Production Downtime Reporting Requirements project

Our manufacturing line has not been meeting daily production requirements; we want to capture and identify the causes of production downtime so that we may reduce the impact of unplanned downtime. Operators should report downtime events via a WinCC Screen when they occur. Repair technicians should enter in any notes on the downtime event record when the issue has been analyzed.

Requirements:

1. Create a system where Operators can enter in reasons for downtime events on the WinCC SCADA at their station.
2. Operators should enter their name, station ID, time, reason, and duration (in minutes) for the downtime event, and their comments.
3. Repair Technicians should be able to add comments to downtime events entered by operators.
4. Reports should be generated weekly or as desired for downtime events.
