

Lambda Functions Part Two

Exercises

- Rewrite the `equal_strings()` function from earlier in the course, using an algorithm and a lambda expression
- Write a simple program to test your function

- What are the advantages of this implementation of `equal_strings()` compared to writing a loop?
- Are there any disadvantages?

- What is meant by "capture" in a lambda expression?
- What is the syntax for performing lambda capture?
- How is lambda capture implemented?

- Rewrite the `find_if()` function from earlier in the course, using a lambda function with capture instead of a functor
- Write a simple program to test your code
