

# Transform Algorithm Exercises

# transform()

- What does transform() do?
- What arguments does transform() take?
- Write a simple program that uses transform()
- Write the equivalent code without using transform()

# Overload of transform()

- What does the overloaded version of transform() do?
- What arguments does this version of transform() take?
- Write a simple program that uses the overloaded version of transform()
- Write the equivalent code without using transform()

# Case-insensitive string comparison

- Use `transform()` to implement the `equal_strings()` function from previous videos
