

Case Study Revisited

Student Grades Program

Exercises

Scenario

- If you have not done this case study before, convert the code given in the video to a complete working program
- The program should prompt the user to enter in student grades, entering -1 when they are finished
- The program will read these grades, display them in numerical order, calculate the average grade and display it on output
- The highest possible grade is 100. Grades which are higher than this should be rejected

- Convert the code given in the video to a complete working program.
- Why is this version better than the previous one?
