

Base and Derived Classes Exercises

- Imagine we have two classes A and B
- What is the syntax for defining B as a subclass of A?
- Write a constructor for B that takes no arguments and has no body

- If A has a member a of type int and B has a member b of type double, write a constructor for B that performs the necessary initialization (and has no constructor body)
- What is the syntax for defining another class C as a child class of B?

- What is the purpose of the final keyword?
