{\partial w}{\partial x}\frac{\partial^2 w}{\partial t\partial x}-\frac{\partial w}{\partial t}\frac{\partial^2 w}{\partial x^2}=0,$$

which, after renaming $x \Rightarrow y$ and $t \Rightarrow x$, can be reduced to a special case of the equation in question with $f(x)=-\frac{1}{2}$ and $g(x)=h(x)=0$.

11. $$\left[\frac{\partial w}{\partial y}+f(y)\right]\frac{\partial^2 w}{\partial x\partial y}=\left[\frac{\partial w}{\partial x}+g(x)\right]\frac{\partial^2 w}{\partial y^2}.$$

First integral:

$$\frac{\partial w}{\partial y}=\Phi\left(w+\int f(y)\,dy+\int g(x)\,dx\right),$$

where $\Phi(z)$ is an arbitrary function.

⊙ *Reference*: V. F. Zaitsev (2008, http://eqworld.ipmnet.ru/eqarchive/view.php?id=60).

12. $$\left[f(w)\frac{\partial w}{\partial y}+g(y)\right]\frac{\partial^2 w}{\partial x\partial y}=\left[f(w)\frac{\partial w}{\partial x}+h(x)\right]\frac{\partial^2 w}{\partial y^2}.$$

First integral:

$$\frac{\partial w}{\partial y}=\Phi\left(\int f(w)\,dw+\int g(y)\,dy+\int h(x)\,dx\right),$$

where $\Phi(z)$ is an arbitrary function.

⊙ *Reference*: V. F. Zaitsev (2008, http://eqworld.ipmnet.ru/eqarchive/view.php?id=65).

13. $$\frac{\partial w}{\partial y}\frac{\partial^2 w}{\partial x\partial y}+f(y)\frac{\partial w}{\partial x}\frac{\partial^2 w}{\partial y^2}=g(y)w+h(y)x+s(y).$$

Generalized separable solution linear in x:

$$w=\varphi(y)x+\psi(y),$$

where the functions $\varphi(y)$ and $\psi(y)$ are determined by the system of ordinary differential equations

$$f\varphi\varphi''_{yy}+(\varphi'_y)^2=g\varphi+h,$$
$$f\varphi\psi''_{yy}+\varphi'_y\psi'_y=g\psi+s.$$

14. $$\left(\frac{\partial w}{\partial y}\right)^2\frac{\partial^2 w}{\partial x^2}-2\frac{\partial w}{\partial x}\frac{\partial w}{\partial y}\frac{\partial^2 w}{\partial x\partial y}+\left(\frac{\partial w}{\partial x}\right)^2\frac{\partial^2 w}{\partial y^2}=0.$$

1°. First integrals:

$$\frac{w_y}{w_x}+\varphi(w)=0,\qquad x+y\frac{w_y}{w_x}+\psi(w)=0,$$

where $\varphi(w)$ and $\psi(w)$ are arbitrary functions.

2°. General solution in implicit form:

$$x-\varphi(w)y+\psi(w)=0,$$

where $\varphi(w)$ and $\psi(w)$ are arbitrary functions.

⊙ *References for equation* 11.1.5.14: M. E. Goursat (1896), O. V. Kaptsov (2009).

15. $\left[1+\left(\dfrac{\partial w}{\partial y}\right)^2\right]\dfrac{\partial^2 w}{\partial x\partial y}-\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial y^2}=0.$

1°. First integrals:

$$\frac{w_x}{\sqrt{1+w_y^2}}-\varphi(x)=0, \qquad y+ww_y-\psi(w_y)=0,$$

where $\varphi(x)$ and $\psi(u)$ are arbitrary functions.

2°. General solution in parametric form:

$$w=\sqrt{1+\xi^2}\,\Phi(x)+\xi y+\psi(\xi), \qquad y+\Phi'(\xi)+\frac{\xi}{\sqrt{1+\xi^2}}\psi(x)=0,$$

where $\Phi'(\xi)=\varphi(\xi)$ and ξ is the parameter.

⊙ *References for equation* 11.1.5.15: M. E. Goursat (1896), O. V. Kaptsov (2009).

16. $\left[1-\left(\dfrac{\partial w}{\partial t}\right)^2\right]\dfrac{\partial^2 w}{\partial x^2}+2\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial t}\dfrac{\partial^2 w}{\partial x\partial t}-\left[1+\left(\dfrac{\partial w}{\partial x}\right)^2\right]\dfrac{\partial^2 w}{\partial t^2}=0.$

Born–Infeld equation (see Born and Infeld, 1934). It is used in nonlinear electrodynamics and field theory.

1°. Solutions:

$$w(x,t)=\varphi(x+t),$$
$$w(x,t)=\psi(x-t),$$

where $\varphi(z_1)$ and $\psi(z_2)$ are arbitrary functions.

2°. Cauchy problem with initial conditions:

$$w=f(x) \quad \text{at} \quad t=0, \qquad \partial_t w=g(x) \quad \text{at} \quad t=0.$$

The hyperbolicity condition $1+[f_x'(x)]^2-g^2(x)>0$ is assumed to hold.

Solution in parametric form:

$$t=\frac{1}{2}\int_\alpha^\beta \frac{1+[f_\zeta'(\zeta)]^2}{\sqrt{1+[f_\zeta'(\zeta)]^2-g^2(\zeta)}}\,d\zeta,$$
$$x=\frac{\alpha+\beta}{2}-\frac{1}{2}\int_\alpha^\beta \frac{f_\zeta'(\zeta)g(\zeta)\,d\zeta}{\sqrt{1+[f_\zeta'(\zeta)]^2-g^2(\zeta)}},$$
$$w=\frac{f(\alpha)+f(\beta)}{2}+\frac{1}{2}\int_\alpha^\beta \frac{g(\zeta)\,d\zeta}{\sqrt{1+[f_\zeta'(\zeta)]^2-g^2(\zeta)}}.$$

3°. By the introduction of the new variables

$$\xi=x-t, \quad \eta=x+t, \quad u=\frac{\partial w}{\partial \xi}, \quad v=\frac{\partial w}{\partial \eta},$$

the Born–Infeld equation can be rewritten as the equivalent system of equations

$$\frac{\partial u}{\partial \eta} - \frac{\partial v}{\partial \xi} = 0,$$
$$v^2 \frac{\partial u}{\partial \xi} - (1 + 2uv)\frac{\partial u}{\partial \eta} + u^2 \frac{\partial v}{\partial \eta} = 0.$$

The hodograph transformation (where u, v are treated as the independent variables and ξ, η as the dependent ones) leads to the linear system

$$\begin{aligned} \frac{\partial \xi}{\partial v} - \frac{\partial \eta}{\partial u} &= 0, \\ v^2 \frac{\partial \eta}{\partial v} + (1 + 2uv)\frac{\partial \xi}{\partial v} + u^2 \frac{\partial \xi}{\partial u} &= 0. \end{aligned} \tag{1}$$

On eliminating η, we can reduce this system to the second-order linear equation

$$u^2 \frac{\partial^2 \xi}{\partial u^2} + (1 + 2uv)\frac{\partial^2 \xi}{\partial u \partial v} + v^2 \frac{\partial^2 \xi}{\partial v^2} + 2u\frac{\partial \xi}{\partial u} + 2v\frac{\partial \xi}{\partial v} = 0.$$

Looking for solutions in the hyperbolic domain, we write out the equation of characteristics

$$u^2\, dv^2 - (1 + 2uv)\, du\, dv + v^2\, du^2 = 0.$$

Integrals of this equation are given by $r = C_1$ and $s = C_2$, where

$$r = \frac{\sqrt{1 + 4uv} - 1}{2v}, \qquad s = \frac{\sqrt{1 + 4uv} - 1}{2u}. \tag{2}$$

Passing in (1) to the new variables of (2), we obtain

$$\begin{aligned} r^2 \frac{\partial \xi}{\partial r} + \frac{\partial \eta}{\partial r} &= 0, \\ \frac{\partial \xi}{\partial s} + s^2 \frac{\partial \eta}{\partial s} &= 0. \end{aligned} \tag{3}$$

Eliminating η yields the simple equation

$$\frac{\partial^2 \xi}{\partial r \partial s} = 0,$$

whose solution is the sum of two arbitrary functions with different arguments, $\xi = \varphi(r) + \psi(s)$. The function η is found from system (3).

4°. The Legendre transformation

$$w(x,t) + u(\zeta,\tau) = x\zeta + t\tau, \quad \zeta = \frac{\partial w}{\partial x}, \quad \tau = \frac{\partial w}{\partial t}, \quad x = \frac{\partial u}{\partial \zeta}, \quad t = \frac{\partial u}{\partial \tau}$$

leads to the linear equation

$$\left(1 - \tau^2\right)\frac{\partial^2 u}{\partial \tau^2} - 2\zeta\tau\frac{\partial^2 u}{\partial \zeta \partial \tau} - \left(1 + \zeta^2\right)\frac{\partial^2 u}{\partial \zeta^2} = 0.$$

⊙ *References for equation* 11.1.5.16: B. M. Barbashov and N. A. Chernikov (1966), G. B. Whitham (1974).

17. $\dfrac{\partial^2 w}{\partial t^2} + 2\dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial x \partial t} + \left[a + b\dfrac{\partial w}{\partial t} + c\left(\dfrac{\partial w}{\partial x}\right)^2\right]\dfrac{\partial^2 w}{\partial x^2} = 0.$

Potential equation of the one-dimensional flow of a compressible gas.

1°. The *von Mises solution*:

$$w = \varphi_0(t) + \varphi_1(t)x + \varphi_2(t)x^2,$$

where the functions $\varphi_n = \varphi_n(t)$ $(n = 0, 1, 2)$ are determined by the system of ordinary differential equations

$$\begin{aligned}
\varphi_0'' &= -2\varphi_1\varphi_1' - 2a\varphi_2 - 2b\varphi_2\varphi_0' - 2c\varphi_1^2\varphi_2,\\
\varphi_1'' &= -4(\varphi_1\varphi_2)' - 2b\varphi_2\varphi_1' - 8c\varphi_1\varphi_2^2,\\
\varphi_2'' &= -2(4+b)\varphi_2\varphi_2' - 8c\varphi_2^3.
\end{aligned}$$

The last equation for φ_2 can be solved independently in terms of Jacobi elliptic functions.

2°. The Legendre transformation (see Subsection 26.3.3)

$$w(x,t) + u(\zeta,\tau) = x\zeta + t\tau, \quad \zeta = \frac{\partial w}{\partial x}, \quad \tau = \frac{\partial w}{\partial t}, \quad x = \frac{\partial u}{\partial \zeta}, \quad t = \frac{\partial u}{\partial \tau}$$

leads to the linear equation

$$\frac{\partial^2 u}{\partial \zeta^2} - 2\zeta\frac{\partial^2 u}{\partial \zeta \partial \tau} + (a + b\tau + c\zeta^2)\frac{\partial^2 u}{\partial \tau^2} = 0.$$

⊙ *Reference for equation* 11.1.5.17: V. A. Galaktionov and S. R. Svirshchevskii (2007, pp. 2–3).

18. $\left[a + \left(\dfrac{\partial w}{\partial y}\right)^2\right]\dfrac{\partial^2 w}{\partial x^2} - 2b\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial x \partial y} + \left[c + \left(\dfrac{\partial w}{\partial x}\right)^2\right]\dfrac{\partial^2 w}{\partial y^2} = 0.$

Equation of minimal surfaces (with $a = b = c = 1$). It describes, for example, the shape of a foam film bounded by a given contour.

1°. The Legendre transformation

$$w(x,y) + u(\xi,\eta) = x\xi + y\eta, \quad \xi = \frac{\partial w}{\partial x}, \quad \eta = \frac{\partial w}{\partial y}, \quad x = \frac{\partial u}{\partial \xi}, \quad y = \frac{\partial u}{\partial \eta}$$

leads to the linear equation

$$\left(a + \eta^2\right)\frac{\partial^2 u}{\partial \eta^2} + 2b\xi\eta\frac{\partial^2 u}{\partial \xi \partial \eta} + \left(c + \xi^2\right)\frac{\partial^2 u}{\partial \xi^2} = 0.$$

2°. General solution in parametric form for $a = b = c = 1$:

$$x = \operatorname{Re} f_1(z), \quad y = \operatorname{Re} f_2(z), \quad w = \operatorname{Re} f_3(z),$$

where the $f_k(z)$ are arbitrary analytic functions of the complex variable $z = \alpha + i\beta$ with derivatives constrained by

$$[f_1'(z)]^2 + [f_2'(z)]^2 + [f_3'(z)]^2 = 0,$$

and $\operatorname{Re} f(z)$ stands for the real part of the analytic function $f(z)$ of the complex variable z.

Note that z can be taken as one of the functions $f_k(z)$.

⊙ *Reference for equation* 11.1.5.18: R. Courant and D. Hilbert (1989).

19. $f(w)\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial x^2}+\left[g(w)\dfrac{\partial w}{\partial y}-f(w)\dfrac{\partial w}{\partial x}\right]\dfrac{\partial^2 w}{\partial x\partial y}-g(w)\dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial y^2}=0.$

1°. First integral:

$$f(w)\frac{\partial w}{\partial x}+g(w)\frac{\partial w}{\partial y}=\varphi(w),$$

where $\varphi(w)$ is an arbitrary function.

2°. General solution in implicit form:

$$\Psi\left(x-\int\frac{f(w)}{\varphi(w)}\,dw,\ y-\int\frac{g(w)}{\varphi(w)}\,dw\right)=0,$$

where $\Psi(z_1,z_2)$ and $\varphi(w)$ are arbitrary functions.

20. $\dfrac{\partial^2 w}{\partial x\partial y}=F\left(y,\dfrac{\partial w}{\partial x}\right)\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial x^2}.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the function

$$w_1=C_1^{-1}w(C_1x+C_2,y)+C_3,$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. The Euler transformation

$$w(x,y)+u(\xi,\eta)=x\xi,\quad x=\frac{\partial u}{\partial\xi},\quad y=\eta$$

leads to the linear equation (for details, see Subsection 26.3.4)

$$\frac{\partial^2 u}{\partial\xi\partial\eta}=F(\eta,\xi)\frac{\partial u}{\partial\eta},$$

whose order can be reduced with the substitution $U=\frac{\partial u}{\partial\eta}$.

21. $\dfrac{\partial^2 w}{\partial y^2}+f(\theta)\dfrac{\partial^2 w}{\partial x\partial y}-[\theta f(\theta)+\theta^2]\dfrac{\partial^2 w}{\partial x^2}=0,\qquad \theta=\dfrac{\partial w}{\partial y}\Big/\dfrac{\partial w}{\partial x}.$

1°. Suppose $w(x,y)$ is a solution of the equation in question. Then the functions

$$w_1=C_1w(C_2x+C_3,\ C_2y+C_4)+C_5,$$
$$w_2=\Phi\big(w(x,y)\big),$$

where $C_1,\dots,C_5$ are arbitrary constants, and $\Phi(u)$ is an arbitrary function, are also solutions of the equation.

2°. Traveling-wave solution:

$$w=\Phi(k_1x+k_2y),$$

where $\Phi(z)$ is an arbitrary function, and k_1 and k_2 are arbitrary constants.

3°. There are solutions of the forms

$$w(x,y) = e^{kx}U_1(y) \quad \text{(multiplicative separable solution)},$$
$$w(x,y) = e^{ky}U_2(x) \quad \text{(multiplicative separable solution)},$$
$$w(x,y) = x^kU_1(y/x) \quad \text{(self-similar solution)},$$

where k is an arbitrary constant.

4°. The Legendre transformation

$$x = \frac{\partial u}{\partial \xi}, \quad y = \frac{\partial u}{\partial \eta}, \quad w = x\xi + y\eta - u$$

leads to the linear equation

$$\frac{\partial^2 u}{\partial \xi^2} + f(\theta)\frac{\partial^2 u}{\partial \xi \partial \eta} - [\theta f(\theta) + \theta^2]\frac{\partial^2 u}{\partial \eta^2} = 0, \qquad \theta = \frac{\eta}{\xi}.$$

⊙ *References for equation* 11.1.5.21: V. I. Arnold (2000, p. 139), O. F. Menshikh (2004).

22. $$\left[f^2 - \left(\frac{\partial w}{\partial x}\right)^2\right]\frac{\partial^2 w}{\partial x^2} - 2\frac{\partial w}{\partial x}\frac{\partial w}{\partial y}\frac{\partial^2 w}{\partial x \partial y} + \left[f^2 - \left(\frac{\partial w}{\partial y}\right)^2\right]\frac{\partial^2 w}{\partial y^2} = 0,$$
$$f = f(w_x^2 + w_y^2).$$

This equation describes a two-dimensional steady-state isentropic flow of a compressible gas; w is the velocity potential and f is the sound speed.

The Legendre transformation

$$w(x,y) + U(\xi,\eta) = x\xi + y\eta, \quad \xi = \frac{\partial w}{\partial x}, \quad \eta = \frac{\partial w}{\partial y}, \quad x = \frac{\partial U}{\partial \xi}, \quad y = \frac{\partial U}{\partial \eta}$$

leads to the linear equation

$$\left(f^2 - \xi^2\right)\frac{\partial^2 U}{\partial \eta^2} + 2\xi\eta\frac{\partial^2 U}{\partial \xi \partial \eta} + \left(f^2 - \eta^2\right)\frac{\partial^2 U}{\partial \xi^2} = 0, \qquad f = f(\xi^2 + \eta^2).$$

⊙ *Reference*: R. Courant and D. Hilbert (1989).

11.1.6. Other Equations with Three and More Independent Variables

1. $$\frac{\partial^2 w}{\partial x \partial t} + f\left(\frac{\partial w}{\partial x}\right)\frac{\partial^2 w}{\partial x^2} + b\frac{\partial^2 w}{\partial y^2} = 0.$$

1°. Suppose $w(x,y,t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-1}w(C_1x + C_2, C_1y + C_3, C_1t + C_4) + C_5yt + C_6y + C_7t + C_8,$$
$$w_2 = w(x + \lambda y - b\lambda^2 t, y - 2b\lambda t, t) + \varphi(t)y + \psi(t),$$

where $C_1, \ldots, C_8$ and λ are arbitrary constants and $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are arbitrary functions, are also solutions of the equation.

2°. "Two-dimensional" solution:

$$w(x,y,t) = U(z,t) + \varphi(t)y^2 + \psi(t)y + \chi(t), \quad z = x + \lambda y,$$

where $\varphi = \varphi(t)$, $\psi = \psi(t)$, and $\chi = \chi(t)$ are arbitrary functions, λ is an arbitrary constant, and the function $U = U(z,t)$ is determined by the first-order partial differential equation

$$\frac{\partial U}{\partial t} + F\left(\frac{\partial U}{\partial z}\right) + b\lambda^2\frac{\partial U}{\partial z} + 2b\varphi(t)z = \sigma(t), \quad F(u) = \int f(u)\,du,$$

where $\sigma(t)$ is an arbitrary function. A complete integral of this equation has the form

$$U = A(t)z + B(t),$$

where the functions $A(t)$ and $B(t)$ are given by

$$A(t) = -2b\int \varphi(t)\,dt + C_1, \quad B(t) = \int\left[\sigma(t) - F(A(t)) - b\lambda^2 A(t)\right]dt + C_2,$$

and C_1 and C_2 are arbitrary constants.

⊙ *References for equation* 11.1.6.1: A. D. Polyanin and V. F. Zaitsev (2002, p. 245).

2. $\dfrac{\partial^2 w}{\partial x\partial t} + f(t)\Phi\left(\dfrac{\partial w}{\partial x}\right)\dfrac{\partial^2 w}{\partial x^2} + g(t)\dfrac{\partial^2 w}{\partial y^2} = 0.$

1°. Suppose $w(x,y,t)$ is a solution of this equation. Then the function

$$w_1 = w(\xi,\eta,t) + \varphi(t)y + \psi(t), \quad \xi = x + \lambda y - \lambda^2\int g(t)\,dt + C_1, \quad \eta = y - 2\lambda\int g(t)\,dt + C_2,$$

where C_1, C_2, and λ are arbitrary constants and $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are arbitrary functions, is also a solution of the equation.

2°. "Two-dimensional" solution:

$$w(x,y,t) = U(z,t) + \varphi(t)y^2 + \psi(t)y + \chi(t), \quad z = x + \lambda y,$$

where $\varphi = \varphi(t)$, $\psi = \psi(t)$, and $\chi = \chi(t)$ are arbitrary functions, λ is an arbitrary constant, and the function $U = U(z,t)$ is determined by the first-order partial differential equation

$$\frac{\partial U}{\partial t} + f(t)\Psi\left(\frac{\partial U}{\partial z}\right) + \lambda^2 g(t)\frac{\partial U}{\partial z} + 2g(t)\varphi(t)z = \sigma(t), \quad \Psi(u) = \int \Phi(u)\,du,$$

where $\sigma(t)$ is an arbitrary function. This equation can be fully integrated—a complete integral is sought in the form $U = A(t)z + B(t)$.

3. $\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial x\partial t} = \dfrac{\partial w}{\partial t}\dfrac{\partial^2 w}{\partial x\partial y}.$

General solution:

$$w(x,y,t) = G(x, F(y,t)),$$

where $F(y,t)$ and $G(x,z)$ are arbitrary functions.

⊙ *Reference*: Yu. N. Kosovtsov (2007, http://eqworld.ipmnet.ru/eqarchive/view.php?id=67).

4. $\dfrac{\partial w}{\partial x}\dfrac{\partial w}{\partial z}\dfrac{\partial^2 w}{\partial y\partial t} = \dfrac{\partial w}{\partial t}\dfrac{\partial w}{\partial y}\dfrac{\partial^2 w}{\partial x\partial z}.$

Solutions:

$$w(x,y,z,t) = F(G(x,t),H(y,z)),$$
$$w(x,y,z,t) = S(G(x,t)+F(z,t)+K(x,y)+H(y,z)),$$

where F, G, H, and K are arbitrary functions of two arguments, and S is an arbitrary function of one argument.

⊙ *Reference*: Yu. N. Kosovtsov (2007, http://eqworld.ipmnet.ru/eqarchive/view.php?id=90).

11.2. Equations Quadratic in the Highest Derivatives

11.2.1. Equations of the Form $\dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = F(x,y)$

▷ *Suppose $w(x,y)$ is a solution of the equation in question. Then the function*

$$w_1 = w(x,y) + C_1xy + C_2x + C_3y + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

1. $\dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(x)y^k.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the function

$$w_1 = C_1^{-k-2}w(x,C_1^2y) + C_2xy + C_3x + C_4y + C_5,$$

where $C_1, \ldots, C_5$ are arbitrary constants, is also a solution of the equation.

2°. Generalized separable solutions:

$$w(x,y) = (C_1x+C_2)y^{k+1} + \frac{y}{k(k+1)}\int_0^x \frac{(x-t)f(t)}{(C_1t+C_2)}\,dt + C_3xy + C_4x + C_5y + C_6,$$
$$w(x,y) = (C_1x+C_2)y^{k+2} + \frac{1}{(k+1)(k+2)}\int_0^x \frac{(x-t)f(t)}{(C_1t+C_2)}\,dt + C_3xy + C_4x + C_5y + C_6,$$

where $C_1, \ldots, C_6$ are arbitrary constants.

3°. Generalized separable solution:

$$w(x,y) = \varphi(x)y^{\frac{k+2}{2}} + C_1xy + C_2x + C_3y + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants and the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$k(k+2)\varphi\varphi''_{xx} = 4f(x).$$

2. $\dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(x)g(y).$

1°. Additive separable solution:

$$w(x,y) = C_1\int_0^x (x-t)f(t)\,dt + C_2x + \frac{1}{C_1}\int_0^y (y-\tau)g(\tau)\,d\tau + C_3y + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants.

2°. Multiplicative separable solution:

$$w(x,y) = \varphi(x)\psi(y),$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(y)$ are determined by the ordinary differential equations (C_1 is an arbitrary constant)

$$\varphi\varphi''_{xx} = C_1 f(x),$$
$$\psi\psi''_{yy} = C_1^{-1} g(y).$$

3. $\dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(ax+by).$

Solutions:

$$w(x,y) = \pm\frac{1}{ab}\int_0^z (z-t)\sqrt{f(t)}\,dt + C_1xy + C_2x + C_3y + C_4, \qquad z = ax+by,$$

where $C_1, \ldots, C_4$ are arbitrary constants.

4. $\dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(x)y^{2k} + g(x)y^k + h(x)y^{k-1}.$

Generalized separable solution:

$$w(x,y) = \varphi(x)y^{k+1} + \psi(x)y + \chi(x),$$

where the functions $\varphi = \varphi(x)$, $\psi = \psi(x)$, and $\chi = \chi(x)$ are determined by the system of ordinary differential equations

$$k(k+1)\varphi\varphi''_{xx} = f(x),$$
$$k(k+1)\varphi\psi''_{xx} = g(x),$$
$$k(k+1)\varphi\chi''_{xx} = h(x).$$

5. $\dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(x)e^{\lambda y}.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the function

$$w_1 = C_1 w\Big(x, y - \frac{2}{\lambda}\ln|C_1|\Big) + C_2xy + C_3x + C_4y + C_5,$$

where $C_1, \ldots, C_5$ are arbitrary constants, is also a solution of the equation.

2°. Generalized separable solution:

$$w(x,y) = (C_1x + C_2)e^{\lambda y} + \frac{1}{\lambda^2}\int_{x_0}^{x} \frac{(x-t)f(t)}{C_1t + C_2}\,dt + C_3xy + C_4x + C_5y + C_6,$$

where $C_1, \ldots, C_6$ are arbitrary constants, and x_0 is any number such that the integrand does not have a singularity at $x = x_0$.

3°. Generalized separable solution:

$$w(x,y) = \varphi(x)e^{\lambda y/2} + C_1xy + C_2x + C_3y + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, and the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation $\lambda^2\varphi\varphi''_{xx} = 4f(x)$.

6. $\dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(x)e^{2\lambda y} + g(x)e^{\lambda y}.$

Generalized separable solution:

$$w(x,y) = \varphi(x)e^{\lambda y} + \frac{1}{\lambda^2}\int_{x_0}^{x}(x-t)\frac{g(t)}{\varphi(t)}\,dt + C_1xy + C_2x + C_3y + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants and the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation $\lambda^2\varphi\varphi''_{xx} = f(x)$.

11.2.2. Monge–Ampère Equation $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = F(x,y)$

Preliminary remarks. The Monge–Ampère equation is encountered in differential geometry, gas dynamics, and meteorology.

1°. Suppose $w(x,y)$ is a solution of the Monge–Ampère equation. Then the functions

$$w_1 = \pm w(x,y) + C_1x + C_2y + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. The transformation

$$\bar{x} = a_1x + b_1y + c_1, \quad \bar{y} = a_2x + b_2y + c_2, \quad \bar{w} = kw + a_3x + b_3y + c_3, \quad \bar{F} = k^2(a_1b_2 - a_2b_1)^{-2}F,$$

where the a_n, b_n, c_n, and k are arbitrary constants, takes the Monge–Ampère equation to an equation of the same form.

3°. The transformation

$$\bar{x} = x(1+\alpha x+\beta y)^{-1}, \quad \bar{y} = y(1+\alpha x+\beta y)^{-1}, \quad \bar{w} = w(1+\alpha x+\beta y)^{-1}, \quad \bar{F} = F(1+\alpha x+\beta y)^4,$$

where α and β are arbitrary constants, takes the Monge–Ampère equation to an equation of the same form.

4°. In the cylindrical coordinates r, φ, where $x = r\cos\varphi$, $y = r\sin\varphi$, the Monge–Ampère equation has the form

$$\left[\frac{\partial}{\partial r}\left(\frac{1}{r}\frac{\partial w}{\partial \varphi}\right)\right]^2 - \frac{\partial^2 w}{\partial r^2}\left(\frac{1}{r^2}\frac{\partial^2 w}{\partial \varphi^2} + \frac{1}{r}\frac{\partial w}{\partial r}\right) = F(r\cos\varphi, r\sin\varphi).$$

5°. In Lagrangian coordinates, the system of equations of the one-dimensional gas dynamics with plane waves is as follows:

$$\frac{\partial u}{\partial t} + \frac{\partial p}{\partial \xi} = 0, \qquad \frac{\partial V}{\partial t} - \frac{\partial u}{\partial \xi} = 0,$$

where t is time, u the velocity, p the pressure, ξ the Lagrangian coordinate, and V the specific volume. The equation of state is assumed to have the form $V = V\big(p, S(\xi)\big)$, where $S = S(\xi)$ is a prescribed entropy profile.

The *Martin transformation*

$$u(\xi, t) = \frac{\partial w}{\partial x}(x, y), \quad t = \frac{\partial w}{\partial y}(x, y), \quad x = \xi, \quad y = p(\xi, t)$$

reduces the equations of the one-dimensional gas dynamics to the nonhomogeneous Monge–Ampère equation

$$\left(\frac{\partial^2 w}{\partial x \partial y}\right)^2 - \frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2} = F(x, y),$$

where $F(x, y) = -\frac{\partial V}{\partial p}\big(p, S(\xi)\big)$.

⊙ *References for Preliminary remarks*: M. N. Martin (1953), B. L. Rozhdestvenskii and N. N. Yanenko (1983), S. V. Khabirov (1990 *b*), N. H. Ibragimov (1994, pp. 94–101).

1. $\left(\dfrac{\partial^2 w}{\partial x \partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = 0.$

Homogeneous Monge–Ampère equation.

1°. Suppose $w(x, y)$ is a solution of the homogeneous Monge–Ampère equation. Then the functions

$$w_1 = C_1 w(C_2 x + C_3 y + C_4, C_5 x + C_6 y + C_7) + C_8 x + C_9 y + C_{10},$$
$$w_2 = (1 + C_1 x + C_2 y) w\left(\frac{x}{1 + C_1 x + C_2 y}, \frac{y}{1 + C_1 x + C_2 y}\right),$$

where $C_1, \ldots, C_{10}$ are arbitrary constants, are also solutions of the equation.

2°. First integrals:

$$\Phi_1\left(\frac{\partial w}{\partial x}, \frac{\partial w}{\partial y}\right) = 0,$$
$$\Phi_2\left(\frac{\partial w}{\partial x}, w - x\frac{\partial w}{\partial x} - y\frac{\partial w}{\partial y}\right) = 0,$$

where $\Phi_1(u, v)$ and $\Phi_2(u, z)$ are arbitrary functions of two arguments.

3°. General solution in parametric form:

$$w = tx + \varphi(t)y + \psi(t),$$
$$x + \varphi'(t)y + \psi'(t) = 0,$$

where t is the parameter, and $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are arbitrary functions.

4°. Solutions involving one arbitrary function:

$$w(x,y) = \varphi(C_1x + C_2y) + C_3x + C_4y + C_5,$$
$$w(x,y) = (C_1x + C_2y)\varphi\left(\frac{y}{x}\right) + C_3x + C_4y + C_5,$$
$$w(x,y) = \sqrt{x^2+y^2}\,\varphi\left(\frac{y}{x}\right) + C_1x + C_2y + C_3,$$
$$w(x,y) = (C_1x + C_2y + C_3)\varphi\left(\frac{C_4x + C_5y + C_6}{C_1x + C_2y + C_3}\right) + C_7x + C_8y + C_9,$$

where $C_1, \ldots, C_9$ are arbitrary constants and $\varphi = \varphi(z)$ is an arbitrary function.

5°. Solutions involving arbitrary constants:

$$w(x,y) = C_1y^2 + C_2xy + \frac{C_2^2}{4C_1}x^2 + C_3y + C_4x + C_5,$$
$$w(x,y) = \frac{1}{x + C_1}\left(C_2y^2 + C_3y + \frac{C_3^2}{4C_2}\right) + C_4y + C_5x + C_6,$$
$$w(x,y) = \pm(C_1x + C_2y + C_3)^k + C_4x + C_5y + C_6,$$
$$w(x,y) = \pm\frac{(C_1x + C_2y + C_3)^{k+1}}{(C_4x + C_5y + C_6)^k} + C_7x + C_8y + C_9,$$
$$w(x,y) = \pm\sqrt{C_1(x+a)^2 + C_2(x+a)(y+b) + C_3(y+b)^2} + C_5x + C_6y + C_7,$$

where the a, b, and the C_n are arbitrary constants.

⊙ *References for equation* 11.2.2.1: E. Goursat (1933, p. 62), S. V. Khabirov (1990 *b*), N. H. Ibragimov (1994, pp. 94–101).

2. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = A.$

1°. First integrals for $A = a^2 > 0$:

$$\Phi_1\left(\frac{\partial w}{\partial x} + ay, \frac{\partial w}{\partial y} - ax\right) = 0,$$
$$\Phi_2\left(\frac{\partial w}{\partial x} - ay, \frac{\partial w}{\partial y} + ax\right) = 0,$$

where the $\Phi_n(u,v)$ are arbitrary functions of two arguments ($n = 1, 2$).

2°. General solution in parametric form for $A = a^2 > 0$:

$$x = \frac{\beta - \lambda}{2a}, \quad y = \frac{\psi'(\lambda) - \varphi'(\beta)}{2a}, \quad w = \frac{(\beta + \lambda)[\psi'(\lambda) - \varphi'(\beta)] + 2\varphi(\beta) - 2\psi(\lambda)}{4a},$$

where β and λ are the parameters and $\varphi = \varphi(\beta)$ and $\psi = \psi(\lambda)$ are arbitrary functions.

3°. Solutions:

$$w(x,y) = \pm\frac{\sqrt{A}}{C_2}x(C_1x + C_2y) + \varphi(C_1x + C_2y) + C_3x + C_4y,$$

$$w(x,y) = C_1y^2 + C_2xy + \frac{1}{4C_1}(C_2^2 - A)x^2 + C_3y + C_4x + C_5,$$

$$w(x,y) = \frac{1}{x + C_1}\left(C_2y^2 + C_3y + \frac{C_3^2}{4C_2}\right) - \frac{A}{12C_2}(x^3 + 3C_1x^2) + C_4y + C_5x + C_6,$$

$$w(x,y) = \pm\frac{2\sqrt{A}}{3C_1C_2}(C_1x - C_2^2y^2 + C_3)^{3/2} + C_4x + C_5y + C_6,$$

where $C_1, \ldots, C_6$ are arbitrary constants and $\varphi = \varphi(z)$ is an arbitrary function.

Another five solutions can be obtained:

(a) from the solution of equation 11.2.2.18 with $\alpha = 0$ and $f(u) = A$, where β is an arbitrary constant;
(b) from the solution of equation 11.2.2.22 with $f(u) = A$, where a, b, and c are arbitrary constants;
(c) from the solution of equation 11.2.2.23 with $f(u) = A$, where a, b, c, k, and s are arbitrary constants;
(d) from the solution of equation 11.2.2.24 with $\alpha = 0$ and $f(u) = A$, where β is an arbitrary constant;
(e) from the solution of equation 11.2.2.26 with $\alpha = 0$ and $f(u) = A$, where β is an arbitrary constant.

4°. The Legendre transformation

$$u = x\xi + y\eta - w(x,y), \quad \xi = \frac{\partial w}{\partial x}, \quad \eta = \frac{\partial w}{\partial y},$$

where $u = u(\xi, \eta)$ is the new independent variable, and ξ and η are the new dependent variables, leads to an equation of the similar form

$$\left(\frac{\partial^2 u}{\partial\xi\partial\eta}\right)^2 - \frac{\partial^2 u}{\partial\xi^2}\frac{\partial^2 u}{\partial\eta^2} = \frac{1}{A}.$$

⊙ *References for equation* 11.2.2.2: E. Goursat (1933, pp. 63–64), A. D. Polyanin and V. F. Zaitsev (2004, pp. 452–453).

3. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(x).$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-1}w(x, C_2x \pm C_1y + C_3) + C_4x + C_5y + C_6,$$

where $C_1, \ldots, C_6$ are arbitrary constants, are also solutions of the equation.

2°. Generalized separable solutions quadratic in y:

$$w(x,y)=C_1y^2+C_2xy+\frac{C_2^2}{4C_1}x^2-\frac{1}{2C_1}\int_0^x(x-t)f(t)\,dt+C_3y+C_4x+C_5,$$

$$w(x,y)=\frac{1}{x+C_1}\left(C_2y^2+C_3y+\frac{C_3^2}{4C_2}\right)-\frac{1}{2C_2}\int_0^x(x-t)(t+C_1)f(t)\,dt+C_4y+C_5x+C_6,$$

where $C_1,\ldots,C_6$ are arbitrary constants.

3°. Generalized separable solutions for $f(x)>0$:

$$w(x,y)=\pm y\int\sqrt{f(x)}\,dx+\varphi(x)+C_1y,$$

where $\varphi(x)$ is an arbitrary function.

4°. Conservation law:

$$D_x\big[y(w_xw_{yy}-w_yw_{xy}+g_y)-g-w_xw_y\big]+D_y\big[y(w_yw_{xx}-w_xw_{xy}+g_x)+(w_x)^2\big]=0,$$

where $D_x=\dfrac{\partial}{\partial x}$, $D_y=\dfrac{\partial}{\partial y}$, $g=y\displaystyle\int f(x)\,dx+\varphi(x)+\psi(y)$, and $\varphi(x)$ and $\psi(y)$ are arbitrary functions.

5°. Let us consider some specific functions $f=f(x)$. Solutions that can be obtained by the formulas of Items 1° and 2° are omitted.

5.1. Solutions with $f(x)=Ax^k$ can be obtained:

(a) from the solution of equation 11.2.2.18 with $f(u)=A$ and $\alpha=k/2$, where β is an arbitrary constant;
(b) from the solution of equation 11.2.2.26 with $f(u)=A$ and $\alpha=k/2$, where β is an arbitrary constant.

5.2. Solutions for $f(x)=Ae^{\lambda x}$:

$$w(x,y)=\pm\frac{2\sqrt{A}}{C_2\lambda}e^{\lambda x/2}\sin(C_1x+C_2y+C_3)+C_4x+C_5y+C_6,$$

$$w(x,y)=\pm\frac{2\sqrt{A}}{C_2\lambda}e^{\lambda x/2}\sinh(C_1x+C_2y+C_3)+C_4x+C_5y+C_6,$$

$$w(x,y)=\pm\frac{2\sqrt{-A}}{C_2\lambda}e^{\lambda x/2}\cosh(C_1x+C_2y+C_3)+C_4x+C_5y+C_6.$$

Another solution can be obtained from the solution of equation 11.2.2.24 with $\alpha=\lambda$ and $f(u)=A$, where β is an arbitrary constant.

⊙ *References for equation* 11.2.2.3: M. N. Martin (1953), C. S. Ludford (1955), B. L. Rozhdestvenskii and N. N. Yanenko (1983), S. V. Khabirov (1990 *b*), A. D. Polyanin and V. F. Zaitsev (2002, p. 250).

4. $\left(\dfrac{\partial^2w}{\partial x\partial y}\right)^2-\dfrac{\partial^2w}{\partial x^2}\dfrac{\partial^2w}{\partial y^2}=f(x)y.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the functions

$$w_1=\pm C_1^{-3}w(x,C_1^2y)+C_2x+C_3y+C_4,$$

where $C_1,\ldots,C_4$ are arbitrary constants, are also solutions of the equation.

2°. Generalized separable solution quadratic in y:

$$w(x,y) = C_1y^2 - y\int F(x)\,dx + \frac{1}{2C_1}\int_a^x (x-t)F^2(t)\,dt + C_2x + C_3y + C_4,$$
$$F(x) = \frac{1}{2C_1}\int f(x)\,dx + C_5,$$

where $C_1, \ldots, C_5$ are arbitrary constants.

3°. Generalized separable solution quadratic in y:

$$w(x,y) = \varphi(x)y^2 + \psi(x)y + \chi(x),$$

where

$$\varphi(x) = \frac{1}{C_1x + C_2}, \quad \psi(x) = C_3\varphi(x) + C_4 + \frac{\varphi(x)}{2C_1}\int \frac{f(x)\,dx}{[\varphi(x)]^3} - \frac{1}{2C_1}\int \frac{f(x)\,dx}{[\varphi(x)]^2},$$
$$\chi(x) = \frac{1}{2}\int_a^x (x-t)\frac{[\psi_t'(t)]^2}{\varphi(t)}\,dt + C_5x + C_6.$$

4°. Generalized separable solutions cubic in y:

$$w(x,y) = C_1y^3 - \frac{1}{6C_1}\int_a^x (x-t)f(t)\,dt + C_2x + C_3y + C_4,$$
$$w(x,y) = \frac{y^3}{(C_1x + C_2)^2} - \frac{1}{6}\int_a^x (x-t)(C_1t + C_2)^2 f(t)\,dt + C_3x + C_4y + C_5,$$

where $C_1, \ldots, C_5$ are arbitrary constants.

5°. See solution of equation 11.2.2.7 in Item 3° with $k = 1$.

⊙ *Reference for equation* 11.2.2.4: A. D. Polyanin and V. F. Zaitsev (2002, p. 250).

5. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(x)y^2.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the function

$$w_1 = \pm C_1^{-2}w(x, C_1y) + C_2x + C_3y + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. Generalized separable solution quadratic in y:

$$w(x,y) = \varphi(x)y^2 + \left[C_1\int \varphi^2(x)\,dx + C_2\right]y + \frac{1}{2}C_1^2\int_a^x (x-t)\varphi^3(t)\,dt + C_3x + C_4,$$

where the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$\varphi\varphi_{xx}'' = 2(\varphi_x')^2 - \tfrac{1}{2}f(x).$$

3°. Generalized separable solutions in the form of polynomials of degree 4 in y:

$$w(x,y) = C_1y^4 - \frac{1}{12C_1}\int_a^x (x-t)f(t)\,dt + C_2x + C_3y + C_4,$$
$$w(x,y) = \frac{y^4}{(C_1x + C_2)^3} - \frac{1}{12}\int_a^x (x-t)(C_1t + C_2)^3 f(t)\,dt + C_3x + C_4y + C_5,$$

where $C_1, \ldots, C_5$ are arbitrary constants.

4°. See solution of equation 11.2.2.7 in Item 3° with $k = 2$.

⊙ *Reference for equation* 11.2.2.5: A. D. Polyanin and V. F. Zaitsev (2002, p. 251).

6. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(x)y^2 + g(x)y + h(x).$

Generalized separable solution quadratic in y:

$$w(x,y) = \varphi(x)y^2 + \psi(x)y + \chi(x),$$

where the functions $\varphi = \varphi(x)$, $\psi = \psi(x)$, and $\chi = \chi(x)$ are determined by the system of ordinary differential equations

$$\begin{aligned}
\varphi\varphi''_{xx} &= 2(\varphi'_x)^2 - \tfrac{1}{2}f(x),\\
\varphi\psi''_{xx} &= 2\varphi'_x\psi'_x - \tfrac{1}{2}g(x),\\
\varphi\chi''_{xx} &= \tfrac{1}{2}(\psi'_x)^2 - \tfrac{1}{2}h(x).
\end{aligned}$$

7. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(x)y^k.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the functions

$$w_1 = \pm C_1^{-k-2} w(x, C_1^2 y) + C_2 x + C_3 y + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation.

2°. Generalized separable solutions:

$$w(x,y) = \frac{C_1 y^{k+2}}{(k+1)(k+2)} - \frac{1}{C_1}\int_a^x (x-t)f(t)\,dt + C_2 x + C_3 y + C_4,$$

$$w(x,y) = \frac{y^{k+2}}{(C_1 x + C_2)^{k+1}} - \frac{1}{(k+1)(k+2)}\int_a^x (x-t)(C_1 t + C_2)^{k+1} f(t)\,dt + C_3 x + C_4 y + C_5,$$

where $C_1, \ldots, C_5$ are arbitrary constants.

3°. Multiplicative separable solution:

$$w(x,y) = \varphi(x) y^{\frac{k+2}{2}},$$

where the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$k(k+2)\varphi\varphi''_{xx} - (k+2)^2(\varphi'_x)^2 + 4f(x) = 0.$$

4°. Let us consider the case where f is a power-law function of x, $f(x) = Ax^n$, in more detail.

Solutions:

$$w(x,y) = \frac{C_1 x^{n+2}}{(n+1)(n+2)} - \frac{A y^{k+2}}{C_1(k+1)(k+2)} + C_2 y + C_3 x + C_4,$$

$$w(x,y) = \frac{C_1 x^{n+2}}{(n+1)(n+2)y^{n+1}} - \frac{A y^{k+n+3}}{C_1(k+n+2)(k+n+3)} + C_2 y + C_3 x + C_4,$$

$$w(x,y) = \frac{C_1 y^{k+2}}{(k+1)(k+2)x^{k+1}} - \frac{A x^{k+n+3}}{C_1(k+n+2)(k+n+3)} + C_2 y + C_3 x + C_4,$$

$$w(x,y) = (C_1 x + C_2)^{-k-1} y^{k+2} - \frac{A}{(k+1)(k+2)}\int_a^x (x-t)t^n (C_1 t + C_2)^{k+1}\,dt + C_3 y + C_4 x,$$

$$w(x,y) = (C_1 y + C_2)^{-n-1} x^{n+2} - \frac{A}{(n+1)(n+2)}\int_a^y (y-t)t^k (C_1 t + C_2)^{n+1}\,dt + C_3 y + C_4 x,$$

where $C_1, \ldots, C_4$ are arbitrary constants.

There is also a multiplicative separable solution, see Item 3° with $f(x) = Ax^n$, and a solution of the same type:

$$w(x,y) = \psi(y)x^{\frac{n+2}{2}},$$

where the function $\psi = \psi(y)$ is determined by the ordinary differential equation

$$n(n+2)\psi\psi''_{yy} - (n+2)^2(\psi'_y)^2 + 4Ay^k = 0.$$

The substitution $\psi = U^{-n/2}$ brings it to the Emden–Fowler equation

$$U''_{yy} = \frac{8A}{n^2(n+2)}y^kU^{n+1},$$

whose exact solutions for various values of k and n can be found in the books by Polyanin and Zaitsev (1995, 2003).

Another exact solution for $f(x) = Ax^n$ can be obtained from the solution of equation 11.2.2.18 with $f(u) = Au^k$ and $n = 2\alpha + k\beta$, where α and β are arbitrary constants.

⊙ *Reference for equation* 11.2.2.7: A. D. Polyanin and V. F. Zaitsev (2002, pp. 251–252).

8. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(x)y^{2k+2} + g(x)y^k.$

Generalized separable solution:

$$w(x,y) = \varphi(x)y^{k+2} - \frac{1}{(k+1)(k+2)}\int_a^x (x-t)\frac{g(t)}{\varphi(t)}\,dt + C_1x + C_2y + C_3,$$

where the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$(k+1)(k+2)\varphi\varphi''_{xx} - (k+2)^2(\varphi'_x)^2 + f(x) = 0.$$

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2002, p. 252).

9. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(x)e^{\lambda y}.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the functions

$$w_1 = \pm C_1 w\Big(x,\ y - \frac{2}{\lambda}\ln|C_1|\Big) + C_2x + C_3y + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation.

2°. Generalized separable solutions:

$$w(x,y) = C_1\int_a^x (x-t)f(t)\,dt + C_2x - \frac{1}{C_1\lambda^2}e^{\lambda y} + C_3y + C_4,$$

$$w(x,y) = C_1e^{\beta x+\lambda y} - \frac{1}{C_1\lambda^2}\int_a^x (x-t)e^{-\beta t}f(t)\,dt + C_2x + C_3y + C_4,$$

where $C_1, \ldots, C_4$ and β are arbitrary constants.

3°. Multiplicative separable solution:

$$w(x,y) = \varphi(x)\exp\big(\tfrac{1}{2}\lambda y\big),$$

where the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$\varphi\varphi''_{xx} - (\varphi'_x)^2 + 4\lambda^{-2}f(x) = 0.$$

⊙ *Reference for equation* 11.2.2.9: A. D. Polyanin and V. F. Zaitsev (2002, p. 252).

10. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(x)e^{2\lambda y} + g(x)e^{\lambda y}.$

Generalized separable solution:

$$w(x,y) = \varphi(x)e^{\lambda y} - \frac{1}{\lambda^2}\int_a^x (x-t)\frac{g(t)}{\varphi(t)}\,dt + C_1 x + C_2 y + C_3,$$

where the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$\varphi\varphi''_{xx} - (\varphi'_x)^2 + \lambda^{-2} f(x) = 0.$$

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2002, p. 252).

11. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(x)g(y) + A^2.$

Generalized separable solutions:

$$w(x,y) = C_1\int_a^x (x-t)f(t)\,dt - \frac{1}{C_1}\int_b^y (y-\xi)g(\xi)\,d\xi \pm Axy + C_2 x + C_3 y + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants; a and b are any numbers.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2004, p. 457).

12. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(ax + by).$

1°. Solutions:

$$w(x,y) = \pm\frac{x}{b}\int \sqrt{f(z)}\,dz + \varphi(z) + C_1 x + C_2 y, \qquad z = ax + by,$$

where C_1 and C_2 are arbitrary constants and $\varphi(z)$ is an arbitrary function.

2°. The transformation

$$w = U(x,z), \quad z = ax + by$$

leads to an equation of the form 11.2.2.3:

$$\left(\frac{\partial^2 U}{\partial x\partial z}\right)^2 = \frac{\partial^2 U}{\partial x^2}\frac{\partial^2 U}{\partial z^2} + b^{-2} f(z).$$

Here, x and z play the role of y and x in 11.2.2.3, respectively.

⊙ *References for equation* 11.2.2.12: M. N. Martin (1953), C. S. Lundford (1955), B. L. Rozhdestvenskii and N. N. Yanenko (1983).

13. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = x^k f(ax + by).$

The transformation

$$w = U(x,z), \quad z = ax + by$$

leads to an equation of the form 11.2.2.7:

$$\left(\frac{\partial^2 U}{\partial x\partial z}\right)^2 = \frac{\partial^2 U}{\partial x^2}\frac{\partial^2 U}{\partial z^2} + b^{-2} x^k f(z).$$

Here, x and z play the role of y and x in 11.2.2.7, respectively.

14. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = x^{2k+2} f(ax+by) + x^k g(ax+by).$

The transformation

$$w = U(x,z), \quad z = ax + by$$

leads to an equation of the form 11.2.2.8:

$$\left(\frac{\partial^2 U}{\partial x\partial z}\right)^2 = \frac{\partial^2 U}{\partial x^2}\frac{\partial^2 U}{\partial z^2} + b^{-2}x^{k+2}f(z) + b^{-2}x^k g(z).$$

Here, x and z play the role of y and x in 11.2.2.8, respectively.

15. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = e^{\lambda x} f(ax+by).$

The transformation

$$w = U(x,z), \quad z = ax + by$$

leads to an equation of the form 11.2.2.9:

$$\left(\frac{\partial^2 U}{\partial x\partial z}\right)^2 = \frac{\partial^2 U}{\partial x^2}\frac{\partial^2 U}{\partial z^2} + b^{-2}e^{\lambda x}f(z).$$

Here, x and z play the role of y and x in 11.2.2.9, respectively.

16. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = e^{2\lambda x} f(ax+by) + e^{\lambda x} g(ax+by).$

The transformation

$$w = U(x,z), \quad z = ax + by$$

leads to an equation of the form 11.2.2.10:

$$\left(\frac{\partial^2 U}{\partial x\partial z}\right)^2 = \frac{\partial^2 U}{\partial x^2}\frac{\partial^2 U}{\partial z^2} + b^{-2}e^{2\lambda x}f(z) + b^{-2}e^{\lambda x}g(z).$$

Here, x and z play the role of y and x in 11.2.2.10, respectively.

17. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = \dfrac{1}{x^4} f\left(\dfrac{y}{x}\right).$

This is a special case of equation 11.2.2.18 with $\alpha = -2$ and $\beta = -1$.

1°. Suppose $w(x,y)$ is a solution of the equation in question. Then the functions

$$w_1 = \pm w(C_1 x,\, C_1 y) + C_2 x + C_3 y + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation.

2°. First integral:

$$w - x\frac{\partial w}{\partial x} - y\frac{\partial w}{\partial y} \pm \int \sqrt{f(z)}\,dz = C, \qquad z = \frac{y}{x},$$

where C is an arbitrary constant.

3°. Solutions:

$$w = x\varphi\left(\frac{y}{x}\right) \pm \int \sqrt{f(z)}\,dz + C, \qquad z = \frac{y}{x},$$

where $\varphi(z)$ is an arbitrary function.

4°. Conservation law:

$$D_x\left(\frac{\partial w}{\partial x}\frac{\partial^2 w}{\partial y^2}\right) + D_y\left[-\frac{\partial w}{\partial x}\frac{\partial^2 w}{\partial x \partial y} + x^{-3}F\left(\frac{y}{x}\right)\right] = 0,$$

where $D_x = \dfrac{\partial}{\partial x}$, $D_y = \dfrac{\partial}{\partial y}$, and $F(z) = \displaystyle\int f(z)\,dz$.

⊙ *References for equation* 11.2.2.17: M. N. Martin (1953), C. S. Lundford (1955), B. L. Rozhdestvenskii and N. N. Yanenko (1983), S. V. Khabirov (1990 *b*).

18. $\left(\dfrac{\partial^2 w}{\partial x \partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = x^{2\alpha} f(x^\beta y).$

1°. Suppose $w(x, y)$ is a solution of this equation. Then the functions

$$w_1 = \pm C_1^{\beta-\alpha-1} w(C_1 x,\, C_1^{-\beta} y) + C_2 x + C_3 y + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation.

2°. Self-similar solution:

$$w(x, y) = x^{\alpha-\beta+1} u(z) \quad z = x^\beta y,$$

where the function $u = u(z)$ is determined by the ordinary differential equation

$$[\beta(\beta+1)zu'_z + (\alpha-\beta)(\beta-\alpha-1)u]u''_{zz} + (\alpha+1)^2(u'_z)^2 - f(z) = 0.$$

⊙ *Reference for equation* 11.2.2.18: S. V. Khabirov (1990 *b*).

19. $\left(\dfrac{\partial^2 w}{\partial x \partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(ax - by^2).$

1°. Suppose $w(x, y)$ is a solution of this equation. Then the functions

$$w_1 = w(x + 2bC_1 y + abC_1,\, y + aC_1) + C_2 x + C_3 y + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation.

2°. Solutions:

$$w(x, y) = \pm \int \sqrt{F(z) + C_1}\,dz + C_2 x + C_3 y + C_4, \qquad F(z) = \frac{1}{a^2 b}\int f(z)\,dz, \quad z = ax - by^2,$$

where $C_1, \ldots, C_4$ are arbitrary constants.

⊙ *Reference for equation* 11.2.2.19: A. D. Polyanin and V. F. Zaitsev (2002, p. 254).

20. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(x^2+y^2).$

Solutions in polar coordinates:

$$w = C_1\varphi \pm \int \sqrt{C_2 - 2F(r) - C_1^2 r^{-2}}\,dr + C_3,$$
$$r = \sqrt{x^2+y^2}, \quad \tan\varphi = \frac{y}{x}, \quad F(r) = \int r f(r)\,dr,$$

where C_1, C_2, and C_3 are arbitrary constants.

21. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = (x^2+y^2)^k f\Big(\dfrac{y}{x}\Big).$

Solutions in polar coordinates:

$$w = r^{k+2}u(\varphi) \qquad (x = r\cos\varphi, \quad y = r\sin\varphi),$$

where the function $u = u(\varphi)$ is determined by the ordinary differential equation

$$(k+1)^2(u'_\varphi)^2 - (k+1)(k+2)u[u''_{\varphi\varphi} + (k+2)u] = f(\tan\varphi).$$

22. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(ax^2+bxy+cy^2).$

Solution for $b^2 \neq 4ac$:

$$w(x,y) = u(z) \quad z = ax^2 + bxy + cy^2,$$

where the function $u = u(z)$ is determined by the ordinary differential equation

$$2(4ac-b^2)zu'_z u''_{zz} + (4ac-b^2)(u'_z)^2 + f(z) = 0.$$

Integrating yields

$$u(z) = \pm\int \sqrt{\frac{F(z)}{z}}\,dz + C_1, \quad F(z) = \frac{1}{b^2-4ac}\int f(z)\,dz + C_2,$$

where C_1 and C_2 are arbitrary constants.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2002, p. 254).

23. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(ax^2+bxy+cy^2+kx+sy).$

Solution:

$$w(x,y) = u(z), \quad z = ax^2 + bxy + cy^2 + kx + sy,$$

where the function $u = u(z)$ is determined by the ordinary differential equation

$$2\big[(4ac-b^2)z + as^2 + ck^2 - bks\big]u'_z u''_{zz} + (4ac-b^2)(u'_z)^2 + f(z) = 0.$$

The substitution $V(z) = (u'_z)^2$ leads to a first-order linear equation.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2002, p. 254).

24. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = e^{\alpha x} f(e^{\beta x} y).$

1°. Suppose $w(x, y)$ is a solution of this equation. Then the functions

$$w_1 = \pm C_1^{\alpha-2\beta} w(x - 2\ln C_1,\ C_1^{2\beta} y) + C_2 x + C_3 y + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation.

2°. Generalized self-similar solution:

$$w(x, y) = e^{\mu x} U(z), \quad z = e^{\beta x} y, \quad \mu = \tfrac{1}{2}\alpha - \beta,$$

where the function $U = U(z)$ is determined by the ordinary differential equation

$$\beta^2 z U_z' U_{zz}'' - \mu^2 U U_{zz}'' + (\beta + \mu)^2 (U_z')^2 - f(z) = 0.$$

⊙ *Reference for equation* 11.2.2.24: S. V. Khabirov (1990 *b*).

25. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = e^{ky/x} f(x).$

Solution:

$$w(x, y) = \exp\left(\frac{ky}{2x}\right)\varphi(x),$$

where the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$x^2\varphi\varphi_{xx}'' - x^2(\varphi_x')^2 + 2x\varphi\varphi_x' - \varphi^2 + 4k^{-2}x^4 f(x) = 0.$$

⊙ *Reference*: S. V. Khabirov (1990 *b*).

26. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = x^{2\alpha} f(x^\beta e^{y/x}).$

Solution:

$$w(x, y) = x^{\alpha+2} u(z), \quad z = x^\beta e^{y/x},$$

where the function $u = u(z)$ is determined by the ordinary differential equation

$$z^2\left[\beta z u_z' + (\alpha+2)(\alpha+1)u\right]u_{zz}'' + z\left\{\left[\beta - (\alpha+1)^2\right]z u_z' + (\alpha+2)(\alpha+1)u\right\}u_z' + f(z) = 0.$$

⊙ *Reference*: S. V. Khabirov (1990 *b*).

27. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = y^{-4}\exp(2\alpha y^{-1}) f(xy^{-1} + \beta y^{-2}).$

Solution:

$$w = y\exp(\alpha y^{-1})\varphi(z) + C_1 y + C_2 x + C_3, \quad z = xy^{-1} + \beta y^{-2},$$

where C_1, C_2, and C_3 are arbitrary constants, and the function $\varphi = \varphi(z)$ is determined by the ordinary differential equation

$$(2\beta\varphi_z' + \alpha^2\varphi)\varphi_{zz}'' - \alpha^2\varphi_z'^2 + f(z) = 0.$$

⊙ *Reference*: S. V. Khabirov (1990 *b*).

▷ *For exact solutions of the nonhomogeneous Monge–Ampère equation for some specific $F = F(x, y)$ (without functional arbitrariness), see Khabirov (1990 b,c) and Ibragimov (1994). The Cauchy problem for the Monge–Ampère equation is discussed in Courant and Hilbert (1989).*

11.2.3. Equations of the Form

$$\left(\frac{\partial^2 w}{\partial x\partial y}\right)^2 - \frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2} = F\left(x, y, w, \frac{\partial w}{\partial x}, \frac{\partial w}{\partial y}\right)$$

1. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(x)w + g(x).$

1°. Suppose $w(x, y)$ is a solution of this equation. Then the function

$$w_1 = w(x, y + C_1 x + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Generalized separable solution quadratic in y:

$$w = \varphi(x)y^2 + \psi(x)y + \chi(x),$$

where $\varphi(x)$, $\psi(x)$, and $\chi(x)$ are determined by the system of ordinary differential equations

$$2\varphi\varphi''_{xx} + f(x)\varphi - 4(\varphi'_x)^2 = 0,$$
$$2\varphi\psi''_{xx} + f(x)\psi - 4\varphi'_x\psi'_x = 0,$$
$$2\varphi\chi''_{xx} + f(x)\chi + g(x) - (\psi'_x)^2 = 0.$$

Note that the second equation is linear in ψ and has a particular solution $\psi = \varphi$ (hence, its general solution can be expressed via the particular solution of the first equation).

2. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(x)w^2.$

1°. Suppose $w(x, y)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(x, y + C_2 x + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Multiplicative separable solution:

$$w(x, y) = e^{\lambda y}u(x),$$

where λ is an arbitrary constant and the function $u = u(x)$ is determined by the ordinary differential equation

$$uu''_{xx} - (u'_x)^2 + \lambda^{-2}f(x)u^2 = 0.$$

3. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(x)y^n w^k.$

1°. Suppose $w(x, y)$ is a solution of this equation. Then the function

$$w_1 = C^{n+2}w(x, C^{k-2}y),$$

where C is an arbitrary constant, is also a solution of the equation.

2°. Multiplicative separable solution with $n \neq -2$ and $k \neq 2$:

$$w(x, y) = y^{\frac{n+2}{2-k}}U(x),$$

where the function $U(x)$ is determined by the ordinary differential equation

$$(n + 2)(n + k)UU''_{xx} - (n + 2)^2(U'_x)^2 + (k - 2)^2 f(x)U^k = 0.$$

4. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(x)e^{\lambda y}w^k.$

1°. Suppose $w(x, y)$ is a solution of this equation. Then the function

$$w_1 = Cw\Big(x, y + \frac{k-2}{\lambda}\ln C\Big),$$

where C is an arbitrary constant, is also a solution of the equation.

2°. Multiplicative separable solution with $k \neq 2$ and $\lambda \neq 0$:

$$w(x, y) = \exp\left(\frac{\lambda y}{2-k}\right)U(x),$$

where the function $U(x)$ is determined by the ordinary differential equation

$$UU''_{xx} - (U'_x)^2 + (k-2)^2\lambda^{-2}f(x)U^k = 0.$$

5. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(w).$

1°. Suppose $w(x, y)$ is a solution of this equation. Then the function

$$w_1 = w(A_1x + B_1y + C_1, A_2x + B_2y + C_2), \qquad |A_2B_1 - A_1B_2| = 1,$$

where C_1, C_2, and any three of the four constants A_1, A_2, B_1, and B_2 are arbitrary, is also a solution of the equation.

2°. Functional separable solution:

$$w(x, y) = u(z), \quad z = ax^2 + bxy + cy^2 + kx + sy,$$

where a, b, c, k, and s are arbitrary constants and the function $u = u(z)$ is determined by the ordinary differential equation

$$2\big[(4ac - b^2)z + as^2 + ck^2 - bks\big]u'_zu''_{zz} + (4ac - b^2)(u'_z)^2 + f(u) = 0.$$

⊙ *Reference for equation* 11.2.3.5: A. D. Polyanin and V. F. Zaitsev (2004, p. 462).

6. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 = \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} + f(x)\exp\left(\dfrac{ay}{x}\right)w^k.$

Solution:

$$w(x, y) = \exp\left(\frac{\lambda y}{x}\right)u(x), \qquad \lambda = \frac{a}{2-k},$$

where the function $u = u(x)$ is determined by the ordinary differential equation

$$x^2uu''_{xx} - (xu'_x - u)^2 + \lambda^{-2}x^4f(x)u^k = 0.$$

7. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 = \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} + a\dfrac{\partial w}{\partial y}.$

This equation is used in meteorology for describing wind fields in near-equatorial regions.

1°. Suppose $w(x, y)$ is a solution of the equation in question. Then the function

$$w_1 = C_1^{-2}C_2^{-1}w(C_1x + C_3, C_2y + C_4x + C_5) + C_6x + C_7,$$

where $C_1, \ldots, C_7$ are arbitrary constants, is also a solution of the equation.

2°. Solutions:

$$w = \varphi(x),$$
$$w = \tfrac{1}{4}(\sqrt{a}\,x + C)^2y + \varphi(x),$$

where $\varphi(x)$ is an arbitrary function and C is an arbitrary constant.

3°. Solutions:

$$w = C_1e^{\lambda y} - \tfrac{1}{2}a\lambda^{-1}x^2 + C_2x + C_3,$$
$$w = \tfrac{1}{4}a(x + C_1)^2(y + C_2),$$
$$w = \tfrac{1}{4}aC_2^{-1}(x + C_1)^2\tanh(C_2y + C_3),$$
$$w = \tfrac{1}{4}aC_2^{-1}(x + C_1)^2\coth(C_2y + C_3),$$
$$w = \tfrac{1}{4}aC_2^{-1}(x + C_1)^2\tan(C_2y + C_3),$$

where C_1, C_2, C_3, and λ are arbitrary constants. The first solution is a solution in additive separable form and the other four are multiplicative separable solutions.

4°. Generalized separable solution quadratic in y:

$$w = F(x)y^2 + G(x)y + H(x),$$

where

$$F(x) = \frac{1}{C_1x + C_2}, \quad G(x) = -\frac{a}{6C_1^2}(C_1x + C_2)^2 + \frac{C_3}{C_1x + C_2} + C_4,$$
$$H(x) = \frac{1}{2}\int_0^x (x - t)\frac{[G_t'(t)]^2 - aG(t)}{F(t)}\,dt + C_5x + C_6,$$

and $C_1, \ldots, C_6$ are arbitrary constants.

5°. Generalized separable solution:

$$w = C_1\exp(C_2x + C_3y) - \frac{a}{2C_3}x^2 + C_4x + C_5.$$

6°. There are exact solutions of the following forms:

$$w(x, y) = |x|^{k+2}U(z), \quad z = y|x|^{-k};$$
$$w(x, y) = e^{kx}V(\xi), \quad \xi = ye^{-kx};$$
$$w(x, y) = x^2W(\eta), \quad \eta = y + k\ln|x|,$$

where k is an arbitrary constant.

7°. The Legendre transformation

$$u = x\xi + y\eta - w(x,y), \quad \xi = \frac{\partial w}{\partial x}, \quad \eta = \frac{\partial w}{\partial y},$$

where $u = u(\xi,\eta)$ is the new dependent variable and ξ and η are the new independent variables, leads to the simpler equation

$$\left(\frac{\partial^2 u}{\partial\xi\partial\eta}\right)^2 - \frac{\partial^2 u}{\partial\xi^2}\frac{\partial^2 u}{\partial\eta^2} = \frac{1}{a\eta}.$$

For exact solutions of this equation, see 11.2.2.3.

⊙ *References for equation* 11.2.3.7: E. R. Rozendorn (1984), A. D. Polyanin and V. F. Zaitsev (2004, p. 463).

8. $\displaystyle\left(\frac{\partial^2 w}{\partial x\partial y}\right)^2 = \frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2} + f(x)\frac{\partial w}{\partial y}.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the function

$$w_1 = C_1^{-1} w(x, C_1 y + C_2 x + C_3) + C_4 x + C_5,$$

where $C_1, \ldots, C_5$ are arbitrary constants, is also a solution of the equation.

2°. Solutions:

$$w = \varphi(x),$$
$$w = \frac{1}{4}\left[\int f(x)\,dx + C\right]^2 y + \varphi(x),$$
$$w = C_1 \exp(C_2 x + C_3 y) - \frac{1}{C_3}\int_0^x (x-t) f(t)\,dt + C_4 x + C_5,$$

where $\varphi(x)$ is an arbitrary function and C is an arbitrary constant. For $C_2 = 0$, the last solution is an additive separable solution.

3°. Generalized separable solution quadratic in y:

$$w = \varphi(x)y^2 + \psi(x)y + \chi(x),$$

where

$$\varphi(x) = \frac{1}{C_1 x + C_2}, \quad \psi(x) = -\int\left[\varphi^2(x)\int\frac{f(x)}{\varphi^2(x)}\,dx\right]dx + \frac{C_3}{C_1 x + C_2} + C_4,$$
$$\chi(x) = \frac{1}{2}\int_0^x (x-t)\frac{[\psi_t'(t)]^2 - f(t)\psi(t)}{\varphi(t)}\,dt + C_5 x + C_6,$$

and $C_1, \ldots, C_6$ are arbitrary constants.

⊙ *Reference for equation* 11.2.3.8: A. D. Polyanin and V. F. Zaitsev (2004, p. 464).

9. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(w)\left(\dfrac{\partial w}{\partial x}\right)^4.$

1°. Suppose $w(x, y)$ is a solution of the equation in question. Then the functions

$$w_1 = w(\pm C_1 x + C_2, C_1 y + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. Solutions:

$$x - y\int \sqrt{f(w)}\,dw = \varphi(w),$$
$$x + y\int \sqrt{f(w)}\,dw = \psi(w),$$

where $\varphi(w)$ and $\psi(w)$ are arbitrary functions.

10. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = f(w)\left(\dfrac{\partial w}{\partial x}\right)^2\left(\dfrac{\partial w}{\partial y}\right)^2.$

1°. Suppose $w(x, y)$ is a solution of the equation in question. Then the functions

$$w_1 = w(\pm C_1 x + C_2, C_3 y + C_4),$$

where C_1, C_2, C_3, and C_4 are arbitrary constants, are also solutions of the equation.

2°. Solutions:

$$C_1 x + C_2 y \exp\left(\int \sqrt{f(w)}\,dw\right) = \varphi(w),$$
$$C_3 x + C_4 y \exp\left(-\int \sqrt{f(w)}\,dw\right) = \psi(w),$$

where $\varphi(w)$ and $\psi(w)$ are arbitrary functions.

11. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 - \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} = -f(w)\left(\dfrac{\partial w}{\partial x}\right)^3\dfrac{\partial w}{\partial y}.$

1°. Suppose $w(x, y)$ is a solution of the equation in question. Then the function

$$w_1 = w(C_1 x + C_2, C_1 y + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Solution:

$$x - y\left(\frac{1}{2}\int \sqrt{f(w)}\,dw + C\right)^2 = \varphi(w),$$

where $\varphi(w)$ is an arbitrary function and C is an arbitrary constant.

12. $$\left(\frac{\partial^2 w}{\partial x\partial y}\right)^2 - \frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2} = f_1(w)\left(\frac{\partial w}{\partial x}\right)^4 + f_2(w)\left(\frac{\partial w}{\partial x}\right)^3\frac{\partial w}{\partial y} + f_3(w)\left(\frac{\partial w}{\partial x}\right)^2\left(\frac{\partial w}{\partial y}\right)^2 + f_4(w)\frac{\partial w}{\partial x}\left(\frac{\partial w}{\partial y}\right)^3 + f_5(w)\left(\frac{\partial w}{\partial y}\right)^4.$$

1°. Suppose $w(x, y)$ is a solution of the equation in question. Then the function

$$w_1 = w(C_1x + C_2, C_1y + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Solution:

$$x - \varphi(w)y = \psi(w),$$

where $\psi(w)$ is an arbitrary function and the function $\varphi = \varphi(w)$ is determined by the first-order ordinary differential equation

$$(\varphi'_w)^2 = f_1(w) - f_2(w)\varphi + f_3(w)\varphi^2 - f_4(w)\varphi^3 + f_5(w)\varphi^4.$$

13. $$\left(\frac{\partial^2 w}{\partial x\partial y}\right)^2 = \frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2} + f\left(\frac{\partial w}{\partial x}\right).$$

1°. Suppose $w(x, y)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-1}w(C_1x + C_2y + C_3, \pm y + C_4) + C_5y + C_6,$$

where $C_1, \ldots, C_6$ are arbitrary constants, are also solutions of the equation.

2°. Generalized separable solution linear in x:

$$w(x, y) = \varphi(y)x + \psi(y),$$

where $\psi(y)$ is an arbitrary function and the function $\varphi(y)$ is defined implicitly by

$$\int \frac{d\varphi}{\sqrt{f(\varphi)}} = \pm y + C,$$

where C is an arbitrary constant.

3°. Additive separable solution:

$$w(x, y) = C_1y^2 + C_2y + C_3 + z(x),$$

where the function $z(x)$ is determined by the autonomous ordinary differential equation $2C_1z''_{xx} + f(z'_x) = 0$. Its general solution can be written out in parametric form as

$$x = -2C_1\int \frac{dt}{f(t)} + C_3, \qquad z = -2C_1\int \frac{t\,dt}{f(t)} + C_4.$$

4°. Solution (generalizes the solution of Item 3°):

$$w(x, y) = C_1y^2 + C_2y + C_3 + z(\zeta), \quad \zeta = k_1x + k_2y,$$

where the function $z(\zeta)$ is determined by the autonomous ordinary differential equation $2C_1k_1^2z''_{\zeta\zeta} + f(k_1z'_\zeta) = 0$, whose general solution can be written out in parametric form in a similar manner as in Item 3°.

5°. The Legendre transformation

$$u = x\xi + y\eta - w(x,y), \quad \xi = \frac{\partial w}{\partial x}, \quad \eta = \frac{\partial w}{\partial y},$$

where $u = u(\xi,\eta)$ is the new dependent variable and ξ and η are the new independent variables, leads to an equation of the form 11.2.2.3:

$$\left(\frac{\partial^2 u}{\partial\xi\partial\eta}\right)^2 - \frac{\partial^2 u}{\partial\xi^2}\frac{\partial^2 u}{\partial\eta^2} = \frac{1}{f(\xi)}.$$

14. $\displaystyle\left(\frac{\partial^2 w}{\partial x\partial y}\right)^2 - \frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2} = f(w)\left(\frac{\partial w}{\partial x}\right)^4 g\left(\frac{\partial w}{\partial y}\Big/\frac{\partial w}{\partial x}\right).$

1°. Suppose $w(x,y)$ is a solution of the equation in question. Then the function

$$w_1 = w(C_1x + C_2, C_1y + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Solutions:

$$x + y\varphi_{1,2}(w) = \psi(w).$$

Here $\psi(w)$ is an arbitrary function and the functions $\varphi_{1,2}(w)$ are defined parametrically by

$$\int \frac{d\varphi}{\sqrt{|g(\varphi)|}} = \pm\int \sqrt{|f(w)|}\,dw + C,$$

where C is an arbitrary constant ($fg > 0$).

15. $\displaystyle\left(\frac{\partial^2 w}{\partial x\partial y}\right)^2 = \frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2} + F\left(\frac{\partial w}{\partial x}, \frac{\partial w}{\partial y}\right).$

The Legendre transformation

$$u = x\xi + y\eta - w(x,y), \quad \xi = \frac{\partial w}{\partial x}, \quad \eta = \frac{\partial w}{\partial y},$$

where $u = u(\xi,\eta)$ is the new dependent variable and ξ and η are the new independent variables, leads to the simpler equation

$$\left(\frac{\partial^2 u}{\partial\xi\partial\eta}\right)^2 - \frac{\partial^2 u}{\partial\xi^2}\frac{\partial^2 u}{\partial\eta^2} = \frac{1}{F(\xi,\eta)}.$$

For exact solutions of this equation, see Subsection 11.2.2.

11.2.4. Equations of the Form $\left(\frac{\partial^2 w}{\partial x \partial y}\right)^2 = f(x,y)\frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2} + g(x,y)$

1. $\left(\frac{\partial^2 w}{\partial x \partial y}\right)^2 = f(x)\frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2}.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(x, C_2 y + C_3) + C_4 x + C_5 y + C_6,$$

where $C_1, \ldots, C_6$ are arbitrary constants, is also a solution of the equation.

2°. Degenerate solutions involving arbitrary functions:

$$w(x,y) = \varphi(x) + C_1 y + C_2,$$
$$w(x,y) = \varphi(y) + C_1 x + C_2,$$

where C_1 and C_2 are arbitrary constants and $\varphi = \varphi(z)$ is an arbitrary function.

3°. Generalized separable solution quadratic in y:

$$w(x,y) = \varphi(x)y^2 + [C_1\varphi(x) + C_2]y + \frac{C_1^2}{2}\int_0^x (x-t)\frac{[\varphi_t'(t)]^2}{f(t)\varphi(t)}\,dt + C_3 x + C_4,$$

where the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$f(x)\varphi\varphi_{xx}'' - 2(\varphi_x')^2 = 0.$$

4°. Generalized separable solution involving an arbitrary power of y:

$$w(x,y) = \varphi(x)y^k + C_1 x + C_2 y + C_3$$

where the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$(k-1)f(x)\varphi\varphi_{xx}'' - k(\varphi_x')^2 = 0.$$

5°. Generalized separable solution involving an exponential of y:

$$w(x,y) = \varphi(x)e^{\lambda y} + C_1 x + C_2 y + C_3,$$

where C_1, C_2, C_3, and λ are arbitrary constants and the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$f(x)\varphi\varphi_{xx}'' - (\varphi_x')^2 = 0.$$

2. $\left(\frac{\partial^2 w}{\partial x \partial y}\right)^2 = f(x)\frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2} + g(x).$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the functions

$$w_1 = \pm C_1^{-1} w(x, C_1 y + C_2) + C_3 x + C_4 y + C_5,$$

where $C_1, \ldots, C_5$ are arbitrary constants, are also solutions of the equation.

2°. Generalized separable solution linear in y:

$$w(x,y) = \pm y \int \sqrt{g(x)}\,dx + \varphi(x) + C_1 y,$$

where $\varphi(x)$ is an arbitrary function.

3°. Generalized separable solution quadratic in y:

$$w(x,y) = \varphi(x)y^2 + [C_1\varphi(x) + C_2]y + \frac{1}{2}\int_0^x (x-t)\frac{C_1^2[\varphi_t'(t)]^2 - g(t)}{f(t)\varphi(t)}\,dt + C_3 x + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants and the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$f(x)\varphi\varphi_{xx}'' - 2(\varphi_x')^2 = 0,$$

which has a particular solution $\varphi = C_6$.

3. $\displaystyle\left(\frac{\partial^2 w}{\partial x\partial y}\right)^2 = f(x)\frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2} + g(x)y.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the function

$$w_1 = C_1^{-3} w(x, C_1^2 y) + C_2 x + C_3 y + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. Generalized separable solution cubic in y:

$$w(x,y) = C_1 y^3 + C_2 y - \frac{1}{6C_1}\int_a^x (x-t)\frac{g(t)}{f(t)}\,dt + C_3 x + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants.

A more general solution is given by

$$w(x,y) = \varphi(x)y^3 + C_1 y - \frac{1}{6}\int_a^x (x-t)\frac{g(t)\,dt}{f(t)\varphi(t)} + C_2 x + C_3,$$

where the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$2f(x)\varphi\varphi_{xx}'' - 3(\varphi_x')^2 = 0.$$

3°. For an exact solution quadratic in y, see equation 11.2.4.5 with $g_2 = g_0 = 0$.

4°. See the solution of equation 11.2.4.6 in Item 3° with $k = 1$.

4. $\displaystyle\left(\frac{\partial^2 w}{\partial x\partial y}\right)^2 = f(x)\frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2} + g(x)y^2.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the functions

$$w_1 = \pm C_1^{-2} w(x, C_1 y) + C_2 x + C_3 y + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation.

2°. Generalized separable solution involving y to the power of four:

$$w(x,y) = C_1 y^4 + C_2 y - \frac{1}{12C_1}\int_a^x (x-t)\frac{g(t)}{f(t)}\,dt + C_3 x + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants.

A more general solution is given by

$$w(x,y) = \varphi(x)y^4 + C_1 y - \frac{1}{12}\int_a^x (x-t)\frac{g(t)\,dt}{f(t)\varphi(t)} + C_2 x + C_3,$$

where the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$3f(x)\varphi\varphi''_{xx} - 4(\varphi'_x)^2 = 0.$$

3°. For an exact solution quadratic in y, see equation 11.2.4.5 with $g_1 = g_0 = 0$.

4°. See the solution of equation 11.2.4.6 in Item 3° with $k = 2$.

5. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 = f(x)\dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} + g_2(x)y^2 + g_1(x)y + g_0(x).$

Generalized separable solution quadratic in y:

$$w(x,y) = \varphi(x)y^2 + \psi(x)y + \chi(x),$$

where the functions $\varphi = \varphi(x)$, $\psi = \psi(x)$, and $\chi = \chi(x)$ are determined by the system of ordinary differential equations

$$f(x)\varphi\varphi''_{xx} = 2(\varphi'_x)^2 - \tfrac{1}{2}g_2(x),$$
$$f(x)\varphi\psi''_{xx} = 2\varphi'_x\psi'_x - \tfrac{1}{2}g_1(x),$$
$$f(x)\varphi\chi''_{xx} = \tfrac{1}{2}(\psi'_x)^2 - \tfrac{1}{2}g_0(x).$$

6. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 = f(x)\dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} + g(x)y^k.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the functions

$$w_1 = \pm C_1^{-k-2} w(x, C_1^2 y) + C_2 x + C_3 y + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation.

2°. Additive separable solution:

$$w(x,y) = \frac{C_1 y^{k+2}}{(k+1)(k+2)} + C_2 y - \frac{1}{C_1}\int_a^x (x-t)\frac{g(t)}{f(t)}\,dt + C_3 x + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants.

3°. Multiplicative separable solution:

$$w(x,y) = \varphi(x)y^{\frac{k+2}{2}},$$

where the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$k(k+2)f(x)\varphi\varphi''_{xx} - (k+2)^2(\varphi'_x)^2 + 4g(x) = 0.$$

4°. Generalized separable solution:

$$w(x,y) = \psi(x)y^{k+2} - \frac{1}{(k+1)(k+2)}\int_a^x (x-t)\frac{g(t)}{f(t)\psi(t)}\,dt + C_1 x + C_2 y + C_3,$$

where the function $\psi = \psi(x)$ is determined by the ordinary differential equation

$$(k+1)f(x)\psi\psi''_{xx} - (k+2)(\psi'_x)^2 = 0.$$

7. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 = f(x)\dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} + g(x)y^{2k+2} + h(x)y^k.$

Generalized separable solution:

$$w(x,y) = \varphi(x)y^{k+2} - \frac{1}{(k+1)(k+2)}\int_a^x (x-t)\frac{h(t)}{f(t)\varphi(t)}\,dt + C_1x + C_2y + C_3,$$

where the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$(k+1)(k+2)f(x)\varphi\varphi''_{xx} - (k+2)^2(\varphi'_x)^2 + g(x) = 0.$$

8. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 = f(x)\dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} + g(x)e^{\lambda y}.$

1°. Suppose $w(x,y)$ is a solution of this equation. Then the functions

$$w_1 = C_1 w\Big(x, y - \frac{2}{\lambda}\ln|C_1|\Big) + C_2x + C_3y + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation.

2°. Additive separable solution:

$$w(x,y) = C_1e^{\lambda y} + C_2y - \frac{1}{C_1\lambda^2}\int_a^x (x-t)\frac{g(t)}{f(t)}\,dt + C_3x + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants.

3°. Multiplicative separable solution:

$$w(x,y) = \varphi(x)\exp\big(\tfrac{1}{2}\lambda y\big),$$

where the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$f(x)\varphi\varphi''_{xx} - (\varphi'_x)^2 + 4\lambda^{-2}g(x) = 0.$$

4°. Generalized separable solution:

$$w(x,y) = \psi(x)e^{\lambda y} - \frac{1}{\lambda^2}\int_a^x (x-t)\frac{g(t)}{f(t)\psi(t)}\,dt + C_1x + C_2y + C_3,$$

where the function $\psi = \psi(x)$ is determined by the ordinary differential equation

$$f(x)\psi\psi''_{xx} - (\psi'_x)^2 = 0.$$

9. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 = f(x)\dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} + g(x)e^{2\lambda y} + h(x)e^{\lambda y}.$

Generalized separable solution:

$$w(x,y) = \varphi(x)e^{\lambda y} - \frac{1}{\lambda^2}\int_a^x (x-t)\frac{h(t)}{f(t)\varphi(t)}\,dt + C_1x + C_2y + C_3,$$

where the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$f(x)\varphi\varphi''_{xx} - (\varphi'_x)^2 + \lambda^{-2}g(x) = 0.$$

10. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 = f_1(x)g_1(y)\dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} + f_2(x)g_2(y).$

1°. Suppose $w(x, y)$ is a solution of this equation. Then the function

$$w_1 = w(x, y) + C_1x + C_2y + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Additive separable solution for $f_1g_1 \neq 0$:

$$w(x, y) = C_1\int_a^x (x-t)\frac{f_2(t)}{f_1(t)}\,dt - \frac{1}{C_1}\int_b^y (y-\xi)\frac{g_2(\xi)}{g_1(\xi)}\,d\xi + C_2x + C_3y + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants.

3°. Degenerate solutions for $f_2g_2 = 0$:

$$w(x, y) = \varphi(x) + C_1y + C_2,$$
$$w(x, y) = \varphi(y) + C_1x + C_2,$$

where C_1 and C_2 are arbitrary constants and $\varphi = \varphi(z)$ is an arbitrary function.

4°. Generalized separable solution for $f_2g_2 = 0$:

$$w(x, y) = \varphi(x)\psi(y) + C_1x + C_2y + C_3,$$

where the functions $\varphi = \varphi(x)$ and $\psi = \psi(y)$ are determined by the ordinary differential equations

$$f_1(x)\varphi\varphi''_{xx} - C_4(\varphi'_x)^2 = 0,$$
$$C_4g_1(y)\psi\psi''_{yy} - (\psi'_y)^2 = 0.$$

11. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 = f(ax + by)\dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} + g(ax + by).$

Solution:

$$w(x, y) = \varphi(z) + C_1x^2 + C_2xy + C_3y^2 + C_4x + C_5y, \quad z = ax + by,$$

where $C_1, \ldots, C_5$ are arbitrary constants and the function $\varphi(z)$ is determined by the ordinary differential equation

$$(ab\varphi''_{zz} + C_2)^2 = f(z)(a^2\varphi''_{zz} + 2C_1)(b^2\varphi''_{zz} + 2C_3) + g(z),$$

which is easy to integrate; to this end, the equation should first be solved for φ''_{zz}.

11.2.5. Other Equations with Two Independent Variables

1. $aw\left(\dfrac{\partial w}{\partial y}\right)^2\dfrac{\partial^2 w}{\partial x\partial y} + \dfrac{\partial w}{\partial x}\left(\dfrac{\partial^2 w}{\partial y^2}\right)^2 = 0.$

Solution:

$$w = \frac{2C}{a}\tanh\big[Cy + \Phi(x)\big],$$

where $\Phi(x)$ is an arbitrary function and C is an arbitrary constant.

⊙ *Reference*: V. F. Zaitsev (2008, http://eqworld.ipmnet.ru/eqarchive/view.php?id=211).

2. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 = \left(\dfrac{\partial w}{\partial x}\right)^2 \dfrac{\partial w}{\partial y}.$

General solution:

$$w = -\frac{4F'(y)}{F(y)+G(x)} + \int \left(\frac{F''(y)}{F'(y)}\right)^2 dy,$$

where $F(y)$ and $G(x)$ are arbitrary functions.

⊙ *Reference*: Yu. N. Kosovtsov (2006, http://eqworld.ipmnet.ru/eqarchive/view.php?id=41).

3. $a\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 + \left(\dfrac{\partial w}{\partial y}\right)^2 \dfrac{\partial^2 w}{\partial x^2} = 0.$

Solution:

$$w = a\ln\big[x+\Phi(y)\big] + C,$$

where $\Phi(y)$ is an arbitrary function.

⊙ *Reference*: V. F. Zaitsev (2008, http://eqworld.ipmnet.ru/eqarchive/view.php?id=210).

4. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 = \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} + f(x)\dfrac{\partial^2 w}{\partial y^2}.$

The substitution

$$w = U(x,y) - \int_a^x (x-t)f(t)\,dt$$

leads to an equation of the form 11.2.2.1:

$$\left(\frac{\partial^2 U}{\partial x\partial y}\right)^2 = \frac{\partial^2 U}{\partial x^2}\frac{\partial^2 U}{\partial y^2}.$$

5. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 = \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} + f(x)\dfrac{\partial^2 w}{\partial x\partial y}.$

First integral:

$$\frac{\partial w}{\partial y} = \Phi\left(\frac{\partial w}{\partial x}\right) + \int f(x)\,dx,$$

where $\Phi(u)$ is an arbitrary function.

6. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 = \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} + a_1\dfrac{\partial^2 w}{\partial x^2} + a_2\dfrac{\partial^2 w}{\partial y^2} + b.$

The substitution

$$w = U(x,y) - \tfrac{1}{2}a_2x^2 - \tfrac{1}{2}a_1y^2$$

leads to an equation of the form 11.2.2.2:

$$\left(\frac{\partial^2 U}{\partial x\partial y}\right)^2 = \frac{\partial^2 U}{\partial x^2}\frac{\partial^2 U}{\partial y^2} + b - a_1a_2.$$

7. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 = \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} + a_1\dfrac{\partial^2 w}{\partial x^2} + a_2\dfrac{\partial^2 w}{\partial y^2} + b_1\dfrac{\partial w}{\partial x} + b_2\dfrac{\partial w}{\partial y}.$

This equation is used in meteorology for describing horizontal air flows; w is the stream function for the wind velocity, and x and y are coordinates on the earth surface.

1°. Suppose $w(x, y)$ is a solution of the equation in question. Then the function

$$w_1 = w(x + C_1, y + C_2) + C_3(b_2x - b_1y) + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solution:

$$w = C_3 \exp\left[-\frac{b_1C_1 + b_2C_2}{a_1C_1^2 + a_2C_2^2}(C_1x + C_2y)\right] + C_4.$$

3°. Generalized separable solution linear in y:

$$w = y(C_1e^{-\lambda x} + C_2) + \frac{C_1^2}{2a_1}e^{-2\lambda x} + \left(\frac{b_2C_1}{b_1}x + C_3\right)e^{-\lambda x} - \frac{b_2C_2}{b_1}x + C_4, \qquad \lambda = \frac{b_1}{a_1}$$

where $C_1, \ldots, C_4$ are arbitrary constants.

4°. Generalized separable solution quadratic in y:

$$w = f(x)y^2 + g(x)y + h(x),$$

where the functions $f(x)$, $g(x)$, and $h(x)$ are determined by the system of ordinary differential equations

$$2ff''_{xx} + a_1f''_{xx} + b_1f'_x - 4(f'_x)^2 = 0, \tag{1}$$
$$2fg''_{xx} + a_1g''_{xx} + b_1g'_x - 4f'_xg'_x + 2b_2f = 0, \tag{2}$$
$$2fh''_{xx} + a_1h''_{xx} + b_1h'_x + 2a_2f + b_2g - (g'_x)^2 = 0. \tag{3}$$

This system can be fully integrated. To this end, equation (1) is first reduced, with the change of variable $U(f) = f'_x$, to a first-order linear equation. Equation (2) is linear in g and a fundamental system of solutions of the corresponding homogeneous equation has the form $g_1 = 1$, $g_2 = f(x)$. Equation (3) is finally reduced, with the substitution $V(x) = h'_x$, to first-order linear equation.

Remark. The solutions of Items 3° and 4° can be used to obtain two other solutions by means of the following renaming: $(x, a_1, b_1) \rightleftarrows (y, a_2, b_2)$.

⊙ *References for equation* 11.2.5.7: E. R. Rozendorn (1984), A. D. Polyanin and V. F. Zaitsev (2004, p. 470).

8. $\left(\dfrac{\partial^2 w}{\partial x\partial y}\right)^2 = \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} + f_1(x)\dfrac{\partial^2 w}{\partial x^2} + f_2(x)\dfrac{\partial^2 w}{\partial y^2} + g_1(x)\dfrac{\partial w}{\partial x} + g_2(x)\dfrac{\partial w}{\partial y}.$

There are generalized separable solutions linear and quadratic in y:

$$w(x, y) = \varphi_1(x)y + \varphi_0(x),$$
$$w(x, y) = \psi_2(x)y^2 + \psi_1(x)y + \psi_0(x).$$

9. $$\left(\frac{\partial^2 w}{\partial x\partial y}\right)^2 - \frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2} = -a\left(\frac{\partial w}{\partial y}\right)^2\frac{\partial^2 w}{\partial x^2}.$$

General solution:

$$w(x,y) = \frac{1}{a}\big\{aF(Z) + axZ - \ln[G(Z) + ay]\big\},$$

where $Z = Z(x,t)$ is any solution of the transcendental equation

$$-G'_Z(Z) + axG(Z) + aF'_Z(Z)[G(Z) + ay] + a^2xy = 0,$$

and $F(Z)$ and $G(Z)$ are arbitrary functions.

⊙ *Reference*: Yu. N. Kosovtsov (2008 *a*).

10. $$\left(\frac{\partial^2 w}{\partial x\partial y}\right)^2 = f(x)\frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2} + g(x)w + h_2(x)y^2 + h_1(x)y + h_0(x).$$

Generalized separable solution quadratic in y:

$$w(x,y) = \varphi(x)y^2 + \psi(x)y + \chi(x),$$

where the functions $\varphi = \varphi(x)$, $\psi = \psi(x)$, and $\chi = \chi(x)$ are determined by the system of ordinary differential equations

$$\begin{aligned}
&2f(x)\varphi\varphi''_{xx} - 4(\varphi'_x)^2 + g(x)\varphi + h_2(x) = 0,\\
&2f(x)\varphi\psi''_{xx} - 4\varphi'_x\psi'_x + g(x)\psi + h_1(x) = 0,\\
&2f(x)\varphi\chi''_{xx} - (\psi'_x)^2 + g(x)\chi + h_0(x) = 0.
\end{aligned}$$

11. $$\begin{aligned}\left(\frac{\partial^2 w}{\partial x\partial y}\right)^2 &= f_1(x)\frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2} + \big[f_2(x)w + f_3(x)y^2 + f_4(x)y + f_5(x)\big]\left(\frac{\partial^2 w}{\partial y^2}\right)^2\\
&\quad + g_1(x)\frac{\partial^2 w}{\partial x^2} + \big[g_2(x)w + g_3(x)y^2 + g_4(x)y + g_5(x)\big]\frac{\partial^2 w}{\partial y^2}\\
&\quad + \big[g_6(x)y + g_7(x)\big]\frac{\partial^2 w}{\partial x\partial y} + h_1(x)\left(\frac{\partial w}{\partial y}\right)^2 + h_2(x)\frac{\partial w}{\partial x}\\
&\quad + \big[h_3(x)y + h_4(x)\big]\frac{\partial w}{\partial y} + s_1(x)w + s_2(x)y^2 + s_3(x)y + s_4(x).\end{aligned}$$

There is a generalized separable solution of the form

$$w(x,y) = \varphi(x)y^2 + \psi(x)y + \chi(x).$$

12. $$\frac{\partial^2 w}{\partial x^2}\left[\left(\frac{\partial^2 w}{\partial x\partial y}\right)^2 - \frac{\partial^2 w}{\partial x^2}\frac{\partial^2 w}{\partial y^2}\right] = \frac{\partial^2 w}{\partial y^2}.$$

This equation occurs in plane problems of plasticity; w is the generating function.

1°. Suppose $w(x,y)$ is a solution of the equation in question. Then the functions

$$w_1 = \pm C_1^{-2}w(C_1x + C_2, C_3y + C_4) + C_5x + C_6y + C_7,$$

where $C_1, \ldots, C_7$ are arbitrary constants, are also solutions of the equation.

2°. Introduce the new variable

$$U(x,y)=\frac{\partial w}{\partial x}$$

and apply the Legendre transformation (for details, see Subsection 26.3.3)

$$X=\frac{\partial U}{\partial x},\quad Y=\frac{\partial U}{\partial y},\quad Z=x\frac{\partial U}{\partial x}+y\frac{\partial U}{\partial y}-U$$

to obtain a second-order linear equation:

$$(1+X^2)^2\frac{\partial^2 Z}{\partial X^2}+2XY(1+X^2)\frac{\partial^2 Z}{\partial X\partial Y}+Y^2(X^2-1)\frac{\partial^2 Z}{\partial Y^2}=0. \tag{1}$$

This equation is hyperbolic. The transformation

$$t=\arctan X,\quad \xi=\tfrac{1}{2}\ln(1+X^2)-\ln Y,\quad F=\frac{Z}{\sqrt{1+X^2}}$$

brings (1) to a constant-coefficient linear equation:

$$\frac{\partial^2 F}{\partial t^2}=\frac{\partial^2 F}{\partial \xi^2}-F. \tag{2}$$

For solutions of equation (2), see the books by Tikhonov and Samarskii (1990) and Polyanin (2002).

Remark. The original equation is invariant under the Legendre transformation

$$\overline{x}=\frac{\partial w}{\partial x},\quad \overline{y}=\frac{\partial w}{\partial y},\quad \overline{w}=x\frac{\partial w}{\partial x}+y\frac{\partial w}{\partial y}-w.$$

⊙ *References for equation* 11.2.5.12: Yu. N. Radayev (1988), V. I. Astafiev, Yu. N. Radayev, and L. V. Stepanova (2001).

11.2.6. Plebański Heavenly Equations

1. $\dfrac{\partial^2 w}{\partial t\partial z}\dfrac{\partial^2 w}{\partial x\partial y}-\dfrac{\partial^2 w}{\partial t\partial x}\dfrac{\partial^2 w}{\partial y\partial z}=1.$

Plebański first heavenly equation.

1°. Suppose $w(t,x,y,z)$ is a solution of the equation in question.

1.1. The functions

$$w_1=\pm w(t,x,y,z)+F(t,y)+G(x,z),$$

where $F(t,y)$ and $G(x,z)$ are arbitrary functions, c is an arbitrary constant, are also solutions of the equation.

1.2. The functions $w_2=\pm w(\widetilde{t},\widetilde{x},\widetilde{y},\widetilde{z})$ with

$$\widetilde{t}=a_1t+a_2y+a_3,\quad \widetilde{x}=b_1x+b_2z+b_3,$$
$$\widetilde{y}=c_1t+\frac{1}{a_1}\left(a_2c_1+\frac{1}{b_1k_2-b_2k_1}\right)y+c_2,\quad \widetilde{z}=k_1x+k_2z+k_3,$$

where a_1, a_2, a_3, b_1, b_2, b_3, c_1, c_2, k_1, k_2, and k_3 are arbitrary constants, are also solutions of the equation.

1.3. The function $w_3 = aw(\hat{t}, \hat{x}, \hat{y}, \hat{z})$ with

$$\hat{t} = \varphi(t), \quad \hat{x} = \frac{R(x,z)}{a^2} + G(K(x,z)), \quad \hat{y} = \frac{y}{\varphi_t'(t)} + \psi(t), \quad \hat{z} = K(x,z),$$

where $\varphi(t)$, $\psi(t)$, $K(x,z)$, and $G(K)$ are arbitrary functions, a is an arbitrary constant, is also a solution of the equation. The function $R(x,z)$ solves the first-order linear equation $K_z R_x - K_x R_z = 1$. By changing from x and z to the new independent variables x and $\zeta = K(x,z)$, we obtain the equation $R_x = 1/K_z$ for $R = R(x,\zeta)$; this equation is solved by direct integration with respect to x (the derivative K_z must first be expressed in terms of x and ζ).

2°. Solutions:

$$w(t,x,y,z) = \sqrt{z}\left[\frac{xy}{\varphi_t'(t)} + 2\varphi(t)\right],$$

$$w(t,x,y,z) = 2[\varphi(t) + \psi(x)]\sqrt{\frac{yz}{\varphi_t'(t)\psi_x'(x)}},$$

$$w(t,x,y,z) = F(x,y) + \frac{t\varphi(x)}{\psi_y'(y)} - \frac{z\psi(y)}{\varphi_x'(x)},$$

$$w(t,x,y,z) = F(x,y) + tG(x,y) - z\int \frac{dy}{G_x(x,y)}, \qquad G_x(x,y) = \frac{\partial G}{\partial x},$$

$$w(t,x,y,z) = [y\theta(t) + \eta(t)]\int \frac{dx}{\zeta(x)} + [z\zeta(x) + \varphi(x)]\int \frac{dt}{\theta(t)} + F\big(y\theta(t) + \eta(t), z\zeta(x) + \varphi(x)\big),$$

$$w(t,x,y,z) = \sqrt{2[t\varphi(y) + \psi(y)}\left(\zeta(y) + \eta(x) + \theta(x)\int \frac{dy}{\varphi(y)} + \frac{z}{\theta_x'(x)}\right) + \int G\left(y, \zeta(y) + \eta(x) + \theta(x)\int \frac{dy}{\varphi(y)} + \frac{z}{\theta_x'(x)}\right)dy,$$

where F and G are arbitrary functions of two arguments and φ, ψ, η, θ, and ζ are arbitrary functions of a single argument.

3°. See also exact solutions with arbitrary constants in Dryuma (2006).

⊙ *References for equation* 11.2.6.1: J. F. Plebański (1975), A. Macias, J. L. Cervantes-Cota, and C. Lammerzahl (2001), E. V. Ferapontov and M. V. Pavlov (2003), Yu. Kosovtsov (2008 *b*).

2. $\dfrac{\partial^2 w}{\partial t \partial x} + \dfrac{\partial^2 w}{\partial y \partial z} + \dfrac{\partial^2 w}{\partial x^2}\dfrac{\partial^2 w}{\partial y^2} - \left(\dfrac{\partial^2 w}{\partial x \partial y}\right)^2 = 0.$

Plebański second heavenly equation is descriptive of self-dual Einstein spaces with Ricci-flat metrics. It is a completely integrable equation.

1°. Suppose $w(t,x,y,z)$ is a solution of the equation in question.

1.1. The function

$$w_1 = w(z,y,x,t)$$

is also a solution of the equation.

1.2. The function

$$w_2 = w(t,x,y,z) + (y-cx)F(t+cz) + G(t,z),$$

where $F(\zeta)$ and $G(t,z)$ are arbitrary functions, c is an arbitrary constant, is also a solution of the equation.

1.3. The function

$$w_3 = w(t,x,y,z) + y\frac{\partial F(t,z)}{\partial t} - x\frac{\partial F(t,z)}{\partial z} + G(t,z),$$

where $F(t,z)$ and $H(t,z)$ are arbitrary functions, is also a solution of the equation.

1.4. The function

$$w_4 = w(t,x,y,z) + a_t'(t)yz + b(t)y + c(t)z - a(t)x + d(t) + A_z'(z)xt + B(z)x + C(z)t - A(z)y + D(z),$$

where $a(t)$, $b(t)$, $c(t)$, $d(t)$, $A(z)$, $B(z)$, $C(z)$, and $D(z)$ are arbitrary functions, is also a solution of the equation.

1.5. The function

$$\begin{aligned}
w_5 &= w(\widetilde{t},\widetilde{x},\widetilde{y},\widetilde{z}),\\
\widetilde{t} &= ct + \frac{b^2 - a_1a_2^2c}{a_2^3}z + k_1,\\
\widetilde{x} &= a_1x + a_2y + a_3z - \frac{a_2a_3}{a_1}t + k_2,\\
\widetilde{y} &= \frac{b^2 - a_1a_2^2c}{a_2^2b}x - \frac{a_2c}{b}y + \frac{a_3(b^2 - a_1a_2^2c)}{a_1a_2^2b}z + \frac{a_2a_3c}{a_1b}t + k_3,\\
\widetilde{z} &= bt - \frac{a_1b}{a_2}z + k_4,
\end{aligned}$$

where a_1, a_2, a_3, b, c, k_1, k_2, k_3, and k_4 are arbitrary constants, is also a solution of the equation.

2°. Solutions:

$$\begin{aligned}
w(t,x,y,z) &= F(y+ax,\ t-az) + G(t,z),\\
w(t,x,y,z) &= \tfrac{1}{2}ay^2 + by + F(x-at,\ z) + G(t,z),\\
w(t,x,y,z) &= y\frac{\partial F(t,z)}{\partial t} - x\frac{\partial F(t,z)}{\partial z} + G(t,z),\\
w(t,x,y,z) &= y\frac{\partial F(x,z)}{\partial x} + t\left[\int\left(\frac{\partial^2 F(x,z)}{\partial x^2}\right)^2 dx - \frac{\partial F(x,z)}{\partial z}\right] + G(t,z),
\end{aligned}$$

where the functions F and G are arbitrary functions of their arguments and a and b are arbitrary constants.

3°. There are generalized separable solutions of the forms

$$\begin{aligned}
w &= \varphi_0(y,z,t) + \varphi_1(y,z,t)x + \varphi_2(y,z,t)x^2,\\
w &= \psi_0(x,z,t) + \psi_1(x,z,t)y + \psi_2(x,z,t)y^2.
\end{aligned}$$

⊙ *References for equation* 11.2.6.2: J. F. Plebański (1975), A. Macias, J. L. Cervantes-Cota, and C. Lammerzahl (2001), F. Neyzi, Y. Nutku, and M. B. Sheftel (2005), V. S. Dryuma (2006), V. A. Galaktionov and S. R. Svirshchevskii (2007, p. 271), Yu. Kosovtsov (2008 *c*).

11.3. Bellman Type Equations and Related Equations

11.3.1. Equations with Quadratic Nonlinearities

1. $\dfrac{\partial w}{\partial t}\dfrac{\partial w}{\partial x} - f(t)\dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial y^2} - g(t)\left(\dfrac{\partial w}{\partial y}\right)^2 = 0.$

This equation occurs in problems of optimal correction of random disturbances and is a consequence of the Bellman equation; see Chernousko (1971) and Chernousko and Kolmanovskii (1978). The variable $t = T - \tau$ plays the role of "backward" time.

1°. Suppose $w(x, y, t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w(x + C_2, y + C_3, t) + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. "Two-dimensional" solutions:

$$w = U(z, \tau), \quad z = y \pm 2\left[x \int g(t)\,dt + C_1 x\right]^{1/2} + C_2, \quad \tau = \int f(t)\,dt + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants, and the function $U = U(z, \tau)$ is determined by the linear heat equation

$$\frac{\partial U}{\partial \tau} - \frac{\partial^2 U}{\partial z^2} = 0.$$

3°. "Two-dimensional" solution:

$$w = u(\xi, \tau), \quad \xi = y + C_1 x + \frac{1}{C_1}\int g(t)\,dt + C_2, \quad \tau = \int f(t)\,dt + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants, and the function $u = u(\xi, \eta)$ is determined by the linear heat equation

$$\frac{\partial u}{\partial \tau} - \frac{\partial^2 u}{\partial \xi^2} = 0.$$

4°. The solutions of Items 2° and 3° are special cases of a more general solution with the form

$$w = U(z, \tau), \quad z = y + \varphi(x, t), \quad \tau = \int f(t)\,dt,$$

where the function $\varphi = \varphi(x, t)$ satisfies the first-order nonlinear partial differential equation

$$\frac{\partial \varphi}{\partial t}\frac{\partial \varphi}{\partial x} = g(t), \tag{1}$$

and the function $U = U(z, \tau)$ is determined by the linear heat equation

$$\frac{\partial U}{\partial \tau} - \frac{\partial^2 U}{\partial z^2} = 0.$$

A complete integral of equation (1) is given by

$$\varphi = C_1 x + \frac{1}{C_1}\int g(t)\,dt + C_2, \tag{2}$$

where C_1 and C_2 are arbitrary constants. The general integral of equation (1) can be represented in parametric form with the complete integral (2) and the two relations (see Subsection 24.1.1)

$$C_2 = \psi(C_1),$$
$$x - \frac{1}{C_1^2}\int g(t)\,dt + \psi'(C_1) = 0,$$

where $\psi = \psi(C_1)$ is an arbitrary function and the prime denotes a derivative with respect to the argument; C_1 and C_2 play the role of parameters.

Remark. To the solution of Item 2° there corresponds $\psi(C_1) = \text{const}$.

5°. "Two-dimensional" solutions:

$$w = \pm\exp\big[\lambda y + \zeta(x,t)\big],$$

where λ is an arbitrary constant, and the function $\zeta = \zeta(x,t)$ is determined by the first-order partial differential equation

$$\frac{\partial\zeta}{\partial t}\frac{\partial\zeta}{\partial x} - \lambda^2 f(t)\frac{\partial\zeta}{\partial x} - \lambda^2 g(t) = 0. \tag{3}$$

A complete integral of equation (3) is given by

$$\zeta = C_1 x + \lambda^2\int\left[f(t) + \frac{1}{C_1}g(t)\right]dt + C_2, \tag{4}$$

where C_1 and C_2 are arbitrary constants. The general integral of equation (3) can be represented in parametric form with the complete integral (4) and the two relations

$$C_2 = \varphi(C_1),$$
$$x - \frac{\lambda^2}{C_1^2}\int g(t)\,dt + \varphi'(C_1) = 0,$$

where $\varphi = \varphi(C_1)$ is an arbitrary function; C_1 and C_2 play the role of parameters.

6°. "Two-dimensional" solution:

$$w = e^{\lambda x}\theta(y,t),$$

where λ is an arbitrary constant, and the function $\theta = \theta(y,t)$ is determined by the "two-dimensional" equation

$$\lambda\theta\frac{\partial\theta}{\partial t} - \lambda f(t)\theta\frac{\partial^2\theta}{\partial y^2} - g(t)\left(\frac{\partial\theta}{\partial y}\right)^2 = 0.$$

7°. Cauchy problems and self-similar solutions of the equation for power-law $f(t)$ and $g(t)$ are discussed in Chernousko (1971) and Chernousko and Kolmanovskii (1978).

⊙ *References for equation* 11.3.1.1: A. S. Bratus' and K. A. Volosov (2002), A. D. Polyanin and V. F. Zaitsev (2002, pp. 259–260).

2. $\dfrac{\partial w}{\partial t}\dfrac{\partial w}{\partial x} - f(t)\dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial y^2} - g(t)h(x)\left(\dfrac{\partial w}{\partial y}\right)^2 = 0.$

The substitution $z = \int h(x)\,dx$ leads to an equation of the form 11.3.1.1 for $w = w(z, y, t)$.

3. $\dfrac{\partial w}{\partial t}\dfrac{\partial w}{\partial x} - f(t)\dfrac{\partial w}{\partial x}\left(\dfrac{\partial^2 w}{\partial y^2} + \dfrac{n}{y}\dfrac{\partial w}{\partial y}\right) - g(t)h(x)\left(\dfrac{\partial w}{\partial y}\right)^2 = 0.$

This equation occurs in problems of optimal correction of random disturbances and is a consequence of the Bellman equation; see Chernousko and Kolmanovskii (1978). The variable $t = T - \tau$ plays the role of "backward" time; $n + 1$ is the dimensionality of the equations of motion of the controllable system (n is a nonnegative integer).

"Two-dimensional" solution:

$$w(x, y, t) = \exp\left[\lambda \int h(x)\,dx\right] U(y, t),$$

where the function $U(y, t)$ is determined by the differential equation (λ is an arbitrary constant)

$$\lambda U\frac{\partial U}{\partial t} - \lambda f(t)U\left(\frac{\partial^2 U}{\partial y^2} + \frac{n}{y}\frac{\partial U}{\partial y}\right) - g(t)\left(\frac{\partial U}{\partial y}\right)^2 = 0.$$

4. $\dfrac{\partial w}{\partial t}\dfrac{\partial w}{\partial x} - f(t)\dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial y^2} - g(x, t)\left(\dfrac{\partial w}{\partial y}\right)^2 = 0.$

1°. "Two-dimensional" solution:

$$w = U(z, \tau), \quad z = y + \varphi(x, t), \quad \tau = \int f(t)\,dt.$$

Here, the function $\varphi = \varphi(x, t)$ is determined by the first-order nonlinear partial differential equation

$$\frac{\partial \varphi}{\partial t}\frac{\partial \varphi}{\partial x} = g(x, t), \tag{1}$$

and the function $U = U(z, \tau)$ is determined by the linear heat equation

$$\frac{\partial U}{\partial \tau} - \frac{\partial^2 U}{\partial z^2} = 0. \tag{2}$$

Complete integrals and the general solutions (integrals) of equation (1) for various $g(x, t)$ can be found in Subsection 2.2.1. For solutions of equation (2), see Tikhonov and Samarskii (1990) and Polyanin (2002).

2°. "Two-dimensional" solutions:

$$w = \pm\exp\big[\lambda y + \zeta(x, t)\big],$$

where λ is an arbitrary constant and the function $\zeta = \zeta(x, t)$ is determined by the first-order nonlinear partial differential equation

$$\frac{\partial \zeta}{\partial t}\frac{\partial \zeta}{\partial x} - \lambda^2 f(t)\frac{\partial \zeta}{\partial x} - \lambda^2 g(x, t) = 0.$$

⊙ *Reference for equation* 11.3.1.4: A. D. Polyanin and V. F. Zaitsev (2002, p. 261).

5. $\dfrac{\partial w}{\partial t}\dfrac{\partial w}{\partial x} - f(x,t)\dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial y^2} - g(x,t)\left(\dfrac{\partial w}{\partial y}\right)^2 = 0.$

"Two-dimensional" solutions:

$$w = \pm\exp\big[\lambda y + \zeta(x,t)\big],$$

where λ is an arbitrary constant and the function $\zeta = \zeta(x,t)$ is determined by the first-order nonlinear partial differential equation

$$\frac{\partial \zeta}{\partial t}\frac{\partial \zeta}{\partial x} - \lambda^2 f(x,t)\frac{\partial \zeta}{\partial x} - \lambda^2 g(x,t) = 0.$$

11.3.2. Equations with Power-Law Nonlinearities

1. $\dfrac{\partial w}{\partial t}\left(\dfrac{\partial w}{\partial x}\right)^k - f(t)\left(\dfrac{\partial w}{\partial x}\right)^k\dfrac{\partial^2 w}{\partial y^2} - g(t)\left(\dfrac{\partial w}{\partial y}\right)^{k+1} = 0.$

This equation occurs in problems of optimal correction of random disturbances and is a consequence of the Bellman equation; see Chernousko (1971) and Chernousko and Kolmanovskii (1978). The variable $t = T - \tau$ plays the role of "backward" time.

1°. Suppose $w(x,y,t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w(x + C_2, y + C_3, t) + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. "Two-dimensional" solution:

$$w = U(z,\tau), \quad \tau = \int f(t)\,dt + C_1,$$

$$z = y + (x + C_2)^{\frac{k}{k+1}}\left[\frac{(k+1)^{k+1}}{k^k}\int g(t)\,dt + C_3\right]^{\frac{1}{k+1}} + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants and the function $U = U(z,\tau)$ is determined by the linear heat equation

$$\frac{\partial U}{\partial \tau} - \frac{\partial^2 U}{\partial z^2} = 0.$$

3°. "Two-dimensional" solution:

$$w = u(\xi,\tau), \quad \xi = y + C_1 x + \frac{1}{C_1^k}\int g(t)\,dt + C_2, \quad \tau = \int f(t)\,dt + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants and the function $u = u(\xi,\eta)$ is determined by the linear heat equation

$$\frac{\partial u}{\partial \tau} - \frac{\partial^2 u}{\partial \xi^2} = 0.$$

4°. The solutions of Items 2° and 3° are special cases of the more general solution

$$w = U(z,\tau), \quad z = y + \varphi(x,t), \quad \tau = \int f(t)\,dt,$$

where the function $\varphi = \varphi(x, t)$ satisfies the first-order nonlinear partial differential equation

$$\frac{\partial \varphi}{\partial t}\left(\frac{\partial \varphi}{\partial x}\right)^k = g(t), \tag{1}$$

and the function $U = U(z, \tau)$ is determined by the linear heat equation

$$\frac{\partial U}{\partial \tau} - \frac{\partial^2 U}{\partial z^2} = 0.$$

A complete integral of equation (1) is given by

$$\varphi = C_1 x + \frac{1}{C_1^k}\int g(t)\,dt + C_2, \tag{2}$$

where C_1 and C_2 are arbitrary constants. The general integral of equation (1) can be expressed in parametric form with the complete integral (2) and the two relations (see Subsection 24.1.1)

$$C_2 = \psi(C_1),$$
$$x - \frac{k}{C_1^{k+1}}\int g(t)\,dt + \psi'(C_1) = 0,$$

where $\psi = \psi(C_1)$ is an arbitrary function and the prime denotes a derivative; C_1 and C_2 play the role of parameters.

5°. "Two-dimensional" solution:

$$w = \exp\bigl[\lambda y + \zeta(x, t)\bigr],$$

where λ is an arbitrary constant and the function $\zeta = \zeta(x, t)$ is determined by the first-order partial differential equation

$$\frac{\partial \zeta}{\partial t}\left(\frac{\partial \zeta}{\partial x}\right)^k - \lambda^2 f(t)\left(\frac{\partial \zeta}{\partial x}\right)^k - \lambda^{k+1} g(t) = 0. \tag{3}$$

A complete integral of this equation has the form (see Subsection 24.1.1)

$$\zeta = C_1 x + \int\left[\lambda^2 f(t) + \frac{\lambda^{k+1}}{C_1^k} g(t)\right] dt + C_2, \tag{4}$$

where C_1 and C_2 are arbitrary constants. The general integral of equation (3) can be expressed in parametric form with the complete integral (4) and the two relations

$$C_2 = \varphi(C_1),$$
$$x - k\frac{\lambda^{k+1}}{C_1^{k+1}}\int g(t)\,dt + \varphi'(C_1) = 0,$$

where $\varphi = \varphi(C_1)$ is an arbitrary function; C_1 and C_2 play the role of parameters.

6°. "Two-dimensional" solution:

$$w = e^{\lambda x}\theta(y, t),$$

where λ is an arbitrary constant and the function $\theta = \theta(y, t)$ is determined by the "two-dimensional" equation

$$\frac{\partial \theta}{\partial t} - f(t)\frac{\partial^2 \theta}{\partial y^2} - \frac{g(t)}{(\lambda\theta)^k}\left(\frac{\partial \theta}{\partial y}\right)^{k+1} = 0.$$

7°. Cauchy problems and self-similar solutions of the equation for power-law $f(t)$ and $g(t)$ are discussed in Chernousko (1971) and Chernousko and Kolmanovskii (1978).

⊙ *References for equation* 11.3.2.1: A. S. Bratus' and K. A. Volosov (2002), A. D. Polyanin and V. F. Zaitsev (2002, pp. 261–263).

2. $\dfrac{\partial w}{\partial t}\left(\dfrac{\partial w}{\partial x}\right)^k - f(t)\left(\dfrac{\partial w}{\partial x}\right)^k \dfrac{\partial^2 w}{\partial y^2} - g(t)h(x)\left(\dfrac{\partial w}{\partial y}\right)^{k+1} = 0.$

The substitution $z = \int [h(x)]^{1/k}\,dx$ leads to an equation of the form 11.3.2.1 for $w = w(z, y, t)$.

3. $\dfrac{\partial w}{\partial t}\left(\dfrac{\partial w}{\partial x}\right)^k - f(t)\left(\dfrac{\partial w}{\partial x}\right)^k \dfrac{\partial^2 w}{\partial y^2} - g(x,t)\left(\dfrac{\partial w}{\partial y}\right)^{k+1} = 0.$

1°. "Two-dimensional" solution:

$$w = U(z,\tau), \quad z = y + \varphi(x,t), \quad \tau = \int f(t)\,dt.$$

Here, the function $\varphi = \varphi(x,t)$ is determined by the first-order nonlinear partial differential equation

$$\frac{\partial \varphi}{\partial t}\left(\frac{\partial \varphi}{\partial x}\right)^k = g(x,t), \tag{1}$$

and the function $U = U(z,\tau)$ is determined by the linear heat equation

$$\frac{\partial U}{\partial \tau} - \frac{\partial^2 U}{\partial z^2} = 0. \tag{2}$$

Complete integrals and the general solutions (integrals) of equation (1) for various $g(x,t)$ can be found in Polyanin, Zaitsev, and Moussiaux (2002). For solutions of equation (2), see Tikhonov and Samarskii (1990) and Polyanin (2002).

2°. "Two-dimensional" solution:

$$w = \exp\big[\lambda y + \zeta(x,t)\big],$$

where λ is an arbitrary constant, and the function $\zeta = \zeta(x,t)$ is determined by the first-order nonlinear partial differential equation

$$\frac{\partial \zeta}{\partial t}\left(\frac{\partial \zeta}{\partial x}\right)^k - \lambda^2 f(t)\left(\frac{\partial \zeta}{\partial x}\right)^k - \lambda^{k+1} g(x,t) = 0.$$

⊙ *Reference for equation* 11.3.2.3: A. D. Polyanin and V. F. Zaitsev (2002, p. 263).

4. $\dfrac{\partial w}{\partial t}\left(\dfrac{\partial w}{\partial x}\right)^k - f(x,t)\left(\dfrac{\partial w}{\partial x}\right)^k \dfrac{\partial^2 w}{\partial y^2} - g(x,t)\left(\dfrac{\partial w}{\partial y}\right)^{k+1} = 0.$

"Two-dimensional" solution:

$$w = \exp\big[\lambda y + \zeta(x,t)\big],$$

where λ is an arbitrary constant, and the function $\zeta = \zeta(x,t)$ is determined by the first-order nonlinear partial differential equation

$$\frac{\partial \zeta}{\partial t}\left(\frac{\partial \zeta}{\partial x}\right)^k - \lambda^2 f(x,t)\left(\frac{\partial \zeta}{\partial x}\right)^k - \lambda^{k+1} g(x,t) = 0.$$

Chapter 12
Second-Order Equations of General Form

12.1. Equations Involving the First Derivative in t

12.1.1. Equations of the Form $\dfrac{\partial w}{\partial t} = F\left(w, \dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right)$

Preliminary remarks. Consider the equation

$$\frac{\partial w}{\partial t} = F\left(w, \frac{\partial w}{\partial x}, \frac{\partial^2 w}{\partial x^2}\right). \tag{1}$$

1°. Suppose $w(x,t)$ is a solution of equation (1). Then the function $w(x + C_1, t + C_2)$, where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. In the general case, equation (1) admits traveling-wave solution

$$w = w(\xi), \qquad \xi = kx + \lambda t, \tag{2}$$

where k and λ are arbitrary constants and the function $w(\xi)$ is determined by the ordinary differential equation

$$F\left(w, kw'_\xi, k^2 w''_{\xi\xi}\right) - \lambda w'_\xi = 0.$$

This subsection presents special cases where equation (1) admits exact solutions other than traveling wave (2).

1. $\dfrac{\partial w}{\partial t} = F\left(\dfrac{\partial^2 w}{\partial x^2}\right)$.

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1^{-2} w(C_1 x + C_2, C_1^2 t + C_3) + C_4 x + C_5,$$

where $C_1, \ldots, C_5$ are arbitrary constants, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = F(A)t + \tfrac{1}{2}Ax^2 + Bx + C,$$

where A, B, and C are arbitrary constants.

3°. Generalized separable solution:

$$w(x,t) = (Ax + B)t + C + \varphi(x),$$

where the function $\varphi(x)$ is determined by the ordinary differential equation

$$F\left(\varphi''_{xx}\right) = Ax + B.$$

4°. Solution:

$$w(x,t) = At + B + \psi(\xi), \qquad \xi = kx + \lambda t,$$

where A, B, k, and λ are arbitrary constants and the function $\psi(\xi)$ is determined by the autonomous ordinary differential equation

$$F\left(k^2\psi''_{\xi\xi}\right) = \lambda\psi'_\xi + A.$$

5°. Solution:

$$w(x,t) = \tfrac{1}{2}Ax^2 + Bx + C + U(\xi), \qquad \xi = kx + \lambda t,$$

where A, B, k, and λ are arbitrary constants and the function $U(\xi)$ is determined by the autonomous ordinary differential equation

$$F\left(k^2U''_{\xi\xi} + A\right) = \lambda U'_\xi.$$

6°. Self-similar solution:

$$w(x,t) = t\,\Theta(\zeta), \qquad \zeta = \frac{x}{\sqrt{t}},$$

where the function $\Theta(\zeta)$ is determined by the ordinary differential equation

$$F\left(\Theta''_{\zeta\zeta}\right) + \tfrac{1}{2}\zeta\Theta'_\zeta - \Theta = 0.$$

7°. The substitution $u(x,t) = \dfrac{\partial w}{\partial x}$ brings the original equation to an equation of the form 5.6.18.4:

$$\frac{\partial u}{\partial t} = f\left(\frac{\partial u}{\partial x}\right)\frac{\partial^2 u}{\partial x^2}, \qquad f(z) = F'_z(z).$$

8°. The transformation

$$\begin{aligned}
&\bar{t} = \alpha t + \gamma_1, \quad \bar{x} = \beta_1 x + \beta_2 w + \gamma_2,\\
&\bar{w} = \beta_1\left(\beta_4 w + \tfrac{1}{2}\beta_3 x^2 + \gamma_3 x\right) + \gamma_4 t + \gamma_5 + \beta_2\left[\beta_3(xw_x - w) + \gamma_3 w_x + \tfrac{1}{2}\beta_4 w_x^2\right],\\
&\bar{w}_{\bar{x}} = \beta_3 x + \beta_4 w_x + \gamma_3,
\end{aligned}$$

where α, the β_i, and the γ_i are arbitrary constants ($\alpha \neq 0$, $\beta_1\beta_4 - \beta_2\beta_3 \neq 0$) and the subscripts x and $\bar{x}$ denote the corresponding partial derivatives, takes the equation in question to an equation of the same form. The right-hand side of the equation becomes

$$\bar{F}(\bar{w}_{\bar{x}\bar{x}}) = \frac{\beta_1\beta_4 - \beta_2\beta_3}{\alpha}F(w_{xx}) + \frac{\gamma_4}{\alpha}.$$

Special case 1. Equation with a quadratic nonlinearity in the highest derivative:

$$\frac{\partial w}{\partial t} = a\left(\frac{\partial^2 w}{\partial x^2}\right)^2 + b.$$

1°. Additive separable solution:

$$w(x,t) = Ax^2 + Bx + C + (4aA^2 + b)t,$$

where A, B, and C are arbitrary constants.

2°. Generalized separable solution:

$$w = \varphi_4(t)x^4 + \varphi_3(t)x^3 + \varphi_2(t)x^2 + \varphi_1(t)x + \varphi_0(t),$$

where the functions $\varphi_n(t)$ are determined by the autonomous system of ordinary differential equations

$$\begin{aligned}
\varphi_4' &= 144a\varphi_4^2,\\
\varphi_3' &= 144a\varphi_3\varphi_4,\\
\varphi_2' &= 36a\varphi_3^2 + 48a\varphi_2\varphi_4,\\
\varphi_1' &= 24a\varphi_2\varphi_3,\\
\varphi_0' &= 4a\varphi_2^2 + b.
\end{aligned}$$

This system is easy to solve by successive integration.

Special case 2. Equation:

$$\frac{\partial w}{\partial t} = a\left(\frac{\partial^2 w}{\partial x^2}\right)^k, \qquad k > 0, \quad k \neq 1.$$

1°. Additive separable solution:

$$w(x,t) = \tfrac{1}{2}C_1x^2 + C_2x + aC_1^k t + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants.

2°. Solution:

$$w(x,t) = \left[a(1-k)t + C_1\right]^{\frac{1}{1-k}} u(x) + C_2,$$

where the function $u(x)$ is determined by the autonomous ordinary differential equation $(u_{xx}'')^k - u = 0$, whose general solution can be written out in implicit form:

$$\int \left(\frac{2k}{1+k}u^{\frac{1+k}{k}} + C_3\right)^{-1/2} du = \pm x + C_4.$$

Special case 3. Equation:

$$\frac{\partial w}{\partial t} = a\exp\left(\lambda\frac{\partial^2 w}{\partial x^2}\right).$$

Generalized separable solution:

$$w(x,t) = U(x) - \frac{1}{2\lambda}(x^2 + A_1x + A_2)\ln(B_1t + B_2) + C_1x + C_2,$$

where A_1, A_2, B_1, B_2, C_1, and C_2 are arbitrary constants, and the function $U(x)$ is determined by the ordinary differential equation

$$2a\lambda\exp(\lambda U_{xx}'') + B_1(x^2 + A_1x + A_2) = 0,$$

which is easy to integrate; to this end, the equation should first be solved for U_{xx}''.

Special case 4. Equation:

$$\frac{\partial w}{\partial t} = a\ln\left|\frac{\partial^2 w}{\partial x^2}\right|.$$

Generalized separable solution:

$$w(x,t) = (at + C)\left[\ln\frac{2A^2(at + C)}{\cos^2(Ax + B)} - 1\right] + D,$$

where A, B, C, and D are arbitrary constants.

⊙ *References for equation* 12.1.1.1: I. Sh. Akhatov, R. K. Gazizov, and N. H. Ibragimov (1989), N. H. Ibragimov (1994, pp. 115–118, 131–132), A. D. Polyanin and V. F. Zaitsev (2002, pp. 264–265; 2004, pp. 479–481).

2. $\dfrac{\partial w}{\partial t} = F\left(\dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right)$.

Apart from a traveling-wave solution, this equation has a more complicated exact solution of the form

$$w(x,t) = At + B + \varphi(\xi), \qquad \xi = kx + \lambda t,$$

where A, B, k, and λ are arbitrary constants, and the function $\varphi(\xi)$ is determined by the autonomous ordinary differential equation

$$F\left(k\varphi'_\xi,\ k^2\varphi''_{\xi\xi}\right) - \lambda\varphi'_\xi - A = 0.$$

Special case. Equation:

$$\frac{\partial w}{\partial t} = a\frac{\partial w}{\partial x}\frac{\partial^2 w}{\partial x^2}.$$

1°. Generalized separable solution:

$$w(x,t) = \varphi_1(t) + \varphi_2(t)x^{3/2} + \varphi_3(t)x^3,$$

where the functions $\varphi_k = \varphi_k(t)$ are determined by the autonomous system of ordinary differential equations

$$\varphi'_1 = \tfrac{9}{8}a\varphi_2^2,$$
$$\varphi'_2 = \tfrac{45}{4}a\varphi_2\varphi_3,$$
$$\varphi'_3 = 18a\varphi_3^2.$$

The prime denotes a derivative with respect to t.

2°. Generalized separable solution cubic in x:

$$w(x,t) = \psi_1(t) + \psi_2(t)x + \psi_3(t)x^2 + \psi_4(t)x^3,$$

where the functions $\psi_k = \psi_k(t)$ are determined by the autonomous system of ordinary differential equations

$$\psi'_1 = 2a\psi_2\psi_3,$$
$$\psi'_2 = 2a(2\psi_3^2 + 3\psi_2\psi_4),$$
$$\psi'_3 = 18a\psi_3\psi_4,$$
$$\psi'_4 = 18a\psi_4^2.$$

3°. Generalized separable solution:

$$w(x,t) = \frac{\theta(x) + C_3}{C_1 t + C_2} + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants and the function $\theta = \theta(x)$ is determined by the autonomous ordinary differential equation

$$a\theta'_x\theta''_{xx} + C_1\theta + C_1C_3 = 0,$$

whose solution can be written out in implicit form.

3. $\dfrac{\partial w}{\partial t} = F\left(\dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right) + aw$.

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x + C_1, t + C_2) + C_3e^{at},$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Degenerate solution:

$$w(x,t) = (C_1x + C_2)e^{at} + e^{at}\int e^{-at}F(C_1e^{at}, 0)\,dt.$$

3°. Traveling-wave solution:

$$w = w(z), \qquad z = x + \lambda t,$$

where λ is an arbitrary constant and the function $w(z)$ is determined by the autonomous ordinary differential equation

$$F\left(w'_z, w''_{zz}\right) - \lambda w'_z + aw = 0.$$

4. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial w}{\partial x} + F\left(\dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x + aC_1 t + C_2, t + C_3) + C_1,$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Degenerate solution:

$$w(x,t) = -\frac{x + C_1}{a\tau} + \frac{1}{\tau}\int \tau F\Big(-\frac{1}{a\tau}, 0\Big)\, d\tau, \qquad \tau = t + C_2.$$

3°. Solution:

$$w(x,t) = U(\zeta) + 2C_1 t, \qquad \zeta = x + aC_1 t^2 + C_2 t,$$

where C_1 and C_2 are arbitrary constants and the function $U(\zeta)$ is determined by the autonomous ordinary differential equation

$$F\big(U'_\zeta, U''_{\zeta\zeta}\big) + aUU'_\zeta = C_2 U'_\zeta + 2C_1.$$

In the special case $C_1 = 0$, the above solution converts to a traveling-wave solution.

⊙ *Reference for equation* 12.1.1.4: A. D. Polyanin and V. F. Zaitsev (2004, p. 482).

5. $\dfrac{\partial w}{\partial t} = aw\dfrac{\partial w}{\partial x} + F\left(\dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right) + bw.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x + aC_1 e^{bt} + C_2, t + C_3) + C_1 b e^{bt},$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Degenerate solution:

$$w(x,t) = \varphi(t)x + \psi(t),$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of ordinary differential equations

$$\varphi'_t = a\varphi^2 + b\varphi,$$
$$\psi'_t = a\varphi\psi + b\psi + F(\varphi, 0),$$

which is easy to integrate (the first equation is a Bernoulli equation and the second one is linear in ψ).

3°. Traveling-wave solution:

$$w = w(z), \qquad z = x + \lambda t,$$

where λ is an arbitrary constant and the function $w(z)$ is determined by the autonomous ordinary differential equation

$$F\big(w'_z, w''_{zz}\big) + aww'_z - \lambda w'_z + bw = 0.$$

⊙ *Reference for equation* 12.1.1.5: A. D. Polyanin and V. F. Zaitsev (2004, p. 482).

6. $\dfrac{\partial w}{\partial t} = e^{\beta w} F\left(\dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x + C_1, C_2 t + C_3) + \frac{1}{\beta}\ln C_2,$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = -\frac{1}{\beta}\ln(A\beta t + B) + \varphi(x),$$

where A and B are arbitrary constants, and the function $\varphi(x)$ is determined by the autonomous ordinary differential equation

$$e^{\beta\varphi} F\left(\varphi'_x, \varphi''_{xx}\right) + A = 0.$$

3°. Solution:

$$w(x,t) = -\frac{1}{\beta}\ln(t + C) + \Theta(\xi), \quad \xi = kx + \lambda\ln(t + C),$$

where C, k, and λ are arbitrary constants, and the function $\Theta(\xi)$ is determined by the autonomous ordinary differential equation

$$e^{\beta\Theta} F\left(k\Theta'_\xi, k^2\Theta''_{\xi\xi}\right) = \lambda\Theta'_\xi - \frac{1}{\beta}.$$

7. $\dfrac{\partial w}{\partial t} = F\left(\dfrac{1}{w}\dfrac{\partial w}{\partial x}, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1^{-1} w(x + C_2, C_1 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Solution:

$$w(x,t) = t\varphi(z), \quad z = kx + \lambda\ln|t|,$$

where k and λ are arbitrary constants and the function $\varphi(z)$ is determined by the autonomous ordinary differential equation

$$F\left(k\frac{\varphi'_z}{\varphi}, k^2\frac{\varphi''_{zz}}{\varphi}\right) = \lambda\varphi'_z + \varphi.$$

8. $\dfrac{\partial w}{\partial t} = wF\left(\dfrac{1}{w}\dfrac{\partial w}{\partial x}, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(x + C_2, t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Multiplicative separable solution:

$$w(x,t) = Ce^{\lambda t}\varphi(x),$$

where C and λ are arbitrary constants and the function $\varphi(x)$ is determined by the autonomous ordinary differential equation

$$F\left(\frac{\varphi'_x}{\varphi}, \frac{\varphi''_{xx}}{\varphi}\right) = \lambda.$$

This equation has particular solutions of the form $\varphi(x) = e^{\alpha x}$, where α is a root of the algebraic (or transcendental) equation $F(\alpha, \alpha^2) - \lambda = 0$.

3°. Solution:

$$w(x,t) = Ce^{\lambda t}\psi(\xi), \quad \xi = kx + \beta t,$$

where C, k, λ, and β are arbitrary constants, and the function $\psi(\xi)$ is determined by the autonomous ordinary differential equation

$$\psi F\left(k\frac{\psi'_\xi}{\psi}, k^2\frac{\psi''_{\xi\xi}}{\psi}\right) = \beta\psi'_\xi + \lambda\psi.$$

This equation has particular solutions of the form $\psi(\xi) = e^{\mu\xi}$.

9. $\dfrac{\partial w}{\partial t} = w^n F\left(\dfrac{1}{w}\dfrac{\partial w}{\partial x}, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right).$

For the cases $n = 0$ and $n = 1$, see equations 12.1.1.7 and 12.1.1.8, respectively.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w(x + C_2, C_1^{n-1}t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Multiplicative separable solution:

$$w(x,t) = \big[(1-n)At + B\big]^{\frac{1}{1-n}}\varphi(x),$$

where A and B are arbitrary constants, and the function $\varphi(x)$ is determined by the autonomous ordinary differential equation

$$\varphi^{n-1}F\left(\frac{\varphi'_x}{\varphi}, \frac{\varphi''_{xx}}{\varphi}\right) = A.$$

3°. Solution:

$$w(z,t) = (t + C)^{\frac{1}{1-n}}\Theta(z), \quad z = kx + \lambda\ln(t + C),$$

where C, k, and λ are arbitrary constants, and the function $\Theta(z)$ is determined by the autonomous ordinary differential equation

$$\Theta^n F\left(k\frac{\Theta'_z}{\Theta}, k^2\frac{\Theta''_{zz}}{\Theta}\right) = \lambda\Theta'_z + \frac{1}{1-n}\Theta.$$

10. $\dfrac{\partial w}{\partial t} = w^n F\left(w^k \dfrac{\partial w}{\partial x},\ w^{2k+1}\dfrac{\partial^2 w}{\partial x^2}\right).$

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w(C_1^{-k-1}x + C_2, C_1^{n-1}t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Self-similar solution with $n \neq 1$ and $k \neq -1$:

$$w(x,t) = t^{\frac{1}{1-n}}U(z), \quad z = xt^{\frac{k+1}{n-1}},$$

where the function $U(z)$ is determined by the ordinary differential equation

$$\frac{1}{1-n}U + \frac{k+1}{n-1}zU_z' = U^n F\big(U^k U_z',\ U^{2k+1}U_{zz}''\big).$$

3°. Generalized self-similar solution with $n = 1$ and $k \neq -1$:

$$w(x,t) = \exp\left(-\frac{1}{k+1}t\right)u(\xi), \quad \xi = xe^t,$$

where the function $u(\xi)$ is determined by the ordinary differential equation

$$-\frac{1}{k+1}u + \xi u_\xi' = uF\big(u^k u_\xi',\ u^{2k+1}u_{\xi\xi}''\big).$$

4°. For $k = -1$, see equations 8.1.1.7–8.1.1.9.

11. $\dfrac{\partial w}{\partial t} = F\left(\dfrac{\partial^2 w}{\partial x^2}\Big/\dfrac{\partial w}{\partial x}\right).$

This is a special case of equation 12.1.1.2.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1^{-1}w(x + C_2, C_1 t + C_3) + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. Solution:

$$w(x,t) = At + B + \varphi(\xi), \quad \xi = kx + \lambda t,$$

where A, B, k, and λ are arbitrary constants, and the function $\varphi(\xi)$ is determined by the autonomous ordinary differential equation

$$F\big(k\varphi_{\xi\xi}''/\varphi_\xi'\big) = \lambda\varphi_\xi' + A.$$

If $A = 0$, the equation has a traveling-wave solution.

3°. Solution:

$$w(x,t) = t\Theta(z) + C, \quad z = kx + \lambda\ln|t|$$

where C, k, β, and λ are arbitrary constants, and the function $\Theta(z)$ is determined by the autonomous ordinary differential equation

$$F\big(k\Theta_{zz}''/\Theta_z'\big) = \lambda\Theta_z' + \Theta.$$

12. $\dfrac{\partial w}{\partial t} = \dfrac{\partial w}{\partial x} F\left(\dfrac{\partial^2 w}{\partial x^2} \Big/ \dfrac{\partial w}{\partial x}\right).$

This is a special case of equation 12.1.1.2.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w(x + C_2, t + C_3) + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. Solution:

$$w(x,t) = At + B + \varphi(z), \qquad z = kx + \lambda t,$$

where A, B, k, and λ are arbitrary constants, and the function $\varphi(z)$ is determined by the autonomous ordinary differential equation

$$k\varphi'_z F\left(k\varphi''_{zz}/\varphi'_z\right) = \lambda\varphi'_z + A.$$

3°. Solution:

$$w(x,t) = Ae^{\beta t}\Theta(\xi) + B, \qquad \xi = kx + \lambda t,$$

where A, B, k, β, and λ are arbitrary constants, and the function $\Theta(\xi)$ is determined by the autonomous ordinary differential equation

$$k\Theta'_\xi F\left(k\Theta''_{\xi\xi}/\Theta'_\xi\right) = \lambda\Theta'_\xi + \beta\Theta.$$

13. $\dfrac{\partial w}{\partial t} = \left(\dfrac{\partial w}{\partial x}\right)^{\beta} F\left(\dfrac{\partial^2 w}{\partial x^2} \Big/ \dfrac{\partial w}{\partial x}\right).$

This is a special case of equation 12.1.1.2. For the cases $\beta = 0$ and $\beta = 1$, see equations 12.1.1.11 and 12.1.1.12, respectively.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w(x + C_2, C_1^{\beta-1} t + C_3) + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. Generalized separable solution:

$$w(x,t) = \left[A(1-\beta)t + B\right]^{\frac{1}{1-\beta}} \varphi(x) + C,$$

where A, B, and C are arbitrary constants, and the function $\varphi(x)$ is determined by the autonomous ordinary differential equation

$$\left(\varphi'_x\right)^{\beta} F\left(\varphi''_{xx}/\varphi'_x\right) = A\varphi.$$

3°. Solution:

$$w(x,t) = (t + A)^{\frac{1}{1-\beta}} \Theta(z) + B, \qquad z = kx + \lambda \ln(t + A),$$

where A, B, k, and λ are arbitrary constants, and the function $\Theta(z)$ is determined by the autonomous ordinary differential equation

$$k^{\beta}\left(\Theta'_z\right)^{\beta} F\left(k\Theta''_{zz}/\Theta'_z\right) = \lambda\Theta'_z + \frac{1}{1-\beta}\Theta.$$

14. $\dfrac{\partial w}{\partial t} = wF\left(\left(\dfrac{\partial w}{\partial x}\right)^2 + aw^2,\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right).$

This is a special case of equation 12.1.2.11.

15. $\dfrac{\partial w}{\partial t} = wF\left(\dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2},\ w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2\right).$

This is a special case of equation 12.1.2.12.

16. $\dfrac{\partial w}{\partial t} = wF\left(\dfrac{\partial^2 w}{\partial x^2},\ 2w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2\right) + G\left(\dfrac{\partial^2 w}{\partial x^2},\ 2w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2\right).$

This is a special case of equation 12.1.2.13.

17. $\dfrac{\partial w}{\partial t} = \dfrac{\partial}{\partial x}\big[F\big(w, w_x\big)\big], \qquad w_x = \dfrac{\partial w}{\partial x}.$

1°. The transformation

$$\bar{t} = t - t_0, \quad \bar{x} = -\int_{x_0}^{x} w(y,t)\,dy - \int_{t_0}^{t} F\big(w(x_0,\tau), w_x(x_0,\tau)\big)\,d\tau, \quad \bar{w}(\bar{x},\bar{t}) = \frac{1}{w(x,t)}$$

converts a (nonzero) solution $w(x,t)$ of the original equation to a solution $\bar{w}(\bar{x},\bar{t})$ of a similar equation:

$$\frac{\partial \bar{w}}{\partial \bar{t}} = \frac{\partial}{\partial \bar{x}}\left[\bar{F}\big(\bar{w},\ \bar{w}_{\bar{x}}\big)\right],$$

where

$$\bar{F}\big(w, w_x\big) = wF\big(w^{-1},\ w^{-3}w_x\big). \tag{1}$$

2°. In the special case

$$F\big(w, w_x\big) = g(w)(w_x)^k,$$

it follows from (1) that

$$\bar{F}\big(w, w_x\big) = \bar{g}(w)(w_x)^k, \qquad \bar{g}(w) = w^{1-3k}g(w^{-1}).$$

⊙ *References for equation* 12.1.1.17: W. Strampp (1982), J. R. Burgan, A. Munier, M. R. Feix, and E. Fijalkow (1984), N. H. Ibragimov (1994, pp. 115–118, pp. 129–130).

12.1.2. Equations of the Form $\dfrac{\partial w}{\partial t} = F\left(t, w, \dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right)$

1. $\dfrac{\partial w}{\partial t} = F\left(t, \dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right) + aw.$

Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x,t) + Ce^{at},$$

where C are arbitrary constants, is also a solution of the equation.

2. $\dfrac{\partial w}{\partial t} + f(t)w\dfrac{\partial w}{\partial x} = F\left(t, \dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right) + g(t)w.$

Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w\big(x + \psi(t),\, t\big) + \varphi(t), \quad \varphi(t) = C\exp\left[\int g(t)\,dt\right], \quad \psi(t) = -\int f(t)\varphi(t)\,dt,$$

where C is an arbitrary constant, is also a solution of the equation.

3. $\dfrac{\partial w}{\partial t} = wF\left(t, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right).$

Multiplicative separable solutions:

$$w(x,t) = A\exp\left[\lambda x + \int F(t,\lambda^2)\,dt\right],$$
$$w(x,t) = \big[A\cosh(\lambda x) + B\sinh(\lambda x)\big]\exp\left[\int F(t,\lambda^2)\,dt\right],$$
$$w(x,t) = \big[A\cos(\lambda x) + B\sin(\lambda x)\big]\exp\left[\int F(t,-\lambda^2)\,dt\right],$$

where A, B, and λ are arbitrary constants.

4. $\dfrac{\partial w}{\partial t} = wF\left(t, \dfrac{1}{w}\dfrac{\partial w}{\partial x}, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right).$

Multiplicative separable solution:

$$w(x,t) = A\exp\left[\lambda x + \int F(t,\lambda,\lambda^2)\,dt\right],$$

where A and λ are arbitrary constants.

5. $\dfrac{\partial w}{\partial t} = wF\left(t, w^k\dfrac{\partial w}{\partial x}, w^{2k+1}\dfrac{\partial^2 w}{\partial x^2}\right).$

1°. Multiplicative separable solution for $k \neq -1$:

$$w(x,t) = \big[C_1(k+1)x + C_2\big]^{\frac{1}{k+1}}\varphi(t),$$

where the function $\varphi = \varphi(t)$ is determined by the first-order ordinary differential equation

$$\varphi_t' = \varphi F\big(t, C_1\varphi^{k+1}, -kC_1^2\varphi^{2k+2}\big).$$

2°. For $k = -1$, see equation 12.1.2.4.

6. $\dfrac{\partial w}{\partial t} = f(t)w^{\beta}\Phi\left(\dfrac{1}{w}\dfrac{\partial w}{\partial x}, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) + g(t)w.$

The transformation

$$w(x,t) = G(t)u(x,\tau), \quad \tau = \int f(t)G^{\beta-1}(t)\,dt, \qquad G(t) = \exp\left[\int g(t)\,dt\right],$$

leads to a simpler equation of the form 12.1.1.9:

$$\frac{\partial u}{\partial \tau} = u^{\beta}\Phi\left(\frac{1}{u}\frac{\partial u}{\partial x}, \frac{1}{u}\frac{\partial^2 u}{\partial x^2}\right),$$

which has a traveling-wave solution $u = u(Ax + B\tau)$ and a solution in the multiplicative form $u = \varphi(x)\psi(\tau)$.

7. $\dfrac{\partial w}{\partial t} = f(t)\left(\dfrac{\partial w}{\partial x}\right)^{k}\Phi\left(\dfrac{\partial^2 w}{\partial x^2}\Big/\dfrac{\partial w}{\partial x}\right) + g(t)w + h(t).$

Generalized separable solution:

$$w(x,t) = \varphi(t)\Theta(x) + \psi(t),$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of first-order ordinary differential equations

$$\varphi'_t = Af(t)\varphi^k + g(t)\varphi, \tag{1}$$
$$\psi'_t = g(t)\psi + Bf(t)\varphi^k + h(t), \tag{2}$$

C is an arbitrary constant, and the function $\Theta(x)$ is determined by the second-order ordinary differential equation

$$\left(\Theta'_x\right)^k\Phi\left(\Theta''_{xx}/\Theta'_x\right) = A\Theta + B. \tag{3}$$

The general solution of system (1), (2) is expressed as

$$\varphi(t) = G(t)\left[C - kA\int f(t)G^{k-1}(t)\,dt\right]^{\frac{1}{1-k}}, \quad G(t) = \exp\left[\int g(t)\,dt\right],$$
$$\psi(t) = DG(t) + G(t)\int\left[Bf(t)\varphi^k(t) + h(t)\right]\frac{dt}{G(t)},$$

where A, B, C, and D are arbitrary constants.

For $k = 1$, a solution to equation (3) is given by

$$\Theta(x) = \alpha e^{\lambda x} - B/A,$$

where α is an arbitrary constant and λ is determined from the algebraic (or transcendental) equation $\lambda\Phi(\lambda) = A$.

8. $\dfrac{\partial w}{\partial t} = f(t)e^{\beta w}\Phi\left(\dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right) + g(t).$

The transformation

$$w(x,t) = u(x,\tau) + G(t), \quad \tau = \int f(t)\exp\big[\beta G(t)\big]\,dt, \qquad G(t) = \int g(t)\,dt,$$

leads to a simpler equation of the form 12.1.1.6:

$$\frac{\partial u}{\partial \tau} = e^{\beta u}\Phi\left(\frac{\partial u}{\partial x}, \frac{\partial^2 u}{\partial x^2}\right),$$

which has a traveling-wave solution $u = u(Ax + B\tau)$ and an additive separable solution $u = \varphi(x) + \psi(\tau)$.

9. $\dfrac{\partial w}{\partial t} = f(t)\Phi\left(w, \dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right) + g(t)\dfrac{\partial w}{\partial x}.$

With the transformation

$$w = U(z,\tau), \quad z = x + \int g(t)\,dt, \quad \tau = \int f(t)\,dt$$

one arrives at the simpler equation

$$\frac{\partial U}{\partial \tau} = \Phi\left(U, \frac{\partial U}{\partial z}, \frac{\partial^2 U}{\partial z^2}\right),$$

which has a traveling-wave solution $U = U(kz + \lambda\tau)$.

10. $\dfrac{\partial w}{\partial t} = wF\left(t, w\dfrac{\partial^2 w}{\partial x^2} + aw^2\right).$

Multiplicative separable solutions:

$$w(x,t) = \big[C_1\sin\big(x\sqrt{a}\,\big) + C_2\cos\big(x\sqrt{a}\,\big)\big]\exp\left[\int F(t,0)\,dt\right] \qquad \text{if } a > 0,$$

$$w(x,t) = \big[C_1\sinh\big(x\sqrt{|a|}\,\big) + C_2\cosh\big(x\sqrt{|a|}\,\big)\big]\exp\left[\int F(t,0)\,dt\right] \quad \text{if } a < 0,$$

where C_1 and C_2 are arbitrary constants.

⊙ *Reference*: A. D. Polyanin and V. F. Zaitsev (2004, p. 488).

11. $\dfrac{\partial w}{\partial t} = wF\left(t, \left(\dfrac{\partial w}{\partial x}\right)^2 + aw^2, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right).$

1°. Multiplicative separable solution for $a > 0$:

$$w(x,t) = \big[C_1\sin\big(x\sqrt{a}\,\big) + C_2\cos\big(x\sqrt{a}\,\big)\big]\varphi(t),$$

where C_1 and C_2 are arbitrary constants, and the function $\varphi = \varphi(t)$ is determined by the ordinary differential equation $\varphi_t' = \varphi F\big(t, a(C_1^2 + C_2^2)\varphi^2, -a\big)$.

2°. Multiplicative separable solution for $a < 0$:

$$w(x,t) = \big(C_1 e^{\sqrt{|a|}\,x} + C_2 e^{-\sqrt{|a|}\,x}\big)\varphi(t),$$

where C_1 and C_2 are arbitrary constants, and the function $\varphi = \varphi(t)$ is determined by the ordinary differential equation $\varphi_t' = \varphi F\big(t,\, 4C_1C_2a\varphi^2,\, -a\big)$.

Special case. For $C_1C_2 = 0$, a solution is given by

$$w(x,t) = C\exp\left[\pm\sqrt{|a|}\,x + \int F(t,0,-a)\,dt\right],$$

where C is an arbitrary constant.

⊙ *Reference for equation* 12.1.2.11: A. D. Polyanin and V. F. Zaitsev (2004, p. 489).

12. $\dfrac{\partial w}{\partial t} = wF\left(t,\, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2},\, w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2\right)$.

1°. Multiplicative separable solution:

$$w(x,t) = C\exp\left[\lambda x + \int F(t,\lambda^2,0)\,dt\right],$$

where C and λ are arbitrary constants.

2°. Multiplicative separable solution:

$$w(x,t) = (Ae^{\lambda x} + Be^{-\lambda x})\varphi(t),$$

where A, B, and λ are arbitrary constants, and the function $\varphi = \varphi(t)$ is determined by the ordinary differential equation $\varphi_t' = \varphi F\big(t, \lambda^2, 4AB\lambda^2\varphi^2\big)$.

3°. Multiplicative separable solution:

$$w(x,t) = [A\sin(\lambda x) + B\cos(\lambda x)]\varphi(t),$$

where A, B, and λ are arbitrary constants, and the function $\varphi = \varphi(t)$ is determined by the ordinary differential equation $\varphi_t' = \varphi F\big(t, -\lambda^2, -\lambda^2(A^2+B^2)\varphi^2\big)$.

⊙ *References for equation* 12.1.2.12: Ph. W. Doyle (1996, the case $\partial_t F \equiv 0$ was treated), A. D. Polyanin and V. F. Zaitsev (2004, p. 489).

13. $\dfrac{\partial w}{\partial t} = wF\left(t,\, \dfrac{\partial^2 w}{\partial x^2},\, 2w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2\right) + G\left(t,\, \dfrac{\partial^2 w}{\partial x^2},\, 2w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2\right)$.

Generalized separable solution quadratic in x:

$$w = \varphi_1(t)x^2 + \varphi_2(t)x + \varphi_3(t),$$

where the functions φ_1, φ_2, and φ_3 are determined by the system of first-order ordinary differential equations

$$\begin{aligned}
\varphi_1' &= \varphi_1 F\big(t,\, 2\varphi_1,\, 4\varphi_1\varphi_3 - \varphi_2^2\big),\\
\varphi_2' &= \varphi_2 F\big(t,\, 2\varphi_1,\, 4\varphi_1\varphi_3 - \varphi_2^2\big),\\
\varphi_3' &= \varphi_3 F\big(t,\, 2\varphi_1,\, 4\varphi_1\varphi_3 - \varphi_2^2\big) + G\big(t,\, 2\varphi_1,\, 4\varphi_1\varphi_3 - \varphi_2^2\big).
\end{aligned}$$

It follows from the first two equations that $\varphi_2 = C\varphi_1$, where C is an arbitrary constant.

12.1.3. Equations of the Form $\dfrac{\partial w}{\partial t} = F\left(x, w, \dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right)$

Preliminary remarks. Consider the equation

$$\frac{\partial w}{\partial t} = F\left(x,\, w,\, \frac{\partial w}{\partial x},\, \frac{\partial^2 w}{\partial x^2}\right). \tag{1}$$

Suppose that the auxiliary ordinary differential equation

$$w = F(x,\, w,\, w'_x,\, w''_{xx})$$

is reduced, by a linear transformation

$$x = \varphi(z), \quad w = \psi(z)u + \chi(z)$$

and the subsequent division of the resulting equation by $\psi(z)$, to the autonomous form

$$u = \mathcal{F}(u,\, u'_z,\, u''_{zz}),$$

where $\mathcal{F} = F/\psi$. Then, the original equation (1) can be reduced, by the same transformation

$$x = \varphi(z), \quad w(x,t) = \psi(z)u(z,t) + \chi(z),$$

to the equation

$$\frac{\partial u}{\partial t} = \mathcal{F}\left(u,\, \frac{\partial u}{\partial z},\, \frac{\partial^2 u}{\partial z^2}\right),$$

which has a traveling-wave solution $u = u(kz + \lambda t)$.

The above allows using various known transformations of ordinary differential equations (see Kamke, 1977, and Polyanin and Zaitsev, 2003) for constructing exact solutions to partial differential equations. If the original equation is linear, then such transformations will result in linear constant-coefficient equations.

1. $\dfrac{\partial w}{\partial t} = F\left(x,\, \dfrac{\partial^2 w}{\partial x^2}\right).$

Generalized separable solution:

$$w(x,t) = Axt + Bt + C + \varphi(x),$$

where A, B, and C are arbitrary constants, and the function $\varphi(x)$ is determined by the ordinary differential equation

$$F\left(x,\, \varphi''_{xx}\right) = Ax + B.$$

Special case. Equation

$$\frac{\partial w}{\partial t} = f(x)\exp\left(a\frac{\partial^2 w}{\partial x^2}\right).$$

Generalized separable solution:

$$w = \varphi(x) + \psi(x)\theta(t),$$

where

$$\varphi(x) = \frac{1}{2a}A_1x^2 + C_3x + C_4 + \frac{1}{a}\int_{x_0}^{x}(x-\xi)\ln\frac{\psi(\xi)}{f(\xi)}\,d\xi,$$

$$\psi(x) = \frac{1}{2}A_2x^2 + C_1x + C_2,$$

$$\theta(t) = -\frac{1}{A_2a}\ln\left(C_5 - A_2ae^{A_1}t\right).$$

2. $\dfrac{\partial w}{\partial t} = F\left(x, \dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right).$

Additive separable solution:

$$w(x,t) = At + B + \varphi(x),$$

where A and B are arbitrary constants, and the function $\varphi(x)$ is determined by the ordinary differential equation

$$F\big(x, \varphi'_x, \varphi''_{xx}\big) = A.$$

3. $\dfrac{\partial w}{\partial t} = ax\dfrac{\partial w}{\partial x} + F\left(w, \dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x + C_1 e^{-at}, t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Generalized traveling-wave solution:

$$w = w(z), \quad z = x + Ce^{-at},$$

where C is an arbitrary constant and the function $w(z)$ is determined by the ordinary differential equation

$$F\big(w, w'_z, w''_{zz}\big) + azw'_z = 0.$$

⊙ *Reference for equation* 12.1.3.3: A. D. Polyanin and V. F. Zaitsev (2004, p. 350).

4. $\dfrac{\partial w}{\partial t} = F\left(\dfrac{\partial w}{\partial x}, x\dfrac{\partial^2 w}{\partial x^2}\right).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1^{-1} w(C_1 x, C_1 t + C_2) + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = At + B + \varphi(x),$$

where A and B are arbitrary constants, and the function $\varphi(x)$ is determined by the ordinary differential equation

$$F\big(\varphi'_x, x\varphi''_{xx}\big) = A.$$

3°. Solution:

$$w(x,t) = t\Theta(\xi) + C, \quad \xi = x/t,$$

where C is an arbitrary constant, and the function $\Theta(\xi)$ is determined by the ordinary differential equation

$$F\big(\Theta'_\xi, \xi\Theta''_{\xi\xi}\big) + \xi\Theta'_\xi - \Theta = 0.$$

5. $\dfrac{\partial w}{\partial t} = F\left(w,\ x\dfrac{\partial w}{\partial x},\ x^2\dfrac{\partial^2 w}{\partial x^2}\right).$

The substitution $x = \pm e^z$ leads to the equation

$$\frac{\partial w}{\partial t} = F\left(w,\ \frac{\partial w}{\partial z},\ \frac{\partial^2 w}{\partial z^2} - \frac{\partial w}{\partial z}\right),$$

which has a traveling-wave solution $w = w(kz + \lambda t)$.

6. $\dfrac{\partial w}{\partial t} = x^k F\left(w,\ x\dfrac{\partial w}{\partial x},\ x^2\dfrac{\partial^2 w}{\partial x^2}\right).$

1°. Suppose $w(x, t)$ is a solution of this equation. Then the function

$$w_1 = w(C_1 x, C_1^{-k} t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Self-similar solution:

$$w(x, t) = w(z), \quad z = xt^{1/k},$$

where the function $w(z)$ is determined by the ordinary differential equation

$$kz^{k-1} F\big(w,\ zw'_z,\ z^2 w''_{zz}\big) - w'_z = 0.$$

7. $\dfrac{\partial w}{\partial t} = x^k F\left(w,\ x\dfrac{\partial w}{\partial x},\ x^2\dfrac{\partial^2 w}{\partial x^2}\right) + ax\dfrac{\partial w}{\partial x}.$

Passing to the new independent variables

$$z = xe^{at}, \quad \tau = \frac{1}{ak}\big(1 - e^{-akt}\big),$$

we obtain an equation of the form 12.1.3.6:

$$\frac{\partial w}{\partial \tau} = z^k F\left(w,\ z\frac{\partial w}{\partial z},\ z^2\frac{\partial^2 w}{\partial z^2}\right).$$

8. $\dfrac{\partial w}{\partial t} = e^{\lambda x} F\left(w,\ \dfrac{\partial w}{\partial x},\ \dfrac{\partial^2 w}{\partial x^2}\right).$

1°. Suppose $w(x, t)$ is a solution of this equation. Then the function

$$w_1 = w(x + C_1,\ e^{-\lambda C_1} t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Solution:

$$w(x, t) = w(z), \quad z = \lambda x + \ln t,$$

where the function $w(z)$ is determined by the ordinary differential equation

$$e^z F\big(w,\ \lambda w'_z,\ \lambda^2 w''_{zz}\big) - w'_z = 0.$$

9. $\dfrac{\partial w}{\partial t} = wF\left(x,\ \dfrac{1}{w}\dfrac{\partial w}{\partial x},\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(x,\ t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Multiplicative separable solution:

$$w(x,t) = e^{\lambda t}\varphi(x),$$

where λ is an arbitrary constant and the function $\varphi(x)$ is determined by the ordinary differential equation

$$F\big(x,\ \varphi'_x/\varphi,\ \varphi''_{xx}/\varphi\big) = \lambda.$$

10. $\dfrac{\partial w}{\partial t} = w^{\beta}F\left(x,\ \dfrac{1}{w}\dfrac{\partial w}{\partial x},\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right).$

For $\beta = 1$, see equation 12.1.3.9.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w(x,\ C_1^{\beta-1}t + C_2),$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Multiplicative separable solution:

$$w(x,t) = \big[(1-\beta)At + B\big]^{\frac{1}{1-\beta}}\varphi(x),$$

where A and B are arbitrary constants, and the function $\varphi(x)$ is determined by the ordinary differential equation

$$\varphi^{\beta-1}F\big(x,\ \varphi'_x/\varphi,\ \varphi''_{xx}/\varphi\big) = A.$$

11. $\dfrac{\partial w}{\partial t} = e^{\beta w}F\left(x,\ \dfrac{\partial w}{\partial x},\ \dfrac{\partial^2 w}{\partial x^2}\right).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x,\ C_1 t + C_2) + \frac{1}{\beta}\ln C_1,$$

where C_1 and C_2 are arbitrary constants, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = -\frac{1}{\beta}\ln(A\beta t + B) + \varphi(x),$$

where A and B are arbitrary constants, and the function $\varphi(x)$ is determined by the ordinary differential equation

$$e^{\beta\varphi}F\big(x,\ \varphi'_x,\ \varphi''_{xx}\big) + A = 0.$$

12. $\dfrac{\partial w}{\partial t} = \dfrac{\partial w}{\partial x} F\left(x,\ \dfrac{\partial^2 w}{\partial x^2} \Big/ \dfrac{\partial w}{\partial x}\right).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(x,\ t + C_2) + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = At + B + \varphi(x),$$

where A and B are arbitrary constants, and the function $\varphi(x)$ is determined by the ordinary differential equation

$$\varphi'_x F\big(x,\ \varphi''_{xx}/\varphi'_x\big) = A.$$

3°. Generalized separable solution:

$$w(x,t) = Ae^{\mu t}\Theta(x) + B$$

where A, B, and μ are arbitrary constants, and the function $\Theta(x)$ is determined by the ordinary differential equation

$$\Theta'_x F\big(x,\ \Theta''_{xx}/\Theta'_x\big) = \mu\Theta.$$

13. $\dfrac{\partial w}{\partial t} = \left(\dfrac{\partial w}{\partial x}\right)^{\beta} F\left(x,\ \dfrac{\partial^2 w}{\partial x^2} \Big/ \dfrac{\partial w}{\partial x}\right).$

For $\beta = 1$, see equation 12.1.3.12.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1 = C_1 w(x,\ C_1^{\beta-1} t + C_2) + C_3,$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Additive separable solution:

$$w(x,t) = At + B + \varphi(x),$$

where A and B are arbitrary constants, and the function $\varphi(x)$ is determined by the ordinary differential equation

$$\big(\varphi'_x\big)^{\beta} F\big(x,\ \varphi''_{xx}/\varphi'_x\big) = A.$$

3°. Generalized separable solution:

$$w(x,t) = \big[A(1-\beta)t + C_1\big]^{\frac{1}{1-\beta}}\big[\Theta(x) + B\big] + C_2,$$

where A, B, C_1, and C_2 are arbitrary constants, and the function $\Theta(x)$ is determined by the ordinary differential equation

$$\big(\Theta'_x\big)^{\beta} F\big(x,\ \Theta''_{xx}/\Theta'_x\big) = A\Theta + AB.$$

12.1.4. Equations of the Form $\dfrac{\partial w}{\partial t} = F\left(x, t, w, \dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right)$

1. $\dfrac{\partial w}{\partial t} = a\left(\dfrac{\partial w}{\partial x}\right)^m \left(\dfrac{\partial^2 w}{\partial x^2}\right)^n + \left[f(t)x + g(t)\right]\dfrac{\partial w}{\partial x} + h(t)w.$

The transformation

$$w(x,t) = u(z,\tau)H(t), \quad z = xF(t) + \int g(t)F(t)\,dt, \quad \tau = \int F^{m+2n}(t)H^{m+n-1}(t)\,dt,$$

where the functions $F(t)$ and $H(t)$ are given by

$$F(t) = \exp\left[\int f(t)\,dt\right], \quad H(t) = \exp\left[\int h(t)\,dt\right],$$

leads to the simpler equation

$$\frac{\partial u}{\partial \tau} = a\left(\frac{\partial u}{\partial z}\right)^m \left(\frac{\partial^2 u}{\partial z^2}\right)^n.$$

The last equation admits a traveling-wave solution, a self-similar solution, and a multiplicative separable solution.

2. $\dfrac{\partial w}{\partial t} = f(w)\left(\dfrac{\partial^2 w}{\partial x^2}\right)^k + \left[xg(t) + h(t)\right]\dfrac{\partial w}{\partial x}.$

The transformation

$$z = xG(t) + \int h(t)G(t)\,dt, \quad \tau = \int G^{2k}(t)\,dt, \quad \text{with} \quad G(t) = \exp\left[\int g(t)\,dt\right],$$

leads to the simpler equation

$$\frac{\partial w}{\partial \tau} = f(w)\left(\frac{\partial^2 w}{\partial z^2}\right)^k.$$

The last equation admits a traveling-wave solution and a self-similar solution.

3. $\dfrac{\partial w}{\partial t} = F\left(x, t, \dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right) + aw.$

Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x,t) + Ce^{at},$$

where C is an arbitrary constant, is also a solution of the equation.

4. $\dfrac{\partial w}{\partial t} = F\left(ax + bt,\ w,\ \dfrac{\partial w}{\partial x},\ \dfrac{\partial^2 w}{\partial x^2}\right).$

Solution:

$$w = w(\xi), \quad \xi = ax + bt,$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$F\left(\xi,\ w,\ aw'_\xi,\ a^2 w''_{\xi\xi}\right) - bw'_\xi = 0.$$

5. $\dfrac{\partial w}{\partial t} = f(t)x^k\Phi\left(w,\ x\dfrac{\partial w}{\partial x},\ x^2\dfrac{\partial^2 w}{\partial x^2}\right) + xg(t)\dfrac{\partial w}{\partial x}.$

Passing to the new independent variables

$$z = xG(t), \quad \tau = \int f(t)G^{-k}(t)\,dt, \qquad G(t) = \exp\left[\int g(t)\,dt\right],$$

we obtain a simpler equation of the form 12.1.3.6:

$$\frac{\partial w}{\partial \tau} = z^k\Phi\left(w,\ z\frac{\partial w}{\partial z},\ z^2\frac{\partial^2 w}{\partial z^2}\right).$$

6. $\dfrac{\partial w}{\partial t} = wF\left(t,\ \dfrac{f(x)}{w}\dfrac{\partial^2 w}{\partial x^2}\right).$

Multiplicative separable solution:

$$w(x,t) = \varphi(x)\exp\left[\int F(t,\lambda)\,dt\right],$$

where the function $\varphi = \varphi(x)$ satisfies the linear ordinary differential equation $f(x)\varphi''_{xx} = \lambda\varphi$.

7. $\dfrac{\partial w}{\partial t} = w\Phi\left(t,\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) + f(t)e^{\lambda x}.$

Generalized separable solution:

$$w(x,t) = e^{\lambda x}E(t)\left[A + \int \frac{f(t)}{E(t)}\,dt\right] + Be^{-\lambda x}E(t), \quad E(t) = \exp\left[\int \Phi(t,\lambda^2)\,dt\right],$$

where A, B, and λ are arbitrary constants.

8. $\dfrac{\partial w}{\partial t} = w\Phi\left(t,\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) + f(t)e^{\lambda x} + g(t)e^{-\lambda x}.$

Generalized separable solution:

$$w(x,t) = e^{\lambda x}E(t)\left[A + \int \frac{f(t)}{E(t)}\,dt\right] + e^{-\lambda x}E(t)\left[B + \int \frac{g(t)}{E(t)}\,dt\right],$$
$$E(t) = \exp\left[\int \Phi(t,\lambda^2)\,dt\right],$$

where A, B, and λ are arbitrary constants.

9. $\dfrac{\partial w}{\partial t} = wF_1\left(t,\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) + e^{\lambda x}F_2\left(t,\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) + e^{-\lambda x}F_3\left(t,\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right).$

There is a generalized separable solution of the form

$$w(x,t) = e^{\lambda x}\varphi(t) + e^{-\lambda x}\psi(t).$$

10. $\dfrac{\partial w}{\partial t} = w\Phi\left(t,\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) + f(t)\cosh(\lambda x) + g(t)\sinh(\lambda x).$

Generalized separable solution:

$$w(x,t) = \cosh(\lambda x)E(t)\left[A + \int \frac{f(t)}{E(t)}\,dt\right] + \sinh(\lambda x)E(t)\left[B + \int \frac{g(t)}{E(t)}\,dt\right],$$
$$E(t) = \exp\left[\int \Phi(t,\lambda^2)\,dt\right],$$

where A, B, and λ are arbitrary constants.

11. $\dfrac{\partial w}{\partial t} = w\Phi\left(t,\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) + f(t)\cos(\lambda x).$

Generalized separable solution:

$$w(x,t) = \cos(\lambda x)E(t)\left[A + \int \frac{f(t)}{E(t)}\,dt\right] + B\sin(\lambda x)E(t),$$
$$E(t) = \exp\left[\int \Phi(t,-\lambda^2)\,dt\right],$$

where A, B, and λ are arbitrary constants.

12. $\dfrac{\partial w}{\partial t} = w\Phi\left(t,\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) + f(t)\cos(\lambda x) + g(t)\sin(\lambda x).$

Generalized separable solution:

$$w(x,t) = \cos(\lambda x)E(t)\left[A + \int \frac{f(t)}{E(t)}\,dt\right] + \sin(\lambda x)E(t)\left[B + \int \frac{g(t)}{E(t)}\,dt\right],$$
$$E(t) = \exp\left[\int \Phi(t,-\lambda^2)\,dt\right],$$

where A, B, and λ are arbitrary constants.

13. $\dfrac{\partial w}{\partial t} = wF_1\left(t,\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) + \cos(\lambda x)F_2\left(t,\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) + \sin(\lambda x)F_3\left(t,\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right).$

There is a generalized separable solution of the form

$$w(x,t) = \cos(\lambda x)\varphi(t) + \sin(\lambda x)\psi(t).$$

14. $\dfrac{\partial w}{\partial t} = w\Phi\left(t,\ \dfrac{1}{w}\dfrac{\partial w}{\partial x},\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) + f(t)e^{\lambda x}.$

Multiplicative separable solution:

$$w(x,t) = e^{\lambda x}E(t)\left[A + \int \frac{f(t)}{E(t)}\,dt\right], \quad E(t) = \exp\left[\int \Phi(t,\lambda,\lambda^2)\,dt\right],$$

where A, B, and λ are arbitrary constants.

15. $\dfrac{\partial w}{\partial t} = f(t)w^{\beta}\Phi\left(x,\ \dfrac{1}{w}\dfrac{\partial w}{\partial x},\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) + g(t)w.$

The transformation

$$w(x,t) = G(t)u(x,\tau), \quad \tau = \int f(t)G^{\beta-1}(t)\,dt, \quad \text{with} \quad G(t) = \exp\left[\int g(t)\,dt\right],$$

leads to a simpler equation of the form 12.1.3.10:

$$\frac{\partial u}{\partial \tau} = u^{\beta}\Phi\left(x,\ \frac{1}{u}\frac{\partial u}{\partial x},\ \frac{1}{u}\frac{\partial^2 u}{\partial x^2}\right),$$

which has a multiplicative separable solution $u = \varphi(x)\psi(\tau)$.

16. $\dfrac{\partial w}{\partial t} = f(t)\left(\dfrac{\partial w}{\partial x}\right)^{k}\Phi\left(x,\ \dfrac{\partial^2 w}{\partial x^2}\Big/\dfrac{\partial w}{\partial x}\right) + g(t)w + h(t).$

Generalized separable solution:

$$w(x,t) = \varphi(t)\Theta(x) + \psi(t),$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of first-order ordinary differential equations

$$\varphi_t' = Af(t)\varphi^k + g(t)\varphi, \tag{1}$$
$$\psi_t' = g(t)\psi + Bf(t)\varphi^k + h(t), \tag{2}$$

A and B are arbitrary constants, and the function $\Theta(x)$ is determined by the second-order ordinary differential equation

$$\left(\Theta_x'\right)^k\Phi\left(x,\ \Theta_{xx}''/\Theta_x'\right) = A\Theta + B. \tag{3}$$

The general solution of system (1), (2) is expressed as

$$\varphi(t) = G(t)\left[C - kA\int f(t)G^{k-1}(t)\,dt\right]^{\frac{1}{1-k}}, \quad G(t) = \exp\left[\int g(t)\,dt\right],$$
$$\psi(t) = DG(t) + G(t)\int\left[Bf(t)\varphi^k(t) + h(t)\right]\frac{dt}{G(t)},$$

where C and D are arbitrary constants.

For $k = 1$ and $\Phi(x,y) = \Phi(y)$, a solution of equation (3) is given by

$$\Theta(x) = \alpha e^{\lambda x} - B/A,$$

where α is an arbitrary constant, and λ is found from the algebraic (or transcendental) equation $\lambda\Phi(\lambda) = A$.

17. $\dfrac{\partial w}{\partial t} = \big[f_1(t)w + f_0(t)\big]\left(\dfrac{\partial w}{\partial x}\right)^k \Phi\left(x,\ \dfrac{\partial^2 w}{\partial x^2}\Big/\dfrac{\partial w}{\partial x}\right) + g_1(t)w + g_0(t).$

Generalized separable solution:

$$w(x,t) = \varphi(t)\Theta(x) + \psi(t),$$

where the functions $\varphi(t)$ and $\psi(t)$ are determined by the system of first-order ordinary differential equations (C is an arbitrary constant):

$$\varphi_t' = Cf_1(t)\varphi^{k+1} + g_1(t)\varphi, \tag{1}$$

$$\psi_t' = \big[Cf_1(t)\varphi^k + g_1(t)\big]\psi + Cf_0(t)\varphi^k + g_0(t), \tag{2}$$

and the function $\Theta(x)$ is determined by the second-order ordinary differential equation

$$\big(\Theta_x'\big)^k \Phi\big(x,\ \Theta_{xx}''/\Theta_x'\big) = C. \tag{3}$$

The general solution of system (1), (2) is expressed as

$$\varphi(t) = G(t)\left[A - kC\int f_1(t)G^k(t)\,dt\right]^{-1/k}, \quad G(t) = \exp\left[\int g_1(t)\,dt\right],$$

$$\psi(t) = B\varphi(t) + \varphi(t)\int \big[Cf_0(t)\varphi^k(t) + g_0(t)\big]\frac{dt}{\varphi(t)},$$

where A, B, and C are arbitrary constants.

Further, we assume that Φ is independent of x explicitly, i.e., $\Phi(x,y) = \Phi(y)$. For $\Phi(0) \neq 0$ and $\Phi(0) \neq \infty$, particular solution to equation (3) has the form $\Theta(x) = \alpha x + \beta$, where $\alpha^k\Phi(0) = C$ and β is an arbitrary constant.

For $k = 0$, the general solution of equation (3) is expressed as

$$\Theta(x) = \alpha e^{\lambda x} + \beta,$$

where α and β are arbitrary constants, and λ is determined from the algebraic (transcendental) equation $\Phi(\lambda) = C$.

18. $\dfrac{\partial w}{\partial t} = f(t)e^{\beta w}\Phi\left(x,\ \dfrac{\partial w}{\partial x},\ \dfrac{\partial^2 w}{\partial x^2}\right) + g(t).$

The transformation

$$w(x,t) = u(x,\tau) + G(t), \quad \tau = \int f(t)\exp\big[\beta G(t)\big]\,dt, \qquad G(t) = \int g(t)\,dt$$

leads to a simpler equation of the form 12.1.3.11:

$$\frac{\partial u}{\partial \tau} = e^{\beta u}\Phi\left(x,\ \frac{\partial u}{\partial x},\ \frac{\partial^2 u}{\partial x^2}\right),$$

which has an additive separable solution $u = \varphi(x) + \psi(\tau)$.

19. $\dfrac{\partial w}{\partial t} = wF\left(t,\ \dfrac{\partial^2 w}{\partial x^2},\ \dfrac{\partial w}{\partial x} - x\dfrac{\partial^2 w}{\partial x^2},\ 2w - 2x\dfrac{\partial w}{\partial x} + x^2\dfrac{\partial^2 w}{\partial x^2}\right).$

Multiplicative separable solution:

$$w(x,t) = (C_2x^2 + C_1x + C_0)\varphi(t),$$

where C_0, C_1, and C_2 are arbitrary constants, and the function $\varphi = \varphi(t)$ is determined by the ordinary differential equation $\varphi'_t = \varphi F\big(t, 2C_2\varphi, C_1\varphi, 2C_0\varphi\big)$.

⊙ *References for equation* 12.1.4.19: Ph. W. Doyle (1996, the case $\partial_t F \equiv 0$ was treated), A. D. Polyanin and V. F. Zaitsev (2004, p. 498).

20. $\dfrac{\partial w}{\partial t} = F\left(x,\ t,\ w,\ \dfrac{\partial w}{\partial x}\right)G\left(x,\ \dfrac{\partial w}{\partial x},\ \dfrac{\partial^2 w}{\partial x^2}\right) + h(t).$

Additive separable solution:

$$w(x,t) = \varphi(x) + \int h(t)\,dt,$$

where the function $\varphi(x)$ is determined by the ordinary differential equation

$$G\big(x, \varphi'_x, \varphi''_{xx}\big) = 0.$$

21. $\dfrac{\partial w}{\partial t} = F\left(x,\ t,\ w,\ \dfrac{\partial w}{\partial x}\right)G\left(x,\ \dfrac{1}{w}\dfrac{\partial w}{\partial x},\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) + h(t)w.$

Multiplicative separable solution:

$$w(x,t) = C\exp\left[\int h(t)\,dt\right]\varphi(x),$$

where the function $\varphi(x)$ is determined by the ordinary differential equation

$$G\big(x,\ \varphi'_x/\varphi,\ \varphi''_{xx}/\varphi\big) = 0.$$

22. $\dfrac{\partial w}{\partial t} = g_0(t)F_0\left(\dfrac{\partial^2 w}{\partial x^2}\right) + xg_1(t)F_1\left(\dfrac{\partial^2 w}{\partial x^2}\right) + x^2g_2(t)F_2\left(\dfrac{\partial^2 w}{\partial x^2}\right)$
$+ h(t)\left(\dfrac{\partial w}{\partial x}\right)^2 + \big[p_0(t) + xp_1(t)\big]\dfrac{\partial w}{\partial x} + q(t)w + s_0(t) + xs_1(t) + x^2s_2(t).$

There is a generalized separable solution of the form

$$w(x,t) = x^2\varphi(t) + x\psi(t) + \chi(t).$$

23. $\dfrac{\partial w}{\partial t} = x^2f_2\left(t, \dfrac{\partial^2 w}{\partial x^2}\right) + xf_1\left(t, \dfrac{\partial^2 w}{\partial x^2}\right) + f_0\left(t, \dfrac{\partial^2 w}{\partial x^2}\right).$

Generalized separable solution quadratic in x:

$$w(x,t) = x^2\varphi(t) + x\int f_1(t, 2\varphi)\,dt + \int f_0(t, 2\varphi)\,dt + C_1x + C_2,$$

where C_1 and C_2 are arbitrary constants, and the function $\varphi = \varphi(t)$ is determined by the first-order ordinary differential equation

$$\varphi'_t = f_2(t, 2\varphi).$$

24. $\dfrac{\partial w}{\partial t} = x^2 f_2\left(t, \dfrac{\partial^2 w}{\partial x^2}\right) + x f_1\left(t, \dfrac{\partial^2 w}{\partial x^2}\right) + f_0\left(t, \dfrac{\partial^2 w}{\partial x^2}\right) + g(t)w.$

There is a generalized separable solution of the form

$$w(x,t) = x^2\varphi(t) + x\psi(t) + \chi(t).$$

12.1.5. Equations of the Form $F\left(x, t, w, \dfrac{\partial w}{\partial t}, \dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right) = 0$

1. $F\left(at + bx,\ w,\ \dfrac{\partial w}{\partial t},\ \dfrac{\partial w}{\partial x},\ \dfrac{\partial^2 w}{\partial x^2}\right) = 0.$

Solution:

$$w = w(\xi), \quad \xi = at + bx,$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$F\left(\xi,\ w,\ aw'_\xi,\ bw'_\xi,\ b^2 w''_{\xi\xi}\right) = 0.$$

2. $F\left(t, \dfrac{1}{w}\dfrac{\partial w}{\partial t}, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) = 0.$

1°. Multiplicative separable solution:

$$w(x,t) = \left[A\cosh(\lambda x) + B\sinh(\lambda x)\right]\varphi(t),$$

where A, B, and λ are arbitrary constants, and the function $\varphi(t)$ is determined by the first-order ordinary differential equation

$$F\left(t, \varphi'_t/\varphi, \lambda^2\right) = 0.$$

2°. Multiplicative separable solution:

$$w(x,t) = \left[A\cos(\lambda x) + B\sin(\lambda x)\right]\varphi(t),$$

where A, B, and λ are arbitrary constants, and the function $\varphi(t)$ is determined by the first-order ordinary differential equation

$$F\left(t, \varphi'_t/\varphi, -\lambda^2\right) = 0.$$

3. $F\left(t, \dfrac{1}{w}\dfrac{\partial w}{\partial t}, \dfrac{1}{w}\dfrac{\partial w}{\partial x}, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) = 0.$

Multiplicative separable solution:

$$w(x,t) = Ae^{\lambda x}\varphi(t),$$

where A and λ are arbitrary constants, and the function $\varphi(t)$ is determined by the first-order ordinary differential equation

$$F\left(t, \varphi'_t/\varphi, \lambda, \lambda^2\right) = 0.$$

4. $\boldsymbol{F\left(x, \dfrac{1}{w}\dfrac{\partial w}{\partial t}, \dfrac{1}{w}\dfrac{\partial w}{\partial x}, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) = 0.}$

Multiplicative separable solution:

$$w(x,t) = Ae^{\lambda t}\varphi(x),$$

where A and λ are arbitrary constants, and the function $\varphi(x)$ is determined by the second-order ordinary differential equation

$$F\big(x, \lambda, \varphi'_x/\varphi, \varphi''_{xx}/\varphi\big) = 0.$$

5. $\boldsymbol{F_1\left(t, \dfrac{\partial w}{\partial t}\right) + F_2\left(x, \dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right) = kw.}$

Additive separable solution:

$$w(x,t) = \varphi(t) + \psi(x),$$

where the functions $\varphi(x)$ and $\psi(x)$ are determined by the first- and second-order ordinary differential equations

$$F_1\big(t, \varphi'_t\big) - k\varphi = C,$$
$$F_2\big(x, \psi'_x, \psi''_{xx}\big) - k\psi = -C,$$

and C is an arbitrary constant.

6. $\boldsymbol{F_1\left(t, \dfrac{1}{w}\dfrac{\partial w}{\partial t}\right) + w^k F_2\left(x, \dfrac{1}{w}\dfrac{\partial w}{\partial x}, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) = 0.}$

Multiplicative separable solution:

$$w(x,t) = \varphi(t)\psi(x),$$

where the functions $\varphi(t)$ and $\psi(x)$ are determined by the first- and second-order ordinary differential equations

$$\varphi^{-k} F_1\big(t, \varphi'_t/\varphi\big) = C,$$
$$\psi^k F_2\big(x, \psi'_x/\psi, \psi''_{xx}/\psi\big) = -C,$$

and C is an arbitrary constant.

7. $\boldsymbol{F_1\left(t, \dfrac{\partial w}{\partial t}\right) + e^{\lambda w} F_2\left(x, \dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right) = 0.}$

Additive separable solution:

$$w(x,t) = \varphi(t) + \psi(x),$$

where the functions $\varphi(x)$ and $\psi(x)$ are determined by the first- and second-order ordinary differential equations

$$e^{-\lambda\varphi} F_1\big(t, \varphi'_t\big) = C,$$
$$e^{\lambda\psi} F_2\big(x, \psi'_x, \psi''_{xx}\big) = -C,$$

and C is an arbitrary constant.

8. $\boldsymbol{F_1\left(t,\ \dfrac{1}{w}\dfrac{\partial w}{\partial t}\right) + F_2\left(x,\ \dfrac{1}{w}\dfrac{\partial w}{\partial x},\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) = k\ln w.}$

Multiplicative separable solution:

$$w(x,t) = \varphi(t)\psi(x),$$

where the functions $\varphi(x)$ and $\psi(x)$ are determined by the first- and second-order ordinary differential equations

$$F_1\big(t, \varphi_t'/\varphi\big) - k\ln\varphi = C,$$
$$F_2\big(x, \psi_x'/\psi, \psi_{xx}''/\psi\big) - k\ln\psi = -C,$$

and C is an arbitrary constant.

12.1.6. Equations with Three Independent Variables

1. $\boldsymbol{\dfrac{\partial w}{\partial t} = aw\dfrac{\partial w}{\partial x} + F\left(\dfrac{\partial w}{\partial x},\ \dfrac{\partial w}{\partial y},\ \dfrac{\partial^2 w}{\partial x^2},\ \dfrac{\partial^2 w}{\partial y^2}\right).}$

1°. Suppose $w(x,y,t)$ is a solution of this equation. Then the function

$$w_1 = w(x + aC_1t + C_2, y + C_3, t + C_4) + C_1,$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solution:

$$w = w(z), \quad z = C_1x + C_2y + \lambda t,$$

where C_1, C_2, and λ are arbitrary constants, and the function $w(z)$ is determined by the autonomous ordinary differential equation

$$F\big(C_1w_z', C_2w_z', C_1^2w_{zz}'', C_2^2w_{zz}''\big) + aC_1ww_z' = \lambda w_z'.$$

3°. Solution:

$$w = u(\xi) + 2C_1t, \quad \xi = x + C_2y + aC_1t^2 + C_3t,$$

where C_1, C_2, and C_3 are arbitrary constants, and the function $u(\xi)$ is determined by the autonomous ordinary differential equation

$$F\big(u_\xi', C_2u_\xi', u_{\xi\xi}'', C_2^2u_{\xi\xi}''\big) + auu_\xi' = C_3u_\xi' + 2C_1.$$

4°. "Two-dimensional" solution:

$$w(x,y,t) = U(y,\eta) + 2C_1t, \quad \eta = x + aC_1t^2 + C_2t,$$

where C_1 and C_2 are arbitrary constants and the function $U(y,\eta)$ is determined by the differential equation

$$2C_1 + C_2\frac{\partial U}{\partial \eta} = aU\frac{\partial U}{\partial \eta} + F\left(\frac{\partial U}{\partial \eta},\ \frac{\partial U}{\partial y},\ \frac{\partial^2 U}{\partial \eta^2},\ \frac{\partial^2 U}{\partial y^2}\right).$$

5°. There is a "two-dimensional" solution of the form

$$w(x,y,t) = V(\zeta_1,\zeta_2), \quad \zeta_1 = a_1x + b_1y + c_1t, \quad \zeta_2 = a_2x + b_2y + c_2t.$$

2. $\dfrac{\partial w}{\partial t}+(a_1x+b_1y)\dfrac{\partial w}{\partial x}+(a_2x+b_2y)\dfrac{\partial w}{\partial y}=F\left(w,\dfrac{\partial w}{\partial x},\dfrac{\partial w}{\partial y},\dfrac{\partial^2 w}{\partial x^2},\dfrac{\partial^2 w}{\partial x\partial y},\dfrac{\partial^2 w}{\partial y^2}\right).$

1°. Suppose $w(x,y,t)$ is a solution of this equation. Then the functions

$$w_1 = w\big(x + Cb_1e^{\lambda t}, y + C(\lambda - a_1)e^{\lambda t}, t\big),$$

where C is an arbitrary constant, and $\lambda = \lambda_{1,2}$ are roots of the quadratic equation

$$\lambda^2 - (a_1 + b_2)\lambda + a_1b_2 - a_2b_1 = 0, \tag{1}$$

are also solutions of the equation.

2°. Solutions:

$$w = w(z), \qquad z = a_2x + (\lambda - a_1)y + Ce^{\lambda t},$$

where $\lambda = \lambda_{1,2}$ are roots of the quadratic equation (1), and the function $w(z)$ is determined by the ordinary differential equation

$$\big[\lambda z + a_2c_1 + (\lambda - a_1)c_2\big]w'_z = F\big(w,\ a_2w'_z,\ (\lambda - a_1)w'_z,\ a_2^2w''_{zz},\ a_2(\lambda - a_1)w''_{zz},\ (\lambda - a_1)^2w''_{zz}\big).$$

3°. "Two-dimensional" solutions:

$$w = u(\zeta, t), \qquad \zeta = a_2x + (\lambda - a_1)y,$$

where $\lambda = \lambda_{1,2}$ are roots of the quadratic equation (1), and the function $u(\zeta,t)$ is determined by the differential equation

$$\frac{\partial u}{\partial t} + \big[\lambda\zeta + a_2c_1 + (\lambda - a_1)c_2\big]\frac{\partial u}{\partial \zeta} = F\left(u,\ a_2\frac{\partial u}{\partial \zeta},\ (\lambda - a_1)\frac{\partial u}{\partial \zeta},\ a_2^2\frac{\partial^2 u}{\partial \zeta^2},\ a_2(\lambda - a_1)\frac{\partial^2 u}{\partial \zeta^2},\ (\lambda - a_1)^2\frac{\partial^2 u}{\partial \zeta^2}\right).$$

12.2. Equations Involving Two or More Second Derivatives

12.2.1. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = F\left(w, \dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right)$

1. $\dfrac{\partial^2 w}{\partial t^2} = F\left(\dfrac{\partial^2 w}{\partial x^2}\right).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = C_1^{-2}w(C_1x + C_2, \pm C_1t + C_3) + C_4xt + C_5x + C_6t + C_7,$$

where the C_n are arbitrary constants, are also solutions of the equation.

2°. Solution quadratic in x and t:

$$w(x,t) = \tfrac{1}{2}Ax^2 + Bxt + \tfrac{1}{2}F(A)t^2 + C_1x + C_2t + C_3,$$

where A, B, C_1, C_2, and C_3 are arbitrary constants.

3°. Generalized separable solution quadratic in x:

$$w(x,t)=\frac{1}{2}(C_1t+C_2)x^2+(C_3t+C_4)x+\int_0^t(t-\xi)F(C_1\xi+C_2)\,d\xi+C_5t+C_6,$$

where $C_1,\ldots,C_6$ are arbitrary constants.

4°. Generalized separable solution quadratic in t:

$$w(x,t)=\frac{1}{2}(C_1x+C_2)t^2+(C_3x+C_4)t+\int_0^x(x-\xi)\Phi(C_1\xi+C_2)\,d\xi+C_5x+C_6,$$

where $C_1,\ldots,C_6$ are arbitrary constants, and the function $\Phi(u)$ is the inverse of $F(u)$.

5°. Self-similar solution:

$$w=t^2U(z),\qquad z=x/t,$$

where the function $U=U(z)$ is determined by the ordinary differential equation

$$2U-2zU'_z+z^2U''_{zz}=F(U''_{zz}).$$

6°. The substitution $u(x,t)=\dfrac{\partial w}{\partial x}$ leads to an equation of the form 7.4.7.10:

$$\frac{\partial^2u}{\partial t^2}=f\left(\frac{\partial u}{\partial x}\right)\frac{\partial^2u}{\partial x^2},\qquad f(\xi)=F'_\xi(\xi).$$

Special case 1. Let $F(\xi)=a\xi^n$.

1°. Multiplicative separable solution:

$$w(x,t)=\varphi(x)\psi(t),$$

where the functions $\varphi=\varphi(x)$ and $\psi=\psi(t)$ are determined by the second-order autonomous ordinary differential equations (C is an arbitrary constant)

$$\varphi''_{xx}=C\varphi^{1/n},$$
$$\psi''_{tt}=aC^n\psi^n,$$

whose general solutions can be written out in implicit form.

2°. Self-similar solution:

$$w(x,t)=t^\sigma U(z),\qquad z=t^\beta x,\qquad \sigma=\frac{2(1+n\beta)}{1-n},$$

where β is an arbitrary constant, and the function $U=U(z)$ is determined by the ordinary differential equation

$$\sigma(\sigma-1)U+\beta(2\sigma+\beta-1)zU'_z+\beta^2z^2U''_{zz}=a(U''_{zz})^n.$$

3°. Generalized separable solution quadratic in x:

$$w(x,t)=\frac{1}{2}(C_1t+C_2)x^2+(C_3t+C_4)x+\frac{a}{C_1^2(n+1)(n+2)}(C_1t+C_2)^{n+2}+C_5t+C_6,$$

where $C_1,\ldots,C_6$ are arbitrary constants.

4°. Generalized separable solution quadratic in t:

$$w(x,t)=\frac{1}{2}(C_1x+C_2)t^2+(C_3x+C_4)t+\frac{4a^{1/n}}{C_1^2(4n^2-1)}(C_1x+C_2)^{(2n+1)/2}+C_5x+C_6,$$

where $C_1,\ldots,C_6$ are arbitrary constants.

Special case 2. Let $F(\xi) = a\exp(\lambda\xi)$. Generalized separable solution:

$$w = (A_2x^2 + A_1x + A_0)\varphi(t) + \psi(x),$$

where A_2, A_1, and A_0 are arbitrary constants, and the functions $\varphi(t)$ and $\psi(x)$ are determined by the ordinary differential equations (B_2 is an arbitrary constant)

$$\varphi''_{tt} = aB_2\exp(2A_2\lambda\varphi), \tag{1}$$

$$\exp(\lambda\psi''_{xx}) = B_2(A_2x^2 + A_1x + A_0). \tag{2}$$

The general solution of equation (1) is expressed as

$$\varphi(t) = -\frac{1}{2A_2\lambda}\ln\left[\frac{A_2B_2a\lambda}{C_1^2}\cos^2(C_1t + C_2)\right] \quad \text{if} \quad A_2B_2a\lambda > 0,$$

$$\varphi(t) = -\frac{1}{2A_2\lambda}\ln\left[\frac{A_2B_2a\lambda}{C_1^2}\sinh^2(C_1t + C_2)\right] \quad \text{if} \quad A_2B_2a\lambda > 0,$$

$$\varphi(t) = -\frac{1}{2A_2\lambda}\ln\left[-\frac{A_2B_2a\lambda}{C_1^2}\cosh^2(C_1t + C_2)\right] \quad \text{if} \quad A_2B_2a\lambda < 0,$$

where C_1 and C_2 are arbitrary constants. The general solution of equation (2) is given by

$$\psi(x) = \frac{1}{\lambda}\int_{t_0}^{t}(t-\xi)\ln(A_2B_2\xi^2 + A_1B_2\xi + A_0B_2)\,d\xi + B_1t + B_0,$$

where B_1 and B_0 are arbitrary constants.

Special case 3. Let $F(\xi) = a\ln\xi + b$. Generalized separable solution:

$$w = (A_2t^2 + A_1t + A_0)\varphi(x) + \psi(t),$$

where A_2, A_1, and A_0 are arbitrary constants, and the functions $\varphi(x)$ and $\psi(t)$ are determined by the ordinary differential equations (B_2 is an arbitrary constant)

$$a\ln\varphi''_{xx} - 2A_2\varphi = B_2, \tag{3}$$

$$\psi''_{tt} - a\ln(A_2t^2 + A_1t + A_0) - b = B_2. \tag{4}$$

The general solution of equation (3) is given by

$$\varphi(x) = -\frac{a}{2A_2}\ln\left[\frac{A_2}{aC_1^2}\cos^2(C_1x + C_2)\right] - \frac{B_2}{2A_2} \quad \text{if} \quad A_2a > 0,$$

$$\varphi(x) = -\frac{a}{2A_2}\ln\left[\frac{A_2}{aC_1^2}\sinh^2(C_1x + C_2)\right] - \frac{B_2}{2A_2} \quad \text{if} \quad A_2a > 0,$$

$$\varphi(x) = -\frac{a}{2A_2}\ln\left[-\frac{A_2}{aC_1^2}\cosh^2(C_1x + C_2)\right] - \frac{B_2}{2A_2} \quad \text{if} \quad A_2a < 0,$$

$$\varphi(x) = \tfrac{1}{2}e^{B_2/a}x^2 + C_1x + C_2 \quad \text{if} \quad A_2 = 0,$$

where C_1 and C_2 are arbitrary constants. The general solution of equation (4) is expressed as

$$\psi(t) = a\int_{t_0}^{t}(t-\xi)\ln(A_2\xi^2 + A_1\xi + A_0)\,d\xi + \frac{1}{2}(B_2 + b)t^2 + B_1t + B_0,$$

where B_1 and B_0 are arbitrary constants.

2. $\dfrac{\partial^2 w}{\partial t^2} = F\left(\dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right)$.

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w(x + C_1, \pm t + C_2) + C_3t + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation.

2°. Traveling-wave solution:

$$w = w(z), \qquad z = kx + \lambda t,$$

where k and λ are arbitrary constants, and the function $w(z)$ is determined by the autonomous ordinary differential equation

$$F(kw'_z, k^2 w''_{zz}) - \lambda^2 w''_{zz} = 0.$$

3°. Additive separable solution:

$$w(x,t) = At^2 + Bt + C + \varphi(x),$$

where A, B, and C are arbitrary constants, and the function $\varphi = \varphi(x)$ is determined by the autonomous ordinary differential equation

$$F(\varphi'_x, \varphi''_{xx}) - 2A = 0.$$

4°. Solution (generalizes the solutions of Items 2° and 3°):

$$w(x,t) = At^2 + Bt + C + \varphi(z), \qquad z = kx + \lambda t,$$

where A, B, C, k, and λ are arbitrary constants, and the function $\varphi = \varphi(z)$ is determined by the autonomous ordinary differential equation

$$F(k\varphi'_z, k^2\varphi''_{zz}) - \lambda^2\varphi''_{zz} - 2A = 0.$$

3. $\dfrac{\partial^2 w}{\partial t^2} = aw\dfrac{\partial^2 w}{\partial x^2} + F\left(\dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right)$.

1°. Degenerate solution linear in x:

$$w = (C_1 t + C_2)x + C_3 t + C_4 + \int_0^t (t-\tau)F(C_1\tau + C_2, 0)\,d\tau.$$

2°. Traveling-wave solution:

$$w(x,t) = w(\xi), \qquad \xi = \beta x + \lambda t,$$

where β and λ are arbitrary constants, and the function $w = w(\xi)$ is determined by the autonomous ordinary differential equation

$$(a\beta^2 w - \lambda^2)w''_{\xi\xi} + F(\beta w'_\xi, \beta^2 w''_{\xi\xi}) = 0.$$

3°. Solution:

$$w = U(z) + 4aC_1^2 t^2 + 4aC_1C_2 t, \qquad z = x + aC_1 t^2 + aC_2 t,$$

where C_1 and C_2 are arbitrary constants and the function $U(z)$ is determined by the autonomous ordinary differential equation

$$(aU - a^2C_2^2)U''_{zz} - 2aC_1U'_z + F(U'_z, U''_{zz}) = 8aC_1^2.$$

Special case 1. Let $F(w_x, w_{xx}) = F(w_x)$. Self-similar solution:

$$w(x,t) = t^2 u(\zeta), \quad \zeta = xt^{-2},$$

where the function $u = u(\zeta)$ is determined by the ordinary differential equation

$$2u - 2\zeta u'_\zeta + 4\zeta^2 u''_{\zeta\zeta} = auu''_{\zeta\zeta} + F(u'_\zeta).$$

Special case 2. Let $F(w_x, w_{xx}) = F(w_{xx})$. Generalized separable solution quadratic in x:

$$w(x,t) = \varphi(t)x^2 + \psi(t)x + \chi(t),$$

where the functions $\varphi = \varphi(t)$, $\psi = \psi(t)$, and $\chi = \chi(t)$ are determined by the system of ordinary differential equations

$$\varphi''_{tt} = 6a\varphi^2,$$
$$\psi''_{tt} = 6a\varphi\psi,$$
$$\chi''_{tt} = 2a\varphi\chi + F(2\varphi).$$

4. $\dfrac{\partial^2 w}{\partial t^2} = wF\left(\left(\dfrac{\partial w}{\partial x}\right)^2 + aw^2,\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right).$

This is a special case of equation 12.2.2.7.

5. $\dfrac{\partial^2 w}{\partial t^2} = wF\left(\dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2},\ w\dfrac{\partial^2 w}{\partial x^2} + aw^2\right).$

This is a special case of equation 12.2.2.8.

6. $\dfrac{\partial^2 w}{\partial t^2} = wF\left(\dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2},\ w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2\right).$

This is a special case of equation 12.2.2.9.

7. $\dfrac{\partial^2 w}{\partial t^2} = wF\left(\dfrac{\partial^2 w}{\partial x^2},\ 2w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2\right) + G\left(\dfrac{\partial^2 w}{\partial x^2},\ 2w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2\right).$

This is a special case of equation 12.2.2.11.

12.2.2. Equations of the Form $\dfrac{\partial^2 w}{\partial t^2} = F\left(x, t, w, \dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial t}, \dfrac{\partial^2 w}{\partial x^2}\right)$

1. $\dfrac{\partial^2 w}{\partial t^2} = F\left(t, \dfrac{\partial^2 w}{\partial x^2}\right).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w(\pm x + C_1, t) + C_2 xt + C_3 x + C_4 t + C_5,$$

where the C_n are arbitrary constants, are also solutions of the equation.

2°. Generalized separable solution quadratic in x:

$$w(x,t) = \frac{1}{2}(C_1 t + C_2)x^2 + (C_3 t + C_4)x + \int_0^t (t-\xi)F(\xi, C_1\xi + C_2)\,d\xi + C_5 t + C_6,$$

where $C_1, \ldots, C_6$ are arbitrary constants.

3°. The substitution $u(x,t) = \frac{\partial w}{\partial x}$ leads to a simpler equation which is linear in the highest derivatives:

$$\frac{\partial^2 u}{\partial t^2} = f\left(t, \frac{\partial u}{\partial x}\right)\frac{\partial^2 u}{\partial x^2}, \qquad f(t,\xi) = \frac{\partial}{\partial \xi}F(t,\xi).$$

2. $\dfrac{\partial^2 w}{\partial t^2} = F\left(x, \dfrac{\partial^2 w}{\partial x^2}\right).$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w(x, \pm t + C_1) + C_2 xt + C_3 x + C_4 t + C_5,$$

where C_n are arbitrary constants, are also solutions of the equation.

2°. Generalized separable solution quadratic in t:

$$w(x,t) = \frac{1}{2}(C_1 x + C_2)t^2 + (C_3 x + C_4)t + \varphi(x) + C_5 x + C_6,$$

where $C_1, \ldots, C_6$ are arbitrary constants, and the function $\varphi = \varphi(x)$ is determined by the ordinary differential equation

$$C_1 x + C_2 = F(x, \varphi''_{xx}).$$

3. $\dfrac{\partial^2 w}{\partial t^2} = F\left(x,\, w,\, \dfrac{\partial w}{\partial x},\, \dfrac{\partial^2 w}{\partial x^2}\right).$

Suppose the auxiliary ordinary differential equation

$$w = F(x,\, w,\, w'_x,\, w''_{xx})$$

is reduced, with the linear transformation

$$x = \varphi(z), \quad w = \psi(z)u + \chi(z)$$

followed by the division of the resulting equation by $\psi(z)$, to the autonomous form

$$u = \mathcal{F}(u,\, u'_z,\, u''_{zz}),$$

where $\mathcal{F} = F/\psi$. Then the original partial differential equation can be reduced, with the same transformation,

$$x = \varphi(z), \quad w(x,t) = \psi(z)u(z,t) + \chi(z),$$

to

$$\frac{\partial^2 u}{\partial t^2} = \mathcal{F}\left(u,\, \frac{\partial u}{\partial z},\, \frac{\partial^2 u}{\partial z^2}\right),$$

which has a traveling-wave solution $u = u(z + \lambda t)$.

The above allows using various known transformations of ordinary differential equations (see Kamke, 1977; Polyanin and Zaitsev, 2003) for constructing exact solutions to partial differential equations. If the original equation is linear, then such transformations will result in linear constant-coefficient equations.

4. $\dfrac{\partial^2 w}{\partial t^2} = (aw + bx)\dfrac{\partial^2 w}{\partial x^2} + F\left(\dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right).$

The substitution $w = u - (b/a)x$ leads to an equation of the form 12.2.1.3:

$$\frac{\partial^2 u}{\partial t^2} = au\frac{\partial^2 u}{\partial x^2} + F\left(\frac{\partial u}{\partial x} - \frac{b}{a}, \frac{\partial^2 u}{\partial x^2}\right).$$

5. $\dfrac{\partial^2 w}{\partial t^2} = F\left(x,\, \dfrac{\partial w}{\partial x},\, \dfrac{\partial^2 w}{\partial x^2}\right) + G\left(t,\, \dfrac{\partial w}{\partial t}\right) + bw.$

Additive separable solution:

$$w(x,t) = \varphi(x) + \psi(t),$$

where the functions $\varphi(x)$ and $\psi(t)$ are determined by the ordinary differential equations (C is an arbitrary constant)

$$F\big(x, \varphi'_x, \varphi''_{xx}\big) + b\varphi = C,$$
$$\psi''_{tt} - G\big(t, \psi'_t\big) - b\psi = C.$$

6. $\dfrac{\partial^2 w}{\partial t^2} = F\left(x,\, t,\, \dfrac{\partial w}{\partial x},\, \dfrac{\partial^2 w}{\partial x^2}\right) + aw.$

Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = w(x,t) + C_1\cosh(kt) + C_2\sinh(kt) \quad \text{if } a = k^2 > 0,$$
$$w_2 = w(x,t) + C_1\cos(kt) + C_2\sin(kt) \quad \text{if } a = -k^2 < 0,$$

where C_1 and C_2 are arbitrary constants, are also solutions of the equation.

7. $\dfrac{\partial^2 w}{\partial t^2} = wF\left(t,\, \dfrac{1}{w}\dfrac{\partial w}{\partial t},\, \left(\dfrac{\partial w}{\partial x}\right)^2 + aw^2,\, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right).$

1°. Multiplicative separable solution for $a > 0$:

$$w(x,t) = \left[C_1\sin\left(x\sqrt{a}\,\right) + C_2\cos\left(x\sqrt{a}\,\right)\right]\varphi(t),$$

where C_1 and C_2 are arbitrary constants, and the function $\varphi = \varphi(t)$ is determined by the ordinary differential equation

$$\varphi''_{tt} = \varphi F\left(t,\, \varphi'_t/\varphi,\, a(C_1^2 + C_2^2)\varphi^2,\, -a\right).$$

2°. Multiplicative separable solution for $a < 0$:

$$w(x,t) = \left(C_1 e^{\sqrt{|a|}\,x} + C_2 e^{-\sqrt{|a|}\,x}\right)\varphi(t),$$

where C_1 and C_2 are arbitrary constants, and the function $\varphi = \varphi(t)$ is determined by the ordinary differential equation

$$\varphi''_{tt} = \varphi F\left(t,\, \varphi'_t/\varphi,\, 4aC_1C_2\varphi^2,\, -a\right).$$

⊙ *Reference for equation* 12.2.2.7: A. D. Polyanin and V. F. Zaitsev (2004, p. 507).

8. $\dfrac{\partial^2 w}{\partial t^2} = wF\left(t,\, \dfrac{1}{w}\dfrac{\partial w}{\partial t},\, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2},\, w\dfrac{\partial^2 w}{\partial x^2} + aw^2\right).$

Multiplicative separable solutions:

$$w(x,t) = \left[C_1\sin\left(x\sqrt{a}\,\right) + C_2\cos\left(x\sqrt{a}\,\right)\right]\varphi(t) \quad \text{if } a > 0,$$
$$w(x,t) = \left(C_1 e^{\sqrt{|a|}\,x} + C_2 e^{-\sqrt{|a|}\,x}\right)\varphi(t) \quad \text{if } a < 0,$$

where C_1 and C_2 are arbitrary constants, and the function $\varphi = \varphi(t)$ is determined by the ordinary differential equation

$$\varphi''_{tt} = \varphi F\left(t, \varphi'_t/\varphi, -a, 0\right).$$

⊙ *Reference for equation* 12.2.2.8: A. D. Polyanin and V. F. Zaitsev (2004, p. 507).

9. $\dfrac{\partial^2 w}{\partial t^2} = wF\left(t,\ \dfrac{1}{w}\dfrac{\partial w}{\partial t},\ \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2},\ w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2\right).$

1°. Multiplicative separable solution:

$$w(x,t) = (Ae^{\lambda x} + Be^{-\lambda x})\varphi(t),$$

where A, B, and λ are arbitrary constants, and the function $\varphi = \varphi(t)$ is determined by the ordinary differential equation $\varphi''_{tt} = \varphi F\big(t,\ \varphi'_t/\varphi,\ \lambda^2, 4AB\lambda^2\varphi^2\big)$.

2°. Multiplicative separable solution:

$$w(x,t) = [A\sin(\lambda x) + B\cos(\lambda x)]\varphi(t),$$

where A, B, and λ are arbitrary constants, and the function $\varphi = \varphi(t)$ is determined by the ordinary differential equation $\varphi''_{tt} = \varphi F\big(t,\ \varphi'_t/\varphi, -\lambda^2, -\lambda^2(A^2 + B^2)\varphi^2\big)$.

⊙ *Reference for equation* 12.2.2.9: A. D. Polyanin and V. F. Zaitsev (2004, p. 507).

10. $\dfrac{\partial^2 w}{\partial t^2} = wF\left(t,\ \dfrac{\partial^2 w}{\partial x^2},\ \dfrac{\partial w}{\partial x} - x\dfrac{\partial^2 w}{\partial x^2},\ 2w - 2x\dfrac{\partial w}{\partial x} + x^2\dfrac{\partial^2 w}{\partial x^2}\right).$

Multiplicative separable solution:

$$w(x,t) = (C_2x^2 + C_1x + C_0)\varphi(t),$$

where C_0, C_1, and C_2 are arbitrary constants, and the function $\varphi = \varphi(t)$ is determined by the ordinary differential equation $\varphi''_{tt} = \varphi F\big(t, 2C_2\varphi, C_1\varphi, 2C_0\varphi\big)$.

11. $\dfrac{\partial^2 w}{\partial t^2} = wF\left(t,\ \dfrac{\partial^2 w}{\partial x^2},\ 2w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2\right) + G\left(t,\ \dfrac{\partial^2 w}{\partial x^2},\ 2w\dfrac{\partial^2 w}{\partial x^2} - \left(\dfrac{\partial w}{\partial x}\right)^2\right).$

Generalized separable solution quadratic in x:

$$w = \varphi_1(t)x^2 + \varphi_2(t)x + \varphi_3(t),$$

where the functions φ_1, φ_2, and φ_3 are determined by the solution of the ordinary differential equations

$$\begin{aligned}
\varphi''_1 &= \varphi_1 F\big(t,\ 2\varphi_1,\ 4\varphi_1\varphi_3 - \varphi_2^2\big),\\
\varphi''_2 &= \varphi_2 F\big(t,\ 2\varphi_1,\ 4\varphi_1\varphi_3 - \varphi_2^2\big),\\
\varphi''_3 &= \varphi_3 F\big(t,\ 2\varphi_1,\ 4\varphi_1\varphi_3 - \varphi_2^2\big) + G\big(t,\ 2\varphi_1,\ 4\varphi_1\varphi_3 - \varphi_2^2\big).
\end{aligned}$$

It follows from the first two equations that

$$\varphi_2 = C_1\varphi_1 + C_2\varphi_1\int\frac{dt}{\varphi_1^2},$$

where C_1 and C_2 are arbitrary constants.

⊙ *Reference for equation* 12.2.2.11: A. D. Polyanin and V. F. Zaitsev (2004, p. 508).

12. $\dfrac{\partial^2 w}{\partial t^2} = wF_1\left(t, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) + e^{\lambda x}F_2\left(t, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) + e^{-\lambda x}F_3\left(t, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right).$

There is a generalized separable solution of the form

$$w(x,t) = e^{\lambda x}\varphi(t) + e^{-\lambda x}\psi(t).$$

13. $\dfrac{\partial^2 w}{\partial t^2} = wF_1\left(t, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) + \cos(\lambda x)F_2\left(t, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right) + \sin(\lambda x)F_3\left(t, \dfrac{1}{w}\dfrac{\partial^2 w}{\partial x^2}\right).$

There is a generalized separable solution of the form

$$w(x,t) = \cos(\lambda x)\varphi(t) + \sin(\lambda x)\psi(t).$$

14. $\dfrac{\partial^2 w}{\partial t^2} = x^2 f_2\left(t, \dfrac{\partial^2 w}{\partial x^2}\right) + xf_1\left(t, \dfrac{\partial^2 w}{\partial x^2}\right) + f_0\left(t, \dfrac{\partial^2 w}{\partial x^2}\right).$

Generalized separable solution quadratic in x:

$$w(x,t) = x^2\varphi(t) + x\int_0^t (t-\xi)f_1\big(\xi, 2\varphi(\xi)\big)\,d\xi + \int_0^t (t-\xi)f_0\big(\xi, 2\varphi(\xi)\big)\,d\xi + C_1xt + C_2x + C_3t + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, and the function $\varphi = \varphi(t)$ is determined by the ordinary differential equation

$$\varphi''_{tt} = f_2(t, 2\varphi).$$

15. $\dfrac{\partial^2 w}{\partial t^2} = x^2 f_2\left(t, \dfrac{\partial^2 w}{\partial x^2}\right) + xf_1\left(t, \dfrac{\partial^2 w}{\partial x^2}\right) + f_0\left(t, \dfrac{\partial^2 w}{\partial x^2}\right) + g(t)w.$

There is a generalized separable solution of the form

$$w(x,t) = x^2\varphi(t) + x\psi(t) + \chi(t).$$

12.2.3. Equations Linear in the Mixed Derivative

1. $\dfrac{\partial^2 w}{\partial x \partial t} = F\left(t, \dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right) + g(t)w\dfrac{\partial^2 w}{\partial x^2}.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(x + \varphi(t), t) + \frac{\varphi'_t(t)}{g(t)},$$

where $\varphi(t)$ is an arbitrary function, is also a solution of the equation.

2°. Degenerate solution linear in x:

$$w(x,t) = \varphi(t)x + \psi(t),$$

where $\psi(t)$ is an arbitrary function and $\varphi(t)$ is determined by the first-order ordinary differential equation $\varphi'_t = F(t, \varphi, 0)$.

3°. For $g(t) = a$ and $F = F(w_x, w_{xx})$, the equation has a traveling-wave solution

$$w = U(z), \quad z = kx + \lambda t,$$

where k and λ are arbitrary constants, and the function $U(z)$ is determined by the autonomous ordinary differential equation

$$k\lambda U''_{zz} = ak^2 UU''_{zz} + F(kU'_z, k^2U''_{zz}).$$

2. $\dfrac{\partial w}{\partial x}\dfrac{\partial^2 w}{\partial t\partial x} - \dfrac{\partial w}{\partial t}\dfrac{\partial^2 w}{\partial x^2} = F\left(t, w, \dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right).$

1°. Let $\widetilde{w}(t,x)$ be a solution of the equation in question. Then the function

$$w(t,x) = \widetilde{w}\big(t, x+\varphi(t)\big),$$

where $\varphi(t)$ is an arbitrary function, is also a solution of the equation.

2°. In the original equation, let us change from the old variables to the von Mises variables:

$$t,\ x,\ w = w(t,x) \quad \Longrightarrow \quad t,\ w,\ \eta = \eta(t,w), \quad \text{where} \quad \eta = \frac{\partial w}{\partial x}. \tag{1}$$

The derivatives are transformed as follows:

$$\frac{\partial^2 w}{\partial x^2} = \eta\frac{\partial \eta}{\partial w}, \quad \frac{\partial^2 w}{\partial t\partial x} = \frac{\partial \eta}{\partial t} + \frac{\partial w}{\partial t}\frac{\partial \eta}{\partial w}.$$

The von Mises transformation reduces the original second-order equation to a first-order equation:

$$\eta\frac{\partial \eta}{\partial t} = F\left(t, w, \eta, \eta\frac{\partial \eta}{\partial w}\right). \tag{2}$$

Special case 1. The original equation with $F = f(t,w)w_{xx} + g(t,w)w_x^2 + h(t,w)w_x$ reduces to equation (2) of a special form, which is further reduced, by canceling by η, to a linear first-order equation:

$$\eta_t - f(t,w)\eta_w = g(t,w)\eta + h(t,w).$$

Special case 2. With $F = f(t,w)w_{xx} + g(t,w)w_x^2 + h(t,w)$, equation (2) is reduced, with the change of variable $Z = \eta^2$, to a linear first-order equation:

$$Z_t - f(t,w)Z_w = 2g(t,w)Z + h(t,w).$$

3. $f\left(\dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}\right)\dfrac{\partial^2 w}{\partial x^2} + g\left(\dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}\right)\dfrac{\partial^2 w}{\partial x\partial y} + h\left(\dfrac{\partial w}{\partial x}, \dfrac{\partial w}{\partial y}\right)\dfrac{\partial^2 w}{\partial y^2} = 0.$

The Legendre transformation

$$w(x,y) + u(\xi,\eta) = x\xi + y\eta, \quad \xi = \frac{\partial w}{\partial x}, \quad \eta = \frac{\partial w}{\partial y}$$

leads to the linear equation (for details, see Subsection 26.3.3)

$$f(\xi,\eta)\frac{\partial^2 u}{\partial \eta^2} - g(\xi,\eta)\frac{\partial^2 u}{\partial \xi\partial \eta} + h(\xi,\eta)\frac{\partial^2 u}{\partial \xi^2} = 0.$$

4. $\dfrac{\partial^2 w}{\partial x\partial t} = F\left(t, w, \dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}\right) + g(t)\dfrac{\partial^2 w}{\partial y^2}.$

1°. "Two-dimensional" solution:

$$w(x,y,t) = u(z,t), \qquad z = x + C_1 y + C_1^2\int g(t)\,dt + C_2,$$

where C_1 and C_2 are arbitrary constants and the function $u(z,t)$ is determined by the differential equation

$$\frac{\partial^2 u}{\partial z \partial t} = F\left(t, u, \frac{\partial u}{\partial z}, \frac{\partial^2 u}{\partial z^2}\right).$$

2°. "Two-dimensional" solution:

$$w(x,y,t) = U(\xi,t), \qquad \xi = x + \varphi(t)(y+C_1)^2, \qquad \varphi(t) = -\left[4\int g(t)\,dt + C_2\right]^{-1},$$

where the function $U(\xi,t)$ is determined by the differential equation

$$\frac{\partial^2 U}{\partial \xi \partial t} = F\left(t, U, \frac{\partial U}{\partial \xi}, \frac{\partial^2 U}{\partial \xi^2}\right) + 2g(t)\varphi(t)\frac{\partial U}{\partial \xi}.$$

12.2.4. Equations with Two Independent Variables, Nonlinear in Two or More Highest Derivatives

1. $\boldsymbol{f_1\left(\dfrac{\partial^2 w}{\partial x^2}\right) f_2\left(\dfrac{\partial^2 w}{\partial y^2}\right) = g_1(x)g_2(y).}$

Generalized separable solution:

$$w(x,y) = \varphi(x) + \psi(y) + C_1 xy + C_2 x + C_3 y + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, and the functions $\varphi = \varphi(x)$ and $\psi = \psi(y)$ are determined by the ordinary differential equations (a is any)

$$f_1(\varphi''_{xx}) = a g_1(x),$$
$$a f_2(\psi''_{yy}) = g_2(y).$$

2. $\boldsymbol{F\left(x, y, \dfrac{\partial w}{\partial x}, \dfrac{\partial^2 w}{\partial x^2}, \dfrac{\partial^2 w}{\partial x \partial y}\right) = 0.}$

The substitution $u = \frac{\partial w}{\partial x}$ leads to the first-order partial differential equation

$$F\left(x, y, u, \frac{\partial u}{\partial x}, \frac{\partial u}{\partial y}\right) = 0.$$

For details about integration methods and exact solutions for such equations (with various F), see Section 24.1 and Sections 3.2–3.3.

3. $\boldsymbol{\dfrac{\partial^2 w}{\partial y^2} = F\left(\dfrac{\partial^2 w}{\partial x^2}, \dfrac{\partial^2 w}{\partial x \partial y}\right).}$

1°. Solution quadratic in both variables:

$$w(x,y) = \tfrac{1}{2}C_1 x^2 + C_2 xy + \tfrac{1}{2}F(C_1, C_2)y^2 + C_3 x + C_4 y + C_5,$$

where $C_1, \ldots, C_5$ are arbitrary constants.

2°. We differentiate the equation with respect to x, introduce the new variable

$$U(x,y)=\frac{\partial w}{\partial x},$$

and then apply the Legendre transformation (for details, see Subsection S.2.3)

$$X=\frac{\partial U}{\partial x},\quad Y=\frac{\partial U}{\partial y},\quad Z=x\frac{\partial U}{\partial x}+y\frac{\partial U}{\partial y}-U$$

to obtain the second-order linear equation

$$\frac{\partial^2 Z}{\partial X^2}=F_X(X,Y)\frac{\partial^2 Z}{\partial Y^2}-F_Y(X,Y)\frac{\partial^2 Z}{\partial X\partial Y},$$

where the subscripts X and Y denote the corresponding partial derivatives.

Special case. Let $F(X,Y)=aX+f(Y)$, or

$$\frac{\partial^2 w}{\partial y^2}=a\frac{\partial^2 w}{\partial x^2}+f\left(\frac{\partial^2 w}{\partial x\partial y}\right).$$

Solution:

$$w=\varphi(z)+\tfrac{1}{6}(A_2A_3-A_1A_4)x^3+\tfrac{1}{2}aA_1A_3x^2y+\tfrac{1}{2}aA_2A_3xy^2+\tfrac{1}{6}(a^2A_1A_3+aA_2A_4)y^3$$
$$+\tfrac{1}{2}B_1x^2+B_2xy+\tfrac{1}{2}B_3y^2+B_4x+B_5y+B_6,\qquad z=A_1x+A_2y,$$

where the A_n and B_m are arbitrary constants and the function $\varphi(z)$ is determined by the ordinary differential equation

$$(A_2^2-aA_1^2)\varphi''_{zz}+aA_4z+B_3-aB_1=f(A_1A_2\varphi''_{zz}+aA_3z+B_2).$$

4. $F\left(\dfrac{\partial^2 w}{\partial x^2},\dfrac{\partial^2 w}{\partial x\partial y},\dfrac{\partial^2 w}{\partial y^2}\right)=0.$

1°. Solution quadratic in both variables:

$$w(x,y)=A_{11}x^2+A_{12}xy+A_{22}y^2+B_1x+B_2y+C,$$

where A_{11}, A_{12}, A_{22}, B_1, B_2, and C are arbitrary constants constrained by

$$F(2A_{11},A_{12},2A_{22})=0.$$

2°. Solving the equation for w_{yy} (or w_{xx}), one arrives at an equation of the form 12.2.4.3.

5. $F_1\left(x,\dfrac{\partial w}{\partial x},\dfrac{\partial^2 w}{\partial x^2},\dfrac{\partial^2 w}{\partial x\partial y}\right)+F_2\left(y,\dfrac{\partial w}{\partial y},\dfrac{\partial^2 w}{\partial x\partial y},\dfrac{\partial^2 w}{\partial y^2}\right)=kw.$

Additive separable solution:

$$w(x,y)=\varphi(x)+\psi(y).$$

Here, $\varphi(x)$ and $\psi(y)$ are determined by the ordinary differential equations

$$F_1\big(x,\varphi'_x,\varphi''_{xx},0\big)-k\varphi=C,$$
$$F_2\big(y,\psi'_y,0,\psi''_{yy}\big)-k\psi=-C,$$

where C is an arbitrary constant.

6. $F_1\left(x, \frac{1}{w}\frac{\partial w}{\partial x}, \frac{1}{w}\frac{\partial^2 w}{\partial x^2}\right) + F_2\left(y, \frac{1}{w}\frac{\partial w}{\partial y}, \frac{1}{w}\frac{\partial^2 w}{\partial y^2}\right) = \ln w.$

Multiplicative separable solution:

$$w(x, y) = \varphi(x)\psi(y).$$

Here, the functions $\varphi(x)$ and $\psi(y)$ are determined by the ordinary differential equations

$$F_1\big(x, \varphi'_x/\varphi, \varphi''_{xx}/\varphi\big) - \ln\varphi = C,$$
$$F_2\big(y, \psi'_y/\psi, \psi''_{yy}/\psi\big) - \ln\psi = -C,$$

where C is an arbitrary constant.

7. $F_1\left(x, \frac{1}{w}\frac{\partial w}{\partial x}, \frac{1}{w}\frac{\partial^2 w}{\partial x^2}\right) + w^k F_2\left(y, \frac{1}{w}\frac{\partial w}{\partial y}, \frac{1}{w}\frac{\partial^2 w}{\partial y^2}\right) = 0.$

Multiplicative separable solution:

$$w(x, y) = \varphi(x)\psi(y).$$

Here, the functions $\varphi(x)$ and $\psi(y)$ are determined by the ordinary differential equations

$$\varphi^{-k} F_1\big(x, \varphi'_x/\varphi, \varphi''_{xx}/\varphi\big) = C,$$
$$\psi^k F_2\big(y, \psi'_y/\psi, \psi''_{yy}/\psi\big) = -C,$$

where C is an arbitrary constant.

8. $F\left(ax + by,\ w,\ \frac{\partial w}{\partial x},\ \frac{\partial w}{\partial y},\ \frac{\partial^2 w}{\partial x^2},\ \frac{\partial^2 w}{\partial y^2},\ \frac{\partial^2 w}{\partial x \partial y}\right) = 0.$

Solution:

$$w = w(\xi), \quad \xi = ax + by,$$

where the function $w(\xi)$ is determined by the ordinary differential equation

$$F\big(\xi,\ w,\ aw'_\xi,\ bw'_\xi,\ a^2 w''_{\xi\xi},\ b^2 w''_{\xi\xi},\ abw''_{\xi\xi}\big) = 0.$$

9. $F\left(ax + by,\ w + kx + sy,\ \frac{\partial w}{\partial x},\ \frac{\partial w}{\partial y},\ \frac{\partial^2 w}{\partial x^2},\ \frac{\partial^2 w}{\partial y^2},\ \frac{\partial^2 w}{\partial x \partial y}\right) = 0.$

The substitution $u(x, y) = w(x, y) + kx + sy$ leads to an equation of the form 12.2.4.8:

$$F\left(ax + by,\ u,\ \frac{\partial u}{\partial x} - k,\ \frac{\partial u}{\partial y} - s,\ \frac{\partial^2 u}{\partial x^2},\ \frac{\partial^2 u}{\partial y^2},\ \frac{\partial^2 u}{\partial x \partial y}\right) = 0.$$

10. $(a_1 x + b_1 y)\frac{\partial w}{\partial x} + (a_2 x + b_2 y)\frac{\partial w}{\partial y} = F\left(w,\ \frac{\partial w}{\partial x},\ \frac{\partial w}{\partial y},\ \frac{\partial^2 w}{\partial x^2},\ \frac{\partial^2 w}{\partial x \partial y},\ \frac{\partial^2 w}{\partial y^2}\right).$

Traveling-wave type solutions:

$$w = w(z), \qquad z = a_2 x + (k - a_1)y,$$

where k is a root of the quadratic equation

$$k^2 - (a_1 + b_2)k + a_1 b_2 - a_2 b_1 = 0,$$

and the function $w(z)$ is determined by the ordinary differential equation

$$kzw'_z = F\big(w,\ a_2 w'_z,\ (k - a_1)w'_z,\ a_2^2 w''_{zz},\ a_2(k - a_1)w''_{zz},\ (k - a_1)^2 w''_{zz}\big).$$

11. $$(a_1x+b_1y+c_1)\left(\frac{\partial w}{\partial x}\right)^k+(a_2x+b_2y+c_2)\left(\frac{\partial w}{\partial y}\right)^k = F\left(w,\ \frac{\partial w}{\partial x},\ \frac{\partial w}{\partial y},\ \frac{\partial^2 w}{\partial x^2},\ \frac{\partial^2 w}{\partial x\partial y},\ \frac{\partial^2 w}{\partial y^2}\right).$$

Exact solutions are sought in the traveling-wave form

$$w = w(z), \qquad z = Ax + By + C,$$

where the constants A, B, and C are determined by solving the algebraic system

$$a_1A^k + a_2B^k = A, \tag{1}$$
$$b_1A^k + b_2B^k = B, \tag{2}$$
$$c_1A^k + c_2B^k = C. \tag{3}$$

Equations (1) and (2) are first solved for A and B, and then C is evaluated from (3).

The desired function $w(z)$ is determined by the ordinary differential equation

$$z(w_z')^k = F\big(w,\ Aw_z',\ Bw_z',\ A^2w_{zz}'',\ ABw_{zz}'',\ B^2w_{zz}''\big).$$

12. $$(a_1x+b_1y)\frac{\partial^2 w}{\partial x^2}+(a_2x+b_2y)\frac{\partial^2 w}{\partial x\partial y}+(a_3x+b_3y)\frac{\partial^2 w}{\partial y^2} = F\left(w,\ \frac{\partial w}{\partial x},\ \frac{\partial w}{\partial y},\ \frac{\partial^2 w}{\partial x^2},\ \frac{\partial^2 w}{\partial x\partial y},\ \frac{\partial^2 w}{\partial y^2}\right).$$

Traveling-wave type solutions:

$$w = w(z), \qquad z = Ax + By,$$

where the constants A and B are determined by solving the algebraic system of equation

$$a_1A^2 + a_2AB + a_3B^2 = A,$$
$$b_1A^2 + b_2AB + b_3B^2 = B,$$

and the desired function $w(z)$ is determined by the ordinary differential equation

$$zw_{zz}'' = F\big(w,\ Aw_z',\ Bw_z',\ A^2w_{zz}'',\ ABw_{zz}'',\ B^2w_{zz}''\big).$$

13. $$F\left(w, \frac{\partial w}{\partial x}, \frac{\partial w}{\partial y}, x\frac{\partial w}{\partial x}+y\frac{\partial w}{\partial y}, \frac{\partial^2 w}{\partial x^2}, \frac{\partial^2 w}{\partial x\partial y}, \frac{\partial^2 w}{\partial y^2}\right) = 0.$$

Traveling-wave type solutions:

$$w = w(z), \quad z = C_1x + C_2y,$$

where C_1 and C_2 are arbitrary constants, and the function $w(z)$ is determined by the ordinary differential equation

$$F(w, C_1w_z', C_2w_z', zw_z', C_1^2w_{zz}'', C_1C_2w_{zz}'', C_2^2w_{zz}'') = 0.$$

Remark. The above solution is a nonclassical (noninvariant) traveling-wave solution, since the equation is not invariant under translation transformations.

⊙ *Reference*: A. D. Polyanin (2004 *a*).

14. $$F\left(w, \frac{\partial w}{\partial x}, \frac{\partial w}{\partial y}, x\frac{\partial w}{\partial x} + y\frac{\partial w}{\partial y}, \frac{\partial^2 w}{\partial x^2}, \frac{\partial^2 w}{\partial x \partial y}, \frac{\partial^2 w}{\partial y^2}, x\frac{\partial^2 w}{\partial x^2} + y\frac{\partial^2 w}{\partial x \partial y}, x\frac{\partial^2 w}{\partial x \partial y} + y\frac{\partial^2 w}{\partial y^2}\right) = 0.$$

Traveling-wave type solutions:

$$w = w(z), \quad z = C_1 x + C_2 y,$$

where C_1 and C_2 are arbitrary constants, and the function $w(z)$ is determined by the ordinary differential equation

$$F(w, C_1 w'_z, C_2 w'_z, z w'_z, C_1^2 w''_{zz}, C_1 C_2 w''_{zz}, C_2^2 w''_{zz}, C_1 z w''_{zz}, C_2 z w''_{zz}) = 0.$$

15. $$F\left(w, \frac{\partial w}{\partial x}, \frac{\partial w}{\partial y}, x\frac{\partial w}{\partial x} + y\frac{\partial w}{\partial y}, \frac{\partial^2 w}{\partial x^2}, \frac{\partial^2 w}{\partial x \partial y}, \frac{\partial^2 w}{\partial y^2}, x^2\frac{\partial^2 w}{\partial x^2} + 2xy\frac{\partial^2 w}{\partial x \partial y} + y^2\frac{\partial^2 w}{\partial y^2}\right) = 0.$$

Traveling-wave type solutions:

$$w = w(z), \quad z = C_1 x + C_2 y,$$

where C_1 and C_2 are arbitrary constants, and the function $w(z)$ is determined by the ordinary differential equation

$$F(w, C_1 w'_z, C_2 w'_z, z w'_z, C_1^2 w''_{zz}, C_1 C_2 w''_{zz}, C_2^2 w''_{zz}, z^2 w''_{zz}) = 0.$$

12.2.5. Equations with n Independent Variables

1. $$\sum_{k=1}^{n} f_k\left(x_k, \frac{\partial w}{\partial x_k}, \frac{\partial^2 w}{\partial x_k^2}\right) = aw.$$

Additive separable solution:

$$w(x_1, \ldots, x_n) = \sum_{k=1}^{n} \varphi_k(x_k),$$

where the functions $\varphi_k = \varphi_k(x_k)$ are determined by the second-order ordinary differential equations

$$\sum_{k=1}^{n} f_k\left(x_k, \frac{d\varphi_k}{dx_k}, \frac{d^2\varphi_k}{dx_k^2}\right) - a\varphi_k = C_k, \qquad k = 1, 2, \ldots, n.$$

The arbitrary constants $C_1, \ldots, C_n$ are related by the constraint $C_1 + \cdots + C_n = 0$.

Remark. The functions f_k in the original equation can also depend on any number of mixed derivatives $\partial_{x_i x_j} w$. In this case, the arguments corresponding to $\partial_{x_i x_j} w$ in the second-order ordinary differential equations obtained will be replaced by zeros.

2. $\displaystyle\sum_{k=1}^{n} f_k\left(x_k, \frac{1}{w}\frac{\partial w}{\partial x_k}, \frac{1}{w}\frac{\partial^2 w}{\partial x_k^2}\right) = a\ln w.$

Multiplicative separable solution:

$$w(x_1,\ldots,x_n) = \prod_{k=1}^{n}\varphi_k(x_k),$$

where the functions $\varphi_k = \varphi_k(x_k)$ are determined by the second-order ordinary differential equations

$$f_k\left(x_k, \frac{1}{\varphi_k}\frac{d\varphi_k}{dx_k}, \frac{1}{\varphi_k}\frac{d^2\varphi_k}{dx_k^2}\right) - a\ln\varphi_k = C_k; \qquad k = 1,\ldots,n.$$

The arbitrary constants $C_1,\ldots,C_n$ are related by a single constraint, $C_1+\cdots+C_n = 0$.

3. $\displaystyle F\left(x_1,\ldots,x_k; \frac{\partial w}{\partial x_1},\ldots,\frac{\partial w}{\partial x_k}; \frac{\partial^2 w}{\partial x_1^2},\ldots,\frac{\partial^2 w}{\partial x_k^2}\right)$
$\displaystyle + G\left(x_{k+1},\ldots,x_n; \frac{\partial w}{\partial x_{k+1}},\ldots,\frac{\partial w}{\partial x_n}; \frac{\partial^2 w}{\partial x_{k+1}^2},\ldots,\frac{\partial^2 w}{\partial x_n^2}\right) = aw.$

Additive separable solution:

$$w(x_1,\ldots,x_k,x_{k+1},\ldots,x_n) = \varphi(x_1,\ldots,x_k) + \psi(x_{k+1},\ldots,x_n).$$

Here, the functions $\varphi = \varphi(x_1,\ldots,x_k)$ and $\psi = \psi(x_{k+1},\ldots,x_n)$ are determined by solving the two simpler partial differential equations

$$F\left(x_1,\ldots,x_k; \frac{\partial\varphi}{\partial x_1},\ldots,\frac{\partial\varphi}{\partial x_k}; \frac{\partial^2\varphi}{\partial x_1^2},\ldots,\frac{\partial^2\varphi}{\partial x_k^2}\right) = a\varphi + C,$$
$$G\left(x_{k+1},\ldots,x_n; \frac{\partial\psi}{\partial x_{k+1}},\ldots,\frac{\partial\psi}{\partial x_n}; \frac{\partial^2\psi}{\partial x_{k+1}^2},\ldots,\frac{\partial^2\psi}{\partial x_n^2}\right) = a\psi - C,$$

where C is an arbitrary constant.

4. $\displaystyle F\left(x_1,\ldots,x_k; \frac{1}{w}\frac{\partial w}{\partial x_1},\ldots,\frac{1}{w}\frac{\partial w}{\partial x_k}; \frac{1}{w}\frac{\partial^2 w}{\partial x_1^2},\ldots,\frac{1}{w}\frac{\partial^2 w}{\partial x_k^2}\right)$
$\displaystyle + G\left(x_{k+1},\ldots,x_n; \frac{1}{w}\frac{\partial w}{\partial x_{k+1}},\ldots,\frac{1}{w}\frac{\partial w}{\partial x_n}; \frac{1}{w}\frac{\partial^2 w}{\partial x_{k+1}^2},\ldots,\frac{1}{w}\frac{\partial^2 w}{\partial x_n^2}\right) = a\ln w.$

Multiplicative separable solution:

$$w(x_1,\ldots,x_k,x_{k+1},\ldots,x_n) = \varphi(x_1,\ldots,x_k)\psi(x_{k+1},\ldots,x_n).$$

Here, the functions $\varphi = \varphi(x_1,\ldots,x_k)$ and $\psi = \psi(x_{k+1},\ldots,x_n)$ are determined by solving the two simpler partial differential equations

$$F\left(x_1,\ldots,x_k; \frac{1}{\varphi}\frac{\partial\varphi}{\partial x_1},\ldots,\frac{1}{\varphi}\frac{\partial\varphi}{\partial x_k}; \frac{1}{\varphi}\frac{\partial^2\varphi}{\partial x_1^2},\ldots,\frac{1}{\varphi}\frac{\partial^2\varphi}{\partial x_k^2}\right) = a\ln\varphi + C,$$
$$G\left(x_{k+1},\ldots,x_n; \frac{1}{\psi}\frac{\partial\psi}{\partial x_{k+1}},\ldots,\frac{1}{\psi}\frac{\partial\psi}{\partial x_n}; \frac{1}{\psi}\frac{\partial^2\psi}{\partial x_{k+1}^2},\ldots,\frac{1}{\psi}\frac{\partial^2\psi}{\partial x_n^2}\right) = a\ln\psi - C,$$

where C is an arbitrary constant.

5. $$F\left(x_1,\dots,x_k;\frac{1}{w}\frac{\partial w}{\partial x_1},\dots,\frac{1}{w}\frac{\partial w}{\partial x_k};\frac{1}{w}\frac{\partial^2 w}{\partial x_1^2},\dots,\frac{1}{w}\frac{\partial^2 w}{\partial x_k^2}\right)$$
$$+\,w^{\beta}G\left(x_{k+1},\dots,x_n;\frac{1}{w}\frac{\partial w}{\partial x_{k+1}},\dots,\frac{1}{w}\frac{\partial w}{\partial x_n};\frac{1}{w}\frac{\partial^2 w}{\partial x_{k+1}^2},\dots,\frac{1}{w}\frac{\partial^2 w}{\partial x_n^2}\right)=0.$$

Multiplicative separable solution:

$$w(x_1,\dots,x_k,x_{k+1},\dots,x_n)=\varphi(x_1,\dots,x_k)\psi(x_{k+1},\dots,x_n).$$

Here, the functions $\varphi=\varphi(x_1,\dots,x_k)$ and $\psi=\psi(x_{k+1},\dots,x_n)$ are determined by solving the two simpler partial differential equations

$$\varphi^{-\beta}F\left(x_1,\dots,x_k;\frac{1}{\varphi}\frac{\partial\varphi}{\partial x_1},\dots,\frac{1}{\varphi}\frac{\partial\varphi}{\partial x_k};\frac{1}{\varphi}\frac{\partial^2\varphi}{\partial x_1^2},\dots,\frac{1}{\varphi}\frac{\partial^2\varphi}{\partial x_k^2}\right)=C,$$
$$\psi^{\beta}G\left(x_{k+1},\dots,x_n;\frac{1}{\psi}\frac{\partial\psi}{\partial x_{k+1}},\dots,\frac{1}{\psi}\frac{\partial\psi}{\partial x_n};\frac{1}{\psi}\frac{\partial^2\psi}{\partial x_{k+1}^2},\dots,\frac{1}{\psi}\frac{\partial^2\psi}{\partial x_n^2}\right)=-C,$$

where C is an arbitrary constant.

Chapter 13
Third-Order Equations

13.1. Equations Involving the First Derivative in t

13.1.1. Korteweg–de Vries Equation $\dfrac{\partial w}{\partial t} + a\dfrac{\partial^3 w}{\partial x^3} + bw\dfrac{\partial w}{\partial x} = 0$

1. $\dfrac{\partial w}{\partial t} + \dfrac{\partial^3 w}{\partial x^3} - 6w\dfrac{\partial w}{\partial x} = 0.$

Korteweg–de Vries equation in canonical form (or *KdV equation* for short). It is used in many sections of nonlinear mechanics and theoretical physics for describing one-dimensional *nonlinear dispersive nondissipative waves* (in which the dissipation law for linear waves has the form $\omega = a_1 k + a_3 k^3$, where k is the wavenumber). In particular, the mathematical modeling of moderate-amplitude shallow-water surface waves is based on this equation (see Korteweg and de Vries, 1895).

The Korteweg–de Vries equation is solved by the inverse scattering method; see Items 9 and 10 and the references at the end of this equation.

1. The similarity formula.

Suppose $w(x,t)$ is a solution of the Korteweg–de Vries equation. Then the function

$$w_1 = C_1^2 w(C_1 x + 6C_1 C_2 t + C_3, C_1^3 t + C_4) + C_2,$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

⊙ *Reference*: P. J. Olver (1986).

2. Traveling-wave solutions. Soliton. Cnoidal waves. Periodic solutions.

2.1. Traveling-wave solution:

$$w = w(z), \quad z = x - \lambda t,$$

where the function $w(z)$ defined in implicit form as

$$\int \frac{dw}{\sqrt{2w^3 + \lambda w^2 + C_1 w + C_2}} = \pm z + C_3. \tag{1}$$

Here, λ, C_1, C_2, and C_3 are arbitrary constants; to $\lambda = 0$ there corresponds a stationary solution.

Below are important cases where solution (1) can be written out in explicit form.

2.2. *Soliton*. The unique solution regular for all real values of $z = x - \lambda t$ and vanishing as $z \to \pm\infty$ is expressed as

$$w(z) = -\frac{\lambda}{2\cosh^2\left[\frac{1}{2}\sqrt{\lambda}\,(z + B)\right]}, \qquad \lambda > 0, \tag{2}$$

where B is an arbitrary constant.

2.3. *Cnoidal waves*. There are periodic solutions that are real and regular for any real $z = x - \lambda t$:

$$w(z) = A\,\mathrm{cn}^2\big[p(z+B),k\big], \quad A = -2p^2k^2, \quad \lambda = 4p^2(2k^2-1). \tag{3}$$

They depend on an arbitrary positive constant $k^2 < 1$. Here, $\mathrm{cn}(y,k)$ is the Jacobian elliptic cosine. Solution (2) can be obtained from (3) by letting $k^2 \to 1$. The periods of solution (3) are $\omega_1 = 4K$ and $\omega_2 = 2K + 2iK_*$, where K and K_* are complete elliptic integrals of the first kind:

$$K = \int_0^1 \frac{dt}{\sqrt{(1-t^2)(1-k^2t^2)}}, \quad K_* = \int_0^1 \frac{dt}{\sqrt{(1-t^2)(1-k_*^2t^2)}}, \quad k^2 + k_*^2 = 1.$$

2.4. *Unlimited periodic solutions*:

$$w(z) = \tfrac{1}{6}\lambda\Big\{1 + 3\tan^2\big[\tfrac{1}{2}\sqrt{\lambda}\,(z+B)\big]\Big\} \quad \text{if } \lambda > 0,$$
$$w(z) = -\frac{\lambda}{2\cos^2\big[\frac{1}{2}\sqrt{-\lambda}\,(z+B)\big]} \quad \text{if } \lambda < 0,$$

where B and λ are arbitrary constants.

2.5. *Rational solution*. It has the form

$$w(z) = \frac{2}{(z+B)^2} - \frac{\lambda}{6}, \qquad z = x - \lambda t,$$

where B is an arbitrary constant.

2.6. Other traveling-wave solutions:

$$w(z) = \frac{\lambda}{2\sinh^2\big[\frac{1}{2}\sqrt{\lambda}\,(z+B)\big]} \quad \text{if } \lambda > 0,$$
$$w(z) = \tfrac{1}{6}\lambda\Big\{1 - 3\tanh^2\big[\tfrac{1}{2}\sqrt{-\lambda}\,(z+B)\big]\Big\} \quad \text{if } \lambda < 0,$$
$$w(z) = \tfrac{1}{6}\lambda\Big\{1 - 3\coth^2\big[\tfrac{1}{2}\sqrt{-\lambda}\,(z+B)\big]\Big\} \quad \text{if } \lambda < 0,$$

where B and λ are arbitrary constants.

3. Two-, Three-, and N-soliton solutions.

3.1. Two-soliton solution:

$$w(x,t) = -2\frac{\partial^2}{\partial x^2}\ln\big(1 + B_1e^{\theta_1} + B_2e^{\theta_2} + AB_1B_2e^{\theta_1+\theta_2}\big),$$
$$\theta_1 = a_1x - a_1^3t, \quad \theta_2 = a_2x - a_2^3t, \quad A = \left(\frac{a_1-a_2}{a_1+a_2}\right)^2,$$

where B_1, B_2, a_1, and a_2 are arbitrary constants.

⊙ *References*: R. Hirota (1971, 1972).

3.2. Three-soliton solution:

$$w = -2\frac{\partial^2}{\partial x^2}F(x,t), \qquad F(x,t) = 1 + \exp(\theta_1) + \exp(\theta_2) + \exp(\theta_3)$$
$$+ \frac{(k_1-k_2)^2}{(k_1+k_2)^2}\exp(\theta_1+\theta_2) + \frac{(k_1-k_3)^2}{(k_1+k_3)^2}\exp(\theta_1+\theta_3) + \frac{(k_2-k_3)^2}{(k_2+k_3)^2}\exp(\theta_2+\theta_3)$$
$$+ \frac{(k_1-k_2)^2(k_1-k_3)^2(k_2-k_3)^2}{(k_1+k_2)^2(k_1+k_3)^2(k_3+k_3)^2}\exp(\theta_1+\theta_2+\theta_3),$$
$$\theta_1 = k_1x - k_1^3t + C_1, \quad \theta_2 = k_2x - k_2^3t + C_2, \quad \theta_3 = k_3x - k_3^3t + C_3,$$

where C_1, C_2, C_3, k_1, k_2, and k_3 are arbitrary constants.

⊙ *Reference*: A. M. Wazwaz (2008).

3.3. N-soliton solutions:

$$w(x,t) = -2\frac{\partial^2}{\partial x^2}\Big\{\ln\det\big[\mathbf{I} + \mathbf{C}(\mathbf{x},\mathbf{t})\big]\Big\}.$$

Here, $\mathbf{I}$ is the $N\times N$ identity matrix and $\mathbf{C}(x,t)$ the $N\times N$ symmetric matrix with entries

$$C_{mn}(x,t) = \frac{\sqrt{\rho_m(t)\rho_n(t)}}{p_m+p_n}\exp\big[-(p_m+p_n)x\big],$$

where the normalizing factors $\rho_n(t)$ are given by

$$\rho_n(t) = \rho_n(0)\exp\big(8p_n^3t\big), \quad n = 1,2,\ldots,N.$$

The solution involves $2N$ arbitrary constants p_n and $\rho_n(0)$.

The following asymptotic formula holds:

$$w(x,t) \approx -2\sum_{n=1}^{N}\frac{p_n^2}{\cosh^2\big[p_n\big(x-\xi_n^{\pm}-v_nt\big)\big]} \quad \text{as} \quad t\to\pm\infty,$$

where $v_n = 4p_n^2$ is the speed of the nth soliton and the real constants $\xi_n^{\pm}$ are constrained by

$$\xi_n^+ - \xi_n^- = \sum_{m=1}^{n-1}p_n^{-1}\ln\frac{p_n+p_m}{p_n-p_m} - \sum_{m=n+1}^{N}p_n^{-1}\ln\frac{p_n+p_m}{p_n-p_m}.$$

⊙ *Reference*: F. Calogero and A. Degasperis (1982).

4. "Soliton + pole" solutions.

4.1. "One soliton + one pole" solution:

$$w(x,t) = -2p^2\big[\cosh^{-2}(pz) - (1+px)^{-2}\tanh^2(pz)\big]\big[1-(1+px)^{-1}\tanh(pz)\big]^{-2}, \qquad z = x-4p^2t-c,$$

where p and c are arbitrary constants.

4.2. "N solitons + one pole" solution:

$$w(x,t) = -2\frac{\partial^2}{\partial x^2}\Big\{x\ln\det\big[\mathbf{I} + \mathbf{D}(\mathbf{x},\mathbf{t})\big]\Big\}.$$

Here, $\mathbf{I}$ is the $N \times N$ identity matrix and $\mathbf{D}(x,t)$ the $N \times N$ symmetric matrix with entries

$$D_{mn}(x,t) = c_m(t)c_n(t)\big[(p_m + p_n)^{-1} + (p_m p_n x)^{-1}\big] \exp\big[-(p_m + p_n)x\big],$$

where the normalizing factors $c_n(t)$ are given by

$$c_n(t) = c_n(0)\exp\big(4p_n^3 t\big), \quad n = 1, 2, \ldots, N.$$

The solution involves $2N$ arbitrary constants p_n and $c_n(0)$.

⊙ *Reference*: F. Calogero and A. Degasperis (1982).

5. Rational solutions.

5.1. The simplest rational solution is as follows:

$$w(x,t) = 2(x-\xi)^{-2},$$

where ξ is an arbitrary constant that can be complex (if it is real, the solution is singular for real values of x).

5.2. General form of a rational solution:

$$w(x,t) = 2\sum_{j=1}^{N}\big[x - \xi_j(t)\big]^{-2}. \tag{4}$$

The functions $\xi_j(t)$ must meet the conditions

$$\begin{aligned} &\sum_{\substack{k=1\\ j\neq k}}^{N}\big[\xi_j(t) - \xi_k(t)\big]^{-3} = 0, \qquad j = 1, 2, \ldots, N, \\ &\xi_j(t) = -12\sum_{\substack{k=1\\ j\neq k}}^{N}\big[\xi_j(t) - \xi_k(t)\big]^{-2}, \quad j = 1, 2, \ldots, N. \end{aligned} \tag{5}$$

A solution exists if $N = \frac{1}{2}m(m+1)$, $m = 1,\ 2,\ 3,\ \ldots$; if $m > 1$, there are no real solutions. In particular, if $m = 2$, there are three poles $\xi_j(t) = -e^{2\pi i j/3}(12t)^{1/3}$ ($j = 1,\ 2,\ 3$) and solution (4) can be written out as follows:

$$w(x,t) = \frac{6x(x^3 - 24t)}{(x^3 + 12t)^2} \qquad (\text{for } N = 3).$$

A solution for $m = 3$ (corresponds to $N = 6$) is given by

$$w(x,t) = -2\frac{\partial^2}{\partial x^2}\ln\big(x^6 + 60x^3 t - 720t^2\big).$$

Note that (4) can be rewritten in the equivalent form

$$w(x,t) = -2\frac{\partial^2}{\partial x^2}\big[\ln P_N(x,t)\big], \quad \text{where} \quad P_N(x,t) = \prod_{j=1}^{N}\big[x - \xi_j(t)\big].$$

⊙ *References*: M. J. Ablowitz and H. Segur (1981), F. Calogero and A. Degasperis (1982).

6. Self-similar solutions.

6.1. Simplest self-similar solution (degenerate solution):

$$w(x,t) = -\frac{1}{6}\frac{x-x_0}{t-t_0},$$

where x_0 and t_0 are arbitrary constants.

6.2. Self-similar solution:

$$w(x,t) = \big[3(t-t_0)\big]^{-2/3} f(y), \quad y = \big[3(t-t_0)\big]^{-1/3}(x-x_0),$$

where the function $f(y)$ is determined by the third-order ordinary differential equation

$$f'''_{yyy} - yf'_y - 2f - 6ff'_y = 0. \tag{6}$$

Equation (6) has a first integral

$$(y+2f)[f''_{yy} - (y+2f)f] - (1+f'_y)f'_y = C,$$

where C is the constant of integration. A solution of equation (6) can be represented as

$$f(y) = g'_y(y) + g^2(y),$$

where the function $g(y)$ is any solution of the *second Painlevé equation* (see Conte and Musette, 2008)

$$g''_{yy} - 2g^3 - yg = A, \qquad A \text{ is an arbitrary constant.} \tag{7}$$

For $A = 2^{-2/3}$, equation (7) has a solution

$$g(y) = \frac{d}{dy}\Big[\ln F\big(-2^{-1/3}y\big)\Big],$$

where the function $F = F(z)$ satisfies the *Airy equation* $F''_{zz} = zF$.

⊙ *Reference*: F. Calogero and A. Degasperis (1982).

7. General similarity solutions.

7.1. Solution:

$$w(x,t) = 2\varphi(z) + 2C_1 t, \quad z = x + 6C_1 t^2 + C_2 t,$$

where C_1 and C_2 are arbitrary constants, and the function $\varphi(z)$ is determined by the second-order ordinary differential equation

$$\varphi''_{zz} = 6\varphi^2 - C_2\varphi - C_1 z + C_3,$$

where C_3 is an arbitrary constant. To the case $C_1 = -1$, $C_2 = C_3 = 0$ there corresponds the *first Painlevé equation* (if all C_n are nonzero, the equation for φ can also be reduced to the first Painlevé equation).

7.2. Solution:

$$w = \varphi^2 F(z) + \frac{1}{6\varphi}(\varphi'_t x + \psi'_t), \quad z = \varphi(t)x + \psi(t).$$

Here, the functions $\varphi = \varphi(t)$ and $\psi = \psi(t)$ are given by

$$\varphi(t) = (3At + C_1)^{-1/3}, \qquad \psi(t) = C_2(3At + C_1)^{2/3} + C_3(3At + C_1)^{-1/3},$$

where A, C_1, C_2, and C_3 are arbitrary constants, and the function $F(z)$ is determined by the ordinary differential equation

$$F'''_{zzz} - 6FF'_z - AF + \tfrac{2}{3}A^2 z = 0.$$

⊙ *Reference*: P. A. Clarkson and M. D. Kruskal (1989).

8. Miura transformation and Bäcklund transformations.

8.1. The Korteweg–de Vries equation can be reduced, with the differential change of variable (*Miura transformation*)

$$w = \frac{\partial u}{\partial x} + u^2, \tag{8}$$

to the form

$$\frac{\partial w}{\partial t} + \frac{\partial^3 w}{\partial x^3} - 6w\frac{\partial w}{\partial x} = \left(\frac{\partial}{\partial x} + 2u\right)\left(\frac{\partial u}{\partial t} + \frac{\partial^3 u}{\partial x^3} - 6u^2\frac{\partial u}{\partial x}\right) = 0.$$

It follows that any solution $u = u(x, t)$ of the modified Korteweg–de Vries equation

$$\frac{\partial u}{\partial t} + \frac{\partial^3 u}{\partial x^3} - 6u^2\frac{\partial u}{\partial x} = 0 \tag{9}$$

generates a solution (8) of the Korteweg–de Vries equation.

⊙ *References*: R. M. Miura (1968), F. Calogero and A. Degasperis (1982).

8.2. The Bäcklund transformations

$$\begin{aligned} &\frac{\partial u}{\partial x} = \varepsilon(u^2 - w), \qquad \varepsilon = \pm 1, \\ &\frac{\partial u}{\partial t} = -\varepsilon\frac{\partial^2 w}{\partial x^2} + 2\frac{\partial}{\partial x}(uw) \end{aligned} \tag{10}$$

link solutions of the Korteweg–de Vries equation with those of the modified Korteweg–de Vries equation (9). With $\varepsilon = 1$, the first relation in (10) turns into the Miura transformation (8).

⊙ *References*: G. L. Lamb (1974), N. H. Ibragimov (1985).

8.3. The auto-Bäcklund transformation expressed via the potential functions $\frac{\partial \varphi}{\partial x} = -\frac{1}{2}w$ and $\frac{\partial \widetilde{\varphi}}{\partial x} = -\frac{1}{2}\widetilde{w}$ has the form

$$\begin{aligned} &\frac{\partial}{\partial x}(\widetilde{\varphi} - \varphi) = k^2 - (\widetilde{\varphi} - \varphi)^2, \\ &\frac{\partial}{\partial t}(\widetilde{\varphi} - \varphi) = 6(\widetilde{\varphi} - \varphi)^2\frac{\partial}{\partial x}(\widetilde{\varphi} - \varphi) - 6k^2\frac{\partial}{\partial x}(\widetilde{\varphi} - \varphi) - \frac{\partial^3}{\partial x^3}(\widetilde{\varphi} - \varphi), \end{aligned}$$

where k is an arbitrary constant.

⊙ *Reference*: R. K. Dodd, J. C. Eilbeck, J. D. Gibbon, and H. C. Morris (1982).

9. Gelfand–Levitan–Marchenko integral equation.

Any rapidly decreasing function $F = F(x, y; t)$ as $x \to +\infty$ that satisfies simultaneously the two linear equations

$$\frac{\partial^2 F}{\partial x^2} - \frac{\partial^2 F}{\partial y^2} = 0,$$
$$\frac{\partial F}{\partial t} + \left(\frac{\partial}{\partial x} + \frac{\partial}{\partial y}\right)^3 F = 0$$

generates a solution of the Korteweg–de Vries equation in the form

$$w = -2\frac{d}{dx}K(x, x; t), \tag{11}$$

where $K(x, y; t)$ is a solution of the linear *Gelfand–Levitan–Marchenko integral equation*

$$K(x, y; t) + F(x, y; t) + \int_x^\infty K(x, z; t)F(z, y; t)\,dz = 0. \tag{12}$$

Time t appears in this equation as a parameter.

10. Cauchy problem.

Consider the Cauchy problem for the Korteweg–de Vries equation subject to the initial conditions

$$w = f(x) \quad \text{at} \quad t = 0 \qquad (-\infty < x < \infty), \tag{13}$$

where the function $f(x)$ is quite rapidly vanishing as $|x| \to \infty$. The solution of the Cauchy problem falls into several stages.

First stage. Initially, a linear eigenvalue problem is solved for the auxiliary ordinary differential equation

$$\psi''_{xx} - \big[f(x) - \lambda\big]\psi = 0. \tag{14}$$

The eigenvalues fall into two types:

$$\begin{aligned} &\lambda_n = -\varkappa_n^2, \quad n = 1, 2, \ldots, N \quad \text{(discrete spectrum)},\\ &\lambda = k^2, \qquad -\infty < k < \infty \qquad \text{(continuous spectrum)}. \end{aligned} \tag{15}$$

Let the $\lambda_n = -\varkappa_n^2$ be discrete eigenvalues and let the $\psi_n = \psi_n(x)$ be the corresponding normalized eigenfunctions, which vanish at infinity and are square summable, so that

$$\int_{-\infty}^{\infty} \psi_n^2(x)\,dx = 1.$$

The leading asymptotic term in the expansion of ψ_n for large x is given by

$$\psi_n \to c_n \exp(-\varkappa_n x) \quad \text{as} \quad x \to \infty. \tag{16}$$

For continuous spectrum, $\lambda = k^2$, the wave function ψ at infinity is determined by a linear combination of the exponentials $\exp(\pm ikx)$ (since $f \to 0$ as $|x| \to \infty$). The conditions

$$\begin{aligned} &\psi \to e^{-ikx} && \text{as} \quad x \to -\infty,\\ &\psi \to a(k)e^{-ikx} + b(k)e^{ikx} && \text{as} \quad x \to \infty, \end{aligned} \tag{17}$$

and equation (14) enable us to uniquely determine the transmission and reflection coefficients $a(k)$ and $b(k)$; note that $|a|^2 - |b|^2 = 1$.

Second stage. At the next stage, one considers the linear Gelfand–Levitan–Marchenko integral equation (12), where

$$F(x, y; t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} b(k) e^{i[8k^3 t + k(x+y)]}\, dk + \sum_{n=1}^{N} c_n^2 e^{8\varkappa_n^3 t - \varkappa_n (x+y)}. \tag{18}$$

It involves the constants $\varkappa_n$ and c_n and the function $b(k)$ determined at the first state; see (15)–(17). It is apparent from (18) that $F(x, y; t) = F(x + y; t)$.

Third stage. The solution of the integral equation (12), (18) is finally substituted into (11) to give a solution of the Cauchy problem for the Korteweg–de Vries equation with the initial condition (13).

Remark. Solving the Cauchy problem for the given nonlinear equation is reduced to solving two linear problems sequentially. The procedure for solving the Cauchy problem for the Korteweg–de Vries equation is described Section 36.4 in more detail.

⊙ *References*: R. M. Miura (1977), F. Calogero and A. Degasperis (1982), S. P. Novikov, S. V. Manakov, L. B. Pitaevskii, and V. E. Zakharov (1984).

11. Conservation laws and motion integrals.

11.1. The Korteweg–de Vries equation has infinitely many conservation laws. The simplest conservation laws are expressed as

$$\begin{aligned}
&D_t(w) + D_x\left(w_{xx} - 3w^2\right) = 0,\\
&D_t\left(\tfrac{1}{2}w^2\right) + D_x\left(ww_{xx} - \tfrac{1}{2}w_x^2 - 2w^3\right) = 0,\\
&D_t\left(w_x^2 + 2w^3\right) + D_x\left(2w_x w_{xxx} - w_{xx}^2 + 6w^2 w_{xx} - 12ww_x^2 - 9w^4\right) = 0,\\
&D_t\left(3tw^2 + xw\right) + D_x\left[t\left(6ww_{xx} - 3w_x^2 - 12w^3\right) - w_x + xw_{xx} - 3xw^2\right] = 0,
\end{aligned}$$

where $D_t = \frac{\partial}{\partial t}$, $D_x = \frac{\partial}{\partial x}$.

⊙ *References*: G. B. Whitham (1965), R. M. Miura, C. S. Gardner, and M. D. Kruskal (1968), N. H. Ibragimov (1994).

11.2. The Korteweg–de Vries equation has infinitely many motion integrals:

$$I_n = \int_{-\infty}^{\infty} P_n(w, w_x, \dots)\, dx = \text{const}, \qquad n = 0,\ 1,\ 2,\ \dots,$$

where P_n is a polynomial in w and its derivatives; w is assumed to decay rapidly as $|x| \to \infty$. In particular, the first four polynomials are as follows:

$$P_0 = w, \quad P_1 = w^2, \quad P_2 = w_x^2 + 2w^3, \quad P_3 = \tfrac{1}{2}\left(w_{xx}^2 - 5w^2 w_{xx} + 5w^4\right).$$

⊙ *References for equation* 13.1.1.1: G. B. Whitham (1965), C. S. Gardner, J. M. Greene, M. D. Kruskal, and R. M. Miura (1967, 1974), R. M. Miura (1968, 1977), R. M. Miura, C. S. Gardner, and M. D. You (2005).

2. $\dfrac{\partial w}{\partial t} + a\dfrac{\partial^3 w}{\partial x^3} + bw\dfrac{\partial w}{\partial x} = 0.$

Unnormalized Korteweg–de Vries equation.

1°. Suppose $w(x,t)$ is a solution of the Korteweg–de Vries equation. Then the function

$$w_1 = C_1^2 w(C_1 x - bC_1C_2 t + C_3, C_1^3 t + C_4) + C_2,$$

where $C_1, \ldots, C_4$ are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solutions:

$$w = \frac{3ac}{b\cosh^2\left[\frac{1}{2}\sqrt{c}\,(x - act + B)\right]} \quad \text{if } c > 0,$$

$$w = -\frac{3ac}{b\sinh^2\left[\frac{1}{2}\sqrt{c}\,(x - act + B)\right]} \quad \text{if } c > 0,$$

$$w = -\frac{ac}{b}\left\{1 - 3\tanh^2\left[\tfrac{1}{2}\sqrt{-c}\,(x - act + B)\right]\right\} \quad \text{if } c < 0,$$

$$w = -\frac{ac}{b}\left\{1 - 3\coth^2\left[\tfrac{1}{2}\sqrt{-c}\,(x - act + B)\right]\right\} \quad \text{if } c < 0,$$

$$w = -\frac{ac}{b}\left\{1 + 3\tan^2\left[\tfrac{1}{2}\sqrt{c}\,(x - act + B)\right]\right\} \quad \text{if } c > 0,$$

$$w = \frac{3ac}{b\cos^2\left[\frac{1}{2}\sqrt{-c}\,(x - act + B)\right]} \quad \text{if } c < 0,$$

where c and B are arbitrary constants.

3°. Consider the Cauchy problem with the initial condition

$$w = f(x) \quad \text{at} \quad t = 0 \qquad (-\infty < x < \infty),$$

where the function $f(x)$ decays quite rapidly as $|x| \to \infty$.

The asymptotic solution as $t \to \infty$ (for sufficiently large x) is the sum of solitons

$$w(x,t) = 2\sum_{n=1}^{N} |\lambda_n| \cosh^{-2}\left[\sqrt{\frac{b|\lambda_n|}{6a}}\left(x - \tfrac{2}{3}b|\lambda_n|t + c_n\right)\right],$$

where the λ_n are discrete eigenvalues of the linear Schrödinger equation

$$\Psi''_{xx} + \frac{b}{6a}\left[\lambda + f(x)\right]\Psi = 0, \qquad \Psi(\pm\infty) = 0.$$

4°. The transformation $w(x,t) = -\dfrac{6a}{b}u(x,\tau)$, $\tau = at$ leads to the Korteweg–de Vries equation in canonical form 13.1.1.1:

$$\frac{\partial u}{\partial \tau} + \frac{\partial^3 u}{\partial x^3} - 6u\frac{\partial u}{\partial x} = 0.$$

⊙ *References for equation* 13.1.1.2: C. S. Gardner, J. M. Greene, M. D. Kruskal, and R. M. Miura (1974), G. I. Barenblatt (1989).

13.1.2. Cylindrical, Spherical, and Modified Korteweg–de Vries Equations

1. $\dfrac{\partial w}{\partial t}+\dfrac{\partial^3 w}{\partial x^3}-6w\dfrac{\partial w}{\partial x}+\dfrac{1}{2t}w=0.$

Cylindrical Korteweg–de Vries equation. This is a special case of equation 13.1.2.3 for $a=1$, $b=-6$, and $k=\frac{1}{2}$.

The transformation

$$w(x,t)=-\frac{x}{12t}-\frac{1}{2t}u(z,\tau),\quad x=\frac{z}{\tau},\quad t=-\frac{1}{2\tau^2}$$

leads to the Korteweg–de Vries equation in canonical form 13.1.1.1:

$$\frac{\partial u}{\partial \tau}+\frac{\partial^3 u}{\partial z^3}-6u\frac{\partial u}{\partial z}=0.$$

⊙ *References*: R. S. Johnson (1979), F. Calogero and A. Degasperis (1982), G. C. Zhu and H. H. Chen (1986), G. W. Bluman and S. Kumei (1989, p. 313).

2. $\dfrac{\partial w}{\partial t}+\dfrac{\partial^3 w}{\partial x^3}-6w\dfrac{\partial w}{\partial x}+\dfrac{1}{t}w=0.$

Spherical Korteweg–de Vries equation. This is a special case of equation 13.1.2.3 for $a=1$, $b=-6$, and $k=1$.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1=C_1^2 w\big(C_1x+6C_1C_2\ln|t|+C_3,\ C_1^3t\big)+C_2t^{-1},$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Degenerate solution linear in x:

$$w(x,t)=\frac{C_1-x}{t(C_2+6\ln|t|)}.$$

3°. Self-similar solution:

$$w(x,t)=t^{-2/3}u(z),\qquad z=xt^{-1/3},$$

where the function $u=u(z)$ is determined by the ordinary differential equation

$$au'''_{zzz}+buu'_z-\tfrac{1}{3}zu'_z+\tfrac{1}{3}u=0.$$

3. $\dfrac{\partial w}{\partial t}+a\dfrac{\partial^3 w}{\partial x^3}+bw\dfrac{\partial w}{\partial x}+\dfrac{k}{t}w=0.$

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1=C_1^2 w\left(C_1x-\frac{bC_1C_2}{1-k}t^{1-k}+C_3,\ C_1^3t\right)+C_2t^{-k},$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Degenerate solution linear in x:

$$w(x,t)=\frac{(1-k)x+C_1}{C_2t^k+bt}.$$

3°. Self-similar solution:

$$w(x,t)=t^{-2/3}u(z),\quad z=xt^{-1/3},$$

where the function $u=u(z)$ is determined by the ordinary differential equation

$$au'''_{zzz}+buu'_z-\tfrac{1}{3}zu'_z+\left(k-\tfrac{2}{3}\right)u=0.$$

⊙ *References for equation* 13.1.2.3: A. D. Polyanin and V. F. Zaitsev (2004, p. 522).

4. $\dfrac{\partial w}{\partial t}+\dfrac{\partial^3 w}{\partial x^3}-6w^2\dfrac{\partial w}{\partial x}=0.$

Modified Korteweg–de Vries equation in canonical form (or *mKdV equation* for short). This is a special case of equation 13.1.3.2 with $a=-6$ and $k=2$ and is a special case of equation 13.1.2.6 with $a=-6$.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1=C_1w(C_1x+C_2,C_1^3t+C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. One-soliton solution:

$$w=\frac{2kC\exp(kx-k^3t)}{1-C^2\exp[2(kx-k^3t)]},$$

where C and k are arbitrary constants.

3°. Traveling-wave solutions:

$$w=\pm\frac{\sqrt{c}}{\sinh\left[\sqrt{c}\,(x-ct+B)\right]} \quad \text{if } c>0,$$

$$w=\pm\sqrt{-c}\,\tanh\left[\sqrt{-c}\,(x-2ct+B)\right] \quad \text{if } c<0,$$

$$w=\pm\sqrt{-c}\,\coth\left[\sqrt{-c}\,(x-2ct+B)\right] \quad \text{if } c<0,$$

$$w=\pm\frac{\sqrt{-c}}{\cos\left[\sqrt{-c}\,(x-ct+B)\right]} \quad \text{if } c<0,$$

$$w=\pm\tfrac{1}{2}\sqrt{-c}\left\{2+\tan^2\left[\tfrac{1}{2}\sqrt{-c}\,(x-ct+B)\right]+\cot^2\left[\tfrac{1}{2}\sqrt{-c}\,(x-ct+B)\right]\right\}^{1/2} \quad \text{if } c<0,$$

where B and c are arbitrary constants.

4°. Self-similar solution (x_0 and t_0 are arbitrary constants):

$$w(x,t)=\left[3(t-t_0)\right]^{-1/3}f(y),\quad y=\left[3(t-t_0)\right]^{-1/3}(x-x_0),$$

where the function $f(y)$ is determined by the third-order ordinary differential equation

$$f'''_{yyy}-yf'_y-f-6f^2f'_y=0.$$

Integrating yields the second Painlevé equation (see Conte and Musette, 2008)

$$f''_{yy}-2f^3-yf=a,$$

where a is an arbitrary constant.

5°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function $u(x,t)$ obtained with the Miura transformation

$$u(x,t) = \frac{\partial w}{\partial x} + w^2 \tag{1}$$

satisfies the Korteweg–de Vries equation 13.1.1.1:

$$\frac{\partial u}{\partial t} + \frac{\partial^3 u}{\partial x^3} - 6u\frac{\partial u}{\partial x} = 0. \tag{2}$$

In general, the converse is not true: if $u(x,t)$ is a solution of the Korteweg–de Vries equation (2), the function $w(x,t)$ linked to it with the Miura transformation (1) satisfies the nonlinear integro-differential equation

$$\frac{\partial w}{\partial t} + \frac{\partial^3 w}{\partial x^3} - 6w^2\frac{\partial w}{\partial x} = c(t)\exp\left[-2\int w(x,t)\,dx\right].$$

6°. The modified Korteweg–de Vries equation is an integrable equation and can be solved by inverse scattering method.

Solutions of the modified Korteweg–de Vries equation

$$\frac{\partial w}{\partial t} + \frac{\partial^3 w}{\partial x^3} - 6\sigma w^2\frac{\partial w}{\partial x} = 0, \qquad \sigma = \pm 1 \tag{3}$$

may be obtained from solutions of the linear Gelfand–Levitan–Marchenko integral equation. Any function $F = F(x,y;t)$ rapidly decaying as $x \to +\infty$ and satisfying simultaneously the two linear equations

$$\begin{aligned} \frac{\partial F}{\partial x} - \frac{\partial F}{\partial y} &= 0, \\ \frac{\partial F}{\partial t} + \left(\frac{\partial}{\partial x} + \frac{\partial}{\partial y}\right)^3 F &= 0, \end{aligned} \tag{4}$$

generates a solution of equation (3) in the form

$$w = K(x,x;t),$$

where $K(x,y;t)$ is a solution of the linear Gelfand–Levitan–Marchenko integral equation,

$$K(x,y;t) = F(x,y;t) + \frac{\sigma}{4}\int_x^\infty \int_x^\infty K(x,z;t)F(z,u;t)F(u,y;t)\,dz\,du. \tag{5}$$

Time t appears in (5) as a parameter. It follows from the first equation in (4) that $F(x,y;t) = F(x+y;t)$.

7°. Conservation laws:

$$\begin{aligned} &D_t(w) + D_x\left(w_{xx} - 2w^3\right) = 0, \\ &D_t\left(\tfrac{1}{2}w^2\right) + D_x\left(ww_{xx} - \tfrac{1}{2}w_x^2 - \tfrac{3}{2}w^4\right) = 0, \end{aligned}$$

where $D_t = \frac{\partial}{\partial t}$ and $D_x = \frac{\partial}{\partial x}$.

⊙ *References for equation* 13.1.2.4: G. B. Whitham (1965), R. M. Miura (1968), R. M. Miura, C. S. Gardner, and M. D. Kruskal (1968), M. Wadati (1972, 1973), M. Wadati and K. Sawada (1980), M. J. Ablowitz and H. Segur (1981), F. Calogero and A. Degasperis (1982), J. Hietarinta (1987 *b*), P. G. Drazin and R. S. Johnson (1996), A. M. Wazwaz (2008).

5. $\dfrac{\partial w}{\partial t} + \dfrac{\partial^3 w}{\partial x^3} + 6w^2\dfrac{\partial w}{\partial x} = 0.$

Modified Korteweg–de Vries equation (another form). This is a special case of equation 13.1.3.2 with $a = 6$ and $k = 2$ and is a special case of equation 13.1.2.6 with $a = 6$.

1°. Suppose $w(x, t)$ is a solution of the equation in question. Then the functions

$$w_1 = \pm C_1 w(C_1 x + C_2, C_1^3 t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, are also solutions of the equation.

2°. One-soliton solution:

$$w(x,t) = a + \frac{k^2}{\sqrt{4a^2 + k^2}\,\cosh z + 2a}, \qquad z = kx - (6a^2k + k^3)t + b,$$

where a, b, and k are arbitrary constants.

3°. Two-soliton solution:

$$w(x,t) = 2\frac{a_1 e^{\theta_1} + a_2 e^{\theta_2} + A a_2 e^{2\theta_1+\theta_2} + A a_1 e^{\theta_1+2\theta_2}}{1 + e^{2\theta_1} + e^{2\theta_2} + 2(1-A)e^{\theta_1+\theta_2} + A^2 e^{2(\theta_1+\theta_2)}},$$

$$\theta_1 = a_1 x - a_1^3 t + b_1, \quad \theta_2 = a_2 x - a_2^3 t + b_2, \quad A = \left(\frac{a_1 - a_2}{a_1 + a_2}\right)^2,$$

where a_1, a_2, b_1, and b_2 are arbitrary constants.

4°. Rational solutions (algebraic solitons):

$$w(x,t) = a - \frac{4a}{4a^2z^2 + 1}, \qquad z = x - 6a^2 t,$$

$$w(x,t) = a - \frac{12a\left(z^4 + \frac{3}{2}a^{-2}z^2 - \frac{3}{16}a^{-4} - 24tz\right)}{4a^2\left(z^3 + 12t - \frac{3}{4}a^{-2}z\right)^2 + 3\left(z^2 + \frac{1}{4}a^{-2}\right)^2},$$

where a is an arbitrary constant.

5°. Traveling-wave solutions involving hyperbolic functions:

$$w = \pm\tfrac{1}{2}\sqrt{c}\left\{2 - \tanh^2\left[\tfrac{1}{2}\sqrt{c}\,(x - ct + B)\right] - \coth^2\left[\tfrac{1}{2}\sqrt{c}\,(x - ct + B)\right]\right\}^{1/2},$$

where B and $c > 0$ are arbitrary constants.

6°. Traveling-wave solutions involving trigonometric functions:

$$w = \pm\frac{2\sqrt{\lambda/3}\,\cos^2\left[\frac{1}{2}\sqrt{\lambda}\,(x - \lambda t)\right]}{3 - 2\cos^2\left[\frac{1}{2}\sqrt{\lambda}\,(x - \lambda t)\right]}.$$

Setting $w = 0$ for $\frac{1}{2}\sqrt{\lambda}\,|x - \lambda t| \geq \frac{\pi}{2}$, one obtains (formal) compacton-like solutions, which are located in the interval of length $2\pi/\sqrt{\lambda}$.

7°. The modified Korteweg–de Vries equation is an integrable equation and can be solved by inverse scattering method; see Item 6° in equation 13.1.2.4 with $\sigma = -1$.

⊙ *References for equation* 13.1.2.5: H. Ono (1976), M. J. Ablowitz and H. Segur (1981), R. K. Dodd, J. C. Eilbeck, J. D. Gibbon, and H. C. Morris (1982), J. Hietarinta (1987 *b*), P. G. Drazin and R. S. Johnson (1996), S. N. Kumar and P. K. Panigrahi (1999), P. Rosenau (2000).

6. $\dfrac{\partial w}{\partial t}+\dfrac{\partial^3 w}{\partial x^3}+aw^2\dfrac{\partial w}{\partial x}=0.$

Unnormalized modified Korteweg–de Vries equation. This is a special case of equation 13.1.3.2 with $k=2$.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1=C_1 w(C_1x+C_2,C_1^3t+C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solutions:

$$w=\pm\left\{\frac{6c}{a\cosh^2\left[\sqrt{c}\,(x-ct+B)\right]}\right\}^{1/2} \quad \text{if } a>0 \text{ and } c>0,$$

$$w=\pm\left\{-\frac{6c}{a\sinh^2\left[\sqrt{c}\,(x-ct+B)\right]}\right\}^{1/2} \quad \text{if } a<0 \text{ and } c>0,$$

$$w=\pm\left\{\frac{6c}{a\cos^2\left[\sqrt{-c}\,(x-ct+B)\right]}\right\}^{1/2} \quad \text{if } a<0 \text{ and } c<0,$$

$$w=\pm\sqrt{\frac{6c}{a}}\,\tanh\left[\sqrt{-c}\,(x-2ct+B)\right] \quad \text{if } a<0 \text{ and } c<0,$$

$$w=\pm\sqrt{\frac{6c}{a}}\,\coth\left[\sqrt{-c}\,(x-2ct+B)\right] \quad \text{if } a<0 \text{ and } c<0,$$

where B and c are arbitrary constants.

3°. Traveling-wave solutions:

$$w=\pm\left\{\frac{3c}{2a}\left(2-\tanh^2\left[\tfrac{1}{2}\sqrt{c}\,(x-ct+B)\right]-\coth^2\left[\tfrac{1}{2}\sqrt{c}\,(x-ct+B)\right]\right)\right\}^{1/2}$$
$$\text{if } a>0 \text{ and } c>0,$$

$$w=\pm\left\{\frac{3c}{2a}\left(2+\tan^2\left[\tfrac{1}{2}\sqrt{-c}\,(x-ct+B)\right]+\cot^2\left[\tfrac{1}{2}\sqrt{-c}\,(x-ct+B)\right]\right)\right\}^{1/2}$$
$$\text{if } a<0 \text{ and } c<0,$$

where B and c are arbitrary constants.

4°. The substitution $w=\pm\sqrt{6/|a|}\,u$ leads to an equation of the form 13.1.2.4 or 13.1.2.5:

$$\frac{\partial u}{\partial t}+\frac{\partial^3 u}{\partial x^3}+6\operatorname{sign} a\,u^2\frac{\partial u}{\partial x}=0.$$

5°. See Item 6° in equation 13.1.2.4 with $\sigma=-\frac{1}{6}a$.

⊙ *References for equation* 13.1.2.6: J. Hietarinta (1987 *b*), A. M. Wazwaz (2008).

7. $\dfrac{\partial w}{\partial t}+\dfrac{\partial^3 w}{\partial x^3}-\dfrac{3}{2}\dfrac{w_{xx}^2}{w_x}=0.$

Schwarzian Korteweg–de Vries equation. It is an integrable equation.

⊙ *References*: I. M. Krichever and S. P. Novikov (1980), J. Weiss (1983), G. Wilson (1988), I. Ya. Dorfman (1989, 1993), F. Guil and M. Mañas (1991).

13.1.3. Generalized Korteweg–de Vries Equation

$$\frac{\partial w}{\partial t} + a\frac{\partial^3 w}{\partial x^3} + f(w)\frac{\partial w}{\partial x} = 0$$

Preliminary remarks. For $f(w) = bw$, see equations 13.1.1.1 and 13.1.1.2; for $f(w) = bw^2$, see equations 13.1.2.4 and 13.1.2.5.

1°. Equations of this form admit traveling-wave solutions

$$w = w(z), \qquad z = kx + \lambda t,$$

where k and λ are arbitrary constants, and the function $w(z)$ is determined by the second-order autonomous ordinary differential equation (C is an arbitrary constant)

$$\alpha k^3 w''_{zz} + k\int f(w)\,dw - \lambda w = C.$$

2°. Conservation laws:

$$D_t\big(w\big) + D_x\big[\alpha w_{xx} + F_0(w)\big] = 0,$$
$$D_t\big(\tfrac{1}{2}w^2\big) + D_x\big[\alpha w w_{xx} - \tfrac{1}{2}\alpha w_x^2 + F_1(w)\big] = 0,$$

where

$$D_t = \frac{\partial}{\partial t}, \quad D_x = \frac{\partial}{\partial x}, \quad F_0(w) = \int f(w)\,dw, \quad F_1(w) = \int w f(w)\,dw.$$

1. $\dfrac{\partial w}{\partial t} + \big(2aw - 3bw^2\big)\dfrac{\partial w}{\partial x} + \dfrac{\partial^3 w}{\partial x^3} = 0.$

Gardner equation or the *combined KdV-mKdV equation*. It is used to model nonlinear phenomena in plasma and solid-state physics and in quantum field theory.

1°. Traveling-wave solutions:

$$w = \frac{a}{3b}\left\{1 \pm \tanh\left[\frac{a}{3\sqrt{2b}}\left(x - \frac{2a^2}{9b}t + B\right)\right]\right\} \quad \text{if } b > 0;$$
$$w = \frac{a}{3b}\left\{1 \pm \coth\left[\frac{a}{3\sqrt{2b}}\left(x - \frac{2a^2}{9b}t + B\right)\right]\right\} \quad \text{if } b > 0;$$
$$w = \frac{6c}{2a \pm \sqrt{4a^2 - 18bc}\,\cosh[\sqrt{c}\,(x - ct + B)]} \quad \text{if } c > 0 \text{ and } 2a^2 > 9bc;$$
$$w = \frac{6c}{2a \pm \sqrt{18bc - 4a^2}\,\sinh[\sqrt{c}\,(x - ct + B)]} \quad \text{if } c > 0 \text{ and } 2a^2 < 9bc,$$

where B and c are arbitrary constants.

2°. Traveling-wave solution with $b > 0$ and $k = a^2 - 3bc > 0$:

$$w = \frac{a}{3b} + \frac{\sqrt{3k}}{3b}\operatorname{csch}\left[\sqrt{\frac{2k}{3b}}\,(x - ct + B)\right] + \frac{\sqrt{3k}}{3b}\coth\left[\sqrt{\frac{2k}{3b}}\,(x - ct + B)\right].$$

3°. Traveling-wave solution with $k = 9b^2 - 16a^2 > 0$:

$$w = \operatorname{csch}\xi\left(1 + \frac{3b - \sqrt{k}}{4a}\operatorname{csch}\xi\right)^{-1}, \qquad \xi = \frac{\sqrt{9b + 3\sqrt{k}}}{6}\left(x - \frac{3b + \sqrt{k}}{12}\,t + B\right),$$

where B and c are arbitrary constants.

4°. Traveling-wave solutions:

$$w = \operatorname{sech}\xi\left(1 + \frac{3b \pm \sqrt{k}}{4a}\operatorname{sech}\xi\right)^{-1}, \qquad \xi = \pm\frac{\sqrt{-9b \pm 3\sqrt{k}}}{6}\left(x - \frac{-3b \pm \sqrt{k}}{12}\,t + B\right),$$

where $k = 9b^2 + 16a^2$, and B and c are arbitrary constants.

5°. The transformation

$$w = u(z,t) + \frac{a}{3b}, \qquad z = x - \frac{a^2}{3b}t$$

leads to an integrable equation of the form 13.1.2.6:

$$\frac{\partial u}{\partial t} - 3bu^2\frac{\partial u}{\partial z} + \frac{\partial^3 u}{\partial z^3} = 0.$$

⊙ *References for equation* 13.1.3.1: Z. Fu, S. Liu, and Sh. Liu (2004), A. M. Wazwaz (2007, 2008).

2. $\dfrac{\partial w}{\partial t} + \dfrac{\partial^3 w}{\partial x^3} + aw^k\dfrac{\partial w}{\partial x} = 0.$

Korteweg–de Vries type equation with a power-law nonlinearity. For $k = 1$ and $k = 2$ see equations 13.1.1.1–13.1.1.2 and 13.1.2.4–13.1.2.5. For $k = 1/2$, the equation describes ion-acoustic waves in a cold-ion plasma with nonisothermal electrons.

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1^{2/k}w(C_1x + C_2, C_1^3t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solutions:

$$w = \left\{\frac{c(k+1)(k+2)}{2a\cosh^2\left[\frac{1}{2}k\sqrt{c}\,(x - ct + B)\right]}\right\}^{1/k} \quad \text{if } c > 0,$$

$$w = \left\{-\frac{c(k+1)(k+2)}{2a\sinh^2\left[\frac{1}{2}k\sqrt{c}\,(x - ct + B)\right]}\right\}^{1/k} \quad \text{if } c > 0,$$

$$w = \left\{\frac{c(k+1)(k+2)}{2a\cos^2\left[\frac{1}{2}k\sqrt{-c}\,(x - ct + B)\right]}\right\}^{1/k} \quad \text{if } c < 0,$$

where B and c are arbitrary constants. The first solution is the soliton solution.

3°. Traveling-wave solutions:

$$w = \left\{\frac{c(k+1)(k+2)}{8a}\left(2 - \tanh^2\left[\tfrac{1}{4}k\sqrt{c}\,(x - ct + B)\right] - \coth^2\left[\tfrac{1}{4}k\sqrt{c}\,(x - ct + B)\right]\right)\right\}^{1/k}$$
$$\text{if } c > 0,$$

$$w = \left\{\frac{c(k+1)(k+2)}{8a}\left(2 + \tan^2\left[\tfrac{1}{4}k\sqrt{-c}\,(x - ct + B)\right] + \cot^2\left[\tfrac{1}{4}k\sqrt{-c}\,(x - ct + B)\right]\right)\right\}^{1/k}$$
$$\text{if } c < 0,$$

where B and c are arbitrary constants.

4°. Self-similar solution:

$$w(x,t) = t^{-\frac{2}{3k}} U(z), \qquad z = xt^{-\frac{1}{3}},$$

where the function $U = U(z)$ is determined by the ordinary differential equation

$$-\frac{2}{3k}U - \frac{1}{3}zU'_z + U'''_{zzz} + aU^k U'_z = 0.$$

5°. Conservation laws:

$$D_t w + D_x\left(w_{xx} + \frac{a}{k+1}w^{k+1}\right) = 0,$$
$$D_t\left(w^2\right) + D_x\left(2ww_{xx} - w_x^2 + \frac{2a}{k+2}w^{k+2}\right) = 0.$$

⊙ *References for equation* 13.1.3.2: H. Schamel (1973), M. J. Ablowitz and H. Segur (1981), P. G. Drazin and R. S. Johnson (1996), A. M. Wazwaz (2008).

3. $\dfrac{\partial w}{\partial t} + \left(aw^n - bw^{2n}\right)\dfrac{\partial w}{\partial x} + \dfrac{\partial^3 w}{\partial x^3} = 0.$

This equation describes the propagation of nonlinear long acoustic-type waves.

1°. Traveling-wave solutions:

$$w = \left\{\frac{a(2n+1)}{2b(n+2)}\left[1 \pm \tanh\left(knx - 4k^3nt + C\right)\right]\right\}^{1/n}; \quad k = \frac{a}{2(n+2)}\sqrt{\frac{2n+1}{b(n+1)}},$$
$$w = \left\{\frac{a(2n+1)}{2b(n+2)}\left[1 \pm \coth\left(knx - 4k^3nt + C\right)\right]\right\}^{1/n}, \quad k = \frac{a}{2(n+2)}\sqrt{\frac{2n+1}{b(n+1)}},$$

where C is an arbitrary constant (the two first solutions with tanh are the kink solutions).

2°. Traveling-wave solutions:

$$w = \left\{\frac{(n+1)(n+2)c}{a \pm a\sqrt{k}\,\cosh[n\sqrt{c}\,(x-ct)+B]}\right\}^{1/n}, \quad k = 1 - \frac{n^3+5n^2+8n+4}{2n+1}\frac{bc}{a^2} \quad \text{if } c>0;$$
$$w = \left\{\frac{(n+1)(n+2)c}{a \pm a\sqrt{s}\,\sinh[n\sqrt{c}\,(x-ct)+B]}\right\}^{1/n}, \quad s = \frac{n^3+5n^2+8n+4}{2n+1}\frac{bc}{a^2} - 1 \quad \text{if } c>0;$$
$$w = \left\{\frac{(n+1)(n+2)c}{a \pm a\sqrt{k}\,\cos[n\sqrt{-c}\,(x-ct)+B]}\right\}^{1/n}, \quad k = 1 - \frac{n^3+5n^2+8n+4}{2n+1}\frac{bc}{a^2} \quad \text{if } c<0,$$

where B and c are arbitrary constants.

⊙ *References for equation* 13.1.3.3: A. M. Wazwaz (2006, 2008; some other traveling-wave solutions can also be found there).

4. $\dfrac{\partial w}{\partial t} + \dfrac{\partial^3 w}{\partial x^3} + ae^w \dfrac{\partial w}{\partial x} = 0.$

Korteweg–de Vries type equation with an exponential nonlinearity.

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = w(C_1 x + C_2, C_1^3 t + C_3) + 2\ln|C_1|,$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Traveling-wave solution:

$$w = w(z), \qquad z = x + \lambda t,$$

where the function $w(z)$ is determined by the second-order autonomous ordinary differential equation

$$w''_{zz} + \lambda w + ae^w = C,$$

and λ and C are arbitrary constants.

3°. Solution:

$$w(x,t) = U(\xi) - \tfrac{2}{3}\ln t, \qquad \xi = xt^{-\frac{1}{3}},$$

where the function $U = U(\xi)$ is determined by the ordinary differential equation

$$U'''_{\xi\xi\xi} + \left(ae^U - \tfrac{1}{3}\xi\right)U'_\xi - \tfrac{2}{3} = 0.$$

5. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^3 w}{\partial x^3} + (b\ln w + c)\dfrac{\partial w}{\partial x}.$

Korteweg–de Vries type equation with a logarithmic nonlinearity.

1°. Suppose $w(x,t)$ is a solution of the equation in question. Then the function

$$w_1 = e^{C_1} w(x + bC_1 t + C_2, t + C_3),$$

where C_1, C_2, and C_3 are arbitrary constants, is also a solution of the equation.

2°. Generalized traveling-wave solution:

$$w(x,t) = \exp\left[\frac{C_2 - x}{bt + C_1} + \frac{a}{b}\frac{1}{(bt + C_1)^2} - \frac{c}{b}\right],$$

where C_1 and C_2 are arbitrary constants.

3°. Solution:

$$w(x,t) = e^{\lambda t}u(z), \qquad z = x + \tfrac{1}{2}b\lambda t^2 + kt,$$

where k and λ are arbitrary constants, and the function $u(z)$ is determined by the autonomous ordinary differential equation

$$au'''_{zzz} + (b\ln u + c - k)u'_z - \lambda u = 0.$$

To $\lambda = 0$ there corresponds a traveling-wave solution.

⊙ *References for equation* 13.1.3.5: W. I. Fushchich, N. I. Serov, and T. K. Akhmerov (1991), V. A. Galaktionov (1999), A. D. Polyanin and V. F. Zaitsev (2004, p. 525).

6. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^3 w}{\partial x^3} + (b\operatorname{arcsinh} w + c)\dfrac{\partial w}{\partial x}.$

Generalized traveling-wave solution:

$$w(x,t) = \sinh\left[\frac{C_2 - x}{bt + C_1} + \frac{a}{b}\frac{1}{(bt + C_1)^2} - \frac{c}{b}\right],$$

where C_1 and C_2 are arbitrary constants.

⊙ *Reference*: W. I. Fushchich, N. I. Serov, and T. K. Akhmerov (1991).

7. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^3 w}{\partial x^3} + (b\operatorname{arccosh} w + c)\dfrac{\partial w}{\partial x}.$

Generalized traveling-wave solution:

$$w(x,t) = \cosh\left[\frac{C_2 - x}{bt + C_1} + \frac{a}{b}\frac{1}{(bt + C_1)^2} - \frac{c}{b}\right],$$

where C_1 and C_2 are arbitrary constants.

8. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^3 w}{\partial x^3} + (b\arcsin w + c)\dfrac{\partial w}{\partial x}.$

Generalized traveling-wave solution:

$$w(x,t) = \sin\left[\frac{C_2 - x}{bt + C_1} - \frac{a}{b}\frac{1}{(bt + C_1)^2} - \frac{c}{b}\right],$$

where C_1 and C_2 are arbitrary constants.

⊙ *Reference*: W. I. Fushchich, N. I. Serov, and T. K. Akhmerov (1991).

9. $\dfrac{\partial w}{\partial t} = a\dfrac{\partial^3 w}{\partial x^3} + (b\arccos w + c)\dfrac{\partial w}{\partial x}.$

Generalized traveling-wave solution:

$$w(x,t) = \cos\left[\frac{C_2 - x}{bt + C_1} - \frac{a}{b}\frac{1}{(bt + C_1)^2} - \frac{c}{b}\right],$$

where C_1 and C_2 are arbitrary constants.

13.1.4. Equations Reducible to the Korteweg–de Vries Equation

1. $\dfrac{\partial w}{\partial t} + a\dfrac{\partial^3 w}{\partial x^3} + bw\dfrac{\partial w}{\partial x} = f(t).$

The transformation

$$w = u(z,t) + \int_{t_0}^{t} f(\tau)\,d\tau, \qquad z = x - b\int_{t_0}^{t} (t-\tau) f(\tau)\,d\tau,$$

where t_0 is any, leads to an equation of the form 13.1.1.2:

$$\frac{\partial u}{\partial t} + a\frac{\partial^3 u}{\partial x^3} + bu\frac{\partial u}{\partial x} = 0.$$

2. $\dfrac{\partial w}{\partial t} + a\dfrac{\partial^3 w}{\partial x^3} + \left[bw^2 + f(t)\right]\dfrac{\partial w}{\partial x} = 0.$

The transformation

$$w = ku(z,t), \qquad z = a^{-1/3}x - a^{-1/3}\int f(t)\,dt, \quad \text{with} \quad k = \sqrt{|6a^{1/3}b^{-1}|},$$

leads to an equation of the form 13.1.2.4 or 13.1.2.5:

$$\frac{\partial u}{\partial t} + \frac{\partial^3 u}{\partial z^3} + 6\,\mathrm{sign}(ab)\,u^2\frac{\partial u}{\partial z} = 0.$$

3. $\dfrac{\partial w}{\partial t} + \dfrac{\partial^3 w}{\partial x^3} + a\left(\dfrac{\partial w}{\partial x}\right)^2 = 0.$

Potential Korteweg–de Vries equation (or *potential KdV equation* for short).

1°. Suppose $w(x,t)$ is a solution of this equation. Then the function

$$w_1 = C_1 w(C_1 x - 2aC_1C_2 t + C_3, C_1^3 t + C_4) + C_2 x - aC_2^2 t + C_5,$$

where $C_1, \ldots, C_5$ are arbitrary constants, is also a solution of the equation.

2°. One-soliton solution:

$$w = \frac{2kC\exp\left(\frac{1}{3}akx - \frac{1}{27}a^3k^3t\right)}{1 - C\exp\left(\frac{1}{3}akx - \frac{1}{27}a^3k^3t\right)},$$

where C and k are arbitrary constants.

3°. Traveling-wave solutions:

$$w = A + \frac{3\sqrt{c}}{a}\tanh\left[\frac{\sqrt{c}}{2}(x - ct + B)\right] \qquad \text{if } c > 0,$$

$$w = A + \frac{3\sqrt{c}}{a}\coth\left[\frac{\sqrt{c}}{2}(x - ct + B)\right] \qquad \text{if } c > 0,$$

$$w = A + \left\{\sqrt{\frac{3cB^2 - aB\sqrt{c}}{3c}} + B\tanh\left[\frac{\sqrt{c}}{2}(x - ct + C)\right]\right\}^{-1} \qquad \text{if } c > 0,$$

$$w = A + \left\{\sqrt{\frac{3cB^2 - aB\sqrt{c}}{3c}} + B\coth\left[\frac{\sqrt{c}}{2}(x - ct + C)\right]\right\}^{-1} \qquad \text{if } c > 0,$$

$$w = A - \frac{3\sqrt{-c}}{a}\tan\left[\sqrt{-c}\,(x - ct + B)\right] - \frac{3\sqrt{-c}}{a}\sec\left[\sqrt{-c}\,(x - ct + B)\right] \qquad \text{if } c < 0,$$

$$w = A + \frac{3\sqrt{-c}}{a}\cot\left[\sqrt{-c}\,(x - ct + B)\right] + \frac{3\sqrt{-c}}{a}\csc\left[\sqrt{-c}\,(x - ct + B)\right] \qquad \text{if } c < 0,$$

where A, B, C, and c are arbitrary constants.

4°. The Bäcklund transformation

$$\frac{\partial w}{\partial x} = -\frac{3}{a}u, \qquad \frac{\partial w}{\partial t} = \frac{3}{a}\frac{\partial^2 u}{\partial x^2} - \frac{9}{a}u^2 \tag{1}$$

links the equation in question with the Korteweg–de Vries equation 13.1.1.1:

$$\frac{\partial u}{\partial t} + \frac{\partial^3 u}{\partial x^3} - 6u\frac{\partial u}{\partial x} = 0. \tag{2}$$

Let $u = u(x,t)$ be a solution of equation (2). Then the linear system of first-order equations (1) enables us to find the corresponding solution $w = w(x,t)$ of the original equation.

⊙ *References for equation* 13.1.4.3: N. H. Ibragimov (1985), A. M. Wazwaz (2008).

4. $\dfrac{\partial w}{\partial t} + \dfrac{\partial^3 w}{\partial x^3} - a\left(\dfrac{\partial w}{\partial x}\right)^2 = f(t).$

The substitution $w = u(x,t) + \int f(t)\,dt$ leads to an equation of the form 13.1.4.3:

$$\frac{\partial u}{\partial t} + \frac{\partial^3 u}{\partial x^3} - a\left(\frac{\partial u}{\partial x}\right)^2 = 0.$$

5. $\dfrac{\partial w}{\partial t} + \dfrac{\partial^3 w}{\partial x^3} - 3\left(\dfrac{\partial w}{\partial x}\right)^2 + \dfrac{1}{2t}w = 0.$

The Bäcklund transformation

$$w_t = -\xi_{xx} + 3\xi^2 - \frac{1}{2t}w,$$
$$w_x = \xi$$

links the equation in question with the cylindrical Korteweg–de Vries equation 13.1.2.1:

$$\frac{\partial \xi}{\partial t} + \frac{\partial^3 \xi}{\partial x^3} - 6\xi\frac{\partial \xi}{\partial x} + \frac{1}{2t}\xi = 0.$$

6. $\dfrac{\partial w}{\partial t} + \dfrac{\partial^3 w}{\partial x^3} - a\left(\dfrac{\partial w}{\partial x}\right)^3 = 0.$

Potential modified Korteweg–de Vries equation (or *potential mKdV equation* for short).

1°. Suppose $w(x,t)$ is a solution of this equation. Then the functions

$$w_1 = \pm w(C_1 x + C_2, C_1^3 t + C_3) + C_4,$$

where $C_1, \ldots, C_4$ are arbitrary constants, are also solutions of the equation.

2°. The Bäcklund transformation

$$\frac{\partial w}{\partial x} = bu, \quad \frac{\partial w}{\partial t} = -b\frac{\partial^2 u}{\partial x^2} + 2bu^3, \qquad \text{where} \quad b = \pm\sqrt{2/a}, \tag{1}$$

links the equation in question with the modified Korteweg–de Vries equation 13.1.2.4:
